Carlo Caccioli contributed another novel of serious and spiritual values, *La piccola valle di Dio* (Vallecchi, Florence). A simple and beautiful narration of life in this world of ours, it offers a formula for solace and ultimate salvation. Enzo Amodio, a newcomer in the field of literature wrote *L'Abisso* (Casella, Naples). It tells of the adventures of a young man, of war, and of impending ruin. The novel did not create a stir.

Guido Seborga's *L'Uomo di camporosso* (Mondadori, Milan) is written in a direct and incisive style. Here again the story evolves about a man in rebellion against his surroundings. The veteran writer, Aldo Palazzeschi, contributed something of a counterpart to his famous novel, *Le Sorelle Materassi* (*The Sisters Materassi*), in *I fratelli Cuccoli* (Vallecchi, Florence). A regional novel was contributed by Lucifero Falcone, in *Tonna* (Palombi, Rome). Tonna, a calabrese mother clings to the only indestructible reason for being alive; the constant reality that a mother does bear children, and that this relationship of mother and children has an "eternal quality and strength."

Riccardo Bacchelli, a writer of long standing, also contributed a novel on the spiritual plane, *Lo sguardo di Gesù* (Garzanti, Milan). It draws its inspiration from the Biblical episodes dealing with Christ's miracles on those possessed of the devil. Two novels on different motifs were contributed by Alfredo Orecchio and Vittorio G. Rossi. Orecchio's *Gli sposi sensibili* (Reanda, Rome) constituted the first volume of a trilogy. It deals with the atmosphere around the *petite bourgeoisie* with its attendant "misery," "morbidly," and "lack of ethics." Rossi's *Preludio alla notte* (Bompiani, Milan) makes fare of the story and adventure formula: two young people meet on a steamer and in three short days are deeply in love. While speaking of adventure novels, one might mention Ugo Betti's *La Piera Alta* (Garzanti, Milan), an addition to the numerous books on mountain climbing, with the usual dosage of danger and excitement. The book was criticized as being overly stylistic. Libero Bigiaretti gained the "Fiugi Prize" for his novel, *Un discorso d'amore* (Garzanti, Milan). The novel is written in the form of a long letter to a former "love," and shows some influence of the "existentialism" theme.

In the short story field, the venerable name of Vincenzo Cardarelli reappeared in his volume of "reminiscences," couched in poetic vein, *Villa Ta-*

rantola (Edizione della Meridiana, Rome). The book was awarded the "Strega Prize." Nine short stories in "bold" and "violent" moods made up Maria Luisa Astoldi's *La torre del diavolo* (De Fonseca, Rome). Another collection of short stories, dipping frequently into the Neopolitan vernacular, and with zest and color, was Domenico Rea's *Spaccanapoli* (Mondadori, Milan). This young author writes with effortless simplicity and creates effortless drama at every turn of the page; he will no doubt be heard from in the future. Ugo Betti had a busy season; in addition to his novel, discussed above, he found time to assemble 19 short stories, *Una strana serata* (Garzanti, Milan); in a lively idiom and with vivid characterizations.

Poetry and Varia. The poetry prize "S. Babila" was awarded to Giuseppe Ungaretti for his *Il Dolore* (Mondadori, Milan) which constitutes the fourth volume in his series "Vita di un uomo." Vincenzo Cardarelli's *Poesie* appeared in the collection "Poeti dello Specchio" (Mondadori, Milan). G. Cimino's volume of poems, *Le cose* (Gastoldi, Milan), is divided into three groups: "poems on times gone by," "poems on modern times," and "philosophic poems." Umberto Fraccacreta contributed poems with echoes of Pascoli and D'Annunzio, *Ultimi canti* (Laterza, Bari).

One of the best books of poetry, singled out in the past season, was P. David Turoldi's *Io non ho mani* (Bompiani, Milan). The poems suggest a mystic and sincere exultation. Essays on poetry were contributed by Vincenzo Cardarelli, *Solitario in Arcadia* (Mondadori, Milan). These were observations on style, on color, and on the author himself, as man and poet. Giovanni Scalvini published his critical studies: *Foscolo*, *Manzoni*, *Goethe* (Einaudi, Turin). Luigi Pirandello's plays continued to be reprinted by the "Collezione Omnibus" and "Biblioteca Moderna," both editions put out by the famous house of Mondadori of Milan. Lionello Venturi, the internationally famous art critic, prepared a handsome volume on contemporary painting, *Pittura Contemporanea* (Hoepli, Milan). In conclusion, thanks are due to the monthly, *ICS*, for material consulted in the preparation of the foregoing bibliographical notes.

—O. A. BONTEMPO

ITALIAN SOMALILAND (Somalia). A territory along the east coast of Africa from the Gulf of Aden to Kenya. Formerly an Italian colony, it was conquered by Allied military forces and has been under British military administration since February, 1941. Area: 194,000 square miles. Population: 1,021,572. The majority of the people are Somalis of the Sunni sect of Islam. Capital: Mogadishu, 55,000 inhabitants. Agriculture and cattle-raising are the chief occupations of the people.

ITALY. A republic of southern Europe. Area: 116,235 square miles. By the treaty of peace of Feb. 10, 1947, Italy ceded several small border areas to France, larger areas to Yugoslavia, and Rhodes and other Dodecanese Islands to Greece. The region of Trieste became a "Free Territory." Sovereignty over the African colonies was renounced. Population (estimated in mid-1947): 45,943,000.

Religion and Education. Catholic religious teaching is given in elementary and intermediate schools: In 1931, 99.6 percent of Italians were Catholics. According to the treaty of Feb. 11, 1929, between the Holy See and Italy, the Catholic Apostolic Roman Religion is the only religion of the State. Education is free and compulsory from the ages of 6 to 14. In 1945-46, there were 45,851 elementary

schools (public and private) with 5,226,249 pupils. There were 1,138 non-technical government secondary schools with 382,539 pupils. There were 27 universities and higher institutes.

Production and Industry. Food production in 1946-47 was 86 percent of the 1934-38 average. Industrial production in 1947 was 65 percent of the 1938 level. By the autumn of 1948, it had not increased appreciably and had declined in some lines. Official estimates indicated that the Marshall Plan goal of a self-supporting Italian economy by 1952 would require an increase of industrial production to 140 percent of the 1938 level. This objective appeared unattainable without increased and protracted American subsidies. Livestock in 1947 was estimated at 7,245,000 cattle, 3,100,000 pigs, 9,735,000 sheep and goats, 560,000 horses, 500,000 donkeys, 240,000 mules. The 1947 production, in thousands of metric tons: coal, 1,356; lignite, 441.6; iron ore, 225.6; pig iron and ferroalloys, 384; steel ingots and castings, 1,704; lead, 17.52; zinc, 24.12. Wine production for 1946-47 was estimated at 31,857,680 hectolitres.

Foreign Trade. During 1948 a customs union with France was projected, with import duties to be abolished by Jan. 1, 1950. Owing to the progressive depreciation of the value of the lire, along with frequent fluctuations, figures for imports and exports are relatively meaningless. It was estimated, however, by the UN Economic Commission for Europe that Italian exports for the year July, 1946, to June, 1947, had a value in dollars of 1938 purchasing power of \$334 million, while imports, similarly estimated for the same period, totaled \$650 million. From available data it does not appear that these quantities and proportions were significantly changed during 1948.

Finance. Up to June 30, 1948, total American grants and loans to Italy since liberation amounted to \$2,035 million. The public debt by Nov. 30, 1947, was 1,369,872 million lire, including a consolidated debt of 52,947 million lire and a floating debt of 881,235 million lire. In December, 1947, there were 788.1 million lire in circulation. The index number of the cost of living in August, 1948, was for all items 4,792; for food, 6,004 (1938 = 100). Price levels in the spring of 1948 were about 15 percent lower than in October, 1947, thanks to the checking of the inflationary spiral through credit restrictions and anti-inflationary fiscal policies.

Communications. In June, 1947, there were 23,222 kilometers of railways, including 15,764 kilometers of state railways, of which 4,692 had been electrified. The monthly average of freight tons carried on the railroads was 2.94 million in 1947 or 81 percent of the prewar level. Passenger travel was estimated at 194 percent of the prewar level. The telephone service in 1947 had 642,555 subscribers.

Government. Italy is a parliamentary republic with a President, a Premier, a Cabinet, and a bicameral legislature. See *Events* below for a discussion of the new Constitution and of political developments during 1948.

Events, 1948. The Italian Republic, like many another great and ancient state, became a football in the game of power played by the giants of East and West. Each contestant offered bribes and threats to win Italian favor. But this practice, far from enabling the Government at Rome to play an independent role of honor and dignity in world affairs, merely gave to Italian politics many of the characteristics of a puppet show, with the strings in the hands of Washington and Moscow. America's victory, promoted by ECA funds and regis-

tered in the election of April 18, was impressive but not definitive. One Italian out of three continued to adhere to Marxism of the Muscovite brand. This perverse addiction to subversion was largely attributable to mass misery, due in turn to defeat, devastation, inflation, chronic unemployment, painfully slow economic recovery, and the continued ascendancy of the industrial, aristocratic, and ecclesiastical élite over an insecure middle class and an impoverished proletariat and peasantry. American aid alleviated the worst symptoms of economic and social malaise. But those who dispensed it could not or would not antagonize their conservative Italian sympathizers who, with few exceptions, supported feudal agriculture in the south, industrial exploitation in the north, and political clericalism throughout the land. The Soviet-oriented agitators of social revolution therefore continued to find customers for their wares—to an extent which continued to jeopardize political stability and economic rehabilitation.

New Constitution. On New Year's Day of 1948, the 1848 *Statuto* of Piedmont-Sardinia—which had hitherto served as the basic law of the Kingdom, despite the distortions of Fascism and the confusions of liberation—was officially superseded by the document hammered out in the Assembly during 1946–47 in the course of 300 sittings, marked by 1,090 speeches and 1,644 amendments, of which 289 were approved. The new charter consisted of 139 articles, plus 17 “temporary” articles, including one denying civil rights to 200,000 Fascists. In its final form, notable for several major concessions by the Communists to Christian Democratic clericalism, it commanded the approval of all major parties. On Dec. 22, 1947, the Deputies endorsed the text by a vote of 453 to 62, with only a few Qualunquists, Monarchists, and ultra-Nationalists in opposition.

Ex-King Victor Emmanuel III died in Alexandria on Dec. 28, 1947, aged 78. His son, Humbert, remained in exile, although willing, as he put it, to return to the throne if summoned to do so by “the people.” No such popular desire was manifested during 1948, nor did Humbert and his Monarchist supporters find the times opportune for any organized efforts looking toward a royalist restoration.

The new Constitution reflected the many compromises which entered into its drafting. Communists abandoned a Soviet-style version of the bill of rights. Christian Democrats retreated from their original concepts of regionalism and corporativism. Marriage is not declared “indissoluble” (as in the initial draft), but children born out of wedlock are denied a legal status equal to those of legitimate offspring. Catholicism remains a State-supported religion with the reaffirmation of the Lateran Pact of 1929. Workers have no right to participate in plant management, but only a right to collaborate, subject to interests of production. Their right to strike is not absolute, but is subject to statutory limitations. The great latifundia are not abolished, but are to be “reformed.”

The polity sought to be established by the Constitution may be described as a unitary, parliamentary republic, based more on French and British practices than on American or Soviet models. The 19 “regions” of the realm are granted certain local powers, but not on such terms as to give the system a federal character. A Constitutional Court of 15 judges, chosen for 12-year terms, one-third each by the higher courts, parliament, and the President, may, as in the United States, pass on the constitutionality of legislation (Art.

135 and Act of Jan. 31, 1948). Parliament consists of two equal houses: a Chamber of Deputies, elected for a five-year term by universal and direct suffrage, with a system of proportional representation, on the part of all citizens over 21, in single member constituencies (Art. 56); and a Senate, also popularly elected but only by citizens over 25, for a six-year term, with each “region” given six Senators, and by means of a complex system of single member constituencies for candidates winning 65 percent of the votes, combined with a regional pooling of ballots for others on the principle of proportional representation.

The President is elected for a seven-year term by secret ballot by a two-thirds majority (or by a simple majority after the third ballot) of the Assembly, consisting of the two chambers meeting jointly. He may propose legislation to parliament and may veto laws within thirty days, although the Chambers may override his veto by a simple majority. He may dissolve either or both houses, but not during the last six months of his term (Art. 88). The parliamentary principle of executive responsibility to the legislature is preserved in Art. 89, under which all Presidential acts must be countersigned by the Ministers. The Premier (“President of the Council of Ministers”) is named by the President, but his Cabinet must be approved by a majority of both Chambers—with lack of confidence by either house requiring resignation. The possible difficulties to which these arrangements may lead are not likely to arise during the next five years, because of the present composition of parliament (see below).

Right vs. Left. General agreement on the provisions of the Constitution had no counterpart with respect to the immediate issues of the day. The schism between the Right parties, led by Premier Alcide de Gasperi's Christian Democrats, and the Left opposition, consisting of Palmiro Togliatti's Communists and Pietro Nenni's Left Socialists, was widened by the reorganization of the Cabinet on Dec. 15, 1947, to include the Republicans and Right Socialists (see YEAR BOOK, *Events* of 1947, p. 255).

Leftist resentment over the trend of events was enhanced by the failure or suppression of sundry strikes and demonstrations at the turn of the year and by President Truman's declaration (December 13) on the occasion of the withdrawal of the last U.S. troops, that in case the “freedom and independence of Italy . . . are threatened directly or indirectly, the U.S. . . . will be obliged to consider what measures would be appropriate for the maintenance of peace and security.” On December 18, in a disorderly session of the Chamber, Togliatti condemned the Republican leader, Pacciardi, for serving a Government “that takes its orders from the U.S.” He likewise denounced the Marshall Plan and accused Ambassador James Clement Dunn of “organizing industrialists against workers” and seeking to found an anti-Communist front. De Gasperi and Foreign Minister Carlo Sforza were upheld by the Deputies, 303 to 118, on December 19. On January 3, 1948, they signed with Dunn the Marshall Plan interim aid agreement, with a general American-Italian treaty of friendship, commerce, and navigation signed on February 1.

These developments set the pattern of Italy's domestic and foreign politics for the balance of the year. Early in February, Washington and Rome rejected Soviet protests over the presence of U.S. warships in Italian ports and American use of the Mellaha air field in Libya. A Cabinet decree of February 5, aimed at Communist partisans, out-

lawed all private organizations of a military character. In opening his political campaign in mid-February for the national elections scheduled for April 18, De Gasperi warned that a Communist victory would mean the end of American aid. Pope Pius joined the fray on February 22 by publicly describing the issue as "Catholicism vs. Communist atheism." "Catholic Action" and the Roman hierarchy were mobilized against the "People's Democratic Front," consisting of the Communists and Left Socialists. On March 5, in the first of a series of speeches, Ambassador Dunn besought Italians to ignore "those propagandists of totalitarianism who are seeking to turn you against us and us against you."

The ensuing campaign was marked by Soviet support of the Left bloc and by vigorous efforts on the part of the Vatican, Italian industrialists and aristocrats, the U.S. Embassy, the State Department, and various Italian-American groups to warn the electorate against the Red Menace. On April 3, Washington, London, and Paris called on the UN Security Council to reconsider the application of Italy and Transjordan for membership, both having been vetoed by the U.S.S.R. On April 10, Gromyko vetoed the Italian application once more, meanwhile denouncing the U.S.A. for meddling in Italian affairs and using Italy as a "pawn." At the same time Washington proposed that the peace treaty be revised to restore Trieste to Italy. Togliatti's supporters championed disarmament, neutrality, and opposition to "American imperialism." Despite the great tension built up in Italy and elsewhere by these maneuvers of the Super-Powers, the campaign proceeded with a minimum of disorders.

The Election of April 18. The springtime balloting in the first election under the new Constitution did not record any overwhelming popular repudiation of the Left opposition. The Communists and Nenni Socialists nonetheless suffered a sharp defeat by virtue of a heavy outpouring of hitherto indifferent voters to give De Gasperi's Christian Democrats a large popular plurality and a parliamentary majority. The results in Chamber and Senate were substantially identical. The Christian Democrats won 48 percent of the popular votes (about 9,250,000), 53.5 percent of the Chamber seats, and 54 percent of the Senate seats. Right Socialists gained 7 percent of the popular votes, the "National Bloc" 6.6 percent, and seven minor parties, together, 5.4 percent. The "Popular Front" won 5,900,000 votes or 30.5 percent of the total. For the first time in recent Italian politics, one party had a legislative majority. But Left strength was still impressive—the more so in view of intensive and expensive efforts to insure a Right victory. Of the 574 seats in the Chamber, the Communists won 142, the Nenni Socialists 36, and other Leftists 4. The distribution of seats in the Center and on the Right was as follows: Christian Socialists 1, Peasant Party 1, South Tyrol Party 3, Republicans 9, Monarchists 18, National Bloc 18, Saragat Socialists 33, and Christian Democrats 307.

The new parliament met on May 8. Giovanni Gronchi was elected President of the Chamber, and Ivanoe Bonomi President of the Senate. In the balloting to choose a successor to President Enrico de Nicola, Carlo Sforza, bitterly denounced by the Left as "pro-American," withdrew after the Saragat Socialists decided to oppose him. On May 11, on the fourth ballot, 74-year-old Senator Luigi Einaudi, Christian Democratic Vice-Premier and Minister of the Budget, was named President of the Republic by 518 votes against 320 for Vittorio

Orlando. In August parliament voted to the President an annual salary of \$21,000, an expense account of \$300,000, a 1,000 room palace, and a 10,000 acre hunting estate. The new Cabinet, announced May 23, was constituted as follows: Premier and Interim Minister of Colonies—Dr. de Gasperi, Christian Democrat.

Vice Premiers—Giuseppe Saragat, Right-Wing Socialist; Attilio Piccioni, Christian Democrat, and Giovanni Porzio, Independent.

Minister Without Portfolio and Vice President of the Interministerial Reconstruction Committee and of the Marshall Plan Committee—Roberto Tremelloni, Right-Wing Socialist.

Minister Without Portfolio and member of the Marshall Plan Committee—Alberto Giovannini, Liberal.

Foreign Affairs—Count Carlo Sforza, Republican. Interior—Mario Scelba, Christian Democrat.

Justice—Giuseppe Grassi, Liberal.

Finance—Ezio Vanoni, Christian Democrat.

Treasury and Interim Minister of Budget—Giuseppe Fella, Christian Democrat.

Defense—Randolfo Pacciardi, Republican.

Public Instruction—Guido Gonella, Christian Democrat.

Public Works—Umberto Tupini, Christian Democrat.

Agriculture—Antonio Signi, Christian Democrat.

Transport—Guido Corbellini, Christian Democrat.

Posts and Telecommunications—Angelo Raffaele Jervolini, Christian Democrat.

Industry and Commerce—Ivan Matteo Lombardo, Right-Wing Socialist.

Labor and Social Security—Amintore Fanfani, Christian Democrat.

Foreign Trade—Cesare Melzagora, Independent.

Merchant Navy—Giuseppe Saragat.

The tide of neo-Fascism, which appeared to be rising during 1947, receded somewhat in 1948 with the absorption of many of its adherents into the Christian Democratic camp. But at the opening in mid-October of the trial of Marshal Rodolfo Graziani on charges of treason and collaborationism, he was hailed as a hero by pro-Fascist rioters in Rome.

The Shooting of Togliatti. Continued mass unemployment, fluctuating around 2,500,000 throughout the year, along with depressed business activity and bitter want for millions of peasants and workers, furnished grist for the mill of the "Popular Front" parties. Communists and Left Socialists continued to challenge the Cabinet in parliament, to denounce America and the Marshall Plan, to sing the praises of Moscow, and to provoke sporadic strikes in various industries. In late June, as the Chambers approved new legislation against illegal possession of weapons, Togliatti attended the international Communist Conference in Warsaw.

On July 14, as parliament voted approval of a new Marshall Plan aid pact, Togliatti was approached outside the Chamber by a young man, Domenico Pallante, who fired four shots at the Communist leader. The would-be assassin confessed to having long planned to kill Togliatti, on the ground that it was intolerable "that an Italian should participate in meetings of the Cominform." His victim was gravely wounded, but recovered after some weeks of hospitalization. The attempted murder precipitated widespread demonstrations and disorders throughout the country, including a brief general strike called by the Communist-controlled Confederation of Labor. As police battled rioters, rumors spread of an impending Communist *coup* and of the probable outlawry of the

Communist party. Neither materialized. In response to Soviet criticism of lack of vigilance, the Communists undertook to purge their members, totaling 2,200,000, of "opportunists" and to strengthen their ranks for new struggles.

Despite the secession from the Confederation of Labor of certain anti-Communist elements and occasional doubts among the Left Socialists regarding the wisdom of their course, Togliatti's Moscow-oriented followers were not appreciably weakened by the close of the year. Secretary of State Marshall's brief visit to Rome on October 18, on his way back to Paris from Athens, coincided with new Leftist denunciations of the U.S.A. and with a spreading rash of strikes in the public services.

The Question of the Colonies. Italian hopes, voiced with variations by spokesmen of all parties, for the restoration of the former African colonies to the new Republic, were frustrated by political and strategic calculations in other capitals and by the imperatives of the "cold war." The deputies of the Big Four Foreign Ministers, meeting in London to dispose of the problem, reached a deadlock in June. France and the U.S.S.R. favored an Italian trusteeship over all the colonies. Britain sought to retain control of Cyrenaica. The U.S.A. had no clear policy. On August 17 New York's Gov. Thomas E. Dewey told a group of Italian-American leaders in Albany that he favored an Italian trusteeship for all the colonies. He was rebuked by President Truman for "playing politics" with the bipartisan foreign policy.

In the absence of an accord among the Big Four, the colonial issue was scheduled under the treaty to go to the UN General Assembly on September 15. Early in September Moscow proposed a meeting of the Council of Foreign Ministers in a final effort to achieve agreement. Marshall and Bevin declined to attend, but sent agents to confer in Paris with Vishinsky and M. Schuman. At this point the State Department openly endorsed the British position—i.e., that Italian Somaliland should become an Italian trusteeship, that the disposition of Tripolitania and Eritrea should be deferred for a year, and that Cyrenaica (site of the Tobruk naval base and of the Mellaha air base) should become a British trust territory. Vishinsky then proposed, as Byrnes had originally done in 1945, that all the colonies be placed under the UN Trusteeship Council, with Soviet and Italian participation. When Bevin and Marshall rejected any such arrangement, the issue went to the UN, where, however, the General Assembly voted on Dec. 8 to postpone the whole question until its next session on Apr. 1, 1949.

The Rome Cabinet welcomed the delay on the assumption that time was working in Italy's favor. But almost all Italians were chagrined and embittered at the course of Anglo-American policy.

Western European Union? In Italy, as in Germany and Japan, many ardent nationalists sought to capitalize on the American-Soviet schism and to take advantage of the assumed willingness of the U.S.A. to subsidize, rehabilitate, and perhaps even rearm its erstwhile foes in the name of defense against Communism. Possible adherence to the Brussels Pact, membership in an enlarged Western European Federation, and adherence to the Atlantic defense treaty projected for 1949 were all bruited about in Rome. In the case of Italy, however, no such program could be carried to completion without a revision of the disarmament clauses of the peace treaty. Washington was not yet prepared to propose such a step, despite the cordial reception accorded early in December to

Gen. Efsio Marras, Chief of the Italian General Staff, who came to plead for modern weapons for the Italian armed forces.

Sforza charged on December 3 that Moscow was permitting Hungary, Bulgaria, and Rumania to arm beyond treaty limits. He implied that Italy should be permitted to do likewise. But these issues remained to be resolved in 1949.

Meanwhile the Italian regime, like its counterpart in France, was regarded by many as too dependent politically on conservative or reactionary vested interests to undertake those bold steps of agrarian, industrial, and fiscal reform without which popular dissatisfaction would continue to nourish the forces of the extreme Left. Even the mildest of measures to improve the status of tenant farmers vis-à-vis landlords evoked opposition within the Cabinet. On November 16 Giovanni Gronchi, "leftwing" Christian Democrat, publicly declared that his own party, and the Cabinet based upon it, were under severe pressure from reactionary capitalists and landowners. He added that he opposed the Brussels Pact as a British security device and likewise opposed the transformation of the Marshall Plan into an alliance "that would look like the outpost of an American advance into the Continent of Europe."

Such small rifts in the political solidarity of Right and Center neither evoked nor foreshadowed any Cabinet crisis. But they epitomized, on the Italian scene, a few of the many difficulties confronting the architects of the global program of anti-Communist "containment."

See ALBANIA, ETHIOPIA, GREECE, FRANCE, U.S.S.R., UNITED NATIONS, UNITED STATES, and YUGOSLAVIA.

Warne, "Italy: Pauper or Convalescent?" *Current History*, November, 1948. —FREDERICK L. SCHUMAN

JAMAICA. A British island colony in the West Indies. Total area: 4,673 square miles, of which the dependencies (Cayman Islands, Turks and Caicos Islands, and the Morant and Pedro Cays) cover 269 square miles. Population (1947 est.): 1,314,004 in Jamaica, 13,500 in the dependencies. Chief cities (1943 census): Kingston 109,056, Spanish Town 12,007, Montego Bay 11,547. In 1943-44 there were 670 public elementary schools and 185,700 students enrolled.

Production and Trade. Agriculture is the predominant industry, with sugar and bananas the chief crops. Other important products are rum, cigars, citrus fruits, coconuts, ginger, coffee, cocoa, and logwood extracts. The annual yield of bananas averages 7 million stems (1947 export, 5,571,560 stems); sugar (1948), 192,853 long tons. Livestock is raised solely for the domestic market and includes some 200,000 cattle, 300,000 goats, and 250,000 pigs. The tourist trade is an important source of revenue and amounted to \$6 million in 1947. Foreign trade (1947): imports £18,900,000; exports £8,800,000. Principal imports are foodstuffs, textiles, petroleum products, machinery, fertilizers, and cement; principal exports sugar, rum, citrus fruit, bananas, cigars, coffee, and ginger.

Government. For 1946-47 revenue was estimated at £8,363,242 and expenditure at £8,315,484.

According to the constitution of Nov. 20, 1944, the governor is assisted by a Privy Council, an Executive Council of 10 members, a Legislative Council (upper house) of 15 members, and a House of Representatives of 32 members elected under universal suffrage. Governor: Sir John Huggins.

JAN MAYEN. An island between Greenland and northern Norway, 220 miles north-northeast of Iceland. Area, 144 square miles. It is mountainous, Mt. Beerenberg in the north being 8,350 feet high. A meteorological station was established on the island by Norwegians in 1921. The island was formally annexed by Norway on Feb. 27, 1930.

JAPAN. The present Japanese state is territorially identical with the "Restoration" Japan of 1867. Consisting of the four main islands (Honshu, Kyushu, Shikoku and Hokkaido), and a number of small adjacent islands, it has an area of somewhat over 147,000 square miles. The mountainous character of the islands makes much of Japan unsuitable for cultivation. Nevertheless, this small land area is expected to sustain a population which, by July, 1948, was estimated to total about 80 million people, as against the estimated 30 million of a century earlier. The population increase from October, 1945, to July, 1948, was 7.8 million. Until the end of 1946, repatriation of overseas Japanese was the major source of increase. Thereafter, as migration fell off to less than 22,000 per month, the increase of births over deaths was responsible. "Throughout the period from Oct. 1, 1945, to the end of May, 1948, the number of births each calendar month exceeded those for the corresponding month. In June, 1948, however, a change occurred; births were fewer in number than in June, 1947." This increase in population has aggravated the economic problem, serious in any event.

The occupation, instituted in 1945, continued throughout 1948 fundamentally unchanged in organization. Its Allied character, on the military side, was lessened with the reduction, during 1948, of British and Commonwealth forces virtually to a token level. Nevertheless Gen. Douglas MacArthur continued to be described as the Supreme Commander for the Allied Powers (SCAP), concurrently with his position as Commander-in-Chief of the American occupation forces. The 11-nation Far Eastern Commission (FEC) continued to issue directives to SCAP or to review his interim directives, both of which were to be implemented through the Japanese government. Contact with the Japanese Cabinet was either direct or through the Central Liaison Office established by the pre-surrender Japanese government on Aug. 25, 1945. Guidance rather than formal direction of the Japanese government continued to be attempted by SCAP during 1948, although the movement was steadily toward a firmer control of Japanese policy by direction rather than by informal methods.

Religion and Education. The organized religions of Japan are Shinto, Buddhism, and Christianity. Shinto takes two forms: State, or Shrine Shinto, and Sect Shinto. State Shinto had been used to reinforce the view of the Emperor as descended from the Gods, and thus politically to develop intense devotion to the Imperial House and the state. Occupation policy of separating Church and State was designed to "prevent misuse of religion for political ends." The freedom of worship consequently proclaimed was safeguarded by provisions of the new constitution.

Withdrawal of state financial support from Shinto forced reliance on individual contributions for

the upkeep of Shrines and maintenance of the priesthood. Inadequate voluntary support of the more than 86,000 Shrine Shinto establishments gave rise to reports, early in 1948, of attempts by some of the priests to find support by methods of extortion. Sect Shinto, with around 11 million adherents and some 19,000 establishments, was in a somewhat stronger financial position, although finding itself adversely affected by the inflation.

There were some indications of growth of Christianity during the period of the Occupation, as might be anticipated. Thus the number of Y.M.C.A.'s increased from the war total of 14 to 89 by the end of the first quarter of 1948, with many more projected. Interest was also indicated in the reception of Cardinal Spellman by Emperor Hirohito in June, 1948, when the Emperor was reported to have expressed admiration for missionary work.

In education the emphases of 1947 were continued. A Board of Education law, designed to further decentralization through the institution of popularly elected local boards of education, was promulgated by Cabinet order of August 19. Between that date and the elections scheduled for October 5, administrative details were worked out by the Ministry of Education and prefectural committees, and an attempt was made to popularize the proposed decentralization of educational administration.

Three additional steps, of at least indirect significance in relation to the educational program of the Occupation, were taken in 1948. On June 14 it was reported that 94 American and British books had been bought for publication in Japan by Japanese firms. This was the first step in enabling the Japanese to refamiliarize themselves with the literature of the West, restoring the intellectual contact which had been cut off. In July the press pre-publication censorship which had been operative since the occupation was discontinued. The press, after July 15, 1948, was put on its own responsibility in operating the code of 1945. And in October it was announced that UNESCO proposed to extend its work to Japan, with the approval of SCAP.

Industrial Production. The production ceiling set by the FEC in January, 1947 (1930-1934 average), had not nearly been attained by the end of 1948. As of July, over-all industrial production had reached only 55 percent of that level, and in September 58.4 percent. The greatest recovery in production was shown in mining, especially coal. While manufacturing had reached 48.6 percent of the agreed ceiling level (taken as the index base of 100), textiles had declined to only 23.3 percent, while metals had reached 62.7 percent, machinery 71.7 percent, and chemicals 79.9 percent. This, compared with the 40.9 percent of the level reached in 1947 and that of 32.5 percent in 1946, shows a slow but steady upward trend in production. This was a result of a more limited operation of some of the factors noted for 1947 as tending to restrict industrial recovery. One of these had been SCAP's policy of de-concentration of industry and of extending the purge to include managers of many of Japan's large companies.

The year 1948 saw a shift in emphasis in Occupation policy from reform and reorganization to that of promoting economic recovery. It was evidenced in the actual discontinuance of the policy of breaking up big concerns into their component production units, although SCAP declared on September 11 that there had been no change in policy. Thus SCAP instructed the government, on November 9, that 1,100 companies which had been

ELECTION EVE IN ITALY. On Apr. 17, 1948, the eve of Italy's elections under the new Constitution, Premier de Gasperi and Communist leader Togliatti address tremendous crowds at a last-minute rally at Milan. The next day the Communists and Nenni Socialists suffered a sharp defeat by virtue of a heavy outpouring of de Gasperi's Christian Democrats.

placed on a restricted list because 10 percent or more of their stock had been held by Zaibatsu holding companies no longer needed to ask for permission to engage in business operations involving capital and plant transfers. Previously, in May, Occupation authorities approved action by the Holding Company Liquidation Commission removing 194 big companies from the list of those required to make structural changes in their organization. Fifty of these were freed entirely, while the others might possibly be required subsequently to sell their subsidiaries engaged in production unrelated to their main lines. On December 9 the United States officially withdrew its support of the much discussed FEC 230, on which the de-concentration program had been based.

The Far Eastern Commission, on October 21, directed that Japanese business men should be permitted, under SCAP directive, to go abroad to arrange for sale of their products. Further encouragement was given to private initiative, as well as to industrial recovery, with the establishment of a \$60 million loan fund (authorized in 1947) to be used for the purchase of raw cotton wherever it could be secured. Pressure was put on the government to pass a tax revision measure removing discriminations against the foreign private investor, and to enact an investment code designed to attract foreign capital to Japan. Action directed toward increase in the level of price-controlled commodities to add an incentive to produce through greater prospects of profits, and toward wage controls, was initiated.

On October 8, price decontrol itself was started, Occupation authorities acting to free 137 categories of industrial and consumer goods. Strikes which might adversely affect production were frowned on. These and other actions were in line with the American aim, stated by Army Secretary Royall on January 5, of "building in Japan a self-sufficient democracy, strong enough and stable enough to support itself and at the same time to serve as a deterrent against any other totalitarian war threats which might arise hereafter in the Far East."

Agriculture. With a big rice crop (314 million bushels), and good crops of sweetpotatoes, wheat, and barley, the food situation was improved in 1948 over 1947. Better collections of higher quotas, as a result partly of greater centralization in the allocation of quotas, made for a more effective rationing system. Collections were also facilitated because more goods were available for exchange and because of assistance in collection by American military government teams. Nevertheless, it remained necessary to import about 25 percent of the total food consumption. With this, it was possible to increase rations to a caloric intake of 1,348 from 1,243. The ration continued to have to be supplemented by open, or black, market purchases. About 60 percent of the income of urban families had to be spent for food.

A continuation of the black market in food (partly the result in certain centers of a falling behind in the issuance of rations) was indicated in a report of September 22 that plans were being made to prohibit the transportation of food in passenger vehicles. This was probably due as much, however, to farmer as to urban needs. The farmer was supposed to sell to the government at a low official price, established at the time of harvest. His purchases had to be made at a price level increased two or three times a year. He was officially allowed to retain for sale at the open market price only 9 percent of his crop in 1948 beyond his family needs. Thus, with an increasingly heavy tax burden

(32 billion yen in 1948, although total payments for his last year's rice crop aggregated only 55 billion yen) and increases in the prices of all of his purchases, there was a pressure on the farmer to reduce his sales to the government if possible and to realize black market prices for his produce. In general, the economic situation tended to move the farmer back to his prewar status in relation to other classes, in spite of good crops.

On the other hand, the land redistribution program moved forward during 1948. By the end of July land sales under the reform program totaled 1,320,113 cho. By the end of the year it was estimated that 83 percent of the total bought for redistribution (1,800,000 cho, or 4,410,000 acres) had been sold.

Foreign Trade. Both imports and exports showed a slight increase over 1947, although the principal deterrents to trade remained. These are low production, lack of foreign purchasing power, and instability of the currency. The dollar value of exports was around 250 million, as compared with 174.2 million for 1947. Imports totaled approximately \$625 million for 1948, as against \$523,300,000 in 1947. The value of textiles exported declined, largely because of the difficulty of financing raw cotton imports, but this decline was compensated by increased exports of processed foods, industrial materials, and other manufactured products. The heaviest imports were of industrial raw materials, with food coming a close second. Among industrial raw materials, raw cotton and petroleum showed the greatest import increase.

American appropriations and government credits, together with use of the \$60 million revolving loan fund, helped to finance dollar purchases. An agreement reported in January was designed to make possible raw cotton purchases, not to exceed 28 percent of the total, in India. A trade agreement with Pakistan, reported on June 6, provided for the payment for 20,000 bales of cotton with exports of cotton yarn and cloth. A similar semi-barter arrangement was made with the Netherlands Indies for the sale of \$36 million worth of textiles, with payment to be made half in dollars and half in bauxite for Japan's aluminum industry.

On November 8 an agreement was announced with British Commonwealth nations for exchanges, during the next year, to a total of £50 million. Under it, Japan is to export goods to the value of £27,500,000, sixteen million of which is to be in textiles, with the balance in machinery, raw silk, rolling stock, chemicals, etc. In exchange, the Commonwealth countries are to supply Japan with raw wool, raw cotton, iron ore, salt, cereals, petroleum, rubber, tin, etc., to the value of £23 million. There also has been direct barter, through individual trading, with Far Eastern countries, Hong Kong serving as a clearing house. This has been possible because of a modification of SCAP's policy of demanding dollar payment for Japanese goods even from "soft currency" countries. In 1948 Japan had approximately an 8-1 favorable balance in trade with other Far Eastern countries; her United States deficit, however was in excess of 25-1. "About 20 percent of import contracts and 50 percent of export contracts have been executed through private trade channels."

Finance. The budget as enacted in July reached the new peak of 414,000 million yen. As previously, the largest single item budgeted was that of occupation costs (98,000 million yen). The second largest item was 50,000 million yen, to be used as a subsidy to producers to permit them to sell at prices below production costs under government

controls. These subsidies were allocated by the Reconstruction Bank which, by June, 1948, already had outstanding loans totalling 59,500 million yen, of which 33,500 million yen represented deficit industrial financing. Approximately 8 percent of the total budget (30,000 million yen) was set aside to meet local government needs. The total was increased in supplementary budget proposals made to the Diet in November.

To meet the proposed expenditures, a new transactions tax was introduced, charges on all government-owned utilities were increased, and 100,000 millions of new currency was to be issued.

Government. Under the constitution of 1947 Japan has the cabinet or parliamentary form of government. The Emperor has a symbolic position as head of the state. Control is vested in a two-chamber legislature (the House of Councillors and the House of Representatives), the members of which are elected by universal suffrage. The Representatives have 4-year terms, and the Councillors 6, with half the membership elected every 3 years. The House of Representatives may be dissolved by the Emperor on advice of the Cabinet. The executive powers are exercised by the Cabinet, headed by the Prime Minister. It is responsible to the legislature, and must resign in the event of a vote of no-confidence or dissolve the House of Representatives. Consequently it must command a majority in the lower House. Unless a single party has a majority, Cabinets are constructed on a coalition basis, after the legislature designates the Premier.

The Prime Minister at the end of 1948 was Shiguru Yoshida, leader of the conservative Democratic-Liberal Party. His Cabinet contained only 3 non-Liberal Party members. Dissolution at the end of 1948 required new elections in January, 1949, which changed the party groupings in the Diet.

Events. Developments of 1948 represented in part the carrying forward of activities initiated by SCAP in previous years and in part a response to the American determination, announced to the FEC on January 21, to revive the Japanese economy and put it on a "peaceful self-supporting basis." The former required a continuation of reform activity, such as the land redistribution program already referred to. The latter was responsible for aspects of economic activity which have been described, such as the trade pacts.

One important series of events brought to a final conclusion in 1948 was the War Guilt trials initiated at the beginning of the Occupation. Presentation of the defense occupied much of 1948. The verdict of guilty was handed down on November 12 by the International Tribunal for General Tojo and 24 others, with the death penalty imposed on him and six of the 24. The sentences were reviewed by General MacArthur, as the Supreme Allied Commander, and upheld on November 24. Appeal for stay of execution and a review of the case was made to the United States Supreme Court by Hirota and Doihara on November 29. The Supreme Court agreed to hear the appeal on December 7. Its findings, however, upheld the authority of the International Tribunal and the sentences were duly executed before the end of the year. In connection with the verdicts, speculation centered on their possible effect on Hirohito, some arguing that he might abdicate in the near future.

The principal political events of the year related to Cabinet changes and party alignments. Splits in both the Democratic and Social Democratic Parties, especially over questions of postal and railway rates, reported in January, and Social Democratic Party left-wing influence on policy, as revealed in

the party convention, so weakened the coalition that the early fall of the Katayama government was predictable. It resigned in February, and was succeeded by a Cabinet headed by Hitoshi Ashida, leader of the Democratic Party, in spite of the strength of Yoshida's Liberal Party which, reorganized as the Democratic Liberal Party, had drawn members away from the other two.

The Ashida government lasted until October when it was overthrown on the charge of corruption. Ashida himself was implicated and, after some hesitancy, his arrest was announced on November 30. His government was replaced on October 19, after a period of inter-party negotiating, by a Liberal Party Cabinet headed by former Premier Yoshida. At the time of his installation a Diet committee had been set up to investigate the affairs of his first government, to ascertain the sources and disposition of contributions made to the Liberal Party war chest.

Corruption in Japanese politics is not a postwar development. The principal prewar source of party funds had been the *Zaibatsu* and other big business enterprises which had been tied through the parties into mutually beneficial relations with the governing bureaucracy. This source of funds had been largely dried up as a result of the anti-*Zaibatsu* and de-concentration policies of the Occupation. Those who could benefit immediately from a close relationship to government were contracting enterprises of various sorts. Consequently they had begun to lavishly finance the governing parties. It was the use of the funds thus secured, together with the policies followed in repayment, which were brought to the surface with the charges of corruption in 1948.

Other causes of dissatisfaction with existing governments during 1948 were both political and economic. There was a recurrent demand for reduction of a swollen administrative personnel. Thus on May 29 it was reported that business interests and the opposition parties were demanding such a reduction. The bureaucracy had virtually doubled since 1945, to a total of 2.8 million. In place of reduction, by October the total had risen to over 3 million. It was argued by the government that no decrease could be made while the complex of controls of the national economy was continued. But the justifications advanced did not remove dissatisfaction with the failure of the government to take action.

Another recurrent political question was raised with attempts to satisfy SCAP demands for political decentralization. Financial dependence on the central government was one reason why local officials now elected continued to look to Tokyo for direction. To lessen this dependence a provincial tax reform bill was introduced into the Diet on June 6. It provided for new provincial taxes, increased rates, and slightly increased subsidies from the national treasury.

Economic events, other than those already listed, were mainly in the field of labor relations. After the relative freedom from strikes of 1947 they were resumed in 1948, first of all by organizations of public employees, with the four-day series of one-day railway strikes beginning May 18. These led the government (July 31), at the request of SCAP, to prohibit strikes on the part of public employees and to deny to them the right to bargain collectively through their unions on questions of wages, hours, etc. Their status thereafter was to be regulated on the basis of law. On August 10 plans for the replacement of most government-employee trade unions by voluntary associations without le-

gal status as unions were announced. Labor dissatisfaction with the new policy (of SCAP as well as the government) led to demonstrations and also to strikes, especially by railway and electrical workers, in various parts of the country. These strikes were broken by the government, where necessary enforcing compulsory arbitration. The policy was also denounced by the Soviet Union, which was, in turn, denounced by MacArthur for its failure to observe its obligations with respect to the repatriation of Japanese prisoners of war.

The shift in emphasis from reform to economic reconstruction made SCAP increasingly intolerant of anything which might adversely affect production and economic recovery. General MacArthur in his New Year message had said: "The pattern has been etched, the path has been laid. The development lies largely in your own hands." This seemed to indicate that the policy of advice and guidance would continue to be followed by SCAP. The continued slowness with which the Japanese government responded to advice, however, brought SCAP more and more toward direction. This slowness is to be explained partly in terms of uncertainty which the guidance system produced as to the real desires of SCAP, and partly in terms of the desire of the government not to assume responsibility for unpopular actions. But the consequence was that on December 17 the United States directed the Japanese government to "enter upon a stringent economic stabilization program aimed at curbing inflation and speeding the country toward self-sufficiency." The indications were that unless the Japanese government moved with rapidity and vigor, the Occupation authorities would replace it.

Concurrently with this American initiative the Yoshida government called for new elections on Jan. 23, 1949. These elections are apparently to be supervised by American military government teams to determine the honesty with which the campaign and election is conducted and also to observe communist election tactics.—HAROLD M. VINACEK

JARVIS ISLAND. An island in the mid-Pacific (0° 23' S. and 159° 54' W.), belonging to the United States. It lies in the path of the main steamship lanes and airways from Honolulu to New Zealand and Australia.

JOHNSTON ISLAND. An island in the central Pacific (16° 44' 32" N. and 169° 30' 59" W.), 717 miles southwest from Honolulu. It has a lagoon formation, the reef being about eight miles long. On the reef are two islands, the larger one, Johnston Island, being about one-half mile long. The small one, Sand Island, is a mere sand bank about 500 yards in diameter. On July 27, 1859, the island was formally annexed to Hawaii by proclamation of Kamehameha IV. By Executive Order dated Dec. 29, 1934, together with Kingman Reef and Sand and Wake Islands, it was placed under the control and jurisdiction of the U.S. Secretary of the Navy, subject to the use of the island by the U.S. Department of Agriculture as a bird reservation. The island is considered part of the Hawaiian Islands and is important as a defense outpost.

JOINT BRAZIL-UNITED STATES DEFENSE COMMISSION. A Commission composed of military delegates (Army, Navy, and Air Forces) of the two countries, established in August, 1942. Meetings are held in Washington for the purpose of making staff plans for the mutual defense of the Western Hemisphere. U.S. Chairman: Rear Adm. Osborne B. Hardison.

JOINT CHIEFS OF STAFF, U.S. The Joint Chiefs of Staff was established within the national Military Establishment by the National Security Act of 1947, with duties as follows:

1. Strategic planning for and direction of military forces.
2. Joint logistic plans and assignment of logistic responsibility to services thereunder.
3. Establish necessary unified commands in strategic areas.
4. Formulate joint training policies.
5. Formulate coordinating education policy for services.
6. Review major military material and personnel requirements under strategic and logistic plans.
7. Provide United States representation on Military Staff Committee of United Nations.

Joint Staff, U.S. The Joint Staff, established under the Joint Chiefs of Staff by the National Security Act of 1947, operates under a Director appointed by the Joint Chiefs of Staff and performs such duties as may be directed by the Joint Chiefs of Staff.

National War College. The National War College, organized by authority of the Joint Chiefs of Staff, has the mission of preparing selected ground, air, and naval officers, and officers of the State Department, for joint staff and command duties on the highest level in behalf of the national security.

The College devotes some four months of the academic year to a close and systematic examination of international relations and world affairs, the international consequences of the atomic bomb, United States commitments and responsibilities abroad, and the formulation of United States foreign policy and its implementation through methods short of war. Instruction in this part of the course is conducted by a small group of distinguished resident civilian instructors and an outstanding group of visiting lecturers. The last six months of the school year are devoted to the study of grand strategy, the strategic areas of the world, and the scientific and technological advances which have complicated the task of maintaining the national security.

Certain parts of the course are held in conjunction with the Industrial College of the Armed Forces, located immediately adjacent to The National War College at Fort Lesley J. McNair.

Industrial College of the Armed Forces. The Industrial College of the Armed Forces is one of the two colleges on the highest plane of the educational system of the Armed Forces. It prepares officers of the Army, Navy, and Air Force, and selected civilians, for important command, staff, and planning assignments in the National Military Establishment and other Government agencies. Other important objectives of the College are: the conduct of study in all economic factors of national strategy and the interrelation of these economic factors to the political, military, and psychological factors; the conduct of study in all aspects of joint logistic planning and the interrelation of this planning to joint strategic planning and to the economy of the Nation; the promotion of understanding and study of all agencies and of economic and joint logistic factors which are important to the Nation and to the Armed Forces; the evaluation of the economic war potential of foreign nations and the conduct of study and research in those fields; and the fostering of close relations between the Armed Forces and civilian engineering, scientific, and educational groups in the study of the social, political, and economic impacts of war.

The regular course extends over a period of ten

months and is conducted by using graduate school methods. It is designed to qualify its students to hold positions of the highest responsibility in the offices of the various Secretaries of the Army, the Navy, and the Air Force; Office of the Joint Staff; Office, Chief of Staff, United States Army; Office, Chief of Naval Operations; Office, Chief of Staff, United States Air Force; the Munitions Board and other joint Army, Navy, and Air Force planning and logistic activities; offices of the chiefs of the various Technical Services, Materiel Commands, and Bureaus; and directorates in the Army, Navy and Air Force.

Armed Forces Staff College. The mission of the Armed Forces Staff College, located in Norfolk, Va., is to train selected officers of the Army, Navy, and Air Force in joint staff techniques and procedures; the organization, composition, and functions of theaters and major task forces, and the strategic, tactical, and logistical responsibilities of such commanders; and the preparation for amphibious and airborne operations involving the employment of joint forces. Graduate officers are assigned duties on joint operations to include joint overseas expeditions and theater operations.

—JOHN H. IVES

JOINT MEXICAN-UNITED STATES DEFENSE COMMISSION. A Commission established Feb. 2, 1942, by Executive Order, to study problems relating to the common defense of the United States and Mexico, to propose to the respective governments the cooperative measures which, in its opinion, should be adopted. U.S. Steering Member: Maj. Gen. Robert L. Walsh, USAF.

JUDAISM. Although Zionism today is not exclusively a religious movement, the emergence of the state of Israel immediately enlarged Jewish religious interest and adherence. In all Jewish communities outside of Israel, as well as in that land itself, there were noteworthy evidences of renewed devotion to Jewish education, the Hebrew language, the synagogue, and traditional observance.

Though there has been some protest against "clericalism" and adherence to Old Testament law, even irreligious members of the Israeli government now support Sabbath and dietary observance in civilian and military life. The compulsion is only moral, but it remains powerful. The displaced persons now streaming into Israel are largely of the religious class; during their years of hardship they were sustained by religious organizations and supplied with books and religious articles by the Joint Distribution Committee. Thus they have been able to carry their predilections into the land; and though only thirteen percent voted the religious ticket in Israeli elections, as many as ninety percent have been shown to be faithful to tradition. American orthodox groups have been agitating for the creation of a new supreme religious court in Israel, and have opposed any further secularization of life in the Holy Land.

The United States has witnessed increase of traditionalism even among liberal Reform groups. The Central Conference of American Rabbis now directly opposes intermarriage by rabbis, and urges all year round services in the temples. During the year past the two Reform seminaries—the Hebrew Union College and the Jewish Institute of Religion—were merged under the presidency of Dr. Nelson Glueck. The Conservative wing of American Jewry, centered in the Jewish Theological Seminary, is helping spread the synagogue-center idea, and is sending rabbis to European communities. The chief

orthodox institution of higher education, Yeshiva University, is projecting a non-sectarian medical school. Brandeis University, in Massachusetts, is now functioning under Jewish auspices, with Dr. Abram Sachser as president.

Remaining European communities are still repairing the war's religious devastation. Great Britain, under its new chief rabbi, Dr. Israel Brodie, is producing many new publications with that end in view. American philanthropy is the chief aid of continental countries. The religious-secular full-day school, rapidly expanding in the United States, has been extended to Australia, Belgium, and other countries.

However, not alone Christian dignitaries, but rabbis and others have fallen where totalitarianism has taken over. Efforts, notably in Poland, to obtain governmental consent to fuller religious observance, are proving vain. Some Balkan countries are rendering it difficult for Jews to migrate to Israel, in accord with previous Communist opposition to Zionism.

The world's ten million professing Jews are everywhere seeking spiritual growth and regeneration. The ancient and medieval literature of Judaism, largely destroyed, is being reproduced in the United States; and there are numerous new studies and texts for religious education.

—ABRAHAM BURSTEIN

JUSTICE, U.S. Department of. A Department of the U.S. Government which in 1948 had the following divisions and offices.

- Office of the Attorney General
- Office of the Solicitor General
- The Assistant to the Attorney General
- The Criminal Division
- The Antitrust Division
- The Tax Division
- The Lands Division
- The Claims Division
- The Customs Division
- The Assistant Solicitor General
- The Federal Bureau of Investigation
- The Federal Bureau of Prisons
- Board of Parole
- Board of Immigration Appeals
- Pardon Attorney
- The Immigration and Naturalization Service
- The Office of Alien Property
- Administrative Assist. to Attorney General
- Attorney General: Tom C. Clark. Solicitor General: Philip B. Perlman.

KANSAS. A west north central State. Area: 82,158 sq. mi. Population: (July 1, 1948) 1,968,000, compared with (1940 census) 1,801,028. Chief cities: Topeka (capital), 67,833 inhabitants in 1940; Wichita, 121,458. SEE AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$112,312,000; total expenditure, \$101,129,000.

Elections. As in 1944, Dewey won the 8 electoral votes, but with a much reduced popular majority. Republican Andrew F. Schoeppel succeeded to the seat held by Senator Capper who did not run for reelection, and all 6 House seats remained Republican. Republican Governor Frank Carlson was re-elected, and the following Republicans were successful: Lieutenant Governor—Frank L. Hagan; Attorney General—Edward F. Arn; Auditor—George Robb; Treasurer—Richard T. Fadely; Superintendent of Public Instruction—Adel F.

Throckmorton; Insurance Commissioner—Frank Sullivan. Democrat Larry Ryan was elected Secretary of State. The voters also voted to repeal prohibition and to increase the pay of legislators.

Officers, 1948. Governor, Frank Carlson; Lieut. Governor, Frank L. Hagaman; Secretary of State, Frank J. Ryan; Attorney General, Edward F. Arn; State Treasurer, Richard T. Fadely; State Auditor, George Robb.

KARAFUTO. The Japanese name for that part (south of 50° N.) of Sakhalin island, formerly under Japanese control. It was occupied and taken over by the U.S.S.R. following the defeat of Japan by the Allies in 1945.

KELLOGG FOUNDATION, W. K. A Foundation established by W. K. Kellogg in 1930 to promote the health, education, and welfare of mankind, but principally of children and youth, directly or indirectly, without regard to sex, race, creed, or nationality. Operates by making grants to established organizations for the conduct of new and experimental programs in the fields of dentistry, education, hospitals, medicine, nursing, and public health.

Expenditures for the year ended Aug. 31, 1948, were \$2,099,484. Total capital assets on that date were \$47,531,830. Membership: Nine members of the Board of Trustees. President and General Director, Emory W. Morris. Headquarters: Battle Creek, Mich.

KENTUCKY. An east south central State. Area: 40,598 sq. mi. Population: (July 1, 1948) 2,819,000, compared with (1940 census) 2,845,927. Chief cities: Frankfort (capital), 11,492 inhabitants in 1940; Louisville, 319,077. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$119,689,000; total expenditure, \$103,908,000.

Legislation. The regular biennial session of the Kentucky General Assembly, which convened January 6, adjourned March 19 and authorized record-breaking biennial general fund expenditures of \$120,500,000. Tax increases included a 3 percent tax on pari-mutuel betting; license fees on coin-operated devices; increased whiskey fees; and increases raising gasoline and Diesel oil levies from 5 to 7 cents a gallon, primarily for rural road improvement.

For educational costs, \$71,395,000 was authorized. The State's educational system is to be studied by a new permanent Legislative Research Commission.

Other new State agencies include the Department of State Police; a Department of Economic Security to administer unemployment compensation, employment service, public assistance, and child welfare programs; Department of Aeronautics; a Building Commission; and an Agricultural and Industrial Development Board. The legislature increased unemployment and workmen's compensation benefits; tightened child labor laws; amended insurance regulatory laws; removed legal barriers to training white and Negro nurses and doctors in the same hospitals; adopted the interstate parole and probation compact; raised the pay of State employees; and authorized cities to levy new nonproperty taxes.

Elections. Truman won the 11 electoral votes, gaining a larger majority over Dewey, Thurmond, and Wallace than Roosevelt had in 1944. In the

Senatorial race Democrat Virgil Chapman defeated Republican incumbent John Sherman Cooper; Democrats gained 2 new House seats for a total of 7 against 2 for the Republicans. There were no Statewide contests for State office.

Officers, 1948. Governor, Earle C. Clements; Lieut. Governor, Lawrence Wetherby; Secretary of State, George G. Hatcher; Attorney General, A. E. Funk; State Treasurer, Edward F. Seiller; State Auditor, Harry N. Jones.

KENYA. A British colony and protectorate in East Africa. Area: 224,960 square miles. Population (1947 estimate): 4,187,355, of whom 23,284 were Europeans. Capital: Nairobi (100,000 inhabitants in 1947).

Production and Trade. Agriculture, stock raising, forestry, and mining are the principal occupations. Estimated crop production in 1946 (in tons): maize 112,530, wheat 76,458, sisal 27,038, potatoes 23,118, wattle extract 11,946, coffee 6,952, tea 5,481, and pyrethrum 6,860. Livestock (1946): 4,529,000 cattle, 3,200,000 sheep and goats, 5,600 horses, 181,000 camels, and 37,000 pigs. Butter production (1946) totaled 6,336,000 lb.

Gold is the principal mineral mined—the 1946 output (29,892 fine oz. troy) being valued at £257,942. Other minerals produced, including salt, lime, asbestos, diatomite, graphite, and soda (but excluding gold), were valued at £636,850 in 1946.

Foreign trade, Kenya and Uganda combined, 1947: imports (general) were valued at £31,200,000; exports (general) including reexports, £31,920,000.

Government. Budget estimates (1948): revenue £7,237,222; expenditure £6,841,712. The colony and the protectorate are administered as a unit. A governor heads the administration and is aided by an Executive Council of 10 members and a Legislative Council consisting of 11 elected European members, 5 elected Indian members, 1 elected Arab member, 2 nominated members, and 11 ex-officio and 9 nominated official members. By the Kenya Annexation Order in Council, 1920, the territories of the mainland dominions of the Sultan of Zanzibar, remain a protectorate. Governor and Commander-in-Chief: Sir Phillip Mitchell. (See EAST AFRICA HIGH COMMISSION.)

KINGMAN REEF. A small reef, 150 feet long by 120 feet wide, in the Pacific (6° 24' 37" N. and 162° 22' W.). By U.S. Executive Order dated Dec. 29, 1934, Kingman Reef was placed under the administrative control and jurisdiction of the Secretary of the U.S. Navy. It is the only possible sea-plane base between Honolulu 1,067 miles north and Pago Pago 1,797 miles to the southwest, on the air route to Auckland, New Zealand. Kingman Reef was made a U.S. National Defense Area by Executive Order of President Roosevelt, dated Feb. 14, 1941, and foreign planes and surface craft were prohibited.

KOREA. A peninsular country located on the Asiatic continent, between the Yellow Sea and the Japan Sea. Formerly a kingdom tributary to China, annexed by Japan on Aug. 22, 1910. Korea was occupied under terms of the Potsdam Agreement in September, 1945, by U.S.S.R. forces in the north and by United States forces in the south, separated by the 38th parallel of latitude.

Area and Population. Total area: 85,246 square miles. Estimated total population (1947): 29,300,000. South Korean Republic: 37,055 square miles; population 20,300,000. North Korean Republic:

48,191 square miles; population 9,000,000. Chief cities: Seoul (capital of the southern republic) 1,141,766 inhabitants (1946); Pusan 249,734 (1940); Pyongyang (capital of the northern republic) 205,965 (1940); Incheon: 171,161 (1940). A total of 410,912 refugees from North Korea entered South Korea between January in 1946 and June of 1948. Migration from south to north was reported to be negligible.

Education and Language. During Korea's 35 years as a Japanese colony, Japanese educational methods were dominant, and use of the Korean language was officially discouraged. Since 1945, Korean has again become the official language, and literacy has risen from 60 percent to 75 percent.

South Korea (July, 1947) had 3,312 elementary schools with 2,109,002 students; 395 secondary schools with 161,927 students; 25 colleges and universities with 13,827 students. North Korea (January, 1947) had 2,482 elementary schools with 70,000 students; 27 colleges and universities with 12,330 students.

The year 1948 in South Korea saw the establishment of school districts and boards of education and the substitution of household levies for the land tax as the chief means of supporting the school system.

Religion. Chief religions are Animism, Confucianism, Buddhism, and Christianity. In 1948 the estimated Christian population was 670,000; some 500 American missionaries were stationed in the south.

Production and Trade. Division of the country into two political units remained the chief economic problem in 1948.

North Korea is the more highly industrialized portion. Its production plans for 1948 included 9,000,000 tons of pig iron, 39,300 tons of crude steel; 332,000 tons of chemical fertilizer; 158,000 tons of salt; 1,770,550 acres of rice land. Figures on North Korea's actual output are not available.

In South Korea shortages of skilled labor, machinery, and raw material continued to impede production. Suspension of power transmission in May, 1948, deprived South Korea of 80 percent of its electrical power, reversing the slow upward trend in industrial output. In March, 1948, the National Land Administration superseded the New Korea Company, established in 1946 to administer holdings of the Oriental Development Company and other Japanese concerns in Korea. The Administration immediately began the sale of land to tenants. The holdings involved comprised one-tenth of the planted area in South Korea (687,246 acres), operated by 587,974 tenant families who represented 43.5 percent of the farm families in South Korea. Purchasers received clear title to their land.

From 1910 to 1945 Japan dominated Korea's foreign trade. After the surrender, the U.S. Military Government regulated trade in the southern sector; the Soviet-sponsored People's Committee that in the northern sector. In mid-1948 the constitutional regimes in both sectors assumed these powers. Imports into South Korea (Jan.-Sept. of 1948) totaled 2,779,953,450 won in value; exports 2,825,668,309 won. Chief imports were rubber, yarn, coal, machinery, textiles, chemicals, and foodstuffs. The important exports were seafoods, minerals, raw silk, and tungsten. Trade was mainly with Hong Kong, China, Japan, and the United States.

In 1940 Korea had 2,919 miles of government railways and 1,234 miles of private railways. On May 1, 1946, South Korea had 1,679 miles of railways.

Finance. The monetary unit in the south, the won (formerly the Japanese yen), continued to depreci-

ate in 1948. The exchange rate (December, 1948): 450 won to U.S.\$\$. Won in circulation rose from 4,000 million in 1946 to 40,000 million in 1948. South Korea's budget for the fiscal year 1948-49 called for expenditure of 21,318,446,463 won; anticipated revenue totaled 22,000 million won.

Government and Politics. Korea has 13 provinces, each under a local prefect. From 1910 to 1945 the country was ruled by a Governor General appointed by the Emperor of Japan; and the administrators were primarily Japanese.

South Korea, 1948. From September 1945 to August 1948 South Korea was governed by the United States Army Military Government in Korea (USAMGIK) operating through a Korean administration called the South Korean Interim Government (SKIG).

The Allied Powers at Moscow, in December, 1945, promised complete independence to Korea after a 5-year period of Allied trusteeship. This elicited protests from all Korean political parties except the Communists. When the Soviet-American Joint Commission in 1946 and 1947 sought to erect an interim government, the Russians insisted that only Koreans who had endorsed the Moscow Agreement should be enfranchised; the Americans declared that such disfranchisement would be undemocratic. On Nov. 14, 1947, at the proposal of the United States, and with the Soviet bloc abstaining, the UN General Assembly voted to constitute a Temporary Commission on Korea (UNTCOK) in order to hold elections to a constituent assembly which would form a united Korean government. After unsuccessful efforts to reach an accord with North Korea, the UN Interim Committee decided on Feb. 27, 1948, to hold elections in South Korea alone.

The UN decision crystallized the cleavage among South Korean political factions, with the rightist Syngman Rhee favoring the UN action, the moderate Kimm Kiusic and the rightist Kim Koo holding out for bizonal elections, and the Communists demanding immediate evacuation of United States and Soviet troops. In the Korean Interim Legislative Assembly the issue led to the resignation of Speaker Kimm Kiusic, Kim Koo, and 30 other legislators. This brought the work of the Legislative Assembly to a standstill.

On May 10, 90.6 percent of the 7,729,909 registered voters (almost 80 percent of those eligible) cast their ballots in the UN-supervised elections to the National Assembly. With the Communists and certain moderate and rightist groups abstaining, candidates supporting the conservative Dr. Rhee won a substantial plurality of the Assembly.

The new Constitution adopted in June, 1948, called for a unicameral legislature (which chooses the president), and state control of foreign trade, transportation, and mineral resources. In July the National Assembly elected Dr. Rhee first President of the South Korean Republic with Lee Si Yung as Vice President. In August the new republic was inaugurated; USAMGIK was abolished; the U.S. Army Civil Affairs Section assumed its functions; Lt. Gen. John Hodge, Commander of U.S. Forces in Korea since V-J Day, was reassigned and succeeded by Maj. Gen. J. B. Coulter. (On Jan. 14, 1949 Brig. Gen. William L. Roberts took over this post.)

Cabinet of the South Korean Republic (autumn, 1948): Prime Minister—Lee Bum Suk; Foreign Affairs—Ko Chang Li; Commerce and Industry—Miss Yim Young Sin; Education—An Ho Sang; Communications—Yoon Suk Koo; Interior—Yun Chi Young; Social Welfare—Lee Yun; Transport—

Min Hi Sik; Agriculture and Forestry—Cho Bong Am; Justice—Lee Inn.

In August the United States agreed to continue to train and equip Korean constabulary and coast-guard units and to command these forces as well as the national police until the withdrawal of American forces. Plans provided for an army of 100,000 men and a navy of 10,000 men.

A number of anti-government uprisings occurred in late 1948, the most serious breaking out in the southeastern port of Yosu. For a brief period martial law was declared.

In December the U.S. Economic Cooperation Administration announced a three-year, \$300 million aid program for South Korea. On Dec. 12, 1948, the UN General Assembly at Paris recognized the Seoul government as the only legitimate government in Korea. On Jan. 1, 1949, the United States extended full recognition to the new republic of Korea. Australia, China, and the Philippines followed suit. Chang Myun, chief of the South Korean delegation to the UN, was made Minister to the United States. Special envoys were sent to London and Manila. The United States named John J. Muccio its first Ambassador to the Seoul regime.

North Korea, 1948. North Korea is administered by the Democratic People's Republic of Korea, proclaimed in September, 1948. The regime succeeded the North Korean People's Committee, established in 1945 under the sponsorship of the U.S.S.R.

During April 19–28 the first North-South Korean Unity Conference met in Pyongyang. It was attended by 545 delegates representing 56 parties, including non-Communist southerners like Kimm Kiusic and Kim Koo. The Conference demanded the immediate withdrawal of U.S.S.R. and United States troops and the abandonment of separate elections. On May 1 a new constitution was adopted calling for a popularly elected assembly which chooses a ruling 15-man presidium. Kim Il Sung was named premier of a cabinet which included 8 South Koreans. The U.S.S.R., Mongolia, and Poland recognized the Pyongyang government, which claimed sovereignty over the entire peninsula.

In May the Government suspended the power supply to South Korea, asserting that an agreement to supply certain materials had been violated. USAMGIK refused to negotiate since such an act would imply recognition of the new Government. In September, the U.S.S.R. announced that her troops would be withdrawn from Korea by December, 1948. The United States refused to do likewise, arguing that troop withdrawal was merely part of the general problem under UN consideration.

Koreans Abroad, 1948. In April, the closing of Korean schools in Kobe and Osaka by Japanese authorities provoked an uprising of Koreans there. United States forces proclaimed a limited emergency—the first since the beginning of the occupation—and aided in quelling the disturbance. In July and August 56 Koreans competed in the London Olympic Games. More than 100 Koreans went to the United States for advanced study or on-the-job-training. The greater part of a \$25 million loan from the U.S. Foreign Liquidation Commission was earmarked to assist Korean students at home and abroad.

—CARL F. BARTZ, JR.

KOREAN LITERATURE, ARTS AND CRAFTS. The most conspicuous change in the field of literature and art during 1948 was in the direction of Westernization, particularly in the so-called fine arts. Two events determined the trend: the visit, lasting eight months, of the members of the UN Commission, and the election and inauguration of Korean governments in both zones. Literature and art developed as accessory tools of various political factions. Libraries and museums grew dusty and school teachers grew more wary as "dangerous thinking" became once more the concern of the police. Rejecting cultural importations from China and Japan, the new Korean revived native folklore and folksong, refreshed his spirit with glorious episodes from his own history and expressed himself in modern media.

A new technique was developed by many writers, that of composing radio-script for which Korean talent had a natural bent. The publication and distribution of textbooks continued at an accelerated pace, the end of the year bringing the total to the 15 million mark. Progress was also made in the perfection of the vernacular style, the standardization of spelling and the elimination of Japanese and to a certain extent, of Chinese, loan-words.

Literature. Journalistic literature still leads the field in both volume and influence. Neutral newspapers were: *Seoul Shinmun*, *Chayoo Shinmun*, *Sin Min Ilbo*, *Choson Ilbo*, etc. On the extreme right was the *Pyungwha Ilbo*, and on the left, the *Choson Choong Ang Ilbo*; and ranging between were some fifty papers all exercising the right to instant and critical editorial comment on the many important political occurrences of the spring and summer.

The forms employed by Korean writers were still the forms most useful to the writer with a message: editorials, essays, historical plays and novels, biographies and histories, and radio-script. *The Cultural History of the Korean People* by Sohn Chintai, a leading historian, was an important publication. Other well-known authors were: Sul Chungsic, editorialist and poet, Lee Insoo, poet, Li Taejun, novelist, Li Kwangsu, novelist, Han Sulya, novelist, and Choi Kiyun, poet.

One daily paper and one monthly paper was published during the year by women for women dealing with domestic problems and informing the feminine public about fashions. (The schoolgirl is "not privileged to wear fancy bows, permanent waves or make-up of any kind.")

Language. Publication of the first volume (of six) of the *New Korean Dictionary* by the Eulyu Publishing Company was an important step forward in Korean lexicography, incorporating as it did new spellings, correct usage, phonetic standards.

Dramatic Art and Music. Twenty dramatic clubs presented plays in Seoul, a week apiece, in a contest conducted by the Department of Education. A patriotic play *For the Fatherland* was prepared for the election campaign and was performed in the provinces by teams "to help Koreans understand

election principles and procedures." The first annual music festival featuring both western and Oriental music was held in Seoul in May; the first shortwave broadcast of symphonic music was made by the Seoul Philharmonic Orchestra also in May; and the first film of the Seoul Symphony Orchestra was made.

Old Korean music and a play *Spring Fragrance* were produced on various occasions for the entertainment of the members of the UN Commission. It should be noted here that the customary prerogatives of the dancing and singing girl were abridged during the year when members of the Commission were entertained officially by Korean leaders who were assisted for the first time by their wives instead of dancing girls. Puppet-shows were used in the provinces to teach conservation of forests, flood and erosion control, in 57 performances of a simple nature. Mobile education units of various types were organized to teach modern techniques. *The Self-Sounding Drum*, a play based on an ancient tale, was produced in Seoul in the summer of 1948 to celebrate the inauguration of the Republic of Korea.

Radio. KBS was reorganized in conformity with BBC rules and so was able to give full coverage to Korea's performance at the Olympics. HLKA (Seoul Station) developed a staff of writers and technical assistants trained in Occidental standards and techniques, who by the year's end were qualified to assume full responsibility for most major programs. KBC added to its library of western transcriptions and also recorded a number of Korean folk songs to export.

Arts and Crafts. Art exhibits were held in Seoul featuring student work from the National University, the work of Chungon Nyon, a woman painter of merit, the work of Kim Kichong, depicting Korean customs, and the work of Kim Doowhan, of life in his native Yesan and in Seoul and Tokyo. Songdo sponsored an industrial and artcraft exposition featuring textiles, ceramics, and straw-weaving. The curio trade prospered with the usual commodities—lacquer, brass, silver, and basket-ware.

—EVELYN B. McCUNE

KURE (Ocean) ISLAND. An atoll in the Pacific 28° 25' N., and 178° 30' W. It is about 15 miles in circumference, oval in shape, enclosing a lagoon, the entrance of which is about one mile wide. Green Island, in the southeasterly part of the lagoon, is about 20 ft. high. Westward of Green Island are two small sand islets. President Roosevelt, on Feb. 20, 1936, signed Executive Order No. 7299, which provided that Kure (Ocean) Island, together with the surrounding reef, "be reserved, set aside, and placed under the control and jurisdiction of the Secretary of the Navy, for Naval purposes."

KURILE ISLANDS (Chishima). A chain of 47 islands reaching from the Japanese island of Hokkaido to the tip of the Kamchatka peninsula in the eastern Asiatic U.S.S.R. The most important islands are Kunashiri, Etorofu, Uruppu, Shimushiru, and Paramushiro. Total area: 3,944 square miles. Population: 5,000, exclusive of a large number of hunters and fishermen who enter the islands from the south during the summer. The islands were occupied by the U.S.S.R. after the surrender of Japan in 1945.

KUWAIT (Koweit). An Arab state south of Iran, at the head of the Persian Gulf. Area: 1,930 square miles. Population (est.): 100,000, exclusive of some Bedouins. Capital: Kuwait. The principal ex-

ports consist of pearls, wool, dhows, and horses. Oil was discovered during 1938. The country is in treaty relations with Great Britain. Ruler: Sheik Sir Ahmed al Jabir-al-Subah.

The Kuwait Oil Company, owned by the Anglo-Iranian Oil Company (British) and the Gulf Oil Corporation (American), continued its two-year program aimed at expanding the current output of 49,000 barrels of oil a day to over 150,000 barrels a day. New equipment was imported from the United States and plans were under way for the construction of a refinery. See SAUDI ARABIA.

KWANTUNG. The territory occupying the southern part of the Liaotung peninsula in Manchuria, leased from China by Japan, 1905-45. It was returned to China in accordance with the conditions of the Sino-Russian agreement of Aug. 14, 1945. Area: including adjacent islands, 1,338 square miles. Population (1940): 1,367,334. Chief towns: Dairen (Dalny), 515,743 inhabitants; Port Arthur (Ryojun), 145,286; Pulantien; Kinchow.

LABOR, U.S. Department of. A Department of the U.S. Government which in 1948 consisted of the following principal bureaus and divisions:

- Bureau of Apprenticeship
- Bureau of Labor Standards
- Bureau of Labor Statistics
- Bureau of Veterans' Reemployment Rights
- U.S. Employment Service, including Veterans' Employment Service (to Federal Security Agency, July 1, 1948)
- Wage and Hour and Public Contracts Divisions
- Women's Bureau

Secretary of Labor: Maurice J. Tobin (apptd. Aug. 13, 1948) to succeed Lewis B. Schwellenbach (died June 10, 1948). See articles on CONSUMER'S COOPERATIVES: LIVING COSTS AND STANDARDS.

LABOR CONDITIONS. Peacetime employment reached an all-time high in the United States during 1948. Wage rates and hourly earnings likewise reached the highest levels in history. It was also a year of increased industrial peace in the United States, as strikes and man-hours lost through work stoppages continued to decline. In Canada, a similar decrease in strikes and increases in wages and earnings took place. Great Britain, too, saw increases in wages and earnings, although strikes increased somewhat during the early part of the year.

Employment and Unemployment. A record high in peacetime employment in the United States was reached in July of 1948. In that month, the total number of persons employed reached 61,615,000, an increase of over 2 million over August, 1947. In September, 1948, the total civilian labor force was 62,212,000. Of this number, 51,590,000 were employed in non-agricultural establishments, while 8,723,000 were employed in agricultural pursuits. Unemployment declined to 1,899,000, slightly less than that reflected in September, 1947.

Employment declined in shipbuilding and in the communications equipment industry. Employment in the aircraft industry, however, increased as that industry began to expand. The employment of women in industry was marked by an increase of approximately 700,000 in September of 1948, as compared with September of 1947.

In Canada, the civilian labor force in August of 1948 declined somewhat, from 5,081,000 in August, 1947, to 5,030,000 in August, 1948. The number of employed persons likewise showed a slight decline from 5,008,000 in August of 1947 to 4,948,000 in August of 1948. Unemployment in-

creased from 73,000 in August of 1947 to 82,000 in August of 1948.

In Great Britain, the total working population in August, 1948, declined to 20,297,000, as compared with 20,430,000 at the end of 1947. Unemployment declined slightly, with 295,000 registered as

Source: U.S. Dept. of Commerce, Bureau of the Census.

unemployed in August of 1948, as compared with 300,000 at the end of 1947. In Japan, the industrial labor force in June of 1948 totaled 17,890,000, of which 5,090,000 were women.

Women Workers. The number of women in the civilian labor force increased by nearly 900,000 between September, 1947, and September, 1948, while the number employed increased by approximately 700,000. Women's average weekly earnings, as reported by the National Industrial Conference Board for 25 selected manufacturing industries, were \$42.13 for July, 1948, as compared with \$38.38 for July, 1947. Average hourly earnings for July, 1948, were \$1.11, and average weekly hours worked were 37.8.

In Japan, women workers represented approximately 28 percent of the industrial labor force. They were enjoying, under the labor standards law, special legal protection, including equal pay for equal work, maternity leave, and limitations on overtime, night work, and hazardous occupations. A Women's and Minor's Bureau has been set up in the Labor Ministry.

Child Labor. The employment of children and young persons 14 through 17 years of age remained at about the same level as in 1947. About the same number of young people were employed in April, 1948, as in April, 1947, 2,040,000 for 1948, as contrasted with 1,970,000 for 1947. By October, 1948, almost 1 in 5 of boys and girls 14 and 15 years old were employed, and more than 1 in 3 of those 16 and 17 years old.

Findings of inspections for compliance with the child labor provisions of the Federal Fair Labor Standards Act for the fiscal year 1948 (that is, ending June 30, 1948), show some reduction from 1947 in the number of establishments found in violation and the number of minors illegally employed. One in every 20 establishments covered by the law were found to have violated the child labor provisions of the law (1,384 out of 28,998). In such plants, 1 out of every 6 employed minors under 18 was found to be illegally employed, or a total of 4,628 out of 26,678. Extremely high percentages of violation were found in sawmills, planing mills and plywood mills, as well as in fruit and vegetable packing sheds.

Kentucky and Virginia established a basic minimum age at 16 for general employment, established a maximum 40-hour work week for boys and girls up to 18 years of age, and increased restrictions upon work outside school hours and night work for minors.

Wages and Working Hours. A new all-time peak in factory earnings in the United States was reached in July, 1948, when gross average hourly earnings reached \$1.33, and weekly earnings amounted to \$53.08. This compares with an average hourly rate of \$1.23 for July, 1947, and average weekly earnings of \$48.98 in the same month. These increases reflected the so-called "third round" of postwar wage increases. As in 1947, there was no uniformity in wage developments. In some industries, increases in wage rates of about 13 cents per hour were characteristic. This was true of the steel and automobile industries.

In other industries, the amounts of increases varied. In the bituminous coal industry, the 1948 agreement provided for a wage increase of \$1.00 per day, and an increase in payments into the welfare and retirement fund from 10 cents to 20 cents per ton of coal mined. Operating employees in the railroad transportation industry received wage increases of 10 cents per hour. In the meat packing industry, the basic average settlement was 9 cents per hour.

Average weekly hours worked in the United States were 39.9 in July, 1948, substantially identical with that found in July, 1947.

Widespread attention was directed to the wage settlement between the General Motors Corporation and the United Auto Workers (CIO), on May 25, 1948, providing for an immediate wage increase of 11 cents per hour, affecting some 225,000 auto workers. The wage clause provided for an immediate cost of living adjustment of 8 cents per hour, and an annual improvement factor, or standard of living adjustment, of 3 cents per hour. It was further agreed that quarterly adjustments, downward or upward, in wages should be made, based upon the movement of the Consumers' Price Index.

Under this arrangement, for each increase of 1.14 points of the index, wages would be adjusted by 1 cent an hour. No limit was placed upon the upward wage adjustments which may be authorized owing to subsequent increases in the cost of living. A limit, or "floor," was imposed as regards wage reductions, however, at 5 cents an hour.

In Canada, weekly earnings in manufacturing in July, 1948, reached \$38.81, as compared with \$36.45 for July, 1947. Average hourly earnings rose almost 11 cents per hour to 91.4 cents, as

AVERAGE HOURS AND EARNINGS OF FACTORY WORKERS IN THE U.S. BY SELECTED MONTHS
1941-1948

Month and Year	Weekly Hours	Hourly Earnings	Weekly Earnings
January, 1941.....	39.0	\$.68	\$26.64

compared with 80.8 cents in July, 1947. Average hours of work remained at approximately 42 per week, as in July of 1947.

In Great Britain, wage rates for all workers by August, 1948, had increased 6 percent over June, 1947. Average weekly hours worked showed little change, 45.3 in April, 1948 (45.2 in Oct., 1947).

The year saw the introduction of a new wage policy by the British government. In February of 1948, the Government issued a "White Paper," which stated, among other things, that in the future wage increases would not be taken into account in allowing increases in prices, except by special agreement, in advance, with the Board of Trade. It was also stated that no further general increases in the level of personal incomes would be granted without at least a corresponding increase in the volume of production.

Strikes. Interruptions to industrial peace in the United States continued to decline in 1948. For the first ten months of 1948, approximately 2,950 stoppages, involving 1.8 million workers and a loss of about 30.2 million man-days took place. This compares with 3,396 stoppages involving 2,080,000 workers and a loss of approximately 33.1 million man-days for the same period in 1947.

Perhaps the most serious strikes during 1948 were those involving West and East Coast maritime workers. Approximately 28,000 West Coast dock workers and seagoing personnel went on strike on September 2, upon termination of an 80-day anti-strike injunction issued under the Labor Management Relations Act of 1947. The issues in dispute involved wages and the union hiring hall. The unions involved in the strike were the International Longshoremen's Union, Marine Cooks and Stewards (CIO), Marine Engineers' Beneficial Association (CIO), Marine Firemen, Oilers, Water Tenders and Wipers, and a radio officers' union.

The strike was finally settled in November, after 85 days, upon the basis of a 3-year contract granting an increase in hourly wage rates of 15 cents per hour, a welfare fund, increased vacations, and other fringe benefits. It was agreed to continue the hiring hall in effect pending a court decision as to its validity.

The East Coast strike began in November, involved 45,000 (AFL) dock workers, and was settled after 18 days, with the grant of 13 cents per hour wage increase, a welfare fund, increased vacations, and other benefits.

On March 16, 100,000 packing workers, members of United Packing House Workers of America (CIO), went on strike to enforce demands for a 29 cent wage increase, despite the prior appointment of a presidential board of inquiry. About half of the approximately 100 plants affected by the stoppage were operated by the large meat packers, Swift, Armour, Wilson, Cudahy, and Morrell. There were scattered incidents involving violence between pickets and non-strikers. The board of inquiry reported that an employer offer of a 9 cent hourly wage increase was "substantial." On May 21, the union accepted a 9 cent hourly wage increase, and the strike was called off in 3 companies. Subsequent settlements were reached with other packers.

On March 15, a strike began in the bituminous coal industry over the failure of the trustees of the welfare fund to reach an agreement upon pension payments. A presidential board of inquiry was appointed to investigate the dispute. On April 3, the Attorney General obtained a temporary restraining order instructing the union to order the soft-coal miners back to work, and directing both parties to resume collective bargaining in an effort to settle the pension dispute.

Subsequently, fines of \$1.4 million were assessed against the United Mine Workers of America and \$20,000 against its president, for failure to comply with this order of the court. By April 26, most of the miners returned to work, pursuant to instruc-

tions from the union president. The pension dispute was subsequently settled by an agreement by a majority of the board of trustees to grant pensions of \$100 per month to qualified members of the union after 20 years of service in the mines, and after such members had reached the age of 62.

A stoppage involving nearly 15,000 workers at the Boeing Airplane Company plant in Seattle was begun on April 22, involving members of the International Association of Machinists. The strike was ended on September 10. In November, the National Labor Relations Board issued an order requiring the company to bargain with the union.

In Canada, strikes likewise showed a substantial decline over 1947. During the 8-month period from January through August, 1948, there were 104 strikes and lock-outs, involving 29,383 workers, with a loss of 657,950 working days, as compared with 157 strikes for the same period in 1947, involving 66,798 workers and a loss of 1,581,319 working days.

In Great Britain, on the other hand, while the number of workers involved in strikes declined, there was an increase in the number of strikes and the amount of time lost due to such strikes. For the first 8 months of 1948, there were 1,277 strikes, involving 354,300 workers, with a loss of 1,728,000 man-days. This compares with 1,174 strikes, involving 428,400 workers, with a loss of 1,610,000 man-days for the same period in 1947.

In France, the series of politically inspired strikes which began in the latter part of 1947 continued into 1948. The most serious of these involved a work stoppage in the coal mines by the Communist-led General Confederation of Labor on October 2, and was called off, after eight weeks, on November 27.

* Preliminary, subject to revision. ^a U.S. Bureau of Labor Statistics. ^b Canadian Labor Gazette. ^c British Ministry of Labor Gazette. ^d Through November of 1948.

Labor Movements. In the United States, the AFL and the CIO held national conventions in November of 1948.

The 67th Convention of the AFL was held at Cincinnati, Ohio, November 15-22. Resolutions were adopted recommending repeal of the Taft-Hartley Law and the restoration of the Wagner Act; supporting federal aid to education; the Marshall Plan; a military alliance against the Soviet

Union; recognizing labor's responsibility for the economic health, safety, and welfare of the nation; and recommending an increase in the minimum wage to \$1 per hour.

The CIO held its 10th Convention at Portland, Ore., from November 22-28. The Convention adopted a resolution favoring further wage increases, which was generally interpreted as signifying an attempt to initiate a "fourth round" of upward wage adjustments. The Convention also adopted resolutions recommending the repeal of the Taft-Hartley Law and the substitution of the Wagner Act; an extension of civil rights; the institution of an anti-inflation program, including a roll-back of prices; the imposition of price controls on commodities which basically affect the price of living; rationing and control of consumer credit; and adopted a resolution condemning the foreign policy of the Soviet Union.

The 31st International Labor Conference was held in San Francisco, June 17-July 10, 1948. The Conference adopted a convention guaranteeing the right of workers and employers to establish and join organizations of their own choice without interference. The subject of freedom of association guaranteed by that convention had been considered by the ILO as the result of a resolution by the Economic and Social Council of the United Nations. The Conference also adopted a convention establishing standards for national employment services, and conventions dealing with night work of women and young persons.

The 80th annual Trades Union Congress was held at Margate, England, on Sept. 6, 1948, and for the four following days. The approximate membership represented was 7,791,000. This represents an increase of approximately 251,000 over 1947. Resolutions were passed declaring the termination of the Congress to expose and defeat those elements in the trade union movement whose activities would result in undermining progressive social, economic, and industrial advance, presumably the Communists.

In Japan, under the influence of the liberal labor legislation enacted by the Japanese Diet, the organization of workers increased the total number of organized employees to 6,636,710, or approximately 37 percent of the industrial labor force.

The Chinese Federation of Labor was established at the National Labor Conference at Nan-king, Apr. 18-22, 1948. There were 173 delegates present from 20 provincial general unions, 10 municipal general unions, and 6 national federations of industrial unions, representing, in all, 5,493,705 members. Resolutions were adopted condemning the Trade Union Act of 1947 as repressive; recommending extension of the principle of fixing wages relative to the cost of living; the improvement of workers' education and the establishment of a Labor College.

In Latin America, two rival labor confederations held meetings in 1948. The Latin American Confederation of Labor, founded in 1938, held its third meeting, in Mexico City. In attendance were delegates from 28 labor organizations in 13 Latin American countries and Puerto Rico. The membership eligibility status of several Mexican labor organizations was considered. Resolutions passed at the Congress condemned the trade charter concluded at Havana and the Marshall Plan, and recommended industrialization of Latin America.

The Inter-American Confederation of Workers was organized at Lima, Peru, in January, 1948. There were present 143 delegates from 13 Latin American countries. The conference call issued by

the Chilean Confederation of Labor asserted that the Latin American Confederation of Labor is under the domination of a president serving the political objectives of the Communist Party. The new organization will coordinate the efforts of workers to seek better working conditions through ILO conventions, and will strive for the incorporation in the constitution of the American nations of clauses dealing with freedom of association, the right to strike, maximum hours, and collective agreements.

Labor Legislation. There was relatively little new labor legislation enacted in 1948. In the United States, a new draft law designed to meet the manpower requirements of the armed forces was enacted. The law makes men 19 to 25 years of age liable for military service for a period of 21 months, and permits the enrollment for one year of 161,000 18-year olds. Exemptions are provided on grounds of previous military service, membership in reserve units, dependency, and occupation.

The Canadian Parliament enacted the Industrial Relations and Disputes Investigations Act, effective as of Sept. 1, 1948. This act repeals the Industrial Disputes Investigation Act which was first passed in 1907, and replaces the wartime Labour Relations Regulations (P.C. 1003).

The general framework of the I.D.I. Act is retained, including the prohibition of a strike or lock-out until conciliation has been tried, and, where conciliation fails, until the causes of the dispute have been investigated and a report made to the Minister of Labour. It incorporates, also, the principles of the wartime regulations requiring an employer to bargain with the representative of a majority of its employees when organized in a trade union. Administrative machinery is provided to implement the provisions of the law.

Court Decisions. Few important labor cases reached the United States Supreme Court in 1948. Considerable interest was aroused, however, by the decision of the United States Supreme Court in *Bay Ridge Operating Co. v. Aaron et al.*, wherein the Court held that premium payments to longshoremen at 1½ times the regular daytime rate for night, week-end, holiday, and meal-period work constituted part of the regular rate of pay, and hence could not be included in overtime compensation due under the Fair Labor Standards Act.

The contracts which the longshoremen had signed with their employers contained a provision that employees are to be paid time and one-half for work done before 8:00 a.m. and after 5:00 p.m., and on Saturday afternoons, Sundays, and holidays. The longshoremen claimed that this premium pay for work outside the regular contract hours should be treated as part of the straight-time rate for the purpose of computing overtime pay after 40 hours of work in a week. Their contention was upheld by the Court.

In *U.S. v. Congress of Industrial Organizations*, the Supreme Court had occasion to consider the limitations contained in Section 304 of the Taft-Hartley Act upon political contributions or expenditures by labor organizations. The CIO and its president were indicted on the ground that the CIO, in its weekly union publication, the *C.I.O. News*, had urged its members to vote for a particular candidate for Congress. The Court held that the law forbidding expenditure of union funds in connection with federal elections was not intended to apply to political articles in regular union periodicals, and dismissed the indictment.

In *National Maritime Commission v. Herzog*, the Supreme Court upheld as constitutional Sec-

tion 9 (f) of the Taft-Hartley Law, which requires labor unions to file financial and organizational data with the Secretary of Labor.

—BERNARD CUSHMAN

LABOR STANDARDS, Bureau of. A Bureau of the U.S. Department of Labor, organized in 1934, authorized to develop desirable labor standards, promote sound labor legislation, develop industrial safety programs, promote Federal-State cooperation, and participate in international labor programs; promotes public support for the employment of otherwise qualified but physically handicapped workers, and performs the functions of the Secretary of Labor under the Labor Management Relations Act, 1947, pertaining to the filing of organizational and financial data by labor organizations. Director: William L. Connolly.

LABOR STATISTICS, Bureau of. A Bureau of the U.S. Department of Labor, established in 1884, charged with the duty of acquiring and diffusing information on subjects connected with labor. Information is issued in special bulletins and in the *Monthly Labor Review*. Commissioner: Ewan Clague.

LABRADOR. A dependency of Newfoundland, occupying the most easterly portion of North America. Area: 110,000 square miles. Population (1946 est.): 5,000. Capital: Battle Harbour. Fishing is the principal industry. Large deposits of high-grade iron ore exist near the headwaters of the Grand River.

LACROSSE. The United States Intercollegiate Lacrosse Association played its biggest schedule in history in 1948, after adding three members in Colgate, the University of Virginia, and Kenyon College. The Wingate Memorial trophy, symbolic of the championship, was retained by Johns Hopkins University, and the titleholders' captain, Brooke Tunstall, won the Jack Turnbull memorial plaque as the year's outstanding player.

A feature of the season was the North-South All-Star game at Baltimore in June, the North winning by 11-6. The United States open champion was Mount Washington, although the same team was the victim of the year's biggest upset when it lost to Army, 5-2.

Rensselaer Polytechnic Institute's team toured England, the highlight of the trip coming on August 5 at Wembley when the United States athletes battled to a 5-5 tie with an All-England ten in a demonstration game in the Olympic Stadium. Honors in the women's national tournament were won by Philadelphia.—THOMAS V. HANEY

LAND MANAGEMENT, Bureau of. An office established in the United States Department of the Interior on July 16, 1946, through the consolidation of the General Land Office and the Grazing Service, in accordance with the provisions of the President's Reorganization Plan III of 1946.

The major objective of the Bureau is the rendering of faster and better service in the handling of problems involving the land and resources on approximately 778 million acres of Federal public domain in the United States and Alaska, through the maintenance of administrative regions with headquarters in Albuquerque, N. Mex.; Billings, Mont.; Portland, Ore.; Salt Lake City, Utah; San Francisco, Calif.; and Anchorage, Alaska.

The scope of the Bureau's responsibilities includes the survey, management, and disposal of the public lands and the resources therein; the ad-

ministration of grazing on 153,000,000 acres of Federal range in ten western States; the maintenance of the only official cadastral engineering service; the adjudication of all claims to public lands; the issuance of land patents; and the maintenance of 17 land offices in the western part of the United States and Alaska. Director: Marion Clawson.

LAND UTILIZATION, Office of. The Office of Land Utilization is charged, under Administrative Order 1466, dated Apr. 15, 1940, with the responsibility of coordinating and integrating the land use and land management activities of the several bureaus and agencies of the Department; the establishment and development of sound forestry practices; the general administration of the soil and moisture conservation work; the maintenance of cooperative relations with Federal, State, and private agencies concerned with the protection, conservation, and prudent use of the lands and natural resources of the United States and Alaska. The Office of Land Utilization acts in a staff capacity for the Water Resources Subcommittee, which committee is charged with coordinating the water-development programs of the Department.

The Office is divided into four branches: the Branch of Forest Management; the Branch of Soil and Moisture Conservation and Range Management; the Branch of Lands; and the Branch of Budget and Finance. It is directed by Lee Muck, Assistant to the Secretary.

The Office of Land Utilization, since its creation in 1940, has proceeded on the theory that the application of the fundamental principles of coordination and cooperation in the field of natural renewable resource management can be effected without overlapping or duplication and without interfering with the administrative authorities of the Bureaus operating in the various functional fields. It has earnestly sought to promote a unification of action directed towards a common goal through cooperative efforts, the dissemination of information, and the rendering of efficient advisory service. The procedures established in this connection were fully crystallized during the year 1948, and the cooperative principles applied were productive of highly effective results in the field of natural resource conservation.

LATIN AMERICAN ART. The large Pan American Exhibition held in Caracas, Venezuela, in February, 1948, during the celebration of the inauguration of Rómulo Gallegos as that nation's new president, was a fitting opening of the year's activities in Latin American art. The Pan American Union in Washington, D.C., organized the show with the cooperation of New York's Museum of Modern Art, from whose permanent Latin American collection many of the works on display were borrowed. Among the nations represented by works of their foremost artists were Brazil with Cândido Portinari; Uruguay with Pedro Figari and Joaquín Torres-García; Argentina with Aquiles Badi, Emilio Pettoruti, and Raquel Forner; Chile with Israel Roa and Roberto Matta; Ecuador with Eduardo Kingman; Colombia with Luis Alberto Acuña and Gonzalo Ariza; and the United States with Darrel Austin, Stuart Davis, Robert Motherwell, and Arthur Osver.

Other artists and countries represented were Carlos Mérida of Guatemala; Rodrigo Peñalba of Nicaragua; Jaime Colson of the Dominican Republic; Cundo Bermúdez, Mario Carreño, Amelia Peláez, Felipe Orlando, and Martínez-Pedro of

Cuba; Gabriel Alix, Philomé Obin, and Louverture Poisson of Haiti; while Mexico was represented by José Clemente Orozco, Diego Rivera, Rufino Tamayo, and, among her younger artists, Raúl Anguiano and Chávez Morado. Venezuelan painters whose works were included were Armando Reverón, Héctor Poleo, and Alejandro Otero. At the same time that the above-mentioned exhibition was being held in the Museum of Fine arts in Caracas, a Venezuelan exhibit entitled "Three Centuries of Venezuelan Painting" was being shown in another wing of the same building.

By taking such steps as sending her young artists abroad to study, and promoting exhibits of their work at home, Venezuela has in recent years not only become very active but also achieved a new significance in the field of art. One of the most important and fruitful measures taken by the Government of Venezuela in encouraging the nation's artists was the organization of the Taller Libre de Pintura; a center where young artists might work unhindered and develop their talents in freedom from strict academic guidance. In September, just three months after the center was founded, some of the work produced by its members was exhibited, giving public recognition to the artists Mario Abreu, Luis Guevara, Rafael Rivero, Mateo Manaure, and others representing the most progressive trends in art.

Of special significance in art circles in Argentina, one of the most active nations in the field of Latin American art, was the Thirty-Eighth National Salon of Fine Arts, which awarded its first prize to the well-known painter J. C. Castagnino, and its second to Luis Borraro. Examples of the work of Castagnino, as well as that of Héctor Basaldúa, Norah Borges, Raquel Forner, Raúl Soldi, and Demetrio Urruchúa, appeared in an exhibit, of "Watercolors and Drawings by Argentine Artists," circulated throughout the United States by the Pan American Union. This show was on display in the Pan American Union in June. Also during 1948, the Museo Provincial "Rosa Galisteo de Rodríguez" in Santa Fe, one of the most prominent art museums in the interior of Argentina, held its Twenty-fifth Annual Salon and awarded the first prize for painting to Eugenio Daneri; for sculpture to Nicolás de San Luis.

The Eleventh Salon of Plastic Arts in Uruguay gave its first three prizes to Eduardo Amézaga, Carmelo Arzadum, and Edgardo Ribeiro, all of whom are significant figures in Uruguayan art. Artists of both Uruguay and Argentina were represented in the exhibition "100 Years of Art of the Rio Plata" which was held early in the year at the Municipal Museum of Buenos Aires.

In Panama, the work of a young revolutionary group, among whom are Victor Garibaldi, Jorge Castillo, Rafael Pérez Molina, and Gloria Cohen de Pérez, has this year brought that country into prominence in the field of modern art for the first time. The same group, which works under the tutelage of Ricardo J. Bermúdez, Professor of Architecture at the University of Panama, held an exhibit in May at the university. Nonobjective in nature, the show resulted in much controversial discussion in the capital.

The Casa de la Cultura Ecuatoriana in Quito, Ecuador, organized an exhibit which was held in November in the National School of Fine Arts in Mexico City. The show featured prominent Ecuadorean artists including Oswaldo Guayasamín, Eduardo Kingman, Diógenes Paredes, Leonardo Tejada, and others.

The Haitian Art Center opened in New York in

October with an exhibit of a new group of primitive paintings brought from Haiti. The show was presented the following month at American University in Washington, D.C. The new Center, which will publicize Haitian primitive painting, is a branch of the institution of the same name in Port-au-Prince.

Cándido Portinari, one of Brazil's foremost artists, completed his mural entitled *The First Mass* for a new building in Rio de Janeiro designed by Oscar Neimeyer, who recently served as consultant on the plans for the United Nations building in New York. Lithuanian-born Lasar Segall, who is a Brazilian citizen and one of his adopted country's most famous modern painters, held his first one-man show in the United States this year, at which time were shown the most outstanding works he has completed in the last twenty years. Segall presented his paintings in the Associated American Artists Galleries in New York and in the Pan American Union before going to Europe where he expects to hold several exhibitions in 1949.

The most controversial issue to arise in Latin American art circles in 1948 was that produced by the Diego Rivera mural in Mexico City's new Hotel del Prado. Completed at the end of 1947, this painting with its sentence "God does not exist," has been the cause of violent discussion, and the Archbishop of Mexico refused to give the hotel his official blessing. The controversy spread throughout this hemisphere and culminated in a ruling by the Department of National Property of the Republic of Mexico to the effect that the painting in question could be neither altered nor removed since all Mexican murals, whether in official or private buildings, are the property of the State.

José Clemente Orozco, master of modern Mexican art, undertook for the first time a work of abstract form when he did a mural in cement in the open-air amphitheater of the Normal School in Mexico City. For this mural, which he completed by the middle of the year, he used ethyl-silicate as a plastic substance, adding glass fragments to catch the reflection of natural light. Earlier in the year Orozco executed a mural for the National Museum of Chapultepec, in honor of Benito Juárez, Mexican hero and statesman.

The work of another outstanding artist of Mexico, Rufino Tamayo, appeared this year in an exhibition in the Palace of Fine Arts in Mexico City. For a long time Tamayo has been held in a position of prominence in the United States, but the aforementioned exhibition was the first official recognition Mexico has given the importance of his work in that nation's art of today.

In November of 1948 an exhibit entitled "Three Contemporary Mexican Painters" was presented in the Dallas Museum of Art. This exhibit was organized by the Gallery Mont-Orendain of Mexico and featured the work of Diego Rivera, Rufino Tamayo, and David Alfaro Siqueiros.

Newly formed in Havana is the APEC (Agrupación de Pintores y Escultores Cubanos) whose members include some of the most outstanding figures in the plastic arts of Cuba: Wifredo Lam, Amelia Peláez, Mario Carreño, Fidelio Ponce, Carlos Enríquez, Cundo Bermúdez, Mariano, Felipe Orlando, René Portocarrero, and Roberto Diago among the painters; Alfredo Lozano, Roberto Estopiñán, and Marta Arjona among the sculptors. The new organization plans to get official and public recognition of the work done by its members, who for a long time have enjoyed prestige abroad but who have not yet received any support from their own government.

Latin American activities in the field of art in 1948 terminated in December with the showing in the Pan American Union of a large exhibition entitled "Some Religious Paintings of Latin America." With the loan of six magnificent paintings of the Cuzco School in Peru, of the 17th Century (belonging to the Brooklyn Museum), of two excellent examples of the Mexican School of the 18th century (lent by the Philadelphia Museum of Art), of two very valuable works of the Quito School (lent by the Ecuadorean Embassy in Washington), and of other beautiful paintings lent by private collectors, this exhibit was a representative showing of the various trends in religious art from the days of the Conquest to the middle of the 19th century in Ecuador, Guatemala, Mexico, Peru, and Venezuela.

—JOSÉ GÓMEZ SICRE

LATIN AMERICAN LITERATURE. The revised edition of Dudley Fitts' *Anthology of Contemporary Latin American Poetry* makes available again to English-speaking readers a comprehensive and indispensable guide to recent Latin American poetry, with English translations facing the original Spanish, Portuguese, or French. Harriet de Onís' *The Golden Land* is an anthology of Latin American folklore in literature, with selections from 44 writers and four centuries of literature based on native themes.

The most important new publishing venture in Latin America is the Biblioteca Americana, a series of studies published by the Fondo de Cultura Económica in Mexico City, whose Colección Tierra Firme has been noted in previous articles in the YEAR BOOK. The first five volumes of the new series, which will be devoted to classic works of literature, are the *Popul Voh*; José Couto's *Diálogo sobre la historia de la pintura*; Ramón Iglesias' edition of Fernando Colón's *Vida del Almirante Don Cristóbal Colón*; Lucio Mancilla's *Una excursión a los indios ranqueles*; and José Joaquín Olmedo's *Poesías completas*.

Argentina. Among the outstanding novels of the year are Guillermo House's *El último perro*, a novel of gaucho life that has been compared to the classic work in this field, *Don Segundo Sombra*; Arturo Capdevila's *Advenimiento*, a religious novel laid in Chile; Raúl Larra's *Gran Chaco*, a novel of social protest, laid in the semitropical north of Argentina; Bernardo Verbitsky's *En esos años*, a skillful portrayal of postwar world conditions; *El vínculo*, *Los Rembrandts*, *La rosa de Cernobbio*, three short novels by Eduardo Mallea, one of the great contemporary Latin American novelists. Two volumes of short stories are worthy of special note: Julio Aramburu's *La centella de fuego*, graceful, concise stories of provincial life; and Gabriel Casaccia's *El pozo*, tales of mystery and emotion.

A distinguished addition to the available works on Domingo Faustino Sarmiento (1811-88), Argentina's great educator and president, is *A Sarmiento Anthology*, selected and edited by A. W. Bunkley and published by the Princeton University Press. *Escritores iberoamericanos de 1900* is a volume of reminiscences on Rubén Darío, Amado Nervo, Rufino Blanco Fombona, and other famous literary figures of the period, written by their great contemporary, Manuel Ugarte. José Luis Lanuza's *Morenada* is a volume of essays and sketches about the Negroes of Buenos Aires. *Filosofía de ayer y de hoy* is a series of articles on thinkers of the 19th and 20th centuries by the illustrious Argentine philosopher, Francisco Romero. Bernardo González Arrioli's *Belgrano* is a definitive biography of Manuel

Belgrano, one of the leaders of Argentine independence.

Among noteworthy volumes of poetry are María Elena Walsh's *Otoño imperdonable*, which shows a fresh and sure poetic imagination; Miguel Etchebarne's *Soliloquio*, a tender and meditative collection of sonnets; Alfredo Roggiano's *El río iluminado*, sonnets that are skillfully though somewhat rhetorically fashioned; Reginaldo Martín Zorrilla's *En mi campiña*; Jorge Perrone's *Romances de la aldaba*, a ballad collection; Juan Ortiz's *El álamo y el viento*, delicate lyrics about the landscape and people of the province of Entre Ríos; *Tiempo cautivo*, a collection of poems written since 1928 by Rafael Alberto Arrieta, a major poet of serene and lyric beauty.

Bolivia. *La poesía quechua* is a survey of the poetry of the Andean Indians by Jesús Lara, the well-known novelist and poet, who has also published a collection of original poems: *Paucarcuara, poemas quechuas*. Noteworthy also are two volumes of verse by Reinaldo López Vidaurte: *La senda perdida, poemas en prosa*, and *Cumbres de oro*.

Brazil. *Marvellous Journey* is an enthusiastic introduction to four centuries of Brazilian literature by Samuel Putnam, the foremost authority on the subject in the United States. Erico Verissimo's *A volta do gata preto* is a sprightly account of the author's two year residence in the United States as guest lecturer on Brazilian literature in several colleges and universities. Cassiano Ricardo's *Um dia depois do outoro* is a collection of verse filled with music and mysticism. *Poemas, sonetos e baladas* is written by Vinicius de Moraes, one of the most brilliant exponents of orthodoxy in modern Brazilian poetry.

Chile. The outstanding novel of the year is Marta Brunet's *Humo hacia el sur*, the dramatic story of a domineering woman's losing fight against progress. María Luisa Bombal's *La amantada*, a strikingly successful impressionistic novel, appeared in English translation as *The Shrouded Woman*. *Alma y cuerpo de Chile* is a group of essays on the Chilean people and countryside by the famous novelist, Luis Durand.

Viajes al corazón de Quevedo; *Por las costas del mundo* are collections of articles on travel and on Spanish literature by Chile's greatest poet, Pablo Neruda, whose *Tercera residencia*, the third part of his *Residencia en la tierra*, rounds out one of the major works of 20th century poetry. Humberto Díaz Casanueva's *La estatua de sal* contains four long poems of unusual merit and perfection of form. Arturo Torres Ríos's *Elegías* are deeply moving lyrics in perfect poetic form by the celebrated Chilean poet who teaches Spanish American literature at the University of California. The death of Vicente Huidobro removes from the Chilean literary scene one of its most stimulating and exasperating *avant-garde* poets.

Colombia. Ramón Manrique's *La venturosa* is a novel of colonial times and local customs. Jesús Botero Restrepo's novel *Andagueda* is based on the author's experiences among the Indians of this region. Manuel Zapata Olivella's *Tierra mojada* is a remarkable first novel, tough and realistic in style, proletarian in point of view.

Outstanding in prose non-fiction are *Rubén Darío y otros poetas*, essays by the distinguished poet and critic, J. B. Jaramillo Mesa; Andrés Holguín's *La poesía inconclusa y otros ensayos*, essays on Colombian poets; *Aspectos de la cultura en Colombia*, essays by the famous literary historian, Guillermo Hernández de Alba; and a biography of

Bolívar by Jorge Ricardo Vajarano that Germán Arciniegas considers the best book of the year. Arciniegas has written an introduction for Octavio Quiñones Pardo's *Interpretación de la poesía popular*, a stimulating study of folk poetry. Miguel Rash Isla's *Sonetos* contains the collected poems of a deservedly popular poet.

Costa Rica. *Manglar* is a psychological novel about a teacher in southern Chile, written by a Costa Rican resident of this region, Joaquín Gutiérrez.

Cuba. Two noteworthy volumes of short stories are Enrique Labrador Ruiz's *Carne de quimera*, *novelinas neblinosas*, 8 vague, surrealistic stories, tinged with ironic fantasy, and *Cuentos cubanos contemporáneos*, a collection of 18 stories with excellent critical notes by José Antonio Portuondo. Other admirable works of scholarship are Antonio Irazoiz's edition of Enrique Piñeyro's *Notas críticas*, Félix Lizaso's edition of José Martí's *Ideario separatista*, and Chacón y Calvo's edition of *Revisiones literarias*, studies by the great poet, José María Heredia.

El huracán is a study of pre-Columbian symbolism by Fernando Ortiz, Cuba's outstanding ethnographer. The novelist Enrique Serpa has collected a group of his political essays under the title *Presencia de España*. A volume of unusual importance is Cintio Vitier's *Diez poetas cubanos*, a selection from the work of ten contemporary Cuban poets.

Dominican Republic. *Cuentos insulares* is a volume of short stories with social themes by Max Henríquez Ureña. *Seis cuentistas dominicanos*, edited by Miguel Román Pérez Echavarría, contains stories by Manuel Cabral, Socrates Nolasco, Vega Batlle, Fabio Fiallo, Nestor Caro, and Ismael Abreu. *Historia de la cultura en América* is a revised and expanded Spanish version of Pedro Henríquez Ureña's *Literary Currents in Hispanic America*. The revision, made just before the author's death, is a landmark in the field of Latin American literary and artistic history.

Ecuador. An unusually promising first novel of rural life is *El éxodo de Yangana*, by Angel Rojas, who also wrote *La novela ecuatoriana*, an excellent critical study. *Los animales puros* is a proletarian novel by the well-known poet and dramatist, Pedro Jorge Vera. Three volumes of poetry of unusual merit are González Escudero's *Alta noche*, César Dávila Andrade's *Espacio, me has vencido*, and Hugo Alemán's *De ayer. El visitante de niebla y otros poemas* is the latest work by Ecuador's greatest poet, Jorge Carrera Andrade.

Guatemala. A well-balanced and much needed anthology of Guatemalan short stories is Alfonso Orautes' *Cuentos de Guatemala. Por un caminito así*, a collection of new as well as previously published verse by Guatemala's most distinguished man of letters, Rafael Arévalo Martínez, contains introductory essays by Arturo Torres Ríosco, Santiago Argüello, and Gabriela Mistral.

Mexico. Among the best novels of the year are María Luisa Ocampo's *Bajo el fuego*, which won the Altamirano Prize; *Donde crecen los tepozanis*, a first novel, dealing with Indian witchcraft, by the well-known poet and dramatist, Miguel N. Lira; Francisco Rojas González's *Lola Casanova*, a novel of adventure, laid in a Mexican setting of a century ago, in which the heroine, captured by Indians, becomes their leader; Diego Cañedo's *La noche anuncia el día*, a fantastic novel involving a thought-reading machine and its use by the hero to explore the thinking of political leaders.

Also Rafael Bernal's *Su nombre era muerte*, in

which a misanthrope forsakes the civilized world to find adventure in the jungles of southwestern Mexico; Agustín Yañez's *Al filo del agua*, an extraordinarily good novel of the Mexican Revolution, laid in a town haunted by fear and desire. César Garizurieta's *El diablo, el cura y otros engaños* is an amusing and imaginative collection of tales. *Quetzalcoatl, sueño y vigilia*, is an imaginative re-creation of the legends of the Mayan god by Ermilo Abreu Gómez, one of Mexico's most brilliant intellectuals.

Cien años de novela mexicana is a series of lectures on the novel by Mexico's foremost living novelist, Mariano Azuela. Carlos González Peña's *Mirando pasar la vida* contains nostalgic memories of bygone customs. *A lápiz and Grata compañía* are two volumes of articles by Alfonso Reyes, the most highly respected literary critic in Spanish America.

Three additions to a notable literature of published plays are Xavier Villaurrutia's *El pobre barba azul* and Rodolfo Usigli's *El gesticulador* and *Otra primavera*.

Paraguay. Carlos Centurión's *Historia de las letras paraguayas, tomo I, Época precursora y época de formación* is a reference book valuable largely because of our scant knowledge of Paraguayan literature.

Peru. José Gálvez has written a nostalgic account of the passing glories of his native city in *Una Lima que se va*. Luis Alberto Sánchez's *Los poetas de la colonia y de la revolución* is a reprint of the first book by this noted literary historian. *Minúsculas* and *Adoración* contain some of the poetry of Manuel González Prada, one of the great figures in 19th century Peruvian literature.

Salvador. Trigueros de León's *Labrando en madera* is a series of subtle, impressionistic studies of Spanish American poets. The *Sonetos* of Claudia Lars are delicate creations by one of the most famous women poets of Latin America.

Uruguay. Two novels of superior literary merit are Francisco Costa Doldán's *Conjunción* and Manuel Medina Betancort's *Beatriz*. Felisberto Hernández's *Nadie encenderá las lámparas* is a volume of fantastic, fourth dimensional stories. Hugo Barbagelata's *La novela y el cuento en Hispano América* is an informative and valid study of Spanish American fiction.

Noteworthy volumes of poetry are Carlos Denis Molina's *Tiempo de sueño*; Rafael Romano's *Nace un tiempo*, a first work in a variety of styles, written with keen sensibility; Felipe Novo's *Viento desnudo*; Julio J. Casal's *Cuaderno de otoño*, a new volume by an outstanding poet; *Las sombras diáfanas*, a collection of sonnets by one of Uruguay's greatest poets, Carlos Sabat Erceasty; *Ariel prisionero*, *Ariel liberado*, a long heroic poem by another great Uruguayan, Sarah Bollo.

Venezuela. Among the outstanding novels are Blanca Rosa López's *En aquellas islas del Caribe*, a first novel by a gifted writer of short stories; José Berti's *Espejismo de la selva*, which deals with life on a rubber plantation; Arturo Uslar Pietri's *El camino de El Dorado*, which won the Aristides Rojas Prize for the best novel of the year. This work is a fictional life of the Spanish conquistador, Lope de Aguirre. Another life of Aguirre is Casto Fulgencio López's *Lope de Aguirre, el Peregrino*.

The field of biography is notably rich this year in Venezuela, with J. A. Cova's *San Martín, Aníbal de los Andes* and Mariano Picón Salas' *Miranda*, which was one of the leading contenders for the Premio Nacional de Literatura. This biennial prize

was awarded to Mario Briceño Iragorri for his *El Regente Heredia o la piedad heroica*, a biography of José Francisco Heredia, one of the forgotten heroes of Venezuelan independence. Another book by Briceño Iragorri is *El caballo de Ledesma*, a collection of beautifully conceived and written essays on various themes. Carlos Brandt's *En el país de Gómez* is a scathing judgment on Juan Vicente Gómez, tyrannical dictator of Venezuela from 1908 to 1935. Andrés Eloy Blanco's *Vargas, el Albacea de la Angustia* is a biography of a leader of Venezuelan independence, written by one of Venezuela's great contemporary poets.

Enrique Bernardo Núñez's *La ciudad de los techos rojos*, a series of sketches of Caracas, was awarded the Premio Municipal de Prosa in 1947. Gilberto Antolínez's *Hacia el indio y su mundo* is a defense of Indian America as opposed to the America of European origin and influence. R. Olivares Figueroa's *Folklore venezolano* is a collection of popular verse by a distinguished poet and critic. Ramón González Paredes' *Samuel* and *Ellos* are two one-act psychological plays, very modern and highly stylized, like those of Pirandello.

In the Juegos Florales Iberoamericanos held in Mexico, the first prize was won by Manuel Felipe Rugeles for his poem, *Iberoamérica*. The Venezuelan Premio Municipal de Poesía went to Carlos Augusto León for his *Los nombres de la vida*. Other poetic works of unusual merit were Vicente Gerbassi's *Poemas*, Pálmenes Yarza's *Instancias*, J. A. Escalona's *Soledad invadida*, Pedro Pablo Paredes' *Alabanza de la ciudad*, Enrique Castellanos' *Sinfonías terrestres*, José Ramón Medina's *La edad de la esperanza*, and Juan Beroes' *Cantos para el abril de una doncella*.

—DONALD D. WALSH

LATTER DAY SAINTS. A religious body, commonly known as the Mormon Church, organized at Fayette, N.Y., on Apr. 6, 1830, by Joseph Smith. The Bible, the Book of Mormon, the Doctrine and Covenants, and the Pearl of Great Price, are regarded as the word of God.

Church of Jesus Christ of Latter Day Saints. The largest body of Mormons, they believe in the same organization that existed in the Primitive Church, namely, apostles, prophets, pastors, teachers, etc.; also they believe in the gift of tongues, prophecy, revelation, visions, and healing. The church maintains 8 temples devoted to sacred ordinances. Besides the Brigham Young University, the church has 14 collegiate institutes and 102 high school seminaries. Church membership: 1,016,170, presided over by the First Presidency of the Church.

Administrative affairs and the performance of all church ordinances are carried on by the Melchizedek Priesthood, numbering 146,330, assisted by the Aaronic Priesthood, numbering 135,313. Priesthood is held only by male members. Auxiliary organizations include the Relief Society, a woman's organization with 111,843 enrollment; a Sunday School with 444,541 members; a Mutual Improvement Association for young people, with 136,843 members. The church also maintains a Genealogical Society and a Library. The church is divided into units termed Stakes and Wards, numbering 172, and Missions and Branches, numbering 42. Two General Conferences, 4 Stake Conferences, and 1 Ward Conference are held each year. Headquarters: 47 East South Temple St., Salt Lake City, Utah.

Reorganized Church of Jesus Christ of Latter Day Saints. Non-Mormon division of the Latter Day

Saints Church, after the death of Joseph Smith, Jr., established 1852. Headquarters now at Independence, Mo. In the United States there are 633 churches, 8,472 priests, and 136,167 members. Converts in 1947 totaled 3,489. The Church maintains 3 homes for the aged and one hospital. Church property is valued at \$10 million; total income from members (1948) is approximately \$1 million. Headquarters: The Auditorium, Independence, Mo.

LATVIA. A republic in the Baltic, occupied by the U.S.S.R. and incorporated into the Soviet Union, as the Latvian Soviet Socialist Republic, on Aug. 3, 1940. The United States and Great Britain have not recognized Latvia's entry into the Soviet Union. Area: 24,840 square miles. Population (1940): 1,950,000. Chief towns: Riga (capital), 393,211 inhabitants, Leipāja (Libau) 57,098, Daugavpils (Dvinsk) 45,160. Budget estimates (1948): revenue 1,455,100,000 rubles; expenditure 1,443,200,000 rubles. The important agricultural crops are oats, hay, rye, barley, wheat, flax, and sugar beets.

LAW. This review is limited to important developments during the judicial year, 1948, in U.S. Supreme Court decisions, jurisprudence and practice. For discussion of legislation and similar topics, the special title involved should be consulted.

Civil Liberties. In these troubled times the preservation of our basic freedoms and the protection of the individual against unwarranted governmental action, both Federal and State, assume an ever increasing importance. Government must be strong enough to further the legitimate interests of the general public without becoming a police state and destroying our democratic tradition, built upon the dignity and worth of the individual.

On many of the difficult cases that reach the Court thoughtful people, just as the Justices themselves, will often be in sharp disagreement. Fault may be found with one or more decisions. But the Supreme Court has long stood as a champion of the individual against arbitrary and oppressive governmental action; and during the last term its decisions dealing with civil liberties were gratifying.

The Court is probably more, certainly not less, responsive to the ideals of civil liberty than is a representative cross section of the people. Highlighting its current efforts are its decisions in aid of racial minorities such as the Negroes and Japanese. Restrictive covenants aimed at segregating Negroes in urban areas were held non-enforceable. The background of the restrictive covenant is this.

In 1917 the Court in *Buchanan v. Warley*, 245 U.S. 60, invalidated an ordinance of Louisville, providing that Negroes and whites should not live in the same block, partly upon the basis of due process of law and partly in reliance on a civil rights statute stating that all citizens of the United States should have the same right as white citizens to purchase, hold and convey real property. Since, therefore, racial segregation could not be achieved by a municipal ordinance, a group of property owners often resorted to the use of restrictive covenants whereby they agreed that certain types of persons, usually those "not of the Caucasian race" may not purchase or occupy the restricted property.

The legal theory in support of such restrictive covenants was that the Fourteenth Amendment restricts only state action and does not proscribe private or individual discriminations. *Corrigan v. Buckley*, 271 U.S. 523 (1926), supported this view.

In the current restrictive covenant cases a unanimous Court, with three Justices not sitting, held that State judicial action was State action and hence State courts could not enforce covenants excluding Negroes from using or occupying real property by virtue of the Fourteenth Amendment, *Shelley v. Kraemer*, 68 S. Ct. 836; and, although the Fourteenth Amendment is inapplicable to the District of Columbia, a Federal court for that district may not enforce similar restrictive covenants since these are contrary to the public policy of the United States and also are prohibited by § 1 of the Civil Rights Act of 1866, *Hurd v. Hodge*, 68 S. Ct. 847.

By this reasoning the Court avoided overruling the *Corrigan* case, and paradoxically restrictive covenants remain valid but judicially non-enforceable. Although this tenuous distinction may cause future troubles, it probably has no great legal significance. Extra-legal practices on the part of real estate brokers in making sales, of mortgagees in extending credit, and of property owners will continue, of course, to work a practical segregation of Negroes and other racial minorities in city areas until the climate of opinion becomes more tolerant. See Frank, *United States Supreme Court*, 16 U. Chi. L. Rev. 1, 25-26, in relation to Indianapolis; and for a good treatment of the general problem, McGovney, *Racial Residential Segregation by State Court Enforcement of Restrictive Agreements, Covenants or Conditions in Deeds is Unconstitutional*, 33 Calif. L. Rev. 5; 21 So. Calif. L. Rev. 358.

And slowly the Negro is gaining admission into academic halls. Although States are still permitted to refuse Negroes admission to white schools, they are gradually being forced to accord equal educational opportunities to the Negro. Following *Gaines v. Canada*, 305 U.S. 337 (1938), the Court in *Sipuel v. Board of Regents*, 68 S. Ct. 299, ruled that when a properly qualified Negro applied for admission to the University of Oklahoma School of Law, which was the only institution for legal education supported and maintained by Oklahoma tax payers, the Negro petitioner "is entitled to secure legal education afforded by a State institution. . . . The State must provide it for her in conformity with the equal protection clause of the Fourteenth Amendment and provide it as soon as it does for applicants of any other group."

Oklahoma thereupon created overnight a new law school for Negroes and the case was brought back by the Negro to the Supreme Court as *Fisher v. Hurst*, 68 S. Ct. 389, to force compliance with the Court's mandate. In denying this request the Court stood on the technical ground that the record was inadequate to determine the sufficiency of the new law school. Dissenting, Mr. Justice Rutledge stated: "Obviously no separate law school could be established elsewhere overnight capable of giving petitioner a legal education equal to that afforded by the State's long-established and well-known State university law school. Nor could the necessary time be taken to create such facilities, while continuing to deny them to petitioner, without incurring the delay which would continue the discrimination our mandate required to end at once."

Discrimination against Japanese was thwarted in two cases arising under California statutes and involving the right of persons of Japanese origin to own land and to engage in commercial fishing. The first, *Oyama v. California*, 68 S. Ct. 269, involved California's Alien Land Law. This law prohibits an alien, ineligible for citizenship (a eu-

phemism for a Japanese), from acquiring, occupying, or transferring agricultural land; escheats land bought in violation to the State; and provides for escheat if transfers are made with "intent to prevent, evade, or avoid" escheat and that such an intent will be presumed when an ineligible alien paid the consideration for a transfer.

In the case at bar title to the land had been taken in the name of the minor son, an American citizen; the father, a Japanese ineligible for citizenship, had provided the purchase price, and managed the property as the guardian of his son. The Court held that the statute was unconstitutional as applied to the facts of the case because it deprived the citizen-son of the equal protection of the State laws and of his privileges as an American citizen.

Since there was no presumption of invalidity if other Americans received gifts from their fathers, a majority held that a different set of presumptions could not be applied to a minority group of citizens simply because their parents were Japanese. By sustaining the attack upon the statutory presumption the Court did not pass upon other aspects of the Alien Land Law and avoided overruling *Cockrill v. California*, 268 U.S. 258 (1925), which had upheld the statutory presumption of the Alien Land Law where the ineligible alien paid for land and had title put in a stranger's name. Thus technically California might have continued with escheat actions in which citizen-sons were not involved, but the California Attorney General chose not to do so. See 17 Civil Liberties Quarterly 1.

On the basis of the Fourteenth Amendment, *Takahashi v. Fish & Game Com'n*, 68 S. Ct. 1138, forthrightly ruled that California may not bar her foreign-born Japanese from commercial fishing in offshore waters, and hence its statute providing that fishing licenses may not be issued to persons ineligible to citizenship is unconstitutional.

Protection accorded an alien against deportation is a most valuable personal right, for in the words of Mr. Justice Douglas "Deportation can be the equivalent of banishment or exile. . . . The stakes are indeed high and momentous for the alien who has acquired his residence here." In *Delgadillo v. Carmichael*, 68 S. Ct. 10, in which this statement was made, and in *Fong Haw Tan v. Phelan*, 68 S. Ct. 374, the Court denied deportation by construing the immigration statutes in favor of the alien: rejecting in the first case the government's captious interpretation of what constitutes "entry"; and construing in the second case the "repeater" provision narrowly so as to affect only aliens who after one conviction subsequently commit a second crime.

On the other hand a sharply divided Court ruled that the President, acting under the Alien Enemy Act of 1798, could direct the removal from the United States of all alien enemies "who shall be deemed by the Attorney General to be dangerous to the public peace and safety of the United States," and that the Attorney General's order of Jan. 18, 1946, for the deportation of a German alien was not subject to any judicial review aside from questions of statutory interpretation and constitutionality.

Mr. Justice Frankfurter states the majority's conclusions thus: "we hold that full responsibility for the just exercise of this great power may validly be left where the Congress has constitutionally placed it—on the President of the United States. The Founders in their wisdom made him not only the Commander-in-Chief but also the guiding organ in the conduct of our foreign affairs. He who was entrusted with such vast powers in relation to the outside world was also entrusted by Congress,

almost throughout the whole life of the nation, with the disposition of alien enemies during a state of war. Such a page of history is worth more than a volume of rhetoric."

In dissent Mr. Justice Black replied: "But I do not reach the question of power to deport aliens of countries with which we are at war while we are at war, because I think the idea that we are still at war with Germany in the sense contemplated by the statute controlling here is a pure fiction. Furthermore, I think there is no act of Congress which lends the slightest basis to the claim that after hostilities with a foreign country have ended the President or the Attorney General, one or both, can deport aliens without a fair hearing reviewable in the courts."

And Mr. Justice Douglas, also dissenting, refused to delimit the historic writ of habeas corpus to "a more narrow range of judicial inquiry here than in habeas corpus arising out of any other deportation proceeding." Procedural due process requires a fair hearing, and that the order be based upon some evidence. "The notion that the discretion of any officer of government can override due process is foreign to our system." *Ludecke v. Watkins*, 68 S. Ct. 1429, 1435, 1436, 1441, 1442.

At the preceding term a divided Court sustained the action of a New Jersey board of education in providing the same free bus transportation for parochial students as supplied for students attending public schools. *Everson v. Board of Education of Ewing Tp.*, 330 U.S. 1, discussed in last year's review. By comparison, at this term the Court considered and held invalid the introduction of religious education into the public schools of Champaign, Illinois.

Under the system of "released" time, sponsored by the Champaign Council on Religious Education, religious training was offered in the public schools once a week for intervals ranging from thirty minutes to forty-five minutes. If the parent desired his children to attend a particular religious class he so indicated and attendance by his children was then compulsory. Children of parents not so inclined were kept at school and given secular education while the other children were receiving religious instruction.

Mr. Justice Black, who spoke for the majority in the *Everson* case, also spoke for the majority in the current case. "Pupils compelled by law to go to school for secular education are released in part," he stated, "from their legal duty upon the condition that they attend the religious classes. This is beyond all question a utilization of the tax-established and tax-supported public school system to aid religious groups to spread their faith. And it falls squarely under the ban of the First Amendment (made applicable to the States by the Fourteenth) as we interpreted it in *Everson*. . . . Here not only are the State's tax-supported public school buildings used for the dissemination of religious doctrines. The State also affords sectarian groups an invaluable aid in that it helps to provide pupils for their religious classes through use of the State's compulsory public school machinery. This is not separation of Church and State."

Justice Reed, dissenting, felt that the Champaign system of "released" time and the use of the public school building was no more than a friendly gesture between Church and State. Noting the indirect financial aid given to parochial schools in the *Everson* case, and that the National School Lunch Act aids all school children attending tax exempt schools, he further noted that the practices of the government offer examples of aid to religion.

"The Congress of the United States has a chaplain for each House who daily invokes divine blessings and guidance for the proceedings. The armed forces have commissioned chaplains from early days. . . . Under the Servicemen's Readjustment Act . . . eligible veterans may receive training at government expense for the ministry in denominational schools. The schools of the District of Columbia have opening exercises which 'include a reading from the Bible without note or comment, and the Lord's Prayer.' In the United States Naval Academy and the United States Military Academy, schools fully supported and completely controlled by the Federal government, there are a number of religious activities. Chaplains are attached to both schools. Attendance at church services on Sunday is compulsory at both the Military and Naval Academies. . . . both schools since their earliest beginnings have maintained and enforced a pattern of participation in formal worship." He concluded that a State should be given great leeway in dealing with its important social problems, and that devotion to the great principle of religious liberty should not lead us into a rigid interpretation of the constitutional guarantee that conflicts with accepted habits of our people. *McCullum v. Board of Education*, 68 S. Ct. 461, discussed in *Owen, The McCullum Case*, 22 *Temple L. Q.* 159; *Catholic Bishop's Statement*, *N.Y. Tribune*, Nov. 21, 1948, p. 36 (sharply critical of the holding).

A decision, having vast political significance to labor during the last election, ruled that labor unions may continue to use union newspapers to advocate a desired course of political action. For the majority, Justice Reed held that use of union funds for such purpose was not an "expenditure" within the meaning of the Federal Corrupt Practices Act as amended by the Taft-Hartley Act. Four Justices concurring in the result interpreted the statute to forbid the activity but held the statute unconstitutional. *U.S. v. C.I.O.*, 68 S. Ct. 1349.

In the field of criminal prosecution a statute denouncing conduct as criminal must not invade the defendant's basic rights, such as freedom of speech, must be sufficiently definite to apprise the defendant of the conduct made criminal, must prescribe the penalty, and the accused must be convicted of the crime charged. Thus a penal ordinance, forbidding the use of sound amplification devices except with permission of the chief of police, invades the basic right of freedom of speech. "We hold that [the] . . . ordinance is unconstitutional on its face," said Mr. Justice Douglas, "for it establishes a previous restraint on the right of free speech. . . . To use a loud-speaker or amplifier one has to get a permit from the Chief of Police. There are no standards prescribed for the exercise of his discretion. The statute is not narrowly drawn to regulate the hours or places of use of loud-speakers, or the volume of sound. . . . Any abuses which loud-speakers create can be controlled by narrowly drawn statutes. . . . The power of censorship inherent in this type of ordinance reveals its vice. Courts must balance the various community interests in passing on the constitutionality of local regulations of the character involved here. But in that process they should be mindful to keep the freedoms of the First Amendment in a preferred position." *Saia v. New York*, 68 S. Ct. 1148. New York Penal Law § 1141, as interpreted by the State Court of Appeals, made criminal the distribution of a book, magazine, or newspaper principally made up of criminal news of bloodshed and lust so "as to become vehicles for inciting violent

and depraved crimes against the person." In reversing the conviction of a bookdealer because the statute was too vague, the Supreme Court held that a "failure of a statute limiting freedom of expression to give fair notice of what acts will be punished and such a statute's inclusion of prohibitions against expressions, protected by the principles of the First Amendment, violates an accused's rights under procedural due process and freedom of speech or press." *Winters v. New York*, 68 S. Ct. 665, 667. Even though the statute define the proscribed act with sufficient definiteness, failure to prescribe the penalty for violation results in a dismissal of the criminal proceeding. *U.S. v. Evans*, 68 S. Ct. 634. And an accused is denied procedural due process where his conviction is not based upon the crime charged. *Cole v. Arkansas*, 68 S. Ct. 514.

In Michigan a trial judge may serve as a one-man grand jury to investigate crimes, and may punish for contempt a witness who testifies "evasively." Such a one-man-judge grand jury, concluding a witness was evasive, immediately charged the witness with contempt, convicted, and sentenced him to sixty days in jail. Very properly the Supreme Court held the contempt proceeding to be a denial of procedural due process.

Mr. Justice Black traces this nation's accepted practice of guaranteeing a public trial to an accused back to a long time before the settlement of our land. "The traditional Anglo-American distrust for secret trials has been variously ascribed to the notorious use of this practice by the Spanish Inquisition, to the excesses of the English Court of Star Chamber, and to the French monarchy's abuse of the *lettre de cachet*. All of these institutions obviously symbolized a menace to liberty." *In re Oliver*, 68 S. Ct. 499.

On the right of a defendant in a Federal criminal proceeding to have counsel, unless the right is intelligently waived by the accused, the Court has set a high standard of which we may justly be proud. "The Sixth Amendment guarantees that an accused, unable to hire a lawyer, shall be provided with the assistance of counsel for his defense in all criminal prosecutions in the Federal courts." And it "is the solemn duty of a Federal judge before whom a defendant appears without counsel to make a thorough inquiry and to take all steps necessary to insure the fullest protection of this constitutional right at every stage of the proceedings. . . . To discharge this duty properly in light of the strong presumption against waiver of the constitutional right to counsel, a judge must investigate as long and as thoroughly as the circumstances of the case before him demand." *Von Moltke v. Gillies*, 68 S. Ct. 316 (reversing a judgment dismissing a petition for habeas corpus and remanding the case for further proceedings to determine definitely whether petitioner had understandingly waived her constitutional right). Regrettably, the Court holds that the Fourteenth Amendment does not require the same civilized standard.

Over the dissent of Justices Douglas, Black, Murphy, and Rutledge, the Court reaffirmed preceding doctrine in the following language: "The due process clause of the Fourteenth Amendment does not incorporate, as such, the specific guarantees found in the Sixth Amendment although a denial by a State of rights or privileges specifically embodied in that and others of the first eight amendments may, in certain circumstances, or in connection with other elements, operate, in a given case, to deprive a litigant of due process of law in violation of the Fourteenth Amendment. . . . As-

serted denial [of counsel] is to be tested by an appraisal of the totality of facts in a given case." *Bute v. Illinois*, 68 S. Ct. 763, 777 (holding counsel was not necessary); *Gryger v. Burke*, 68 S. Ct. 1256 (similar); but *Townsend v. Burke*, 68 S. Ct. 1252 and *Wade v. Mayo*, 68 S. Ct. 1270, held the circumstances required counsel.

In the matter of the use of confessions, the Court is usually vigilant in protecting the rights of the accused. *Haley v. Ohio*, 68 S. Ct. 302, reversed the murder conviction of a fifteen year old Negro boy because of the use of his confession. It had been obtained after five hours of interrogation, starting at midnight, by police officers working in relays, without any warning to the boy of his rights, and without his having the advice of friends, family, or counsel. *Accord, Lee v. Mississippi*, 68 S. Ct. 300 (reversing a conviction of a seventeen year old Negro).

On the closely related constitutional privilege against self-incrimination, the Court held the privilege did not attach to books and records required to be kept by licensed dealers under the Emergency Price Control Act, on the theory that these records are public and designed to assist in the enforcement as well as the administration of the statute.

Justice Jackson's dissent states the danger of this holding: "The protection against compulsory self-incrimination, guaranteed by the Fifth Amendment, is nullified to whatever extent this Court holds that Congress may require a citizen to keep an account of his deeds and misdeeds and turn over or exhibit the record on demand of government inspectors, who then can use it to convict him. . . . It would, no doubt, simplify enforcement of all criminal laws if each citizen were required to keep a diary that would show where he was at all times, with whom he was, and what he was up to. . . . we should have no hesitation in holding that the government must lose some cases rather than the people lose their immunities from compulsory self-incrimination." *Shapiro v. U.S.*, 68 S. Ct. 1375, 1410. The search and seizure doctrine of *Harris v. U.S.*, 331 U.S. 145, discussed in last year's review, has been restricted and its danger lessened in *Johnson v. U.S.*, 68 S. Ct. 367, *U.S. v. DiRe*, 68 S. Ct. 222, and *Trupiano v. U.S.*, 68 S. Ct. 1229. In the last case Federal agents had extensive information regarding the operation of an illicit distillery in ample time to procure a search warrant before making the raid, and the Court, therefore, held that the fact the contraband property seized was in close proximity to one of the arrested operators did not validate the search, without warrant, as an incident to the arrest. No reason was shown why the arresting officers could not have obtained a search warrant—"no reason," said the Court, "except indifference to the legal process for search and seizure which the Constitution contemplated."

The validity of New York's special or "blue ribbon" jury, upheld in *Fay v. New York*, 67 S. Ct. 1613, discussed in last year's review, was again unsuccessfully challenged on the ground that it violated the due process and equal protection clauses of the Fourteenth Amendment. *Moore v. New York*, 68 S. Ct. 705. And the Court has steadfastly adhered to its position that convictions of Negroes cannot stand, where Negroes are intentionally and systematically excluded from jury service. *Patton v. Mississippi*, 68 S. Ct. 184; *Brunson v. North Carolina*, 68 S. Ct. 634.

War Decisions. Because of the similarity of the Selective Service Acts of 1940 and 1948, cases un-

der the former Act have continuing importance. Judicial review available to a draft registrant is extremely limited. Thus in a criminal prosecution of a conscientious objector for being absent without leave from a civilian public service camp, the defendant-registrant is entitled to have the issue of improper classification submitted to the jury only where the court determines that there was no basis in fact for the draft board's classification, and the registrant is not entitled to introduce new evidence as to his status as a minister for it is the board's record upon which the registrant's violation of orders must be based. *Cox v. U.S.*, 68 S. Ct. 115. Compare the very narrow scope of judicial review open to an enemy alien ordered deported. *Ludecke v. Watkins*, *supra*, under Civil Liberties.

To keep the costs of the last war within reasonable limits and because of the continuing cold war, the power of the Federal government to recapture excessive war profits, to mobilize industry, and to requisition property has vast significance.

The Renegotiation Act of 1942 gave certain officials power to renegotiate war contracts, and to determine "excessive profits," subject to review by the Tax Court. *Lichter v. U.S.*, 68 S. Ct. 1294, ruled the Act constitutional, and that the Tax Court had exclusive jurisdiction to review the administrative determination of "excessive profits." Mr. Justice Burton took the position that under the constitutional power "To raise and support Armies" Congress could have conscripted industry and workmen, just as it did in drafting men into the armed forces under the Selective Service Act.

Congress did not choose, however, to mobilize the productive capacity of the nation into a governmental unit on the totalitarian model. Instead, government chose to contract with industry, but due to the unprecedented demand for war materials, the speed with which contracts had to be consummated, and the inability of the contracting parties to determine fair compensation in advance, the Renegotiation Act was designed to permit a recapture of excessive war profits. This Congress might constitutionally do; and the statutory term "excessive profits," in its context, sufficiently expressed the legislative policy so that the delegation of power to administrative officials was constitutional. For comparable reasons the government could requisition meat products for war purposes at OPA prices, and the Fifth Amendment did not require the owner to be compensated on the basis of replacement costs. *U.S. v. John F. Felin & Co.*, 68 S. Ct. 1238 (construing the Emergency Price Control Act, the Second War Powers Act, and related wartime legislation). With equal fairness *Priebe & Sons v. U.S.*, 68 S. Ct. 123, ruled that a liquidated damage clause in a war contract, inserted to compel prompt compliance by the contractor, should not be enforced against a contractor who delivered when the government made demand, although not prepared to do so when the government had a contract right to demand delivery.

Under the Trading With the Enemy Act, as amended by the First War Powers Act of 1941, the Alien Property Custodian could seize shares of stock, in a domestic corporation, held by friendly aliens as pledgees of German corporations. But while the Alien Property Custodian could take this property, the Court was careful to point out the Constitution guarantees to friendly aliens the right to just compensation for property requisitioned, and that it can be assumed the United States will meet this constitutional obligation and hence friendly aliens will be compensated for any prop-

erty taken. *Silesian American Corp. v. Clark*, 68 S. Ct. 179. The same statutes were construed to give the Alien Property Custodian the right to "pierce the corporate veil," in reaching enemy interests technically held by friendly alien corporations. *Clark v. Uebersee Finanz-Korporation, A. G.*, 68 S. Ct. 174 (adopting the English rule established during World War I in the *Daimler* case, (1916) 2 App. Cas. 307).

The Congressional war power does not end with the cessation of hostilities. Nor was it ended by the Presidential proclamation terminating hostilities on Dec. 31, 1946, even though this proclamation inaugurated "peace-in-fact." The deficit in housing was in considerable measure caused by the heavy demobilization of veterans and by the reduction in residential construction during the war due to the allocation of building materials to military projects. Congress could, therefore, constitutionally enact the Housing and Rent Act of 1947. *Woods v. Cloyd W. Miller Co.*, 68 S. Ct. 421. And the remedial provisions of statutory rent control were strengthened by holding that the one-year statute of limitations for the recovery of overcharges commenced to run from date of breach of refund order, rather than from the date of each rental collection, *Woods v. Stone*, 68 S. Ct. 624; and the expiration of the Emergency Price Control Act on June 30, 1947, did not deprive the Emergency Court of Appeals of its exclusive jurisdiction to review OPA rental orders, *Woods v. Hills*, 68 S. Ct. 992.

Business, Transportation, and Labor. Probably the *Cement Institute* decision, 68 S. Ct. 793, invalidating industry's use of the basing point system in fixing prices, is the most important current victory by government in its war on monopoly and discriminatory prices. The Cement Institute, acting for the cement industry, worked out a multiple basing point system built upon the theory of the single basing point system, "Pittsburgh plus," used by steel. Under "Pittsburgh plus" sales of steel were made only at delivered prices, and the delivered price of steel from anywhere in the United States to a point of delivery anywhere in the United States was in general the Pittsburgh price plus the railroad freight rate from Pittsburgh to the point of delivery.

For example, a Chicago steel producer would sell his steel at the Pittsburgh price plus the railroad freight rate from Pittsburgh to the point of delivery, and his purchasers in Chicago were thus required to pay for Chicago produced steel the Pittsburgh base price plus what it would have cost to ship the steel by rail from Pittsburgh to Chicago had it been shipped. The theoretical cost of this fictitious shipment became known as "phantom freight."

On the other hand a Chicago producer selling steel in Pittsburgh had to "absorb" his freight costs. "Several results," stated Mr. Justice Black, "obviously flow from use of a single basing point system such as 'Pittsburgh plus' originally was. One is that the 'delivered prices' of all producers in every locality where deliveries are made are always the same regardless of the producer's different freight costs. Another is that sales made by a non-base mill for delivery at different localities result in net receipts to the seller which vary in amounts equivalent to the 'phantom freight' included in, or the 'freight absorption' taken from the 'delivered price.'"

Due to bulk and a tendency to deteriorate, cement is consumed within a relatively small distance from its point of production, and hence the princi-

ple of "Pittsburgh plus" was modified by the cement industry, which worked out a multiple basing point system with basing points scattered about the country. But the effect on the consumer within any one of the basing-point systems established by the cement industry was substantially the same as under "Pittsburgh plus."

The Court affirmed the finding of the FTC that the cement industry's use of its multiple basing point price system was an unfair method of competition under the Federal Trade Commission Act and an unlawful price discrimination under the Clayton Act; and rejected the contention that the FTC is deprived of jurisdiction to establish a violation of the FTC Act because the same conduct might also be a violation of the Sherman Act.

A second FTC victory, the *Morton Salt* case, 68 S. Ct. 822, may result also in additional widespread changes in pricing methods. The Court ruled that the Clayton Act, as amended by the Robinson-Patman Act, forbids all cost discounts which the vendor cannot justify as reflecting actual cost differences to him, even though there is no theoretical discrimination since the quantity price discount is available to all customers who buy in sufficient amount. Only the five great grocery chain stores could and did buy 50,000 cases of salt in one year, which was required to earn the cost discount involved in this case. And as a matter of procedure, exceedingly important in this type of case, the Court ruled that once the FTC establishes the existence of quantity price discounts, the burden of proof shifts to the company to show that the differential is justified by its actual costs; and the Commission need find only that there is a "possibility" (as distinguished from a "probability") that competition will be injured by the price discrimination.

Students have long recognized that patents are susceptible of use in a manner violating the Sherman Anti-Trust Act. A patent is, of course, a special kind of monopoly granted by the government to the patentee, but patentees have often attempted to go beyond their clear legal monopoly and fix prices and regiment a particular industry.

While an outright sale of a patented article put control of the purchaser's resale price beyond the patentee's power, the *General Electric* case, 272 U.S. 476 (1926), ruled that a patentee could lawfully grant a license to make and vend on condition that the licensee in its sales of the patented devices conformed to the patent-licensor's sale price schedule. Although four Justices, Black, Douglas, Murphy, and Rutledge, desired to overrule the *GE* case, a majority refused to do so but held, however, that the *GE* decision did not allow a patentee to collaborate with another patentee and by a cross-licensing system fix prices. *U.S. v. Line Material Co.*, 68 S. Ct. 550.

And a unanimous Court ruled in the *Gypsum* case, 68 S. Ct. 525, that the *GE* decision "gives no support for a patentee, acting in concert with all members of an industry, to issue substantially identical licenses to all members of the industry under the terms of which the industry is completely regimented, the production of competitive unpatented products suppressed, a class of distributors squeezed out, and prices on unpatented products stabilized." Nor could a salt producer owning patented machines for the utilization of salt products validly lease them on condition that the lessees purchase from it all the salt, which was unpatented, that would be processed in the machines. *International Salt Co. v. U.S.*, 68 S. Ct. 12.

Three cases affecting the motion picture industry should go far toward breaking up monopolistic

practices if the district courts, to which the cases were remanded, mould their decrees realistically to the facts and theory enunciated by the Supreme Court. In the *Paramount* case, 68 S. Ct. 915, the defendants fall into three groups:

(1) Paramount, Loew, RKO, Warner Bros., Twentieth Century-Fox, which produce motion pictures, and their respective subsidiaries or affiliates which distribute and exhibit films. These are the five major defendants or exhibitor-defendants.

(2) Columbia Pictures and Universal, which produce, and their subsidiaries which distribute films.

(3) United Artists, which is engaged only in the distribution of motion pictures. The first group, or the five "majors," own or control approximately 70 percent of the first-run theaters in cities of over 100,000, approximately 60 percent of the first-run theaters in cities of 25,000 to 100,000, and have interests in all theaters in about 30 smaller towns. No film is sold to an exhibitor in the distribution of motion pictures; instead, the right to exhibit under copyright is licensed.

Two price-fixing conspiracies were found to exist: a horizontal one between all the defendants within the rule of the *Gypsum* case; and a vertical one between each distributor-defendant, and its licensees. A reasonable "clearance" (the stipulated period of time in license contracts which must elapse between runs of the same feature within a particular area or in specified theaters) remains permissible.

Other practices such as pooling and division of profits, block booking (requiring exhibitors to take a group of pictures or none at all), and the granting of special privileges to reasonably large independents that were denied small competitors must stop. In determining the relief to be granted the United States, the Court held it would uproot established business relationships to order that films be sold by competitive bidding, and would give no substantial benefit to small independents, since the majors had become too strong for price competition, and the task of supervising such a decree was impracticable.

While Mr. Justice Douglas's opinion indicates that the majors should be required to divest themselves of their exhibiting outlets as the most efficient answer to the monopoly presented, the case was remanded to the trial court for findings and conclusion as to the best remedy for adoption. On the other hand *Schine Chain Theaters*, 68 S. Ct. 947, established that a divestiture decree was an appropriate means of breaking up a monopoly established by a parent company and five of its wholly owned subsidiaries, which owned or controlled a chain of approximately 148 motion picture theaters. And *U.S. v. Griffith*, 68 S. Ct. 941, held that the Sherman Act had been violated by affiliated theater owners which used their circuit buying power to obtain films under master agreements which lumped together towns in which there were competing theaters with towns in which there was no such competition, and which obtained certain exclusive privileges in both monopoly and competitive towns.

While the Sherman Act, which was passed in 1890, was phrased in terms of "commerce" and much Federal legislation enacted during the last twelve or thirteen years has been framed in terms of "affecting commerce," the Court in *Mandeville Island Farms v. American Crystal Sugar Co.*, 68 S. Ct. 996, merged the two lines of theory so that the Sherman Act covers restraints of trade both "in commerce" and "affecting commerce." Thus an

agreement of California sugar refiners, who sell in interstate commerce, to pay a uniform price for sugar beets grown in California violates the anti-trust act, although the final aim of the refiners was to control the local sugar beet market.

The government, though, was unsuccessful in its attempt to curb the expansion of U.S. Steel. In the most important anti-trust case before the Court in years, the United States had sued to enjoin U.S. Steel and its subsidiaries from purchasing Consolidated Steel Corporation, the largest independent steel fabricator on the West coast. During the last war the government developed the Geneva, Utah, steel plant at a cost approximating \$200 million.

U.S. Steel was the wartime operator of the Geneva plant, and purchased it from the Surplus Property Administrator in 1946 for the sum of \$47,500,000, after the Attorney-General had filed an opinion that such a purchase of Geneva did not violate the anti-trust laws. Having obtained Geneva, U.S. Steel then sought to purchase Consolidated for the partial use of its Geneva product.

The United States sought to establish that (1) the acquisition of Consolidated would constitute an illegal restraint of interstate commerce because manufacturers other than U.S. Steel would be excluded from supplying Consolidated's requirements of rolled steel products, and because competition now existing between Consolidated and U.S. Steel in the sale of fabricated products will be eliminated; and (2) the acquisition of Consolidated, viewed in the light of a previous series of acquisitions by U.S. Steel, constitutes an attempt to monopolize the production and sale of fabricated steel products in the Consolidated market. For the majority, Mr. Justice Reed affirmed the trial court in finding against the government. The dissent of four Justices, represented by Douglas, represents the view that bigness in itself is a phenomenon at which the Sherman Act was aimed, and that to permit further growth of U.S. Steel violates the anti-trust Act. "Approval of this acquisition . . . makes dim the prospects that the western steel industry will be free from the control of the eastern giants. . . . United States Steel has one-third of the rolled steel production of the entire country. The least I can say is that a company that has that tremendous leverage on our economy is big enough." *U.S. v. Columbia Steel Co.*, 68 S. Ct. 1107.

In the field of transportation the commodities clause of the Interstate Commerce Act prohibits a railroad from transporting any commodity, with some exceptions, which it owns or in which it has an interest, except for its own use. The *Elgin* case, 298 U.S. 492 (1936), held that this prohibition did not prevent a railroad from transporting commodities of a corporation whose stock is wholly owned by a holding company which also owns all of the stock of the railway, unless the control of the railway is so exercised as to make it the alter ego of the holding company. The Court, four Justices dissenting, refused to depart from that precedent on the ground that its overruling or modification should be left to Congress. *U.S. v. South Buffalo Railway Co.*, 68 S. Ct. 868. The Transportation Act of 1940 vests the Interstate Commerce Commission with an exclusive jurisdiction over, and establishes the standards for approval of, a railroad merger. Hence the Commission must determine whether a plan is "just and reasonable" in its treatment of stockholders; and what Michigan, the incorporating State of one of the merging railroads, might give dissenting stockholders on liqui-

dation is irrelevant, except insofar as it may be reflected in current values for which they are entitled to an equivalent. *Schwabacher v. U.S.*, 68 S. Ct. 958 (dealing with a merger of the Pere Marquette, a Michigan corporation, and the Chesapeake & Ohio, a Virginia corporation). And a railway system, consolidated with ICC approval, cannot be required by a state to establish a subsidiary as a condition to operating therein. *Seaboard Air Line Railway Co. v. Daniel*, 68 S. Ct. 426.

In the labor field, the *Bay Ridge* case, 68 S. Ct. 1186, may have consequences similar to the *Mt. Clemens* portal-to-portal pay decision, 328 U.S. 680 (1946), that necessitated the Portal-to-Portal Act of 1947 to undo its mischief. In *Bay Ridge*, certain dissident longshoremen, opposed not only by their employer but also by their union, sued for compensation alleged to be due under the Fair Labor Standards Act. The Court, five to three, held they were entitled to time and one half for overtime hours in addition to the time and one half the day rate they were given by their contract for evening, holiday, and weekend work. The majority held that the contract time and one half was not "overtime" but was a "night differential," and hence was the "regular rate" for night hours, although this fifty percent differential is two or three times larger than any "night differential" in American industry. By sustaining the employees' demand for "overtime pyramided on overtime," the longshoremen received a multimillion dollar windfall. For discussion, see Farmer, *Overtime on Overtime*, 34 Va. L. Rev. 745.

Migratory Divorces. Construction of the Constitution's Full Faith and Credit Clause puts the Supreme Court very much in the domestic relations field. The first *Williams* case, 317 U.S. 287 (1942), held that a State, Nevada, could grant a valid divorce, provided the plaintiff was domiciled therein, although (1) this State was not the matrimonial domicile and (2) the defendant spouse in North Carolina was served only constructively (by publication) and did not appear in the Nevada divorce action. Such an "ex parte" divorce was entitled to full faith and credit in a North Carolina bigamy prosecution of the divorce-plaintiff, who had remarried.

The second *Williams* case, 325 U.S. 226 (1945), ruled, however, that while the jurisdictional finding of domicile by the Nevada court granting the "ex parte" decree is entitled to prima facie weight, it is not conclusive in a sister State, and North Carolina might relitigate the jurisdictional issue and find that the plaintiff was not in fact domiciled in Nevada and hence his divorce was a nullity.

The question remained as to the validity of "quickie" divorces, granted by such States as Nevada and Florida, when the defendant spouse appeared in the divorce action—which usually, but not always, meant that both spouses desired divorce, but could not or did not want to obtain it at home. The Court has now partially answered the question. Following orthodox doctrines of res judicata established in other areas of litigation, the Court has ruled that where the defendant spouse appears in the divorce proceeding and either litigates the issue of the plaintiff's domicile, or counterclaims for a divorce, any decree of divorce entered in that proceeding is entitled to full faith and credit in any other State, at least in litigation between the spouses and those in privity with them. *Sherrer v. Sherrer*, 68 S. Ct. 1087 (involving validity of Florida divorce decree in Massachusetts), *Coe v. Coe*, 68 S. Ct. 1094 (involving validity of Nevada divorce decree in Massachusetts).

Thus "quickie" Nevada and Florida divorces, granted in proceedings in "contested" cases are valid as between the spouses. Conceivably a State in which the spouses had been domiciled prior to one of them removing to Florida or Nevada may, in a criminal prosecution for bigamy or some related crime, still attack the jurisdictional findings of the Florida or Nevada divorce decree rendered in a "contested" case. If a State, such as North Carolina is not in privity with the parties, the "quickie" divorce decree will be valid for most but not all purposes. This possibility receives some support from doctrine currently announced that a divorce decree is divisible. Thus where a wife was granted a separation decree and awarded alimony by a New York court while the spouses were domiciled in New York, and thereafter the husband removed to and became domiciled in Nevada and subsequently obtained a default decree of divorce based on constructive service, the divorce decree terminates the marriage relation, but does not terminate the duty under the New York decree to pay alimony, provided a support order can survive divorce in New York. *Estin v. Estin*, 68 S. Ct. 1213 (New York law held that a support order can survive divorce, and hence Nevada court not having in *personam* jurisdiction over the wife could not terminate her property interests in the New York judgment), *Kreiger v. Kreiger*, 68 S. Ct. 1221 (similar).

Jurisprudence, Federal Practice and Law Reform. While the Court's totality of judicial work declined slightly during the last Term, division in the Court remains high and sharp. At the last (1947-1948) Term the Court handed down 119 majority opinions disposing of 155 cases compared to 143 opinions disposing of 190 cases at the preceding (1946-47) Term. Of the 119 opinions, 66 percent involved dissenting votes, about a 4 percent increase in dissents. Twenty-four, or 20 percent, of the cases were decided by the narrow margin of five to four, and this is also a slight percentage increase.

Chief Justice Vinson and Justice Reed, being the most infrequent dissenters, represent the core of the Court; all the remaining Justices were in dissent far more frequently, with Justice Douglas the top dissenter. To the extent that a general characterization can be given to a bloc, Justices Burton, Frankfurter, and Jackson comprise the right, and Justices Black, Douglas, Murphy, and Rutledge the left wing. 16 L.W. 3383; Frank, *The United States Supreme Court*, 16 U. Chi. L. Rev. 1, 45. For related discussion, see Braden, *Search for Objectivity in Constitutional Law*, 57 Yale L. J. 571; Bernhardt, *Supreme Court Reversals on Constitutional Issues*, 34 Corn. L. Q. 55.

Professor Frank in his excellent article, *supra*, characterizes the Court's recently concluded Term in this manner:

"Like America, the Supreme Court did not go anywhere very definitely in 1947-48." Congress, on the other hand, definitely did go forward, by revising, modifying, and enacting as positive law Titles 18 and 28 of the United States Code, which were approved by the President on June 25, and became effective Sept. 1, 1948. Title 18 deals with Crimes and Criminal Procedure, Title 28 with the Judiciary and Judicial Procedure.

Both Titles are supplemented by Federal procedural rules promulgated by the Supreme Court under its statutory rule-making power—the Criminal Rules, Civil Rules, Copyright, and Admiralty Rules, and General Orders in Bankruptcy. 2 *Moore's Federal Practice* (2nd ed.) ¶1.03. The revision of Titles 18 and 28 eliminated obsolete statutory ma-

terials; consolidated, compressed, and clarified the older statutory language, and particularly in regard to Title 28 made important changes in civil practice and procedure, without altering the basic structure of the Federal judicial system or its jurisdictional basis. See Maris, *New Federal Judicial Code: Enactment by 80th Congress a Notable Gain*, 34 A.B.A.J. 863; Galston, *An Introduction to the New Federal Judicial Code*, 8 F.R.D. 201; Moore, *Statement Before House Judiciary Committee*, 1948 Code Cong. Serv. 1965. Improvement and clarification in a work of this magnitude can undoubtedly be made, and the Chief Justice has re-constituted his judicial committee, Judges Maris, Galston, and Smith to study the matter. To make the necessary correlating changes to revised Titles 18 and 28, the Court amended the Federal Criminal Rules and the Federal Civil Rules on Dec. 27 and 29, 1948. It did not, however, promulgate the Advisory Committee's proposed Federal rule to govern the condemnation of property under the power of eminent domain, but re-referred the matter to the Committee for more study, particularly as to the method of trial. If and when the Court promulgates the rule, this specialized type of civil litigation will receive simple treatment within the general framework of the Federal Civil Rules.

—JAMES WM. MOORE

LEAD. Consumption of lead by domestic industry was very high last year, which caused further increases in the all-time-high price of 15 cents per lb. for common lead at New York at the first of the year to 21.50 cents at year end. Domestic consumption of primary lead was approximately 700,000 net tons (1947: 744,000 tons). Consumption of primary, antimonial, and secondary lead was about 1,025,000 tons (1947: 1,150,000 tons). The heavy domestic consumption, despite strikes here and abroad, was at the expense of foreign consumption that has remained low since the war.

Domestic mine production continued at a high level under the impetus of high prices, about 378,000 tons (1947: 384,216 tons), despite a loss of 25,000 tons due to a strike at southeastern Missouri properties of St. Joseph Lead Co. Missouri continued, nevertheless, as the leading producing State.

Recovery of secondary lead from scrap was high, 325,000 tons in the first eight months (year 1947: 504,000 tons). Scrap was very scarce and competition for it was so keen that the price approached that of primary metal. Consumers were buying secondary lead and imports at gray market prices as high as 24 cents per lb.

Imports of lead and concentrates were very large, stimulated by the high domestic and premium prices. By the end of November, imports were 294,545 tons (year 1947: 227,787 tons). Refined lead constituted 70 percent of the tonnage, largely from Mexico and Canada, with smaller tonnages from Australia, Peru and Italy. Ore and matte represented 17 percent of the imported tonnage, principally from Bolivia and South Africa. The tariff was suspended for a year beginning July 1.

World mine production of lead should reach 1,380,000 tons, it is estimated (1947, revised: 1,276,000 tons). On a refinery basis, primary lead production by principal producing nations to the end of November was as follows: Australia, 190,500 tons; Mexico, 184,211 tons; Canada, 143,467 tons. Production by Mexico and Canada was significantly lower than in 1947, but Australia showed only a small decline. However most of the smaller producing nations were able to step up their production significantly in 1948.

Shortages of lead in the domestic market during the year were aggravated by strategic stockpiling at the rate of about 16,000 tons a quarter.

—JOHN ANTHONY

LEBANON. An Arab republic on the eastern Mediterranean. Area: 3,881 square miles including the Lebanon and anti-Lebanon mountain ranges, not more than 1,000 square miles cultivated, and 500 more cultivable. Population: over 1,187,000 with a high population density. Chief cities: Beirut (capital and principal port) over 350,000 inhabitants; Tripoli (port) 72,000. More than half the population are Christians, divided into several sects with Maronites predominating. Except for a few Jews the rest are Moslems; the Sunnis being the largest group and the Shias next.

Education. In 1946-47 there were 623 primary and secondary public schools with 52,400 pupils and 326 private schools with some 43,000 pupils. Outstanding among the latter (which include many foreign schools) are the non-sectarian American University of Beirut and the Université Saint Joseph (French Jesuit) also in Beirut. In addition to several institutes for training teachers—commerce, domestic science and other vocational courses—the Ministry of Public Instruction supervises the Lebanese Academy of Fine Arts. Literacy is higher in Lebanon than in any other Arab country.

Production. Almost all the cultivated land depends on rainfall, with olives, citrus and other fruit, vegetables, cereals, and dry legumes important. The estimated 70,000 tons of wheat produced in 1948 was much higher than 1947's 50,000 tons, but there is still a deficit to be made up in part by imports from Syria. Citrus and banana crops, both exported, have increased thanks to improved cultivation methods. The prospects of exporting more olive oil are better because of improved refining. Silk-making has been important but its future is made uncertain by the competition of rayon and nylon. (See SYRIA for Foreign Trade.)

Transportation. There are about 250 miles of railway, of which the war-built link connecting Haifa and Tripoli (and thereby Africa and Europe) is the newest. The good network of asphalted roads connects Beirut with Damascus and all important Lebanese towns. British, Egyptian, and Iraqi airlines use Beirut's airport. There are radio, telephone, and telegraph facilities.

Finance. Lebanon forms a customs and economic union with Syria. Budget estimates for 1947 were balanced at £Leb58.9 million. (Official rate of exchange since 1946: £Leb2.205 equals U.S.\$.)

Government. The republic, whose independence from the French mandate was proclaimed in 1941 and asserted in 1946, is headed by a President (Bechara el-Khoury, elected in 1943) elected for six years by the Chamber of Deputies. He is assisted by Ministers, appointed by him, who are responsible to the Chamber. The Deputies are elected by popular ballot for four years with every citizen over 21 eligible to vote.

Events, 1948. An application was made for a loan from the International Bank for Reconstruction and Development to intensify and improve agricultural production and to complete irrigation projects started during the war. In February, Lebanon's Ambassador to the United States, Charles Malik, was elected President of the United Nations' Economic and Social Council for 1948.

Relations with France. On February 6, Lebanon signed an agreement with France under which France guaranteed Lebanon's currency against devaluation for ten years, the French government's

property claims were liquidated, and the French debt to Lebanon modified. In October, following the recommendations of Belgian and Egyptian experts, the Chamber ratified the agreement. But in loosening, rather than cutting off, financial ties with France, Lebanon complicated its economic relations with Syria.

UNESCO Conference. On November 17, the third general conference of the United Nations Educational and Scientific and Cultural Organization opened in Beirut. Its deliberations were marked by two incidents reflecting the area's tension: Mustafa el-Aris, accredited observer for the World Federation of Trade Unions and alleged leader of the banned Lebanese Communist Party, was arrested while attending the conference. The Israeli application, solicited by UNESCO's organization board in an unofficial capacity, was withdrawn because the Lebanese government was "unwilling to grant the necessary facilities." The conference was climaxed by UNESCO's vote of three "Lebanon Conference Fellowships" to allow Lebanese to spend six months studying abroad as a mark of the conference's gratitude for Lebanese hospitality.

Palestine Problem. Immediately following the United Nations' Palestine partition vote demonstrations started. Government funds were allocated to help Palestinian Arabs. In January the government forbade unauthorized movement by Jews and expelled all Palestinian Jews. By May a state of emergency had been declared. The June report that the government had authorized the seizure of all Israel-bound ships touching at Beirut was followed by the six-week detention of American citizens from the American Export liner *Marine Carp*. The first American protest was rejected on the basis that the action had been taken for the "safety of the Lebanese Army of Occupation in Palestine and for the order and security in Palestine territories occupied." Following its second note the United States agreed to the Lebanese demand that those held return to the United States. (See ARAB LEAGUE AFFAIRS; PALESTINE.)

—DOROTHEA SEELYE FRANCK

LEEWARD ISLANDS, British. A group of islands in the British West Indies comprising the four presidencies: Antigua (with Barbuda and Redonda), St. Christopher and Nevis (with Anguilla and Sombrero), Montserrat, and the Virgin Islands. Area: 422½ square miles. Population (1946 census): 108,847. Agriculture is the principal occupation of the people. Chief products: sugar and molasses (Antigua and St. Christopher), cotton (Montserrat, St. Christopher, Nevis, and Virgin Islands), limes, fruits, and vegetables (Montserrat), coconuts (Nevis), and salt (Anguilla and St. Christopher). Foreign trade (1946): imports £1,500,000; exports £1,100,000. Finance (1946): revenue £700,000; expenditure £620,000. A governor administers the colony, which is divided into four presidencies. An Executive Council and a General Legislative Council assist the governor. The seat of government is at Antigua. Governor: Earl Baldwin of Bewdley (appointed Feb. 9, 1948).

LIBERAL PARTY. The Liberal Party of New York State was formed May 19, 1944. Chairman, Adolf A. Berle, Jr.; Vice Chairmen, David Dubinsky, Dr. John L. Childs, Dr. George S. Counts, Dr. Reinhold Niebuhr, Alex Rose; Secretary, Joseph V. O'Leary; Treasurer, Harry Uviller; Executive Director, Ben Davidson; Upstate Director, James Donnelly.

The Party has 80 Assembly District Clubs in

New York City, county organizations in the various counties of the State, a Trade Union Council comprising AFL and CIO unions with a combined membership of over 500,000, a Women's Division, a Veteran's Division, and a Youth Division. Committees of the Party are active in national, State, and local affairs. In the 1948 national elections the Liberal Party endorsed President Truman for reelection, and Senator Alben W. Barkley for Vice President.

LIBERIA. A Negro republic on the west coast of Africa between Sierra Leone and the Ivory Coast. Capital, Monrovia (population, 10,000).

Area and Population. Total area: 43,000 square miles. No proper census has ever been taken, and the population is estimated at anywhere from one to two million. Only about 60,000 of the coast Negroes are considered civilized by European standards. Among them are some 15,000 Americo-Liberians—the descendants of freed slaves from the United States—who form the governing and intellectual class. The natives are divided among six principal stocks and various smaller tribes. The Mandingoes are Moslems and most of the rest are pagans, though various Christian missions are operating in the country. English is the language of government and commerce.

Education. In 1946 there were 206 schools (81 run by the Government) and 16,000 students. The great mass of the Liberian people is illiterate and wholly innocent of any formal education.

Production and Trade. Most of the inhabitants, living in a tribal state, participate little or not at all in the world's money economy. Such resources as the country possesses are largely undeveloped. Almost the only export is raw rubber, produced on the Firestone plantations and shipped out through the port of Marshall, east of Monrovia. In 1946 exports were valued at \$12,312,982 and imports (largely manufactured goods) at \$4,731,715.

Communications. There are no railways and very few roads, though the latter are being extended here and there, and no interior telegraph or telephone communications. There are several ports, but only one (at Monrovia) with facilities for servicing vessels at docks; all operations in the other ports being carried on by lighter.

Finance. In 1946 the government's revenue amounted to \$2,337,401 and its expenditure to \$2,307,114. Customs account for nearly half of the income; while debt charges, interest and amortization absorb over one-fifth of the outgo. Under the terms of the Loan Agreement with the United States, Liberian finances are supervised by American experts. A first charge on all revenues is the service on the American loan. The external bonded debt as of Jan. 1, 1946, was \$708,000.

Government. The frame of government is modeled after that of the United States. There is a President and his Cabinet, a Senate (10 members) and a House of Representatives (21 members). The President, elected in 1943 for the term 1944-52, is William V. S. Tubman of the True Whig Party. This party is controlled by a small oligarchy of Americo-Liberian families dwelling in the few coastal cities, for the franchise is restricted to Negro landowners. This party has pretty well monopolized political power in the Republic for the last three generations. The real natives of the country have participated very little in the national administration.

Events, 1948. More and more the Negro Republic came under the political and economic tutelage of the United States. The ambitious Stettinius plan

(described in the *YEAR BOOK, Events of 1947*) got under way during the year under review. The operating organ of the scheme was the Liberia Company, for which over two dozen affiliates and subsidiaries were eventually planned. During 1948 it became involved in such enterprises as the public utility business, banking, cocoa-growing, and social welfare programs. The Liberia Foundation, which had charge of the last-mentioned activity, was placed under the direction of Mr. Edwin R. Embree, who had until recently been head of the now defunct Rosenwald Fund, devoted to the advancement of American Negroes. Public health as well as education and welfare were included in the Foundation's sphere of activity.

Before the country could be developed it would require the construction of a modern transportation and communications system, then almost wholly lacking. There was, for example, no railroad. This shortcoming the Liberia Company proposed to remedy by surveying a route for a line from Monrovia inland some 200 miles to the border of French Guinea via the Bomi Hills district, where it would tap the recently explored iron-ore deposits. Such a line would also open up large and fertile areas to agricultural exploitation.

In August it was revealed by the Liberia Company that it had chosen as president of its affiliate, the Liberia Products Company, Major General William W. Richards of the Royal Ordnance Corps. This concern was to operate in such fields as textile production, logging, palm-oil processing, and fishing. During the summer another affiliate, the Liberian International Airways, Inc., began service between New York, Dakar, Monrovia, and Leopoldville.

The deep-water harbor under construction near Monrovia for several years was formally opened on July 26, the 101st anniversary of Liberian independence. Covering some 750 acres and accommodating 8 or 9 vessels, it had been built with American funds made available by lend-lease agreement of 1943. The port's operation was to be in the joint hands of seven American shipping and trading concerns.

During the spring Mr. Stettinius paid a brief visit to Liberia to inspect progress and consult with company and government officials.

—ROBERT GALE WOOLBERT

LIBRARY OF CONGRESS. This library while serving as the principal research source to the Congress of the United States and its Committees, furthering governmental studies and cooperating in international projects and conferences, continued to perform the duties of the world's largest reference library. Congressional, in name and primary function, it is, inescapably, a national library by legislative origin, public maintenance, Federal status, and the constant importunity of layman and scholar. Comprehensive collections—unique in many fields—increasing through gift, domestic and foreign exchange, copyright deposit, purchase and transfer, in excess of cataloging capacity, imposed, in partial solution of the problem, priorities for the treatment of new material.

Among additions, notable for scope and diversity were: manuscripts of major works of Bach, Haydn, Mozart, Beethoven, Brahms, and Reger; the papers of Josephus Daniels, the Russian Library of the American Legation at Riga stored in Stockholm since confiscation in 1940; Confederate war maps, including 275 holographs, prepared by Major Jedediah Hotchkiss, many annotated by Generals Lee and Jackson; Friendship Train testimonials to

Drew Pearson from the French and Italian governments.

Also a rare Chinese Buddhist book printed in Hangchow in 1160 A.D.; Armenian publications presented by the Committee for the Armenian Collections of the Library of Congress; a contemporary engrossed and signed copy of the Thirteenth Amendment; French clandestine war-time publications covering the period from mid-1940 to the liberation of Paris in August, 1944; and selected films declared surplus to the needs of the Department of the Air Force but considered eminently important for current use and permanent retention.

The Lacock Abbey confirmation of Magna Carta (1225) was, by a special courier, returned to the British Museum in accordance with the act of Parliament which had authorized its loan for two years. A colotype facsimile, perfectly executed to the minutest detail, a gift from the British Museum was placed on display. The tour of the Freedom Train made it possible for millions to see 28 basic documents in American history lent from the Library's collections, including Jefferson's "Rough Draft" of the Declaration of Independence (1776), the first volume of the manuscript Journal of the Constitutional Convention (1787), and a draft by George Mason of a Declaration of Rights which became the basis of the Bill of Rights.

Though curtailed hours of reader service continued, in April the exhibit halls were opened on all evenings that visitors might inspect the frequently changing displays as well as the permanently enshrined originals of the Declaration of Independence, the Constitution, and other documentary heritages. An exhibit of material on UNESCO's purposes and progress demonstrated, as well, the Library's interest through the years in promoting the international interchange of knowledge. There were three State exhibits in continuation of the series begun several years ago: the 215th anniversary of the founding of Savannah and the Colony of Georgia was commemorated, Wisconsin's 100th anniversary of statehood was observed, and the establishment of the Territory of Oregon was appropriately marked.

The original Czechoslovak Declaration of Independence, and the original signed copy of the "Declaration of Common Aims of the Independent Mid-European Nations" sent to Woodrow Wilson by Thomas G. Masaryk were distinguished pieces in "Thirty Years of the Czechoslovak Republic—An Exhibition in Honor of Its Founders." The Voice of America beamed a description to Europe with clear reception reported.

Ultrafax, a new high-speed communication system combining modern principles of television and photography, was demonstrated by R.C.A. before a distinguished audience of government officials, scientists, engineers, librarians, service personnel, and leaders in communications in the Library's Coolidge Auditorium. Among the lectures delivered were "Aviation History, 1903-1960" by John K. Northrop; T. S. Eliot, winner of the 1948 Nobel Prize in Literature spoke on "Edgar Poe and his Influence in France"; Dr. Amiya Chakravarty presented the music and dances of India with motion picture illustration; and Robert Frost read selections from his poetry. FM broadcasting of concerts of chamber music was begun, thus increasing the potential audience from five hundred to several million.

Publications ranged from established serials—*The United States Quarterly Book List*, *The Handbook of Latin American Studies*, and *The Quarterly Journal of Current Acquisitions*—to such special

studies as the Legislative Reference Service report on *Limitation of Debate in the United States Senate*. Other publications included *An Album of American Battle Art, 1755-1918*, *A Guide to the Art of Latin America, National Censuses and Vital Statistics in Europe, 1918-1939*, with a supplement for 1939-48, and a new serial, *Monthly List of Russian Accessions*, containing entries for publications in the Russian language currently received by the Library of Congress and a number of cooperating libraries.

Fifty new records of folk songs from the Archive of American Folk Song were issued and the Bollingen Foundation through a special grant made possible a series of recordings of poems read by their authors. The Bollingen Prize in Poetry was established as an annual award for the best book of verse published by an American author during the preceding calendar year. The Fellows in American Letters of the Library of Congress will serve as the Jury of Selection. With the support of the Rockefeller Foundation and under the general editorship of Ralph Henry Gabriel, the Library undertook the sponsorship of a series of extended essays dealing with the various aspects of American civilization in the 20th century.

The striving for international peace through understanding placed privileged responsibilities upon the Library. Luther H. Evans, Librarian of Congress, a member of the U.S. National Commission for UNESCO, assisted the U.S. Delegation at the Second General Conference held at Mexico City in the organization and development of its program. In November he journeyed to Beirut as a delegate to the Third General Conference. The Chief Assistant Librarian, Verner W. Clapp, served on the U.S. Library Mission to advise on the establishment of the National Diet Library of Japan. In August, the Library of Congress undertook, on a contractual basis, the compilation of bibliographies for the Division of Library Services of the United Nations.

Statistics of the Library of Congress, as of July 1, 1948, are presented in the accompanying table.

<i>Contents reckoned at nearly</i>	27,000,000
<i>Pieces included:</i>	
Printed books and pamphlets	8,387,385
Manuscript pieces	8,896,597
Maps and views	1,868,911
Music—volumes and pieces	1,788,449
Phonograph recordings	287,414
Photographic negatives, prints and slides	1,708,247
Prints and broadsides	578,765
Posters, photostats, and miscellany	624,163
Unbound serials parts and newspaper issues	2,392,055

Legislative Reference Service:

Requests from Members and Committees of Congress for reference or research	21,420
Reports prepared in typed form (plus 63 published)	1,900

General reference and circulation services:

Pieces supplied for use	2,081,483
Readers served (452,613 individually)	878,622
Telephone requests for reference and loan service	171,373
Bibliographies prepared (28,266 entries)	654
Letters in response to reference requests	29,660
National Union Catalog entries reached more than	14,000,000
(recording the principal holdings of more than 800 libraries)	

Administrative changes included the establishment of the European Affairs Division and the Air Research Unit. Robert Lowell was succeeded by Léonie Adams as Consultant in Poetry in English for the year 1948-49.

The Legislative Reference Service responded to the largest number of inquiries in the 33 years of its history. Many reports were prepared by senior specialists assigned to broad subjects.

Through the sale of more than 20 million printed catalog cards and *The Cumulative Catalog of the Library of Congress* a million dollars and a million work hours were saved in many institutions.

—LUTHER H. EVANS

LIBRARY PROGRESS. The aim of public library service in America now, as always, has been to serve all of the people of the country regardless of economic status, race, or residence. The ultimate goal of librarianship is to serve all of the people everywhere. Thirty-five million people (mostly rural) still have no public libraries whatever, while approximately 50 million are served by libraries which are inadequate by any reasonable standards to provide a first-class service of information and education.

Acknowledging this lack of libraries and the great variety of complex problems facing the United States today, E. W. McDiarmid, President of the American Library Association, stated in his inaugural address at the Atlantic City conference in June, that "our society requires for every responsible citizen a fundamental education from the first grade through high school, followed by a system of higher education for those competent to profit from it, and an intensive program of adult education for everyone. Our people must not only have a basic general education, covering the fundamentals of history, sociology, politics, science, and literature, but they must in addition have a continuing program of education in the background, history, fundamental issues, and current aspects of the great problems that face us."

Realizing this, libraries throughout the United States adopted the "Great Issues" program (see the A.L.A. *Booklist*, Aug. 15, 1948, supplement) and offered their resources for a better-informed American, especially in regard to the following crucial problems: Inflation-Deflation, How Much World Government?, Management-Labor Relations, American-Russian Relations, and Civil Rights. Similarly, librarians have been greatly concerned about the preservation of intellectual freedom, and as a result adopted the revised "Library Bill of Rights," which reaffirms its belief in the basic policies which should govern the services of all libraries.

Library Planning and Surveys. Concentrated efforts were made to translate the various national plans of library groups into action and the latest of the Planning for Libraries Series was completed. This was *The Public Library Plans for the Teen Age*, which blueprints possibilities for specialized public library service to young people, and shows how the public library enriches and reinforces school library service.

The half-way mark was reached in the two-year Public Library Inquiry being conducted by the Social Science Research Council under the direction of Robert D. Leigh. Initiated by the A.L.A., this appraisal of the American public library as a social institution was made possible by a Carnegie Corporation grant. An over-all group of 60 libraries or library systems in cities, towns, and counties of the United States was included in the survey, the results of which are scheduled for 1949 publication by the Columbia University Press. The 15 projects of the Inquiry were divided as follows: a. (basic aspects of the library) personnel, government, processes, use, and finance; b. (producers of library materials and services) book and magazine publishing, industries, government publications, non-theatrical films, music and other records and library music materials, special libraries and technical services; and c. (subsidiary factors) foreign and

international library developments, the evolution of the public library in the United States, the library in relation to the institutions, process and possibilities of adult education, the relation of the public library to the research-library network, and the relation of the public library to the school system.

A survey of salaries and working conditions of library personnel was begun in November by the U.S. Bureau of Labor Statistics in cooperation with the A.L.A. Board on Personnel Administration. Full time professional and non-professional positions in libraries of all types and sizes were covered. Libraries, library services, and personnel were studied in nine southern states by the Tennessee Valley Library Council. These included Alabama, Florida, Georgia, Kentucky, Mississippi, North and South Carolina, Tennessee, and Virginia. Other surveys were conducted at the Universities of Stanford and Minnesota, the public libraries at Wichita and Los Angeles, and the New Mexico State Library.

State and Federal Relations. Laws covering a variety of library legislation were passed. Colorado, Indiana, and Ohio adopted general recodification of their library laws with far-reaching changes. Elsewhere new library laws or amendments to old laws provided for administrative changes, higher library tax ceilings, certification of librarians, the development of county and regional libraries, and increased state aid.

Several states passed enabling laws to permit the use of federal funds and early in 1948 the Federal Library Demonstration Bill passed the U.S. Senate, but not the House of Representatives. It will be reintroduced in the 1949 Congress. The purposes of the bill are: (a) to provide demonstrations of adequate public library service to people now without it or inadequately served, and (b) to provide means for studying various methods of providing public library service primarily in rural areas and for studying the effect of planning on an area basis upon the development of library services. Provisions of the bill are: (a) State library agencies may submit plans for use of federal funds in demonstrating public library service primarily in rural areas, and (b) two types of plans may be submitted; one calling for a basic demonstration using \$25,000 per year for five years in each state, financed entirely by federal funds, or an expanded plan may be added to this which would allow states to match an additional \$25,000 to \$75,000 of federal funds annually for five years. (c) The Commissioner of Education would be required to make annual reports to the Congress upon the operation of the demonstrations and would be required to make a final public report evaluating the demonstrations.

International Relations. A continued interest in this field was manifested by librarians, both in the United States and abroad. Librarians from about 30 countries visited the United States and 67 foreign students attended American library schools during 1947-48. A number of American librarians attended conferences in Europe and Latin America, or went on special missions to Europe and to the Orient. The International Federation of Library Associations convened in England in September and the 1950 meeting will probably be held in the United States in connection with the A.L.A. conference in Washington, D.C., honoring the 150th anniversary of the Library of Congress and the 75th year of the A.L.A.

At the annual conference of the Canadian Library Association, held June 7-9, at Ottawa and at

tended by 517 delegates, Elizabeth Dafoe, University of Manitoba Library, was elected president. The 1949 conference is scheduled for June 20-24 at Winnipeg. William Kaye Lamb, former librarian of the University of British Columbia, was appointed Dominion Archivist with the special task of planning toward the establishment of a Canadian National Library. Indian libraries are also proposing the establishment of a National Central Library at New Delhi, and discussed this at the 8th All-India Library Conference in October in Nagpur. The Japanese Diet (Congress) Library was established June 5 in Tokyo.

Professional Training and Personnel. Enrollments in the 34 accredited library schools in the United States and two in Canada were 1,889 students in 1948, compared with 1,939 students for 1947. With few exceptions, library schools were engaged in the revision of their programs. The prevalent shortage of librarians was not the primary reason for devising new plans of education but it undoubtedly heightened a profession-wide interest in all aspects of library education. Several conferences on education for librarianship and recruiting for the profession were held and a Joint Committee on Library Work as a Career was formed. While salaries in libraries increased during the year they did not equal the increase in cost of living with the result that *Minimum Library Salary Standards for 1948* were adopted. Due to budgetary measures the Placement Office at A.L.A. headquarters was discontinued September 1 and the A.L.A. Employment Register instituted.

Library Statistics, Books and Reading. The *American Library Directory* for 1948 lists 11,384 libraries in the United States, classified as follows: 7,172 public, 1,547 college and junior college, 253 law, 164 medical, 112 institutional, 202 hospital, 193 federal, 173 state, and 518 special. Not included are the libraries in elementary and secondary schools, hospital collections furnished by public libraries, and special industrial libraries. There are 81 libraries of all types in the United States territories and dependencies, and 945 in Canada and Newfoundland. Library schools in the United States and Canada number 41 and there are 204 library organizations.

According to 1947 statistics compiled by the U.S. Office of Education, public libraries in United States cities with a population of 100,000 or more, contained 44,470,573 volumes, had 8,662,725 registered borrowers, circulated 133,241,491 books, and expended \$39,797,351, excluding capital outlay. This is a slight increase over corresponding figures for both 1946 and 1945. Statistics covering 1946-47 college and university libraries, including student enrollment, staff, book stock, circulation, and expenditures were published in the July 1948 issue of *College and Research Libraries*.

"Reading Trends in 1947" and "The Fifty Notable Books of 1947," chosen by librarians, were published in the A.L.A. *Bulletin* for February 1948. The Great Books educational programs, established several years ago, have spread to the extent that these weekly gatherings are attended by over 50,000 people in some 200 cities and towns throughout the country. The Great Books Foundation was formed to coordinate and centralize all activities connected with the selected group of works. The Great Books are defined by the Foundation as those "which provide new and profound insights into the fundamental problems of mankind." For articles covering such book programs see *Library Quarterly* for January 1948, *Wilson Library Bulletin*, December 1947, etc.

School Libraries. Workshops, institutes, and meetings in many parts of the country emphasized library services to children and young people, with several covering elementary school libraries. The publication of *The Public Library Plans for the Teen Age* was noteworthy, as was a companion publication, *A Youth Library in Every Community*.

As a result of state aid, school library programs in several states made considerable progress. Georgia increased its 1947-48 budget of \$150,000 to \$300,000 for next year. New Jersey received \$10,000 for school library books for 1947-48. North Carolina budgeted \$172,326 in 1947-48 and \$196,855 for 1948-49. Virginia provided \$279,165 for 1947-48, of which \$47,253 was for state and film libraries. Wisconsin appropriated \$142,855 and in Indiana, schools which meet certain requirements may obtain up to 75 cents per student for library books.

College and University Libraries. Cooperative enterprises are being developed in various parts of the country; the latest being by Midwest universities with plans for a cooperative storage building, probably at the University of Chicago. Regional library centers are already established at Denver, Philadelphia, the Pacific Northwest (Seattle), Cleveland and the Joint University Libraries (Nashville) as well as the Library of Congress Union Catalog. Policies in cooperative acquisitions are being followed by the John Crerar Library, Chicago, and the Library Council of the state-wide system of the University of California Libraries.

During the year the first books arrived from France, Switzerland, and Sweden under the Farmington Plan, which provides for the acquisition of current foreign publications of research interest. In 1949 it will be extended to cover Norway, Denmark, Belgium, The Netherlands, and Mexico.

Increasing in numbers are the college and university libraries arranging their collections along divisional lines, of which the University of Nebraska is one. In order to give librarians of the country an opportunity to see a divisional library in operation, this university held an institute, at which time building features and divisional operating problems were discussed.

Gifts, Grants, and Buildings. Gifts of book collections and money for the purchase of books or construction of buildings have materially aided libraries and their services throughout the year. Among the gifts were: a collection of manuscripts and books from Ferenc Molnar, Hungarian playwright, to the New York Public Library; 2,000 volumes and manuscripts of the late Rabbi Chaim F. Epstein, St. Louis, to Yeshiva University, New York; two valuable railroad collections from Frank F. Fowle and Stanley Berge to Northwestern University Library; 1,500 volumes on the theater from Herbert Arnold Speiser, to the University of Pennsylvania Library; \$10,000 from the Wherett Memorial Fund of the Pittsburgh Foundation for science and engineering library material to the Carnegie Institute of Technology; 30,000 documents from Frederick Law Olmsted, landscape architect and city planner, and a remarkable collection of musical manuscripts from Mrs. Gertrude Clark Whittall to the Library of Congress.

A Mohandas K. Gandhi memorial collection came from the Hindustan Association to Cornell University Library; 180 Danish plays and books from Jean Hersholt to the University of California Library, Los Angeles; a \$10,000 art collection from the Reverend Eugene F. Bigler to Kenyon College Library, Gambier, Ohio; manuscripts and letters from the wife of the late Sherwood Anderson to the Newberry Library, Chicago; funds to establish

dormitory libraries from John B. Griffing to Drake University Library, Des Moines, Iowa; a grant from the Central Education Board for social-science collections to the West Virginia Wesleyan College, Buckhannon; the entire Thurlow Weed collection relating to 19th century American political life to the University of Rochester, N.Y.

Also a valuable collection on the history of women from Margaret Sanger to Smith College Library; and the William M. Elkins Library, "the finest collection of Americana in private hands in the world" to the Free Library of Philadelphia. Among the war memorials was the \$100,000 branch-library building (with \$25,000 for renovation) presented to New Orleans by Mr. and Mrs. Harry H. Latter in honor of their son, Milton H. Latter, killed at Okinawa.

Contrasted to the inactivity of the war years, building construction gained a new impetus during the past year. Numerous university and public libraries have long-term plans for new buildings or additions. Among those completed or under construction are; University of California, Princeton University, Colby College, University of Maine, Dana College, Spartanburg Junior College, Virginia Union University, University of Iowa, Harvard University, Massachusetts Institute of Technology, Kansas Wesleyan University, Gustavus Adolphus College, Washington State College, and the public libraries at Topeka, Kan.; Deland, Fla.; Racine, Wis.; Phoenix, Ariz.; Athens, Ga.; Oak Ridge, Tenn.; and Forest Park, Ill.

Publications. During the past year, in addition to the regular periodicals, *A.L.A. Bulletin*, *Booklist*, *Subscription Books Bulletin*, *College and Research Libraries*, and *Hospital Book Guide*, the A.L.A. Publishing Department issued 14 new books and pamphlets and 21 reprints from a total of over 200 projects considered. The films, *New Chapters* and *Use Your Library*, and a set of five children's story records are also sold by A.L.A.

See also *Library Association, American* under SOCIETIES AND ASSOCIATIONS.

—MILDRED OTHMER PETERSON

LIBYA. A territory of northern Africa. Area: 679,358 square miles. Population (Dec. 31, 1938): 888,401. Of these 763,179 were Moslems, 80,046 Jews, 89,098 Italians, and 6,078 other Europeans (including many Maltese). Chief cities: Tripoli, capital (pop., 108,240), Bengasi (64,641), Misurata (45,097), and Homs (34,940). Ghadames, Sinauen, Mizda, Murzûk, and Chat are caravan halting places in the interior.

Production and Trade. There are in Libya 3 zones from the coast inland: the Mediterranean, the only one properly suitable for agriculture; the sub-desert, which produces the alfa plant, and the desert, which contains some fertile oases. The chief products are olive oil, dates, fruits, salt, sponges, fish, and tobacco. Other products include matting, carpets, and leather articles. In 1947 the value of imports from Libya to Great Britain was £247,570; exports to Libya from Great Britain £434,448.

Government. Formerly a colony of Italy, but lost by her in the terms of the peace treaty that came into effect on Sept. 15, 1947, in which she renounced sovereignty over all her African possessions. Under Italian rule it had been divided into four coastal provinces—Derna, Bengasi, Misurata, and Tripoli—and a military territory of the south. Since January, 1943, it has been under two British Military Administrations (one at Tripoli and the other at Bengazi), except for the Fezzan region in the south, which is under French occupation.

Events, 1948. The four-power commission investigating conditions and opinion in the former colonies of Italy arrived at Tripoli in March. It heard from the National Council for the Liberation of Libya, a coalition of all five of the parties in the territory (headed by Beshir el Sadawi Bey), that the people wanted not only independence but unity. The Council also asserted that its views represented those of an important segment of Italian and Jewish opinion within the colony. Though the Arab League had been active in organizing local opinion, the Council opposed a United Nations trusteeship, even one administered by the Arab states. The report of the commission, made public late in July, reflected these statements. At the same time, the British were known to have their eye on naval and air bases in Cyrenaica, while the French were anything but anxious to give up their hold on the Fezzan.

A month before the commission reached Tripoli an incident had been created in that city by the Arab Nationalist, or Kutla, Party, the most exalted of the independence groups. When its leaders were arrested and its headquarters searched by the British administration, it became militant and the authorities were obliged to use firearms to quell the resultant riot, in which 5 persons were killed and 17 seriously wounded. Further violence occurred on June 12-13, when anti-Jewish disturbances in the same city resulted in the death of 16 persons and injuries to 50.

In mid-January the British revealed that they had given the United States permission "temporarily" to reopen the airfield at Mellaha, near Tripoli, for use by American military planes requiring refueling and servicing en route to Greece and points in the Middle East. The Soviet government protested to both Great Britain and the United States that this was a violation of the Italian peace treaty, but these protests were rejected.

—ROBERT GALE WOOLBERT

LIECHTENSTEIN. A central European principality. Area: 62 square miles. Population (1945 census): 12,197. Capital, Vaduz (2,020 inhabitants). Chief products: corn, wine, fruit, wood, marble. Main industries: cotton spinning and weaving, leather goods, pottery, and livestock raising. Liechtenstein belongs to the Swiss Customs Union; Swiss currency is used. Budget estimates (1947): revenue 3,115,400 francs; expenditure 3,120,580 francs. Public debt, Dec. 31, 1946, 3,201,348 francs. Reigning Prince, Francis Joseph II (succeeded Aug. 25, 1938). Head of Government, Alexander Frick (Sept. 3, 1945).

LITHUANIA. A republic on the eastern coast of the Baltic Sea. It was proclaimed the Lithuanian Soviet Socialist Republic and admitted into the Soviet Union on Aug. 3, 1940. The United States and Great Britain, however, have not recognized Lithuania's status as a union republic of the U.S.S.R. Area: 31,600 square miles. Population (1940): 2,879,070. Chief towns: Vilnius (Vilna) 207,750 inhabitants, Kaunas (Kovno) 152,365, Siauliai (Shavli) 31,299. Agriculture is the prime occupation of the people. The main crops include rye, wheat, oats, barley, flax, and sugar beets. Livestock raising is important. Manufactured goods include linen fabrics, yarn, cotton, leather, tobacco, plywood, lumber, and sugar. Budget estimates (1948): 1,199,120,000 rubles.

LIVING COSTS AND STANDARDS. See PRICES AND LIVING COSTS.

LOUISIANA. A west south central State. Area: 48,506 sq. mi. Population: (July 1, 1948) 2,576,000, compared with (1940 census) 2,363,880. Chief cities: Baton Rouge (capital), 34,719 inhabitants in 1940; New Orleans, 494,537. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Legislation. The regular session of the Louisiana Legislature which convened on May 10 and adjourned July 8, and the special session lasting 10 days which adjourned October 3, resulted in record-breaking biennial general fund appropriations of about \$365 million, largely for education.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$186,672,000; total expenditure, \$173,899,000.

Elections. Louisiana's 10 electoral votes were cast for Thurmond who had a popular plurality over Truman and Dewey. In the regular Senatorial race, incumbent Democrat Allen J. Ellender was re-elected with no opposition. Russell B. Long, Democrat, was elected at the same time to complete the unexpired term ending Jan. 3, 1951. All 8 House seats remained Democratic. In the State election on April 20, a complete slate of Democrats was elected, including Earl Long—Governor; William J. Dodd—Lieutenant Governor; Wade O. Martin, Jr.—Secretary of State; Bolivar E. Kemp—Attorney General; A. P. Tugwell—Treasurer; L. B. Baynard—Auditor.

Officers, 1948. Governor, James H. Davis; Lieut. Governor, J. Emile Verret; Secretary of State, Wade O. Martin, Jr.; Attorney General, Fred S. LeBlanc; State Treasurer, A. P. Tugwell; State Auditor, L. B. Baynard.

LUTHERAN CHURCH. The National Lutheran Council with 8 national bodies is the agency for two-thirds of Lutheranism in America. The Council is the U.S. National Committee for the Lutheran World Federation, numbering some 60 million adherents on five continents and in 42 countries. The Synodical Conference, consisting of the Lutheran Church—Missouri Synod and four other smaller groups, comprises the other third of Lutheranism.

In America the Council engages in ministry to college students, social services, American missions, public relations, service to military personnel, resettlement of displaced persons, and collection of relief supplies. Lutherans had contributed more than 40 million dollars for war and postwar emergency relief and reconstruction by the end of 1948. The bicentennial observance of organized Lutheranism in America by Pennsylvania Lutherans was the main anniversary of 1948.

Major task before American Lutheranism was to continue support of its homeless in exile and to find them immigration opportunities in Canada, Australia, the United States, and South America. The rising oppression by totalitarianism in eastern Europe and the Far East was noted in the arrest and conviction of Bishop Lajos Ordass of Hungary and the overrunning of mission fields by Chinese Communist armies. These pressures were felt sensitively by Lutheran churchmen engaged in a world-wide program of evangelization. Three well known church leaders died during the year: Dr. Ralph Long, Executive Director of The National Lutheran Council; Dr. Daniel Nelson, Lutheran World Federation Commissioner to China, in a piracy plane crash; Bishop Frank Wheatcroft of the Lutheran Church of France.

The Lutheran churches in America have a total baptized membership (1947) of 5,836,147 with 6,375 churches and 14,305 ministers. Excluding

elementary schools, there are 94 educational institutions with 35,987 enrolled students. Foreign missionaries number 1,140; confirmed members of mission churches, 170,227. Church properties in the United States were valued at \$539,909,317. Contributions totaled \$131,942,030. Headquarters of the National Lutheran Council, 231 Madison Ave., New York 16, N.Y.—CARL E. LUND-QUIST

LUXEMBOURG (Luxemburg). A grand duchy between Belgium, France, and Germany. Area: 999 square miles. Population (1947 census): 286,786. Capital: Luxembourg, 61,590 inhabitants. Agriculture was the occupation of 32 percent of the people in 1946. Oats, potatoes, wheat, rye, and grapes comprise the chief crops. Livestock (1946) included 118,080 cattle, 78,290 pigs, 15,157 horses, 10,447 sheep, and 1,760 goats. The chief industries are mining and metallurgy. In 1947 output (in metric tons) of iron ore was 1,994,427, pig iron 1,818,160, steel 1,714,297. Budget estimates (1948): revenue 3,511,567,000 francs; expenditure 3,914,299,029 francs. Consolidated debt (1947): 1,787,366,081 francs. On Jan. 1, 1948, an economic union (Benelux) of Belgium, the Netherlands, and Luxembourg came into force. Foreign trade statistics for Luxembourg are included with those of Belgium.

The grand duchy is a constitutional monarchy, with the hereditary sovereignty being in the Nassau family. A democratic form of government is provided by the Constitution of 1863 (amended in 1919). There is a chamber of deputies of 51 members elected for 6 years by universal suffrage. The right to organize the government rests with the sovereign. A council of state of 15 members is chosen for life by the sovereign. Ruler: Grand Duchess Charlotte. Prime Minister, Pierre Dupong (Christian Socialist); Foreign Affairs, Joseph Beck (Christian Socialist).

MACAO. A Portuguese colony in southern China, comprising the island of Macao and the small adjacent islands of Taipa and Colôane, at the mouth of the Canton River. Area: 6 square miles. Population: 374,737, including 9,000 Portuguese (1940). Fishing is the most important industry, engaging more than 40,000 people. The chief exports include cement, fish, and preserves.

MACHINE BUILDING. The building of machines is becoming more and more dependent on machine tools as they replace operations formerly done by hand. While this is having the effect of reducing the percentage of highly skilled men needed in the industry it is making even greater skill necessary in many of the operations. Specialists, trained in the use of one or two machines, have replaced the all-around men in many plants. But the all-around mechanic is more necessary than ever in keeping the more intricate machines in operation. Since we must have machine tools to produce all other types of machines as well as their products, both the skilled mechanic and the machine operator are very necessary to our progress.

There has been an increase in the number of machines which can perform operations on more than one piece at the same time. This began with the multiple-spindle automatic screw machine but is being extended to other machines such as the gear cutter and the lathe.

Steel castings, which at one time were replacing steel forgings to a great extent, are meeting strong competition with forgings in many fields. This is particularly true in the oil-well field where pipelines are under heavy pressure and failures or leak-

age is very expensive. Many of the valves and other fittings used in well-known oil-well "Christmas Trees" are now made of forgings instead of castings. The cost of the forgings has been reduced by improved methods of machine forging, which are receiving careful attention.

Among the cost-reducing methods is the use of robot, or automatic handling devices on some of the heavy forgings. A huge 5,000 ton hydraulic forging machine can now be handled by remote control from a "pulpit" where pushbuttons enable the operator to work huge tongs which hold the forging, moving the work in and out of the press at will. This greatly reduces the cost of direct labor, which in this case would be idle much of the time.

Surface finishing is another item of manufacture which is undergoing drastic changes. While the profilometer, a machine to read the imperfections in the smoothness of a surface, has been in use for some time, there has been no standardizing of the work until quite recently. This is quite an accomplishment, owing to the many conflicting elements which are part of the problem of surface finish. These include roughness, which depends on the nearness of surface grooves or scratches to each other, the depth and direction of these imperfections, and other factors.

A frequent method in surface finishing is to compare the finish with standard steel blocks machined to different finishes. Polish is not necessarily part of a good finish. The accuracy of modern machining can be judged by the fact that some of the scratches or imperfections can be reduced to a few millionths of an inch.

After a part has been finished it must be protected against corrosion, which can ruin the best of finishes. One steel concern has saved a \$40,000 annual loss from this source by air-conditioning the department containing the polished steel parts. The previous loss was caused by pinpoint corrosion after finishing.

Screw Threads. The importance of screw threads can hardly be overestimated. They are used to hold parts together, in sizes so small as to be hardly visible, in watches and some fine instruments, and also in the assembling of machinery weighing many tons. After many years of consultation and strenuous work we are on the verge of having standard screws which can be interchanged in British and American machines. This is equally valuable in peace and war. The British will adopt our 60° thread angle and we will use their rounded form for the bottom of the threads, which adds strength, as it eliminates any sharp corner from which cracks could start. The rounded top of the thread is more or less optional, as it does not affect the fit. And with the growing use of ground threads, made with abrasive wheels having a crushed face, the new form is the easiest to produce. It will be known as the "Unified" thread.

We also have another new thread for use on studs and bolts. Known as the "Lok-Thred," it has a depth of not much over half the standard thread, and an angular bottom face so that the nut bears on the 6° surface and puts the stress on the body of the bolt rather than on the thread itself. It somewhat resembles the Dardalet thread which has had only a limited use.

Castings. Foundry work is also changing. One large mechanized foundry is using synthetic sand while another uses a dry, lean mixture of sand and cement for its molds for large castings. After pouring, the molds are broken up and the material used again, with a little conditioning.

A new development in precision castings is being used to produce the rotors for the Buick Dynaflo transmission, this being known as the "Antioch" process, not to be confused with the "lost wax," or "investment" process, being used in other industries. The new process uses plaster molds which give very accurate castings of exceptional smoothness, free from porosity, and which are homogeneous and compare in strength with sand cast iron. The efficiency of these rotors depends largely on the accuracy of the blade form. This method saves a huge investment in special tools necessary to produce them by machining methods.

Carbide Drills. Carbide tools continue to be used in more and more operations. Their use includes not only the cutting edges of tools but also wear strips on boring bars and similar tools where guides must be provided. One development is a single-lip drill by the Carboloy Company, to be used in shallow as well as in deep holes where this type of drill has been used in the past. It is designed to secure maximum results where sufficient speed is available. Early users of carbide tried to adapt it to the cutting edges of drills but without any great success. Presumably the newer types of carbide are better suited for this work.

Saving Idle Time. With the increase in cutting speeds the time of handling work in and out of the machine becomes more important than before and affects production to a marked degree. Similarly, time lost between different cutting operations affects the output per hour or per day. To test the advantages of saving as much of this time as possible the Warner & Swasey Company equipped a small turret lathe with a motor which could start, stop, and reverse under a heavy load. A lathe was then built to match the motor. All functions except positioning are governed by an automatic drum on the end of the turret slide opposite the turret. Four cam drums are geared to the turret and index with it. Spindle reverse is controlled within $\frac{1}{8}$ of a revolution, eliminating the need for collapsing taps and dies. These changes have greatly reduced idle time and so have increased the output of the machine.

Spinning. The spinning process, which is usually confined to the making of a few sheet metal parts to save the expense of punches and dies, is now being used as a production process by the International Harvester Company. They have developed an automatic spinning machine for making the skimmer disks for their cream separators, more satisfactorily and at a lower cost than was possible with the presses formerly used.

Powdered Metal. Powdered metal parts, impregnated with oil, are being more widely used. Beginning with small bronze bearings, the process now extends to such iron parts as pistons for shock absorbers and contact plates in clutches. Powdered bronze bearings for the steering assembly, windshield wiper cross-shaft, water-pump bushings, and similar parts of the Ford, Mercury, and Lincoln cars are now in use. These parts are at least as strong as solid metal and solve many lubrication problems. Powdered metal parts are also being made in larger sizes than ever before.

Among the minor improvements, but one that can be of great assistance in the shop, is the new adhesive tape which is being used to bond metal, fiber, wood, and plastics, and which has a strength of 3,500 lb. per square inch. Another development is the double-faced tape which is used to hold work in place on face plates firmly so as to permit light machining of metal parts which would be difficult to hold by the usual methods.

—FRED H. COLVIN

MADAGASCAR. A French island colony in the Indian Ocean off the southeastern coast of Africa, from which it is separated by the Mozambique Channel. Area: 241,094 square miles. Population (1946): 4 million. Nossi-Bé and Sainte Marie are considered parts of Madagascar, whereas the Glorious Islands, and the islands of Kerguelen, Crozet, St. Paul, Amsterdam, and other islands are dependencies. The Comoro Islands became an autonomous territory in 1946, under partial authority of the High Commissioner of Madagascar. Tananarive (1946 pop. 163,079) is the capital, Tamatave, the chief port. The official language is French.

Education and Religion. Education is compulsory up to the age of 14. In 1947 there were 1,040 official schools with a total of 120,000 pupils. Native institutions of higher learning include medical, industrial, agricultural, and administrative schools. There are 3,493 Protestant, and 1,867 Roman Catholic churches, also 75 mosques.

Production and Trade. The majority of the natives are engaged in agriculture and cattle raising. Livestock (1945): 5,948,000 cattle, 421,000 pigs, and 319,500 sheep and goats. Principal crops in 1945 were (figures in metric tons): rice (770,000), coffee (28,000), sugarcane (230,000), vanilla (653), maize, tapioca, coconuts, and sweet potatoes. The extensive forests yield rubber, gum, resins, and plants for medicinal, tanning, and dyeing purposes. Minerals include: gold, mica, precious stones, phosphates, and graphite. The 1946 mineral output was valued at 96,495,026 francs.

Chief exports are vanilla (21 percent), coffee (15 percent), cloves, honey, and gold. Total imports in 1946, \$31,023,000; exports, \$39,671,000. Textiles, gasoline, machinery and parts, and paper are the chief imports.

Finance. The 1947 general budget estimates balanced at 1,168,569,340 francs; the provincial budget amounted to 955,889,800 francs.

Government. Madagascar and dependencies, a French colony since 1896, is administered by a Governor General appointed by the French Minister of Colonies. Under the 1946 reorganization, the colony is divided into 5 provinces with a general assembly at Tananarive. The colony is represented in the French National Assembly, the Council of the Republic, and the Assembly of the French Union, by 5 deputies to each. Governor General: Pierre de Chevigné.

MADEIRA. A district (Funchal) of Portugal, comprising a group of islands (Madeira, Porto Santo, and three uninhabited isles) in the Atlantic about 550 miles southwest of Lisbon. Area: 314 square miles. Population (1940): 250,124. Capital, Funchal (on Madeira), 48,493 inhabitants. The chief products are wine, sugar, embroidery, linen, leather, straw hats, baskets, fish, and fruits. Cereals, textiles, and coal are the principal imports.

MAGAZINES. In 1948, for the first time in seven years, the magazine industry began to see some breaks in the prosperity it had enjoyed for so long. Statistically the general picture was deceptive, for many critical problems lay hidden behind the all-time high advertising and circulation volume many magazines could boast. And to replace such problems as inadequate paper supply and printing facilities, both now things of the past, were difficulties more basic and serious. While paper was plentiful and of improved quality, it was taking up to 5 percent more of the total income received by magazines than in 1947, and printing costs had risen up to 25 percent. Even though record

amounts were received from circulation and advertising, much of this could be accounted for by the increases in advertising rates and single copy and subscription prices which a large number of publications had put into effect.

Advertising. Almost all magazines carried less lineage in 1948 than in 1947. There were some notable exceptions, such as *Look*, *Better Homes and Gardens*, *Woman's Home Companion*, *Popular Science*, *Business Week*, and *Holiday* (up 80 percent). But lineage in *Esquire*, for example, dropped 30 percent in 1948; *Redbook* dropped 20 percent; *Vogue*, *Mademoiselle*, *Glamour*, *Charm*, *Harper's Bazaar*, showed decreases of 20 percent and more in lineage. This was particularly serious in view of the fact that the point at which publications break even is higher because of increased production costs. In spite of this general downward trend, Curtis Publishing Company, because of an efficient new plant, was able to increase its profits.

There were about 12,500 national magazine advertisers in the country, spending a total of over \$460 million in magazine advertising during 1948. The return of the buyers' market and more active competition will make it necessary for industry and business to rely even more heavily on national advertising in the future. But the increased budgets for national advertising will be spent with great care and the competition by publications for national advertising is sure to be tremendous. Even before the returns of the presidential elections shook the faith of business in polls and market surveys, there were definite signs that advertising managers were looking for more specific yardsticks to help them evaluate possible media.

The Magazine Advertising Bureau's survey of magazine audiences made early in 1948 failed to satisfy advertising executives or to quiet their general dissatisfaction with the information that had been given them by publishers. Because of this the Association of National Advertisers made its own survey, released at the end of May as the *ANA Magazine Rate and Circulation Study of Fourteen Magazines*. The magazines included in this study were *American*, *American Home*, *Better Homes and Gardens*, *Collier's*, *Cosmopolitan*, *Good Housekeeping*, *Ladies' Home Journal*, *Life*, *Look*, *McCall's*, *Newsweek*, *Saturday Evening Post*, *Time*, and the *Woman's Home Companion*. In this report gauges were suggested to help advertisers select magazines which would give them better value for their advertising dollars. The report stressed the use of accurate mathematical measurements such as the rate per thousand circulation, promotion methods, character and duplication of magazine audiences. The report criticized the intangible measurements such as "readers per copy" upon which many publications had relied heavily during recent years to secure increased advertising.

In spite of the drop in advertising lineage generally and the feeling that magazines should try other alternatives for meeting costs than raising advertising rates, a number of magazines either raised their advertising rates again during the last quarter of 1948, or announced increases effective early in 1949. These included *Better Homes and Gardens*, *American*, *School Management*, *Look*, *Woman's Home Companion*, *Redbook*, *Mechanix Illustrated*, *McCall's*, *Holiday*, and others. In most cases circulation guarantees were also upped.

Circulation. Magazines have fared generally better in circulation than in advertising, with several showing notable gains during 1948. Most impressive advance was made by *Reader's Digest* which now sells over fifteen million copies each month,

including domestic and international editions—two million more than the previous year. But despite these increases and the gain in circulation dollar volume caused by higher subscription and newsstand rates, there is a widespread effort in the magazine industry to boost circulation even beyond the present record peaks. Some of the techniques for selling subscriptions that were in use before the war, were resumed, such as special introductory offers at reduced rates. In 1948 the *Atlantic Monthly* offered seven issues for \$2.50; *Look*, 28 issues for \$3.00; *Popular Science* gave an eight-month introductory subscription for \$1. Other publications, such as *Science Illustrated*, offered savings for long-term subscriptions. *Newsweek* tested five different 40-week special offers at varying rates for different groups. It was planned to arrive at some standard introductory rate by averaging the returns on the various lists.

In 1947, climaxing the reading boom started during the war, over 5,000 million magazines were bought by the American people, but the 1948 figure dropped well below that peak. In spite of this general loss, and even with so many increases in newsstand prices, there were forty-eight magazines which sold over a million copies per issue during 1948. However, at the year's end there were indications that a limit to the price raises which the public would absorb had been reached. In many cases newsstand sales fell off because of higher single-copy prices, and substantial drops in circulation resulted. The *Ladies' Home Journal* gave its advertisers a rebate of 5 percent for several issues in which its circulation guarantees had not been met.

The fight for new readers during 1948 led to practices out of use since before the war. Free examination copies were given; copies of magazines were sent for one or two issues after expiration of subscriptions. And the pressure to protect circulation guarantees to advertisers led to the resumption of door-to-door soliciting for subscriptions, in an effort to increase the proportion of subscription to single-copy buyers. With this house-to-house canvassing came the many abuses which are commonly connected with this operation. Though most of the complaints were against the solicitors themselves, who tended to be over-zealous, unscrupulous, and to use fake appeals and sympathy sales devices, the public relations of the entire magazine industry stood to suffer.

To combat this, the National Association of Magazine Publishers has been trying, through their Central Registry Board (set up but little used since 1940), to eliminate the bad taste left by unscrupulous solicitors. Local Better Business Bureaus have cooperated with them closely in their program of public relations and in their efforts to have solicitors and subscription agencies abide by their Articles of Agreement. Complaint forms were made available to the Better Business Bureaus which could be filed with the Central Registry against any members. Under the Articles of Agreement penalties for those who violate the code include warning letters, payments of damages of not more than \$500 for any single complaint, and expulsion from the Board. Though most of the complaints so far have been about nonfulfillment of subscriptions, the complaints about solicitors have proved more damaging to the industry. The National Association of Magazine Publishers is particularly anxious to enforce its code in order to forestall local restrictions against all magazine solicitation.

The Comics Magazines. The NAMP was not the only magazine executive group that felt impelled

to set up a code of ethics. During 1948 some of the heaviest criticism against any medium of communication was leveled against comics magazines. Such eminent men as Dr. Francis Wertham, noted psychiatrist (in an article in the *Saturday Review of Literature* in May, later reprinted in the *Reader's Digest*), John Mason Brown, and many leading educators and penologists criticized the comics as sources of juvenile delinquency, the "marijuana of the cradle," etc. In New York State, Senator Benjamin Feinberg, majority leader of the State Legislature, announced that he would sponsor a bill to deal with undesirable comics. To combat this barrage of criticism, fourteen of the thirty-five publishers of comics magazines, "realizing their responsibility to . . . millions of readers and to the public," formed the Association of Comics Magazine Publishers, Inc., which put forth a public-relations program to answer critics of this large sector of the magazine industry. This group set up a code of ethics for the comics magazine industry and asked all of its members to submit copies of their comics titles for review. The Association also appointed a committee of responsible leaders and educators to act as advisors to the comics magazine industry. The Comics Code which was worked out by the ACMP urged the publication of comics magazines that contained only good wholesome education or entertainment. The Code provided the following restrictions in comics magazines: (1) no sexy comics or indecent drawings; (2) crime should not be presented to show details and methods of crime, nor should it create sympathy for the criminals rather than the law; (3) no torture scenes; (4) no vulgar or obscene language and a minimum of slang; (5) divorce should not be made alluring or humorous; (6) no ridicule of any religious or racial group.

Other comics publishers took steps to correct the abuses of their industry and to ward off the possibility of increased legal restrictions against the sale or distribution of their products. Already many cities have put in rigid ordinances against comics, and others have censorship committees. Los Angeles County prohibits the sale of comics dealing with murder, burglary, arson, kidnapping, or assault with dangerous weapons. Detroit and Hillsdale, Michigan, have banned 36 titles under a state law outlawing "obscene, indecent, and immoral literature." Other ordinances are expected in New York City, Kansas City, Cleveland, Cincinnati, and New Orleans.

In New Orleans, a report to the Mayor on comics magazines suggested that the solution lay only in the voluntary cooperation and self-regulation of comics book publishers, wholesale distributors, retailers, parents, and organizations. It was also suggested that an advisory committee of parents and city officials be formed.

The National Comics Publications, Inc., one of the largest comics publishing companies, ran a series of full-page advertisements in the *Saturday Evening Post* to answer comics critics. They pointed out that the increase in comics magazine titles to a total of 300 and the consequent competition encourages some publishers to use lurid and sensational features, but that well-edited comics can be a force for good among children.

Foreign Markets. In addition to the drive for domestic business, there has also been a spurt in overseas sales of magazines. *Omnibook* added foreign editions in Australia and France; the international editions of *Reader's Digest* increased from 5 to 8 million. Macfadden Publications was still a giant in overseas sales, with their eleven foreign

editions selling over 60 million annually. *True Story* represents the bulk of their sales, some 50 million annually. The rest of the sales are made up from the Australian and British editions of *True Romances*, the French edition of *Super Detective*, and the Australian edition of *Photoplay*. Seven countries are producing *True Story* locally, mostly as straight translations of the U.S. magazine. Most stories in *True Story* emphasize emotion and not scene, and therefore they have a common denominator suitable to many countries.

A big spurt in overseas sales of magazines can be expected as the result of a \$10 million fund made available by the Economic Cooperation Administration to guarantee new investments made abroad in "informational media." The purpose of this fund is to overcome the dollar shortage in certain foreign countries by enabling American producers of books, magazines, newspapers, and films to accept national currencies for the sale of their products abroad.

Another movement designed to increase understanding of the American way of life abroad by sending United States publications overseas, was a program set up through the Civil Affairs Division of the United States Army for distribution of American magazines, usually newsstand returns, through the United States Information Centers and reading rooms in occupied areas, in Germany, Japan, Austria, and Korea. Practically all general, business, trade, and professional magazines are welcomed, but not pulps, comics, or controversial political magazines. Pressure was put on the Government to allot a fund to pay for the shipment of such magazines. This would be considered part of the State Department's Voice of America program. It is understood that both the Senate and the House agreed tentatively on \$3 million for this purpose.

Still selling widely in Germany were the three magazines published by the U.S. Military Government—*Heute*, a picture magazine, *Der Monat*, a political monthly, and *Neue Auslese*, a cultural digest—supplementing *Die Neue Zeitung*, the three-times-a-week flourishing newspaper published under the same auspices.

Suspensions. A number of magazines were suspended or discontinued. Notable among those discontinued was *Pic*, which in spite of its 622,000 monthly circulation was dropped in December by Street and Smith to divert paper and press time to the year-old Street and Smith publication, *Mademoiselle's Living*. '48, *The Magazine of the Year*, the cooperative undertaking which had gone through a number of reorganizations, was finally discontinued. *Kaleidoscope*, the spectacular fashion magazine, was suspended after publishing three issues. *Salute*, after undergoing several changes in the past few years, stopped publication. *Junior Bazaar* combined with *Harper's Bazaar*; and *Everywoman's*, the magazine distributed through independent groceries, was suspended temporarily.

Among other magazines suspended were *Nuances*, *Best Stories*, *Our Army and Our Air Force*, *The Span*, *Countrybook*, *Catholic Life*, *Reader's Scope*, *Shock*, *New Quarterly of Poetry*, *Hippocrene*, *Go*, *Briarcliff Quarterly*, *South*, *Mammoth Adventure*, *Mammoth Detective*, *The Smart Traveler*, *International Digest*, *The American Woman*, *Silver Star*, *Quest*, *Pilot*, *Sports Stars*, *New Masses*, and *Chimera*.

New Magazines. 1948 was the first year in some time that did not see a flush of new magazines. But in spite of the unsettled state of the industry, there were some new magazines started or announced. Dell Publishing Company was preparing

Sports Illustrated (first issue dated February, 1949). This is *Life* size with 50 percent text and 50 percent pictures, designed to cover the whole world of sports from the point of view of both spectator and participant. Circulation guarantee for the first issue is 400,000 copies. *Sports World* will be published in January by Hillman Publications, Inc. Also noteworthy is *Nation's Heritage*, which will begin with the January, 1949, issue. This lavish magazine, designed to give a real picture of the heritage of America, is backed by B. C. Forbes & Sons, and will sell for \$150 a year, \$25 a copy.

Other new magazine ventures include *Clue*, *4-H Life*, *Radio Stars and Television*, *Bridegroom*, *The Wedding Magazine for Men* (to be published by *Esquire* beginning with the March, 1949, issue), *Television Guide*, *Tele-View*, *Tele-Views*, *Tele-Viewer*, *Physics Today*, *New Sporting Goods Products*, *Two Way Trader*, and *Happy Marriage*.

Editorial changes. Several magazines made changes in editorial slants or physical design to try to attract new readers and keep old ones. *Liberty* started a new "Home Section" with the May issue, carrying brand names and prices. *Harper's* came out with a new size and format. *Fortune* changed its editorial emphasis entirely and will now concern itself with "assisting the successful development of American business enterprise," instead of "mirroring industry." A new *Fortune* feature, "Business Roundup," gives the readers a bird's-eye view of U.S. business during the month. *Esquire* revamped its format, added service features, and will include a regular travel section. *Collier's* changed format and cover design and is now paying \$1,000 to authors for each issue's star story.

The real problem editorially is that continued increased costs may lead to cuts in editorial features, stories, pictures, or articles.

There were many other newsworthy events in the magazine industry during 1948. *World Report* combined with *U.S. News* and changed its name to *U.S. News and World Report*. One hundred and seven educators, lawyers, statesmen, and writers signed an appeal to revoke the ban which had caused the *Nation* to be withdrawn from the New York City public schools, stating that this was a clear matter of freedom of the press. The ban was upheld and the case was taken to the New York State Education Department, which at the end of the year had not acted upon it. *Ladies' Home Journal* carried \$2,677,260 worth of ads in its October issue, probably the largest advertising volume ever carried by one magazine in a single issue.

Theatre Arts, which was bought by Alexander Ince in January, 1949, was sold by him to a Chicago syndicate headed by John D. MacArthur. *Time* celebrated its 25th Anniversary with its Mar. 8, 1948, issue. *Omnibook* completed ten years of publication. 1948 was the Diamond Jubilee of the *Woman's Home Companion*. Its public service program—articles on important social and health problems—aroused much interest and action. These were widely reprinted, and mentioned by radio commentators. Some of the subjects covered were "Women Alcoholics," "The Crisis in Education," "Better Teeth," etc. With the February, 1949, issue, *Mademoiselle's Living* will become a bi-monthly. Industry spent \$108,849,752 last year on its 6,000 house organs. This subsidized circulation totals almost fifty million monthly. Magazine publishers are concerned by the almost certain prospect, early in 1949, of increased second-class postal rates. As the year closed, magazine publishers felt that profits for 1949 would decrease below those of 1948.

—A. S. BURACK

MAINE. A New England State. Area: 33,040 sq. mi. Population: (July 1, 1948) 900,000, compared with (1940 census) 847,226. Chief cities: Augusta (capital), 19,360 inhabitants in 1940; Portland, 73,643. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$55,181,000; total expenditure, \$55,369,000.

Elections. Maine's election was held September 13. Its 5 electoral votes went to Dewey who gained a popular majority of about 35,000 over Truman, Wallace, and other contenders. Mrs. Margaret Chase Smith, Republican nominee, won the Senatorial race, and all 3 House seats remained Republican. In the contest for governor, the Republican, Frederick G. Payne, won.

Officers, 1948. Governor, Horace A. Hildreth; Lieut. Governor, None; Secretary of State, Harold I. Goss; Attorney General, Ralph W. Farris; State Treasurer, Frank S. Carpenter; State Auditor, Fred M. Berry; State Comptroller, Harlan H. Harris.

MALAYA, Federation of. A federation of 9 Malay states and the settlements of Penang and Malacca, under the protection of Great Britain. The Federation of Malaya was established on Feb. 1, 1948, to supersede the Malayan Union, which came into being in 1946. The area and population (1940-41) of the states and settlements are listed in the accompanying table.

<i>Division (Capital)</i>	<i>Area</i>	<i>Population</i>
Johore (Johore Bahru).....	7,500	737,509
Kedah (Alor Star).....	3,680	515,758
Kelantan (Kota Bharu).....	5,750	390,332
Malacca (Malacca).....	640	236,087
Negri Sembilan (Seremban).....	2,580	296,009
Pahang (Pekan).....	13,820	221,800
Penang (George Town).....	390	419,047
Perak (Taiping).....	7,980	992,691
Perlis (Kangar).....	316	57,776
Selangor (Kuala Lumpur).....	3,160	700,552
Trengganu (Kuala Trengganu).....	5,050	211,041
Total.....	50,840	4,248,565

Preliminary figures from the 1948 census estimates the total population at 5,808,247, including 2,608,975 Chinese, 2,214,295 Malays, 533,961 Indians, 9,986 Eurasians, and 9,150 Europeans. Capital of the Federation of Malaya: Kuala Lumpur (1939 pop., 138,425).

Education and Religion. There were, in 1946, a total of 1,014 Malay government schools and 88 private schools with 126,000 pupils; 976 Chinese schools with 172,000 pupils; 724 Indian schools with 12,873 pupils; 187 English schools with 60,967 students. The English schools provide secondary and professional education.

The majority of Malays are Sunni Moslems under the religious leadership of the various state rulers. Hinduism is professed by most of the Indians, while some Indians and Chinese adhere to the Buddhist religion. Christian churches are to be found in the larger towns, their congregations including a large number of Asiatics.

Production. Chief agricultural products are rice, copra, palm oil and kernels, tea, and pineapples. The production (1946) was: rice, 225,045 metric tons from 789,640 acres; tea, 316,000 lb.; palm oil, 11,756 tons and kernels, 932 tons. Rubber yield in 1947 was 656,400 metric tons (1948: 11 months, 587,300). Fisheries are important and yielded an estimated 40,000 tons in 1946.

Minerals include coal, tin ore, phosphate, manganese, bauxite, scheelite, and wolframite. Tin out-

put totaled 27,480 metric tons in 1947 (1948: 9 months, 32,900); coal, 224,676 tons in 1946. Trade (1947): imports M\$1,367,500,000; exports M\$1,319,500,000.

Government. The Federation is composed of the nine Malay States and the two former settlements, Malacca and Penang with Province Wellesley. Any other territory may be admitted into the federation by agreement. The central government comprises a High Commissioner (to whom power is delegated jointly by the King and the Malay rulers), a Federal Executive Council, and a Federal Legislative Council. The Legislative Council is composed of 75 members: 14 official, 50 unofficial, and the remainder presidents of the Councils of State, Settlement Councils, and ex-officio members. In addition the ruler of each state has concluded agreements with the British Government and has undertaken to promulgate a written constitution for his state. A Conference of Rulers was to meet with the High Commissioner at least three times a year.

The Federation agreement establishes a federal citizenship "designed to draw together with a common loyalty all those who can be said to regard Malaya as their true home." Such citizenship will be a requirement for membership of unofficials in the Federal Legislature and also in the Councils of State. The first High Commissioner, Sir Edward Gent, was sworn in on Feb. 1, 1948. He died on July 4, 1948, and was succeeded in September by Sir Henry Gurney. Effective May 1, 1948, the posts of Governor General of Malaya and Special Commissioner in South-East Asia were amalgamated in that of Commissioner General for the United Kingdom in South-East Asia. Commissioner General: Malcolm MacDonald.

Bibliography. For an account of the Communist uprising in Malaya during the last six months of 1948, see "The Communist Uprising in Malaya," *Far Eastern Survey*, Dec. 22, 1949; p. 281-286 (American Institute of Pacific Relations).

MALTA. A British colony in the Mediterranean, comprising the islands of Malta (95 sq. mi.), Gozo (26 sq. mi.), and Comino (1 sq. mi.): a total area of 122 square miles. Civil population (1948 census): 307,000. Capital: Valletta, 22,779 inhabitants. Education (1947-48): 104 primary schools and 43,000 pupils; 60 (12 state-aided) private schools and 10,500 pupils; 4 secondary schools and 965 girl students; one lyceum and 996 boys; and the Royal University with about 300 students. English and Maltese are the official languages.

Production and Trade. Agriculture, cattle raising, and fishing are the chief occupations. The principal crops include wheat, barley, potatoes, vegetables, fruits, and cotton. Total imports (1946, £12,953,413; exports £707,458.

Government. Revenue for 1946-47 was £4,890,748; expenditure, £4,540,263. The 1948 budget estimated expenditure at £5,095,455. A new constitution conferring responsible government on Malta went into operation on Sept. 22, 1947. General adult suffrage is embodied in the constitution. The Legislative Assembly consists of 40 members, 5 from each of the 8 electoral districts. The Cabinet consists of not more than 8 ministers who constitute the Executive Council. Matters relating to foreign affairs and defense are reserved to the governor. Prime Minister: Dr. Paul Boffa. Governor: Sir Francis Douglas.

MANCHURIA. The northeasternmost section of the Republic of China. In September 1945, Manchuria was divided into the following provinces: Liaoning,

Kirin, Heilungkiang, Liaopei, Nunkiang, Hsingan, Sungkiang, Hokiang, and Antung, with a total area of 503,013 square miles. Chief cities: Mukden, Harbin, Changchun, the capital, and Antung. The chief crops include soybeans, kaoliang, millet, maize, and wheat. Minerals include iron, coal, gold, magnesite, and oil shale. See CHINA.

MANGANESE. Imports of manganese ore into the United States were considerably lower in 1948 than in 1947, and well below the rate of consumption required for the current high steel ingot rate. Receipts of metallurgical and battery grades of ore in the first nine months totaled only 897,076 net tons, with a manganese content of 420,295 tons. Battery grade imports were 7 percent of the total. Consumption in the period was 1,011,131 tons of ore. The difference was made up from withdrawals from bonded warehouses (previously imported), and by reductions in the inventories of dealers and producers.

Imports during the nine months were very little more than half the 1947 imports of 1,541,818 tons. It is estimated that current steel operations require 600,000 tons of metallic manganese annually, requiring imported ores to the extent of 1.3 million tons.

The bulk of the imports during the period was shipped by the U.S.S.R., 294,262 tons. Other principal ore shipping countries were: South Africa, 175,068 tons; India, 148,842 tons; Brazil, 111,085 tons; Gold Coast, 80,059 tons.

Domestic production of ore containing 35 percent manganese or more totaled 98,500 tons in the nine month period. This tonnage came largely from Montana, where high grade nodules are produced at Anaconda and the Philipsburg district where battery grade ores are mined.

—JOHN ANTHONY

MANITOBA. A prairie province, situated in about the center of Canada. Area: 246,512 square miles, including 26,789 square miles of fresh water. Population (1948 estimate): 757,000. Leading religious denominations: Roman Catholic, 203,259; United Church, 194,001; Anglican, 125,076; Lutheran, 48,213; and Presbyterian, 43,073. In 1946 there were 18,794 live births, 6,537 deaths, and 8,594 marriages. Education (1945-46): 151,264 students enrolled in schools and colleges. Chief cities: Winnipeg (capital), 229,045 (1946 census); St. Boniface, 21,613; Brandon, 17,551; Portage la Prairie, 7,620.

Production. The gross value of agricultural production for 1947 was \$196,358,000. Value of field crops (1947): \$144,651,000 from 6,807,000 acres. Chief field crops (1947): wheat, 42,000,000 bu. (\$57,960,000); oats, 39,000,000 bu. (\$28,080,000); barley, 34,000,000 bu. (\$35,360,000); flaxseed, 5,200,000 bu. (\$27,248,000). Livestock (June 1, 1947): 778,600 cattle (\$59,776,000); 195,300 horses (\$11,447,000); 347,200 swine (\$7,806,000); 181,000 sheep (\$1,851,000); 8,224,100 poultry (\$8,067,000). Fur production (1946-47): \$3,099,159. There were 638 fur farms in 1946, with fur animals valued at \$2,367,444. Marketed value of fisheries production was recorded at \$4,871,037 in 1946. The total value of creamery butter produced in 1947 was 26,265,000 lb., valued at \$13,526,000. There were 3,590,000 lb. of factory cheese produced in 1947, with an estimated value of \$1,620,000. According to the 1947 estimate, the total farm value of poultry, meat, and eggs was \$16,135,000. The value of 5,180,000 lb. of honey produced in 1947 was \$1,450,000.

Manufacturing. The gross value of manufactured products in 1946 was \$351,887,099. There were 38,367 persons employed in 1,357 establishments. Salaries and wages paid were \$61,018,345. Cost of materials used totaled \$223,096,935. The leading industries in 1946 were slaughtering and meat-packing, flour and feed mills, railway rolling stock, and butter and cheese.

Government. For the fiscal year ended Mar. 31, 1948, revenues were estimated at \$29,495,052 and expenditures were estimated at \$29,405,384. For the year ended Mar. 31, 1947 (11 months) revenues amounted to \$24,019,948 and expenditures were \$19,737,346. The executive power is vested in a lieutenant governor who is advised by a ministry of the legislature. In the Legislative Assembly there are 58 members elected for a five-year term by popular vote of the adult population. Party standing at the provincial election of Oct. 15, 1945, was 43 Coalition (25 Liberal Progressives, 14 Progressive Conservatives, 2 Social Credit, 2 Independent) and 12 Anti-Coalition (10 Cooperative Commonwealth Federation, 1 Independent Anti-Coalition, 1 Labour Progressive). There were also 3 service members with no party affiliation. Six members (appointed for life) in the Senate and 17 members in the House of Commons represent Manitoba in the Dominion Parliament at Ottawa. Lieut. Gov., R. F. McWilliams (appointed Nov. 1, 1940; Premier, Douglas L. Campbell (appointed Nov. 13, 1948). See CANADA.

MARITIME COMMISSION, United States. The Merchant Marine Act of 1936 established the U.S. Maritime Commission as an independent Government agency, charged with providing for a Merchant Marine that should be sufficient in peacetime to carry a substantial portion of the nation's trade, and available in time of emergency to serve as an auxiliary to the armed forces. In carrying out this task, the Maritime Commission helps to equalize American with foreign shipping costs, by paying differential subsidies to ship-owners and builders, and provides ships by selling or chartering its own vessels and by encouraging the building of new vessels.

The high cost of operating American ships has in the past tended to drive them off the sea when shipping competition was keen. This has meant that in time of war there were not enough ships in operation to serve expanded needs for cargo and troop transport. Provision was therefore made in the Merchant Marine Act of 1936 for the Government to pay the difference between United States and foreign costs to American ships operating on foreign trade routes which are considered essential to our trade and security. Companies receiving these subsidies must agree to maintain adequate service and to keep their fleets in efficient condition by replacing obsolete ships with new, modern vessels. If a company earns over a 10 percent profit on its capital employed over a ten-year period, one-half of the excess must be returned to the Government, up to the full amount of the subsidies granted.

Operating subsidies, suspended during World War II, were resumed on Jan. 1, 1947. All operators receiving subsidies before the war have applied for resumption of subsidies, and applications have been filed for additional subsidized operations. Payments since the war will probably be higher than before due to increases in operating costs, such as seamen's wages, food, and fuel, to a greater extent than increases in similar foreign costs. Nevertheless, payments of subsidies for merchant shipping average only about 2 percent of all

Government subsidies, and the recent end of the first ten-year subsidy period for several operators has led to the recapture by the Government of all the subsidy paid to three companies and a substantial amount of that paid to four others.

During World War II nearly all available merchant vessels were taken over by the Government, which employed private companies as its agents to operate the ships. After the war most of the requisitioned ships still afloat were returned to their owners. This left about 4,000 war-built vessels in Government possession. Under the Merchant Ship Sales Act of 1946, the Commission was authorized to sell these vessels to private ship-owners. Up to Dec. 31, 1948, a total of 1,773 had been sold.

American ship-owners purchased 660 of the best types for their own use, while foreign operators bought 1,113 to replenish their war-depleted fleets. By Mar. 1, 1948, the fleets of the leading maritime nations were approaching their prewar levels through purchases and new construction. The United States Congress therefore ended the Commission's authority to sell its surplus vessels to foreign operators, but extended until Mar. 1, 1949, its power to sell vessels to American citizens.

Through these purchases the privately owned United States fleet in active operation has been returned to about its prewar level, numbering 1,008 vessels of 1,000 gross tons and over, on Sept. 30, 1948. This fleet has not been sufficient, however, to meet all the heavy postwar shipping demands, especially the requirements for bulk transport of coal and grain sent abroad for relief purposes. Consequently several hundred Government-owned ships were also kept sailing, a few operated by the Government through general agents to transport displaced persons, but most of them chartered by private companies from the Government. A provision in the Foreign Assistance Act that 50 percent of the cargoes purchased under the Act and sent abroad from the United States should be carried in United States ships whenever they were available at market rates gave employment to these vessels.

Government-owned vessels under charter have dropped in the past year, however, from a peak of 1,510 on June 30, 1947, to 362 on Dec. 31, 1948. United States ships, which carried 67 percent of United States export and import trade in the first six months of 1946, were carrying only about 57 percent in the first seven months of 1948. Foreign flagships increased their carriage of United States imports by 6 percent in the latter half of 1947 and have been taking over a constantly increasing share of the bulk cargo.

The domestic fleet, operating along and between United States coasts, and between the United States and its Territories and possessions, formerly constituted about 60 percent of the total United States merchant fleet and served as a defense reserve. During World War II most of these ships were taken for war service, and since the war they have been unable to regain their business, due to high operating costs and low rates of competing land carriers. The Commission has petitioned the Interstate Commerce Commission to investigate the rail-water rate structure, which is placing an undue burden on water carriers. It has also granted special low charter rates on its vessels to domestic operators, but the fleet has remained at less than half its prewar figure, totaling 205 dry cargo vessels of 1,000 gross tons and over, on June 30, 1948, against 428 on June 30, 1938. The coastwise and inter-coastal fleets alone are at one-third their prewar levels.

Government-owned vessels that are not sold or chartered are kept in reserve fleets at seven permanent, and two temporary sites, along the coasts. These fleets contained a total of 1,901 vessels on Nov. 1, 1948, of which 1,837 were built during World War II and 64 were built before the war. Old or badly damaged ships are being scrapped. All good vessels are treated to preserve them for any future emergency use. Over 500 have been selected by the armed services as part of the permanent National Defense Reserve Fleet.

Since the war the United States shipbuilding industry has been rapidly slipping from its unprecedented wartime peak to its prewar low. Employment on new ship construction has fallen far below the minimum considered essential to provide a nucleus for expansion in an emergency, and the repairs and reconversions of war-built vessels, which kept many yards busy after the war, are nearing completion. During the year ended June 30, 1948, the United States built only 33 vessels, while other countries built 368.

After the war the Maritime Commission suggested a building program of 144 vessels over the next 10 years and a 25-year replacement program. Early in 1948 a Committee of Cabinet members appointed by the President recommended a minimum of 50 passenger vessels and 170 tankers to be built in the next 3 years in order to bring the fleet up to defense requirements. In accordance with national policy, these vessels were to be built and operated by private ship-owners wherever possible, with the Government paying the difference between United States and foreign shipbuilding costs and the cost of national defense features, such as speed in excess of commercial requirements.

A survey of operators showed that there were good prospects for the building of about 18 new passenger-cargo vessels, 2 passenger-trailer vessels for coastwise operation, and 20 tankers. In August 1948 the Commission was able to place contracts for 5 passenger or combination passenger-cargo liners, which two operators had agreed to purchase. A construction subsidy of approximately 45 percent will be paid on these vessels.

Bids were also received for building a number of high-speed tankers, on which the Commission would pay for national defense features only, and for a trans-Atlantic express liner of 50,000 tons, on which a construction subsidy would be paid. Other orders are in prospect, including 2 prototype vessels which the Commission hopes to build as models for vessels suited to competitive peacetime trade but readily adaptable to war service. In addition, private companies have on order some 60 tankers, which will help to meet the continued high demand for oil transport. By Nov. 1, 1948, there were 79 merchant vessels of 1,000 gross tons or more, totaling 1,123,340 gross tons, on order in United States shipyards, and a start had been made on a new postwar building program.

—WILLIAM WARD SMITH

MARKLE FOUNDATION, The John and Mary. Since its inception in 1927, the Foundation has confined its major activities to support of research programs through grants to institutions. The shortage of medical research men and women in this country has, however, dictated a change of policy beginning in 1948. The Foundation proposes to supply \$5,000 a year for a limited number of men, each man to be assured a tenure of five years on the staff of a medical school. President, George Whitney; Executive Director, John M. Russell; Secretary, Doro-

thy Rowden. Offices: 14 Wall St., New York 5, N.Y.

MARTINIQUE. A West Indian overseas department of France. Area: 385 square miles. Population (1946 census): 261,595, mostly Negro and mulatto, with about 5,000 whites. Fort-de-France, the capital, had 66,006 inhabitants in 1946. Sugar (1946 export, 16,519 tons), cacao, bananas, pineapples, and rum are the main products. Trade (1946): imports 1,583,400,000 francs; exports 1,563,500,000 francs. Finance (1947 est.): revenue and expenditure balanced at 1,474,803,000 francs. The department is under a governor, aided by a privy council, and an elected general council. Martinique is represented in the French National Assembly, the Council of the Republic, and in the French Union.

MARYLAND. A south Atlantic State. Area: 12,327 sq. mi. Population: (July 1, 1948) 2,148,000, compared with (1940 census) 1,821,244. Chief cities: Annapolis (capital), 13,069 inhabitants in 1940; Baltimore, 859,100. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$100,382,000; total expenditure, \$101,043,000.

Legislation. A special session in May gave employees of the State of Maryland a cost-of-living raise in pay. An important amendment approved by the voters in November provides for annual sessions of the legislature. Even-year sessions will be restricted largely to consideration of the annual budget. Another amendment facilitates the procedure for territorial annexations to Baltimore City.

Elections. The 8 electoral votes which were Roosevelt's in 1944 went in 1948 to Dewey who won a small plurality over Truman. House seats remained as during the 80th Congress—4 Democratic and 2 Republican. There were no races for Senate or Statewide office.

Officers, 1948. Governor, William Preston Lane, Jr.; Lieut. Governor, None; Secretary of State, Bertram L. Boone, II; Attorney General, Hall Hammond; State Treasurer, Hooper S. Miles; State Comptroller, James J. Lacy; State Auditor, Daniel L. Clayland, III.

MASSACHUSETTS. A New England State. Area: 7,839 sq. mi. Population: (July 1, 1948) 4,718,000 compared with (1940 census) 4,316,721. Chief city: Boston (capital), 770,816 inhabitants in 1940. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$274,342,000; total expenditure, \$350,961,000.

Legislation. The General Court met in annual session on January 7 and adjourned on June 19 after record total appropriations, including deficiencies and supplements, of \$241.6 million. It made \$200 million in State credit and \$5 million in annual contributions available to localities for public housing for veterans. This program contemplates 20,000 new homes in less than two years, with rentals averaging \$45 per month. Also approved were a \$14.5 million bond issue for general construction and repairs and a \$2.5 million metropolitan district commission bond issue.

State employees received a \$150 cost-of-living bonus plus increases under a job reclassification program, while legislative salaries were raised to

\$2,750 a year. Other enactments legalized the sale of colored margarine; established a youth service board with jurisdiction over juvenile offenders; reapportioned legislative districts; reallocated \$14 million in income tax revenue to localities under a new education formula and provided new aid to municipalities for school construction; expanded workmen's compensation benefits to dependent widows and children; and relaxed certain aspects of women's and children's labor laws.

In the November election, the people approved measures to earmark motor vehicle and motor fuel tax revenues for highway purposes, and to restrict the Presidency to two terms.

Elections. Truman won the 16 electoral votes with a popular majority over Dewey, Wallace, and other candidates greater than that of Roosevelt in 1944. In the Senatorial race, Republican incumbent Leverett Saltonstall was reelected, and the Democrats won 6 seats in the House to 8 for the Republicans, a gain of one for the Democrats. In contests for State office, the Democrats made a clean sweep, electing Paul A. Dever governor over incumbent Robert F. Bradford; Charles Sullivan—Lieutenant Governor; Edward Cronin—Secretary of State; Francis Kelly—Attorney General; John Hurley—Treasurer; Thomas Buckley—Auditor.

Officers, 1948. Governor, Robert F. Bradford; Lieut. Governor, Arthur W. Coolidge; Secretary of State, Frederic W. Cook; Attorney General, Clarence A. Barnes; State Treasurer, Laurence Curtis; State Auditor, Thomas J. Buckley; State Comptroller, Fred A. Moncewicz.

MAURITIUS. A British island colony in the Indian Ocean, comprising the island of Mauritius, about 550 miles east of Madagascar, and a number of dependent islands. Area: 720 square miles, excluding the dependent islands totaling 87 square miles. Population of Mauritius (1946 est.): 428,273 with dependencies totaling 13,463 (in 1944). About 63 percent of the population are Indo-Mauritians. Capital: Port Louis (pop. 66,805). The state-aided Christian churches are predominantly Roman Catholic. Except for some 50,000 Moslems, the natives are mostly Hindus. Education (1946): 128 schools and 40,959 pupils.

Production and Trade. The island produces less than 10 percent of its food requirements. Agricultural crops are chiefly for export. Principal export crop is sugar, of which a total of 330,000 metric tons was produced in 1947. The 1948 crop is estimated at 360,000 to 370,000 metric tons. Rum is an important export. Copra and aloe fiber also are exported. Trade (1946): imports Rs66,700,209; exports Rs49,014,680.

Government. Budget estimates (1948-49): revenue Rs36,355,652; expenditure Rs41,320,891. Under the Constitution of Sept. 15, 1947, the colony with its dependencies is administered by a governor assisted by a legislative council of 34 members (3 ex-officio, 12 nominated, and 19 elected) and a reconstituted executive council. In the general election held Aug. 9-10, 1948, the unexpected results gave 11 seats to Indo-Mauritians, 7 seats to the colored section, and 1 seat to the white section of the population. Governor: Sir Henry C. Mackenzie-Kennedy.

MEDICINE AND SURGERY. Treatment of Coronary Thrombosis with Myocardial Infarction by means of Anticoagulants. In 1938 Solandt, Nassim, and Best suggested as the result of experimental studies in animals that the extension of coronary thrombosis, and the development of mural thrombi might be

prevented by the administration of anticoagulants.

The results of preliminary trials of anticoagulant therapy in clinical cases of coronary thrombosis by Wright and others in 1945 and 1946 were so encouraging that the board of directors of the American Heart Association authorized the formation of a Committee For The Evaluation Of Anticoagulants In The Treatment Of Coronary Thrombosis And Myocardial Infarction. This committee made up of cardiologists from 16 hospitals in the United States has recently reported an analysis of the first 800 cases studied in a series which will ultimately comprise 1,000 cases.

The general plan of the study was as follows: 368 patients admitted to the participating services on even days received conventional treatment and make up the control group. The 432 patients admitted on odd days received anticoagulants in addition to conventional therapy and constitute the treated group. The treated group were given either dicumarol alone or heparin combined with dicumarol in sufficient amounts to significantly interfere with the normal clotting mechanism. When heparin was used the aim was to prolong the clotting time of whole blood to approximately three times the normal value by the Lee-White technic. With dicumarol the minimum prolongation of the prothrombin time necessary to obtain a therapeutic effect was considered to be in a range of from 30 to 50 seconds as measured by the Link-Shapiro modification of the Quick one-stage technic.

It was, of course, considered essential that laboratory facilities adequate for the performance of accurate prothrombin time determination be available; and, as a matter of fact, daily determinations of the prothrombin time were considered absolutely essential before the administration of dicumarol, since it is only by such a careful control of the clotting mechanism that dangerous bleeding tendencies may be avoided.

A study of the patients in the two series showed a striking similarity in regard to age, history of previous infarction, and estimated severity of the present attack so that differences observed with the two plans of treatment seemed to be of significance.

The death rate in the treated group was found to be significantly less than in the control group (15 percent as against 24 percent). Of greater importance was the reduction in the number of deaths which followed one or more thromboembolic complications. Such deaths occurred in roughly 10 percent of the control group but in only 3 percent of the treated group. When the mortality rate was analyzed as it related to weeks of illness, it was found that in each period the death rate for the control patients was significantly greater than that for the treated group.

These figures were considered to indicate that anticoagulant therapy, if not used before, should be begun even as late as the second or third week after a myocardial infarction has occurred or even later if complications have developed. And secondly, that to give maximal protection anticoagulant treatment should be continued for at least four weeks after the last thromboembolic episode. When analyzed by age the greatest benefit in the reduction of the mortality rate was in the group of patients 60 years of age or older. An analysis of the incidence of thromboembolic complications shows that these occurred in 25 percent of the control patients and in 11 percent of the treated patients.

An analysis of the types and locations of thromboembolic complications in the two groups is of interest. Secondary myocardial infarction occurred in 9 percent of the controls and in 2 percent of the

treated patients. Infarction of new areas in the myocardium occurred in 6½ percent of the controls against 2½ percent of the treated patients and pulmonary embolism in 9.4 percent of the controls as against 5.2 percent of the treated subjects. Cerebral emboli occurred in 3.4 percent of the controls and in 1.4 percent of the treated patients. Peripheral emboli developed in 3 percent of the controls and in 1 percent of the treated group. Finally venous thrombosis occurred in 5 percent of the controls and in less than 2 percent of the treated.

"Hence it will be seen that at every site and with every type of complication, those receiving anticoagulant treatment in addition to conventional treatment had a distinctly better chance of escaping thromboembolic complications than those who received the conventional forms of treatment only."

This study seemed to indicate that the hazards of hemorrhage with anticoagulant therapy are not great. Of 30 hemorrhages clinically observed, 15 were mild, 14 were moderately severe, and only one was severe. The authors state "The postmortem observations on hemorrhagic phenomena are not yet ready for presentation, but those examined to the date of reporting presented no alarming picture of the hemorrhagic risks in anticoagulant therapy under proper controls."

Finally it was thought that a considerable proportion of the failures occurring with anticoagulant treatment were due to the fact that the prothrombin time was not adequately prolonged. A review of the cases in which thromboembolic complications occurred during the administration of dicumarol revealed that of the 38 complications only four occurred in patients whose prothrombin time was known to have been maintained at 30 seconds or more for at least three days before the complications appeared. The authors conclude:

"1. On the basis of data compiled from 800 cases of coronary occlusion with myocardial infarction, it is concluded that patients treated with anticoagulants in addition to the conventional forms of treatment present a death rate and incidence of thromboembolic complications during the first six-week period following an attack significantly lower than those experienced by patients treated solely by conventional methods.

"2. Anticoagulant therapy should be used in all cases of coronary thrombosis with myocardial infarction unless a definite contraindication exists.

"3. In the absence of hemorrhagic conditions, the hazards from hemorrhage are not sufficient to contraindicate the use of anticoagulants in coronary occlusion, provided that there are facilities for adequate laboratory and clinical control." (Wright, Marple, and Beck JAMA 138:1074, 1948.)

Antibiotics. Clinical experience during the past year has demonstrated that three new antibiotics are of considerable therapeutic value. These are bacitracin, aureomycin, and chloromycetin. Furthermore, a new compound of streptomycin has increased the range of utility of this drug. These developments will be considered separately.

Bacitracin. In 1945 Johnson, Anker, and Meleney isolated from a mixture of organisms found in the debrided tissues removed from a compound fracture an antibiotic produced by the Tracey strain of *Bacillus subtilis*. This substance was found to be of high antibacterial activity and to have a low toxicity. It was designated as bacitracin. Although the chemical constitution of the material has not yet been determined, crude bacitracin has been sufficiently purified and standardized to permit its clinical use. The potency of bacitracin is assayed by determining the amount that will inhibit growth

in a standardized culture of hemolytic streptococcus. Bacitracin appears to contain a mixture of amino acids with a molecular weight of less than 4,000. Bacitracin is now clinically available for local use.

In 1947 Meleney and his co-workers reported on the local use of bacitracin in various types of surgical infections. They found that it yielded favorable results comparable to penicillin and that, furthermore, in many cases in which penicillin had failed bacitracin was effective. A favorable response was elicited in 88 of 100 unselected cases (JAMA 133:675, 1947).

The drug has a wide antibacterial spectrum, and has been found to be effective against most strains of hemolytic streptococci, nonhemolytic streptococci, coagulase-positive staphylococci, pneumococci, gonococci, anaerobic cocci in general, the gas gangrene group, the bacillus of tetanus, the diphtheria bacillus and diphtheroids, the spirochetes of syphilis and also mouth spirochetes, the actinomycotic group of organisms, and the protozoan parasite, *Endamoeba histolytica*. Bacitracin has little or no action against the Gram negative non-spore forming bacilli.

While in general the range of antibiotic activity of bacitracin is similar to that of penicillin, it appears to have these advantages over penicillin. First, it is not inhibited by organisms which produce penicillinase and is, therefore, more likely to be effective in infections due to bacterial mixtures. Second, it is more slowly eliminated from the body than is penicillin and, therefore, can be given at longer intervals. Third, its effectiveness against bacteria is in direct proportion to its concentration. It appears so far that bacitracin has less tendency to produce allergic or hypersensitive reactions than has penicillin. Although certain strains of bacteria may gradually build up a resistance to bacitracin, this is usually of a low order and is not either as common or as great as the resistance which may occur with penicillin.

The chief disadvantage of bacitracin as compared with penicillin is that up to the present time it has not been obtained in a pure crystalline form. The still relatively crude product now available may in certain cases produce damage to the kidneys when the drug is injected systemically in man. As compared to streptomycin, bacitracin has a wider range of antibacterial activity and there is less likelihood of the development of resistance to it during the course of treatment. However, it is not effective against the Gram negative aerobic non-spore forming bacilli against which streptomycin is ordinarily effective.

Bacitracin is absorbed from the gastro-intestinal tract poorly, and for that reason effective concentrations of the drug are built up in the bowel. It appears that bacitracin given by mouth may be effective against susceptible intestinal organisms, especially *Clostridium welchii* and intestinal streptococci. Early clinical trials suggest that the drug may be of value in minimizing the activity of the intestinal flora before surgical operations on the bowel if it is combined with orally administered streptomycin. Furthermore, in a few cases it has been found to be effective in chronic ulcerative colitis and in regional ileitis. It also has been given in both the active and chronic stages of amebic dysentery.

Because of the occasional nephrotoxic action of systemically administered bacitracin, at the present time the routine use of the drug is recommended only where it may be applied locally.

Recently a group of workers from five hospitals

in the United States have reported on the result of the systemic administration of bacitracin (Meleney, et al., *Annals of Surgery* 128:714, 1948). This preliminary study dealt with 105 cases of surgical infections treated with systemically administered bacitracin in New York, Cincinnati, New Orleans, San Antonio, and Philadelphia. These represented a wide diversity of conditions but for the most part consisted of cases which had failed to respond to the sulfonamides and to the other antibiotics.

There was an over-all favorable response in about 70 percent of the cases treated, and in about 20 percent the results were considered dramatic. The most dramatic results were in three cases of extensive progressive bacterial synergistic gangrene, all of which responded in 72 hours. Excellent results were also obtained in human bite infections and in cases of meningitis. The highest percentage of favorable results, 88 percent, was obtained in cases of cellulitis. Results were unfavorable in cases of thrombophlebitis and brain abscess.

In the group responding most favorably to bacitracin the causative organisms were for the most part in the staphylococcal and streptococcal groups. In the 30 percent of cases in which the results were questionable or frankly nil, it was considered that the organisms were for the most part resistant to bacitracin.

In this study evidence of mild renal damage (transient albuminuria) was observed in most of the patients. With some of the later preparations of bacitracin in which the drug was produced commercially on a larger scale by the "deep tank method" the evidences of nephrotoxicity were greater. It is suggested that if the drug be used systemically in its present crude form, close watch be kept for any evidence of renal damage, and should any sign pointing to such damage occur, treatment with bacitracin should be discontinued. It is hoped that further purification of bacitracin will eliminate the nephrotoxic principle without lessening its antibacterial action.

Aureomycin. A new antibiotic, aureomycin hydrochloride, a crystalline material obtained from the mold *Streptomyces aureofaciens*, has been studied extensively during the past year and promises to be of great value. Aureomycin was first described by Dr. B. M. Duggar, Lederle Laboratories Division, American Cyanamid Company. At the present time its chief value seems to be that it is effective against rickettsial disease, in contrast to penicillin and streptomycin. Besides this, aureomycin has two other great advantages: it is effective when administered orally, and the development of resistance to the antibiotic by bacteria during the course of treatment is low or absent.

The rickettsial diseases in which aureomycin has been used effectively include, Rocky Mountain spotted fever, Q-Fever, typhus, Rickettsialpox, lymphogranuloma venereum, and psittacosis (unpublished data by S. C. Wong and H. R. Cox). Studies of aureomycin therapy of Rocky Mountain spotted fever by Ross, et al., from the Research Foundation of Children's Hospital, Washington, D.C., and the Department of Preventive Medicine, the Johns Hopkins University School of Medicine indicate that aureomycin is the most effective agent in the treatment of this disease.

Its efficacy was found to be superior to that of paraaminobenzoic acid which had been the drug of choice. Thirteen patients were studied during the summer of 1948. The temperatures subsided rapidly under aureomycin therapy within an average period of 2½ days, and striking clinical improvement was observed in all the patients. No

toxic effects from the drug were noted. (JAMA 138:1213, 1948.)

Equally good results have been obtained in a few cases of Q-Fever, typhus, and Rickettsialpox which have been treated with aureomycin. Wright and his co-workers made an intensive study of the use of aureomycin in lymphogranuloma venereum, and concluded that this antibiotic is a specific form of therapy for the "virus" as well as being highly effective against the secondary bacterial invaders. Aureomycin was stated to be the treatment of choice in all cases of lymphogranuloma venereum infection with surgery, wherever mechanical conditions demand it.

Aureomycin has also been found to be effective in certain instances of the clinical syndrome of undetermined etiology designated as primary atypical pneumonia. While its unique ability to control rickettsial diseases appears to be the chief value of the drug at the present time, aureomycin has also been found to be effective against many coccic and bacillary forms. Finland and his co-workers at the Boston City Hospital have recently reported the use of this antibiotic in 100 cases of a variety of bacterial infections.

Studies of the sensitivity of bacteria to aureomycin show that strains of hemolytic streptococci, pneumococci, gonococci, and meningococci were almost completely inhibited by aureomycin in very small concentrations (1 microgram per cubic centimeter or less). Staphylococci and most strains of gram-negative bacilli, including typhoid and other *Salmonella*, were inhibited by 25 micrograms per cubic centimeter or less. The only really resistant strains observed were those of *Proteus vulgaris* and *P. pyocyanus*. On a weight basis aureomycin was less effective than penicillin against most of the coccic organisms, but was about as effective as streptomycin against most of the gram-negative bacilli.

Clinical infections studied included gonococcal urethritis, pneumococcal pneumonia, meningococcemia, typhoid fever, *Salmonella* infections, and urinary tract infections. In the cases studied a good result was obtained in 64, a doubtful result in 28, and in 15 cases the drug was considered to have failed. At the present time the indications for aureomycin therapy in other than rickettsial diseases would seem to be in infections caused by penicillin resistant gram-positive cocci and in infections caused by the coli-aerogenes group of bacteria, including those of the urinary tract and peritonitis with or without bacteremia. Aureomycin also appears to be the antibiotic of choice in the treatment of acute brucellosis.

At the present time the value of aureomycin therapy has not been clearly defined in *Salmonella* infections, including typhoid fever, and it appears that penicillin is still the treatment of choice in infections caused by gram-positive cocci which are not penicillin resistant.

Aureomycin also appears to be effective in certain bacterial and viral-like infections of the eye. All the laboratory and clinical studies suggest that the toxicity of aureomycin is minimal. For all practical purposes it may be stated that aureomycin is not toxic in therapeutic dosage except for producing occasional nausea and diarrhea. It is not as yet known whether or not there is any allergy to the antibiotic.

Treatment of Acute Leukemia in Children with Aminopterin. The acute leukemias of childhood are diseases of unknown origin involving primarily the blood-forming organs and the blood. They are characterized clinically by enlargement of the

lymph nodes and of the spleen, usually by a great increase in the number of white blood cells in the circulating blood and by infiltration of various viscera with abnormal cells of leukemic origin. The disease usually progresses rapidly and terminates fatally in a comparatively short period of time. None of the methods of treatment employed up to this time have been of any significant value.

In June Farber and his associates at the Children's Medical Center in Boston reported their interesting experiences with the treatment of a group of children with this disease with a folic acid antagonist, aminopterin. Farber, having previously observed that the injection of folic acid conjugates seemed to accelerate the leukemic process, decided that the trial of chemicals which were antagonistic to folic acid might be justified in this disease. The most powerful antagonist to folic acid yet discovered is aminopterin (4-aminopteroyl-glutamic acid).

Of 16 infants and children with acute leukemia treated by Farber and his associates with aminopterin, 10 showed clinical, hematologic, and pathological evidence of improvement of important nature of as long as three months duration at the time of their report. Six patients did not respond well, and of these four were dead at the time of the report. Observations in the group who responded showed that aminopterin had a marked effect upon the leukemic bone marrow and upon the immature cells in the peripheral blood and very probably upon leukemic deposits in the viscera as well.

Under treatment with aminopterin there was a tendency in this group of patients for the abnormal changes in the peripheral blood and in the bone marrow to revert to a state much more nearly normal. This improvement in the hematologic aspect of the disease was associated with a corresponding improvement in the clinical condition of the patients. Some children who were practically moribund at the beginning of treatment were brought back to what seemed to be a clinically normal state with the aminopterin injections.

While these results are striking, the authors emphasize very strongly that the remissions so far obtained have been only temporary; and that it is impossible to state whether or not the substance will be of value for a longer period than that covered by their studies. They also emphasize the fact that the toxic effects of aminopterin, which may include severe stomatitis, may make continued use of the drug impossible. It should also be stated that spontaneous remissions of short duration are occasionally observed in the course of untreated acute leukemia. At any rate the findings of Farber and his co-workers is of great interest.

As they state "no evidence has been mentioned in this report that would justify the suggestion of the term 'cure' of acute leukemia in children. A promising direction for further research concerning the nature and treatment of acute leukemia in children appears to have been established by the observations reported" (*New England Journal of Medicine* 238:787, 1948).

Use of Human Arterial Grafts in the Treatment of Certain Cardiovascular Defects. One of the most interesting and important surgical reports of the past year was that of Gross and his associates, of the Harvard Medical School and the Children's Hospital in Boston, on the use of human arterial grafts in the treatment of cardiovascular defects. In an attempt to devise a technical procedure which would help in bridging gaps in the arterial system resulting from injury or disease, Gross and his as-

sociates studied in dogs the possibility of transferring a segment of a large artery from one animal to another. Studies of three types were made.

In the first a segment of the aorta was removed from a donor animal and implanted within a few hours into a recipient dog. It was found that when the aortic segments were kept moist and in a common domestic refrigerator for only a few hours there was a very high probability of the survival of the graft in the recipient animal. After a period of 6 hours only about two-thirds of the grafts survived. After 18 hours the vast majority of the dogs died from thrombosis in the graft or from rupture at the suture line. In the second group the excised vessels were rapidly frozen to $-72^{\circ}\text{C}.$, and were stored at this temperature for periods varying from 2 to 35 days before being implanted into recipient dogs. Of 12 grafts of this type only one was at all successful, and Gross was led to believe that freezing would not be a satisfactory method for preserving arterial grafts.

In the third study the excised aorta segments were stored in flasks containing an electrolyte solution to which had been added glucose, dog serum, a buffer, penicillin, streptomycin, and a phenol-red indicator. Each flask was stored in an icebox, the temperature of which did not range beyond $1^{\circ}\text{--}4^{\circ}\text{C}.$ The tissue-culture studies on such vessels showed them to be viable for as long as 35 to 40 days in most cases. Transfer of the graft was carried out in 24 animals with successful results. In the oldest experiments the grafts were known to be carrying blood for periods of as long as 10 months.

With this careful experimental study as a background, Gross secured segments of arteries obtained within a few hours from human beings who had died in automobile accidents and stored them for use whenever the need might arise in a human patient. At the time of his report 9 such grafts had been used to bridge gaps between the aorta and the pulmonary artery in cases of cyanotic heart disease, which did not seem suitable for a treatment by the more commonly employed technics of Blalock or Potts.

Two patients in this group died from causes not attributable to any defect in the graft, and in the 7 survivors the grafts were apparently functioning normally and carrying blood for a period of as long as 5 months. Gross also successfully used human aortic transplants in the treatment of 3 patients with coarctation of the aorta in whom the defect produced by the excision of the stenotic segment was too great to be bridged by an end-to-end suture.

Although none of Gross' patients have been followed for any considerable period of time, the early results certainly suggest that this method of transplantation of arteries in man represents another fundamental advance in the field of cardiovascular surgery. (*New England Journal of Medicine* 239:578, 1948.)

Technical Advances in Surgery. During the past year several important technical suggestions have been made, especially by a group of younger American surgeons. Several of these were reported at the annual meeting of the Society of University Surgeons and deserve brief description.

Ravitch of Johns Hopkins reported that he had employed successfully in man the ingenious technic which he had previously worked out in animals by means of which after excision of the entire colon, the terminal ileum could be brought through the preserved anal sphincters and anastomosed to the perianal skin.

This technic, which permits ablation of the colon and yet at the same time allows the preservation of sphincteric function, seems to represent a great advance in the treatment of patients who demand colectomy for non-malignant disease. It obviates the necessity of a bowel opening on the abdominal wall, with all the difficulties which such an opening involves. These difficulties are especially great when the ileum drains on the skin of the abdominal wall. Ravitch has performed 5 such procedures for chronic ulcerative colitis and one for familial polyoid adenomatosis of the colon. There have been no deaths, and he states that the results thus far have been encouraging. (*Surgery* 24:170, 1948.)

Swenson and Bill of the Children's Hospital in Boston described a method of resection of the rectum and rectosigmoid with preservation of the anal sphincters. They believe this technic will be useful particularly in Hirschsprung's disease. It is their opinion that the great dilatation of the colon observed in this condition is due to spasm of a segment of the rectum or rectosigmoid which produces a functional obstruction and not, as had formerly been thought, to any intrinsic disease of the musculature or innervation of the distended segment of the gut. Their operation has been applied successfully in three children. (*Surgery* 24:212, 1948.)

Longmire and Sanford of Johns Hopkins described an exceedingly ingenious procedure for the relief of obstruction of the common bile duct in cases in which extensive stricture or scar, advanced neo-plastic disease, or congenital atresia made direct anastomosis of the duct to the intestine impossible. The operation described by Longmire and Sanford consists essentially of excision of the left lobe of the liver, identification of the large intrahepatic duct which normally carries bile from this lobe, and anastomosis of this isolated duct to a loop of the small bowel.

They reported that they had employed this procedure successfully in one case of recurrent obstruction of the common bile duct due to acquired stricture. Also the procedure had been attempted in 3 cases of congenital biliary atresia in which previous exploration had shown complete absence of the extrahepatic biliary system. Unfortunately in these cases the atretic process seemed to be generalized since they were not able to find a duct large enough for an anastomosis even after resection of the left lobe of the liver. (*Surgery* 24:264, 1948.)

Gross described a two-stage procedure for the treatment of large omphaloceles. These are anomalies of development in which there is failure of closure of the abdominal wall in the region of the umbilicus. Through a large defect at the umbilicus there protrudes a thin walled hernial sac which contains varying amounts of the abdominal viscera. In the past small omphaloceles have been repaired successfully but larger ones containing the liver together with other viscera have not been repaired successfully because the undeveloped abdomen of the infant has not been large enough to contain the viscera which lies in the sac. In the infants in whom operation has not been possible death has usually occurred within a few days due to necrosis of the amniotic sac and the development of peritonitis.

The novelty of Gross' contribution lies in the fact that he makes no attempt to replace the viscera in the abdomen but merely covers the sac, by suturing over it the skin which has been widely undermined, in order to obtain sufficient laxity to permit suture without tension. Interestingly enough in-

phants so treated do not develop peritonitis or intestinal obstruction and although their appearance is grotesque because of the huge umbilical protrusion, they get along quite well. Gross found that in 6 months or so there was sufficient growth and development of the abdominal cavity to permit replacement of the viscera without difficulty and repair of the abdominal wall. Three cases in which this technic had been employed successfully were reported. (*Surgery* 24:277, 1948.)

—H. WALTON COCHRAN

MELLON INSTITUTE. The aim of Mellon Institute is the creation of new knowledge by scientific investigation for the benefit of mankind, in accordance with the institution's definite fellowship system. According to this procedure the researches are restricted to major problems of the pure and applied sciences and particularly chemistry—problems that require protracted periods of time for solution by specialists. The Institute was founded by Andrew W. Mellon and Richard B. Mellon in 1913 and is located at 4400 Fifth Ave., Pittsburgh 13, Pennsylvania. It is a non-profit institution. Director, Edward R. Weidlein; Assistant Directors, E. Ward Tillotson, William A. Hamor, George D. Beal, Harry S. Coleman, L. H. Cretcher, G. H. Young.

The industrial research of the Institute is organized on a contract basis, the problem being set by a person, firm, or association interested in its solution, the scientific worker being found and engaged by the Institute, and an industrial fellowship being assigned for a period of at least a year. Each holder of an industrial fellowship is given broad facilities for accomplishing the research entrusted to him and all results belong exclusively to the donor of the fellowship. Only one investigation is conducted on a specific subject at any one time and hence there is no duplication of the research activities of the fellowships in operation. At present there are 75 of these industrial fellowships, which employ 490 scientists and engineers. The projects range from ferrous metallurgy and refractories to novel pharmaceuticals or medicinal agents, synthetic rubber, new plastics and textiles, and improvements in foods and other essential commodities. All the work during wartime related to urgent military problems. The Institute's department of research in pure chemistry is concentrating on the synthesis of new chemotherapeutic agents. There is also a strong department of research in chemical physics.

MENNONITES. A religious group founded in Switzerland in 1525 in protest against ecclesiastical rule and rigid liturgy. In the United States the Mennonites began arriving in 1683 and settled in Germantown, Pa., ultimately dividing into 16 bodies.

Mennonite Church. This is the largest group of Mennonites in the U.S., having a total membership of 54,729. The 420 churches are served by 1,050 ordained men. A total of 1,880 students is enrolled in 3 church colleges, and 71,650 persons are enrolled in Sunday or Bible schools. The church maintains 16 institutions for care of the aged, orphans, and the sick.

MERCURY. Domestic production of mercury continued on a decline that began in the latter part of the war. Production in the first nine months of 1948 was only 12,050 flasks (76 lb. each), about half 1947 production, 23,244 flasks. At year end, three mines, two in California and one in Oregon, accounted for 96 percent of production. Increasing consumption, 35,100 flasks in the nine month period, compared with 35,581 flasks in 1947, was

served by a higher volume of imports. These increased to 32,596 flasks in nine months, compared with 10,228 flasks in 1947.

Domestic mines have been gradually forced out of production by the low price set by Mercurio-Europeo, the Spanish-Italian cartel, which established a price of \$56 a flask, Mediterranean ports. U.S. duty is \$19 for the metal plus 25 cents for the flask. Ocean freight and insurance cost about \$3. In December, 1948, the cartel raised its price \$14 a flask, bringing the New York price to a range of \$90 to \$92.

—JOHN ANTHONY

METEOROLOGY. **January-April.** The first four months of 1948 were characterized by periods of above normal temperature punctuated by several severe cold waves. Unusually warm weather prevailed throughout the country in the first half of January. This was brought to an end east of the Rockies by outbreaks of cold polar air on the 15th-16th and again on the 18th, which brought below-freezing temperatures to all southern areas except extreme southern Texas and Florida. The lowest temperatures of the winter were recorded in the Lake region, and snow, measuring a foot in depth in portions of Mississippi and Tennessee, covered much of the South. Severe cold continued in sections east of the Rockies through the remainder of January and the first half of February.

However, warm weather continued in the Mountain and Pacific States until the closing week of January, resulting in the warmest January of record in many portions of that area. During the last week of January and the first half of February low temperatures prevailed in the Far West as well as in the eastern portions of the country. Vegetable and citrus crops in southern Arizona and California were damaged by frosts. On the 12th of February sub-zero temperatures were recorded in every western State. Generally mild weather occurred in the latter half of February. The early days of March brought two rapidly moving cold air masses which spread over practically the entire country.

New low temperature records were set in the Middle West, Arizona, and New Mexico. Freezing temperatures were recorded in Brownsville, Tex., and snow fell in the Rio Grande Valley. A sharp rise in temperature followed this cold wave east of the Rockies. The remainder of the month was marked by changeable conditions although temperatures generally averaged above normal. The month of April was notable for above average temperatures which prevailed over the entire country with the exception of the Northwest, New England, and the Middle Atlantic States. However, during the first week damaging frosts occurred in the Middle West and southern Mountain States, and freezing temperatures were recorded along the Atlantic Coast as far south as Virginia.

Precipitation in January was above normal in Florida and along the Gulf and Atlantic Coasts, and near normal to deficient in all other areas. Drought conditions and high temperatures in Nevada, southern California, and western Arizona resulted in a much below normal mountain snow-pack. Heavy snows fell in the Ohio Valley and in New England. In February precipitation, much of which occurred as snow, was above normal over a considerable area of the country except for the Atlantic Coastal States.

March was characterized by light, though widespread, rainfall over most sections except the Southeast and central Gulf States where large excesses were accumulated. In April the heaviest precipitation occurred east of the Mississippi River, while

dry, windy weather caused dust storms in the Southwest and in the Great Plains. General above normal precipitation in California much improved the outlook for the water supply.

Flooding was reported on several streams in the Ohio Valley in January. A number of damaging floods occurred in March causing over a million dollars' worth of damage in southern Michigan and driving hundreds of families from their homes in the vicinity of Wilkes Barre, Pa. The Ohio River and many of its tributaries overflowed during April, and there was also some flooding in Mississippi and northern Florida. The rapid melting of a heavy snow cover caused the Red River in the North to reach the highest stage reported in many years.

There were a number of severe storms in the early months of 1948. The first to strike in January caused much damage from severe icing and high winds in the Middle West; brought traffic-halting snow to portions of Missouri, Iowa and Wisconsin; gave heavy rains over the Ohio Valley; and resulted in thunderstorms and tornadoes in several mid-western and southern States. Total losses from this storm were tremendous; damage resulting from high winds and icing in Illinois alone were believed to approach \$3,000,000.

Severe winter weather east of the Rockies during the latter part of the month, attended by blizzards, heavy snows, and low temperatures, caused much human suffering, including a large number of injuries and several deaths. Monetary losses were very high, approaching \$20 million in the State of Arkansas as a result of freezing and thawing damage to roads, and ice damage to forests and utilities. In February glaze and ice storms were numerous but caused only minor damage. An unusually heavy snowstorm occurred in Oregon on the 5th and 6th when a total of 16 inches of snow fell in 20 hours at The Dalles.

March was notable for a number of destructive tornadoes. On the 19th a storm which moved from the central Great Plains to the Lake region was marked by no fewer than a score of tornadoes; the most severe occurred at Bunker Hill, Ill., and vicinity, killing 24 persons, injuring 295, and causing about \$3 million damage. High winds with gusts up to 100 m.p.h. caused an estimated \$4 million damages in Indiana, many millions in Ohio, and about \$750,000 in New York. Total tornado and wind damage resulting from this storm probably exceeded \$10 million. On the 20th a tornado struck at Will Rogers and Tinker Air Fields near Oklahoma City, Okla., causing over \$10 million damage, and in less than a week a second tornado struck Tinker Field resulting in damages exceeding \$6 million.

Another storm accompanied by tornadoes, hail, sleet, freezing rain, and heavy snows occurred in the North Central States on the 26th and 27th. As a result, total March storm damage was unusually high, \$30 to \$40 million, with tornado damage alone exceeding \$28 million. The most destructive storms in April occurred in California and Arkansas. In a portion of the San Joaquin Valley wind, dust, and rain caused \$8 million in damage to crops and \$2 million to property. A hailstorm, with some hailstones of $3\frac{1}{2}$ inches in diameter reported, caused more than a million dollars' worth of damage in Union, Ouachita, Calhoun, and Bradley counties in Arkansas.

May-August. Temperature fluctuations during the second period of the year were rather marked. The weather in May was cool and damp in the Pacific and Mountain States and in the Northeast. The

abundant moisture was favorable for agriculture in the Pacific States but delayed planting in New England, and was detrimental to crops and livestock in Idaho and western Montana. Although temperatures averaged below normal in the central regions of the country, the latter half of the month was warm and sunny. Some record maximum temperatures were recorded in North Dakota and Wyoming and along the middle Atlantic Coast.

The mild weather continued into the first half of June except in New England where temperatures were below normal. During the latter half below normal temperatures prevailed over the country except for the Pacific Coast, the South, and Southeast. Some frost damage was reported from north-central Wisconsin on the 15th, and a minimum of 32° F. was recorded at Phillipsburg, Pa., on the 17th. July's temperatures were very close to normal over most areas of the country with the exception of the Northwest where snow and frost occurred at high elevations in Utah and southeastern Idaho on the 27th and 29th, and the second lowest July temperature of record for Montana was reported at West Yellowstone on the 18th.

In August temperatures continued below normal in the Pacific States, but the most outstanding feature of the month's weather was the heat wave which spread over the Lake region and the Northeast during the last decade of the month. Maximum temperature records were established for August at New York, N.Y. with 103° F.; Buffalo, N.Y. with 99° F.; and Nantucket, Mass. with 95° F. A maximum temperature of 107° F. at Mather, Wis., equaled the State record.

Precipitation was heavy in many sections of the country in May, and unusually heavy in Washington, Oklahoma, Maryland, and Delaware. This was rated the wettest May of record in Washington and Delaware, and the second wettest in Maryland. Most precipitation which occurred in June was of the thunderstorm type with much local variation. Exceedingly heavy rains fell in Nebraska, Kansas, and Oklahoma, but below normal amounts were recorded in the South, New England, through the lower Ohio Valley and much of the Lake region, in northern North Dakota, and along the coast of Washington and central California. Heavy rains partially relieved an acute drought in southeastern Louisiana, and lesser droughts in Minnesota and Illinois.

Again in July unusually heavy rain occurred in Kansas, and above normal totals were accumulated in the Northwest, the Ohio Valley, the Appalachians, and the extreme Southeast. Light to extremely light precipitation was reported from the other sections of the country. August again bestowed extremely heavy rainfall on Kansas, and above normal falls were reported from the Great Plains, the northern Rocky Mountain States, and the Pacific States. East of the Mississippi and in most areas of the Southwest the monthly totals were below average.

Serious floods made spectacular news all during this period. In May a devastating flood resulting from heavy rains and melting snows on the upper reaches of the Columbia River and its tributaries, and along most major streams in northern Idaho and western Montana, took an undetermined number of lives. Thousands of homes and thousands of acres of crops were destroyed and tremendous damage done to other property. Preliminary estimates show \$3 million in damages in western Montana, over \$7 million in northern Idaho, and approximately \$21.5 million near Portland, Ore. In June,

Nebraska reported more than \$4 million loss in flood damage. Torrential rains occurring during the period 20-24 of June resulted in destructive floods in various parts of Oklahoma. Several lives were lost, and estimated damages exceeded \$4 million.

The Columbia River remained at high stages during the first part of June taking additional lives and causing property damage of many millions of dollars. Estimates of total property damage from this flood place the losses at more than \$100 million. Several hundred thousand dollars additional damage was suffered in northern Idaho and western Montana. As a result of the unusually heavy rains in Kansas in July most of the rivers in the State overflowed, some reaching record-breaking stages. Losses of more than \$13 million were suffered, more than half to growing crops. More than 10 inches of rain fell in 3 hours over a considerable area along the Hocking River in Ohio on the 22nd; resulting flood loss was estimated at about \$2 million. Again in August floods which caused nearly a million dollars' worth of damage occurred in southern and western Kansas. Northern Arizona experienced flash floods which caused some damage.

Several storms which occurred during May left total losses of at least \$15 million; tornado damage alone amounted to \$5.5 million. June was notable for an unusual number of destructive storms, but relatively few lives were lost. On the 10th a rain and hailstorm in Douglas County, Wash., caused \$2 million damage. Some \$4.5 million worth of damage was done by hail and wind in Cheyenne County, Kans., on the 13th, and on the 15th wind, hail, and lightning in three Kansas counties caused an additional \$2,175,000 damage. Total storm losses in Nebraska for the month of June exceeded \$7.5 million, and for the country as a whole tornado damage alone amounted to over \$3.5 million. Storm losses during July were lower than usual, for July storms, though numerous, were rarely severe. Hail caused a million dollars in damages in Colorado on the 15th, and losses of \$250,000 were sustained at Nashville from thunderstorms on the 22nd, and in Iowa from a tornado on the 29th. Damage from hail was very high in August. Montana suffered an estimated \$7.5 million in damages from several hailstorms, and in portions of northern Illinois on the 17th a number of hailstorms occurred, each causing damage of a million dollars or more.

September-December. In the last third of the year temperatures showed a wide variability. September's average temperatures were generally above normal especially in the North Central region where, during the second and third weeks, departures averaged as high as 15° F. above normal. Unusually cold weather occurred in the Middle Atlantic and New England States in the first week of September and again in the third week. From the 15th to the 17th, killing frosts occurred in the St. Lawrence River Valley and Adirondack region of New York and at higher elevations in New England. Generally warm weather prevailed west of the Rockies during most of the month, but in the last week an influx of cool Pacific air brought temperature averages to below normal and killing frosts occurred on the 24-25th at higher elevations in the Rocky Mountain region. Frosts also occurred in the northeast.

This period of cool weather carried over into the first two weeks of October. Killing frosts were general in most northern regions during the second week, and also caused some damage to vegetation in portions of Arizona and New Mexico. From the

16th to the 19th freezing temperatures in middle portions of the country reached as far south as northern Louisiana and Mississippi, resulting in one of the earliest killing frosts on record in those States.

In November temperatures in the eastern parts of the country and extreme north central areas were considerably above normal, with departures in the Lake region and northeastern States averaging about 8° F. above normal. Snow began to accumulate in the Rockies, and in the Far West cold Polar air masses accompanied by snow and wind brought subzero temperatures to northern and central portions of the region, and occasionally frost and freezing to vegetable and citrus areas of the extreme south. Near the end of the month frost occurred in the Rio Grande Valley in Texas as far south as Brownsville, and a low of 25° F. was recorded at Eagle Pass. A severe snow storm occurred in the Central Great Plains during the period 17th to 20th but temperatures remained just below freezing.

The cold weather was persistent in the Far West during December. Unusually mild weather prevailed in the East with the exception of Florida where a departure of 6° F. below normal was recorded. Extreme southern Texas and extreme northern Maine also showed minus departures. Although temperatures in the middle portions of the country averaged near normal, they showed much fluctuation, plus departures in Montana ranging from 6° to 9° F. Fairmont, Minn., reported a record-breaking high temperature of 86° F. on the 3rd.

Precipitation in September was generally light except in scattered areas in the East and Northwest, and in the central Gulf area. Extreme southern portions of Louisiana, Mississippi, and Alabama all received twice the normal amount of rain. October was very dry. Only Oregon, Arizona, Florida, and Virginia reported above-normal rainfall; Montana received only 17 percent of normal amount. Precipitation was above normal in November in the Mississippi Valley, Washington, western Montana, and the central Rockies, and eastern portions of the country except Florida. Heavy rains occurred from Arkansas and Louisiana to the Atlantic Coast, especially during the latter part of the month. Montgomery, Ala., recorded more than 8 inches of rain in 24 hours, and the State average precipitation was 459 percent of normal. The southwestern portion of the country was exceptionally dry, Arizona received only 2 percent of the November rainfall, and many stations in that State and in southern California received no measurable amounts. December precipitation was above normal in Atlantic Coastal States from New Jersey to South Carolina, the Ohio Valley, portions of the Middle West and the Mountain States, and in scattered areas of New England and along the Pacific Coast. Most of this precipitation occurred in the form of snow except in the southeastern States. Tallahassee, Fla., and nearby stations reported heavy rainfall on the 9th, with 24-hour amounts exceeding 4 inches.

Three hurricanes affected the mainland of the United States during September. The first skirted the Atlantic Coast, resulting in heavy rains from Florida to North Carolina. The second moved inland from the Gulf of Mexico over southeastern Louisiana on the 4th, and held a northerly course through western Mississippi and Tennessee into southern Illinois where it dissipated on the 6th. Heavy rains occurred along its path in southern Louisiana and Mississippi, and total damage was estimated at \$900,000. There was no loss of life.

On the 22nd a severe hurricane accompanied by heavy rain and winds of more than one hundred miles per hour moved across southern Florida. Three people were killed and 45 hospitalized. Considerable flooding occurred in the Lake Okeechobee region where 10 to 11 inches of rain fell at some stations. Crop damage was considerable. Total damage from this hurricane was estimated at \$6,500,000. On the 5th of October southern Florida was again struck by a hurricane, the center of which passed over Miami. There were no fatalities but damage was estimated at \$5,500,000.

Losses from other storms were unusually low in October. The two most damaging storms were a tornado in Florida on the 5th—a side issue of the hurricane—which caused \$100,000 in damages, and a wind and hail storm in Texas on the 31st resulting in \$180,500 worth of damage. Total losses for the month from local storms amounted to less than \$500,000. There were no serious floods. During the first week of November, several windy days in the Great Plains and Far West caused some damage along the northern Oregon coast on the 3rd, local damage to California citrus crops on the 4th, and severe dust storms in western Oklahoma on the 7th. One of the most severe early season snow storms of record in the central Great Plains occurred on the 17th-20th. In Kansas and central and northeastern Nebraska, where 4 to 20 inches of snow fell, gale force winds sometimes reaching speeds of 70 m.p.h. piled up drifts 20 feet deep. Railroads and highways were blocked, motorists stranded, and communications disrupted. Many communities were completely isolated, and heavy losses of livestock were suffered. Snow in huge drifts also covered parts of eastern Colorado, southeastern South Dakota, northwestern Iowa, and extreme southwestern Minnesota. In eastern Colorado the high winds caused additional damage to small grains by moving soil. At least 9 lives were lost in this storm and millions of dollars of damage incurred. Destructive tornadoes hit Mississippi on the 5th and again on the 18th. Nine people were killed and more than 60 injured; damage amounted to \$700,000. In all, more than \$2,500,000 in damages were suffered throughout the country in November in addition to the damage from the severe snow described above.

During the period December 3rd-6th a storm which moved northeastward from southern California developed great intensity over the Great Plains and the Lake region. Strong winds and heavy snows in the central Rockies gave Salt Lake City a record December fall of 11 inches on the 4th. The strong southerly winds preceding this storm caused numerous dust storms in the central and lower Great Plains. During the second week the northern Cascade and Rocky Mountains received heavy falls of snow. Stampede, Washington, reported a total of 53 inches for the week. In the mountains of California heavy amounts of snow which fell during the third week of December improved the prospects for irrigation water for the summer of 1949. A general snowstorm in the Northeast brought more than 19 inches of snow to New York City, the third greatest fall of record. In the southeastern States heavy rains which fell during the latter part of November caused severe flooding in Mississippi, Oklahoma, and Georgia, with streams overflowing in coastal regions from Mississippi through Virginia in the first week of December. Heavy rainfall in Oregon during the second week caused moderate overflow along the Willamette River.

Weather conditions were generally favorable

for agriculture during the last period of the year. Most crops and livestock in the eastern parts of the country were in satisfactory condition, but cold weather had caused some shrinkage of livestock in the West and some damage to citrus. At the end of the year small grains were well protected by snow cover in the West, although the Northeast and much of the Lake region were unusually bare for this time of year.

—F. W. REICHELDERFER

METHODIST CHURCH, The. In the somewhat complex organization of the 13¼ million members of Methodist churches throughout the world about three out of every four belong to that branch centering in the United States and known as "The Methodist Church." It was formed by the reunion in 1939 of three bodies, all stemming from the Methodist Episcopal Church, organized in 1784 in Baltimore under the leadership of emissaries of John Wesley, of London, founder of the movement. Division in one case, over lay-participation and the episcopacy, resulted in 1828 in the Methodist Protestant Church. The other, over slavery, produced the Methodist Episcopal Church, South, in 1844.

These churches, in merging a decade ago, combined to form America's largest Protestant body with a domestic membership, including preparatory members (592,675) of 9,243,737 and an additional 875,000 overseas membership in the churches of mission lands. Also, closely affiliated are the autonomous Methodist churches of Brazil, Japan, Korea, and Mexico, totaling 116,000.

There are, however, in the United States other independent Methodist bodies, totaling 1,900,000 members. The major ones are the African Methodist Episcopal Church (863,755), the African Methodist Episcopal Zion Church (489,244), and the Colored Methodist Episcopal Church (381,000).

The parent body of Methodism, the Methodist Church in Great Britain, numbering 900,000 has fostered the organization of other independent bodies in South Africa, Australasia, and New Zealand. Since the word Methodist in the United States most frequently is used in reference to "The Methodist Church," described above, from this point the facts and figures following pertain to this body.

Being a quadrennial year, 1948 records the denomination's General Conference held in Boston in April, the supreme law and policy making authority. The episcopal address of the 63 bishops, effective and retired, reviewed accomplishments of the past four years, notably the successful "Crusade for Christ," appraised the "state of the church" and pointed the direction for future movement. The 754 delegates, half of them laymen, considered 1,511 proposals for legislation. Their enactments, as usual, resulted in a new book of Discipline.

Primary action of the Conference was the launching of a four-year program, "the Advance for Christ and His Church." Bishop W. C. Martin of Dallas, Tex., is Chairman and Dr. E. Harold Mohn the Executive Director, with headquarters in Chicago. The movement calls for a teaching and preaching endeavor to deepen understanding and commitment to "Our Faith, Our Church, Our Ministry, and Our Mission." Study of the World Council of Churches is first on the syllabus, to be followed by preaching missions of several months on each emphasis. Expressional aspects of the Advance will be a 33 percent increase in benevolent giving, to meet rising costs, plus heavy underwriting by persons and groups of specific missionary projects, home and foreign, and overseas relief.

New Bishops. Changes in the episcopacy, earlier made by the General Conference, since unification follow a "home rule" principle. In the United States they are now effected by the six Jurisdictional Conferences, and abroad by Central Conferences, which meet quadrennially following the General Conference.

Bishops retiring were H. Lester Smith, Columbus, O.; Titus Lowe, Indianapolis, Ind.; Raymond J. Wade, Detroit, Mich.; Edwin F. Lee, (deceased) Singapore; Wilbur E. Hammaker, Denver, Colo.; Charles C. Seelman, Dallas, Tex.; James H. Straughn, Pittsburgh, Pa.; Lewis O. Hartman, Boston, Mass.; and D. D. Alejandro, Manila, P.I.

Two new episcopal areas were added to the 33 into which the United States had been divided for administrative purposes, San Francisco, Calif., and Jacksonville, Fla. Fourteen new bishops were chosen, consecrated, and assigned, as follows: John Wesley Lord, Boston; Lloyd C. Wicke, Pittsburgh; Marvin A. Franklin, Jackson, Miss.; Roy H. Short, Jacksonville, Fla.; John W. E. Bowen, Atlantic Coast Area, Atlanta; Marshall R. Reed, Detroit; Richard C. Raines, Indianapolis; Hazen G. Werner, Columbus, O.; H. Clifford Northcott, Madison, Wis.; Dana Dawson, Topeka, Kan.; Glenn R. Phillips, Denver; Donald H. Tippet, San Francisco; Gerald H. Kennedy, Portland, Ore. The Philippine Central Conference chose Jose L. Valencia to succeed Bishop Alejandro.

Other New Leaders. Other notable changes in leadership include: Mrs. F. G. Brooks, Mt. Vernon, Iowa, succeeding Mrs. J. D. Bragg, St. Louis, Mo., as president of the Woman's Division of Christian Service (1,455,086 members). Chilton G. Bennett, Chicago, succeeding Dr. George L. Morelock, as Executive Secretary of the Board of Lay Activities; Dr. John O. Gross, succeeding Dr. H. W. McPherson as Executive Secretary, Division of Educational Institutions, Nashville, Tenn.; Dr. Eugene L. Smith to succeed Dr. Ralph E. Diffendorfer as Executive Secretary of the Division of Foreign Missions, New York, effective Aug. 1, 1949; Bishop Titus Lowe, succeeding Bishop Herbert Welch as executive of Methodist Committee on Overseas Relief; Dr. J. Manning Potts, succeeding Dr. Roy H. Short as editor of *Upper Room*.

The Methodist Publishing House, operating in three manufacturing and 14 distribution centers, reported its largest gross receipts in its 159 years, \$11,232,564, and appropriated \$400,000, of the produce of the year, following long custom, to retired preachers' funds. Construction of the first two units of a \$3 million plant expansion was ordered. Dr. Fred D. Stone, one of two publishing agents, retired and was succeeded by Dr. Roy L. Smith, Chicago. Dr. T. Otto Nall was made acting editor of *The Christian Advocate* (Chicago), official weekly, and the Rev. Prince A. Taylor was elected editor of *The Central Christian Advocate* (New Orleans), which serves the denomination's 340,000 Negro members.

Activities. Autumn saw large Methodist participation in an inter-church missionary conference in Columbus, O., followed by 36 regional conferences which gave a new impetus to missions. In addition to routine assignments, 23 men and 28 women were recruited, given six weeks' briefing, and dispatched to Japan and Korea to teach English. A plan of systematic visitation of mission fields by the bishops, approved by the General Conference, was put into immediate operation. Currently there are 1,275 Methodist missionaries working in 49 countries under the supervision of 16 overseas bishops.

Endowments of the 125 educational institutions

related to the denomination, including 9 universities and 69 colleges, are now \$230 million, a sum 52 percent above the 1940 figure. In the same period 100 new buildings have been erected. During this year 134 students from abroad are being supported from a million dollar appropriation for this purpose from the \$27 million fund raised for relief and reconstruction.

Summer institutes, camps, and assemblies for training and service were held in 700 centers. Nearly 500 picked collegians and adult counselors, coached and organized into "Caravan" teams of five, spent the summer in unreimunerated service to 1,827 churches. Church school extension service provided formal training for 100 young women who had volunteered for a year's service in rural areas on a subsistence basis. Special effort during the quadrennium to offset declining church (Sunday) school attendance stopped the slump and registered advances of 12 percent in enrollment, 14 percent in attendance. Related to The Methodist Church are 228 hospitals, homes, and other philanthropic institutions.

Correlation of audio and visual activities of several church agencies has been effected in the organization of the Radio and Film Commission of The Methodist Church. A Survey Commission, named by the General Conference, will study the administrative organization of the church. Another commission has engaged an executive to devote himself to recruitment and guidance of youth interested in preparing for Christian life service.

Statistics. Latest figures show 40,397 preaching places in the United States divided into 21,603 pastoral charges. There are 37,458 church schools with an enrollment of 5,343,446 and an average attendance of 2,770,234. Churches and parsonages have a total valuation of \$996,057,805 against which there are debts of \$23,564,184. During the past year \$60 million was paid for building, improvements, and debt reduction. An over-all figure for all Methodist property held locally and by Methodist agencies is \$1,475,530,795. The Methodist Church raised for all purposes during its last reported year \$196,435,168, an advance of \$38,296,711 over the preceding year. The Woman's Societies of Christian Service, organized in 27,478 parishes, raised \$5,630,252 for their educational, missionary, and philanthropic work, in addition to having contributed more than \$10 million to their local church programs.

The Methodist Church operates without a single central headquarters. Between General Conferences the Council of Bishops gives general guidance in some aspects of church life, and the administrative boards and agencies in others. Bishop James C. Baker, Los Angeles, is the 1948-49 President of the Council. New York (150 Fifth Ave.) is home of the Board of Missions, including the Woman's Division. Chicago (740 Rush St.) has World Service, World Peace Commission, Board of Lay Activities, Board of Pensions, and Publishing offices. Nashville, Tenn. (810 Broadway) is home of the Board of Education and additional Publishing activities and of the Board of Evangelism (1908 Grand Ave.). The Board of Temperance is at 100 Maryland Ave. N.E., Washington, D.C. Other branches of administrative agencies are in St. Louis, Louisville, Cincinnati, New Orleans, and San Francisco.

—RALPH STOODY

MEXICO. A republic of North America. The country is largely a high plateau, bordered by cordilleras and volcanic peaks. Coastal lowlands mark the maritime margins of the plateau. Mexico has

two peninsulas, Yucatán and Lower California. Winters as a rule are dry. In the north, temperatures range from cool in the plateaus to hot in the desert. The southeast is tropical, especially Yucatán.

Area and Population. Area, 759,258 square miles. Population, 23,425,000 (1947), of which mestizos make up more than 50 percent, Indians 29 percent and the rest are persons of European descent. Principal cities: Mexico (capital), Guadalajara, Puebla, Monterrey, Mérida, and Tampico.

Education and Religion. The constitution guarantees freedom of worship, although it establishes restrictions with regard to the religious ceremonies, which must be confined to churches, temples, and homes. Roman Catholicism is predominant. Spanish is the official language, but numerous Indian languages are spoken in the rural areas. The most recent statistics indicated that about 60 percent of the adult population was literate, and that the number of primary schools of all kinds exceeded 24,000, with an enrollment of 2,154,368. Of these schools, according to President Alemán's report to Congress of Sept. 1, 1947, 12,419 were Federal primary schools, instructing 935,000 pupils. Intermediate education is offered by about 400 schools, with an approximate total registration of 64,000, not including normal and vocational institutions. There are 13 important universities in Mexico. The literacy campaign in the rural areas, under the Cultural Missions, made substantial progress in 1948. In 1947, there were 66 missions operating throughout the country.

Production. The nation's economy is based on agriculture and mining, but rapid progress toward industrialization has been made in recent years. 1947 was a good year for agriculture; production of corn, the staple food, was over two million metric tons. In spite of that, Mexico imported 376,000 pesos of corn (peso = \$U.S. 0.1453; Dec. 2, 1948). Wheat production was 450,000 metric tons. Production forecasts, for 1948, of the basic agricultural items were (in metric tons): corn, 2,756,191; wheat, 577,254; beans, 197,750, and rice, 134,387.

Stock raising is an important industry, and Mexico has a population of about 12 million cattle and 5 million hogs. Hoof-and-mouth disease seriously affected the industry in 1947, exports decreasing to a value of one million pesos, as compared with 47 million the previous year. Mineral production is a large item in the country's economy. Silver is the largest export commodity. Industrial metal exports in 1947 increased in the sum of 307 million pesos compared with the previous year. Important minerals produced in 1947 were (metric tons): coal, 86,600; crude petroleum, 671,000; iron ore, 45,300; steel ingots, 26,800; copper, 5,290; lead, 18,600, and zinc, 16,300.

Manufacturing has grown considerably, but in 1947 production figures on the whole decreased, due in general to the lack of export markets. Textile production decreased about 40 percent, and lost markets valued at 95 million pesos. The shoe industry lost markets valued at 4 million pesos, and beer 28 million. As a contrast, the sugar industry, after satisfying domestic needs, had enough production to export 100,000 metric tons to the U.S. and Europe.

Foreign Trade. Exports in 1947 were valued at 2,152 million pesos and imports to 3,237 million, an increase in exports of 12 percent and in imports of 22 percent over the previous year. The geographic distribution of exports was 74 percent to the U.S.; 7.5 percent to Europe; 8.3 percent to Latin America, and the rest to other countries. Im-

ports were 88 percent from the U.S., 7.8 percent from Europe, 1.4 percent from Latin America and the rest from other countries.

A characteristic of Mexican trade in 1947 that alarmed the economists and the government was the large amount of luxury goods imported, which increased from 150 million pesos in 1946 to 260 million, and came mostly from the United States, including 170 million pesos in automobiles, 31 million in radio sets, and 21 million pesos in refrigerators.

The trade picture for the first four months of 1948 indicated a trend toward normalcy. In May, the National Bank of Mexico reported the monthly average for exports at 211.4 million, as compared with 180 million in 1947, while the monthly import average was 223.3 million pesos, compared with 270 million the previous year.

Transportation. Mexico has 12,741 miles of railroad track, on which nearly 300 million ton-kilometers were carried in 1947, an increase of 4 million over the previous year. There are 43,711 miles of highway, and the most recent figures show nearly 180,000 motor vehicles registered. There are 750,000 radio sets and 175,100 telephones. International airlines provide transportation to the outside world, and more than 14 national airlines operate within the country. The merchant marine has about 260 ocean-going vessels.

Finance. The 1948 budget calculated revenue at 2,050 million pesos, an increase of thirty percent over 1947, and expenditure estimated at 2,300 million, as compared with 1,665 million in 1947. Largest appropriations were for Communications (415.5 million pesos); Public Debt (361.186 million); Education (246 million); Electrification (235 million) and Defense (240 million). At the end of 1947, currency in circulation was 1,757 million pesos, and bank deposits amounted to 1,742 million. Gold reserves were calculated at \$100 million. Gold exchange holdings were reduced to \$224 million, indicating the dangerous decline of 50 percent over the previous year. Cost of living index in September, 1948, was 376 (1937 = 100). Mexico has a limited list of import controls, and none in exchange.

Government. The Constitution of Feb. 5, 1917, provides for a Federal Union of 28 states, three territories, and the Federal District. The Congress is bicameral, with a Senate of two members for each state and for the Federal District, and a Chamber of Deputies in the proportion of one for each 150,000 inhabitants. The President is elected for a 6-year term, and may not be reelected. On July 7, 1946, Dr. Miguel Alemán was elected President, and took office Dec. 1, 1946.

Events, 1948. Mexico's second year under the administration of President Miguel Alemán was relatively uneventful in domestic politics, but active internationally, and like other Latin American republics, she was seriously concerned with her economic future.

Backed by the strong majority party, *Partido Revolucionario Institucional*, the government had to face the traditional opposition of entrenched interests. Early in the year, the new *Partido Popular* campaigned for changes in the electoral law. This new party was formed by leftist groups, and has among its directors the well-known labor leader Vicente Lombardo Toledano. The question of the day was whether Lombardo would be able to swing labor into his ranks, an interesting parallel with the Wallace-New Party picture in the United States. In February, an interesting illustration of the use of the principle of state sovereignty as op-

posed to the policies of the state government was provided by the attitude of several states which refused to comply with the new tax law revising the municipal tax system. The government enforced the new law, pointing out that Mexico is one of the countries in which the Federal Government gets the smallest share of revenue from the local organs.

Labor Activities. On March 22, the powerful Latin American Confederation of Labor (CTAL) held its third congress. The event was important, because all the Latin American countries were interested in hearing of postwar plans for labor. The presence of Louis Sallant, President of the World Federation of Trade Unions, was significant, as well as the role played by Lombardo Toledano, who had previously been suspended from his position as Director of the Confederation of Mexican Workers (CTM). A serious split in the Mexican labor front was considered possible. The congress was also affected by the withdrawal from the CTAL of important labor groups from Chile and Mexico. One of the resolutions approved by the congress was the demand for the end of the colonial system in the hemisphere, specifically for the return of Chamizal to Mexico, Belize to Guatemala and Mexico, the Falkland Islands to Argentina, part of the Antarctic territory to Chile, and the independence of Puerto Rico. At the end of the congress, Lombardo Toledano was reelected President of the CTAL.

On May 1, all Mexican labor unions celebrated the traditional Labor Day, and in spite of wild rumors that had circulated that they would attempt a revolutionary coup, the festivities were conducted in an orderly manner. A colorful note was provided by famous painters Diego Rivera and David Alfaro Siqueiros, who marched with a group campaigning for U.S. presidential candidate Henry Wallace.

Disturbances in the University. On April 17, a series of strikes and agitation began in the National University, lasting several weeks. The movement was started by a group of law students who petitioned the University Council for several changes, and ended by demanding the resignation of Rector Salvador Subirán. The students took the University buildings, and on the 27th the government was forced to close the institution. The situation was aggravated by clashes between rival student groups, and took a political turn when Antonio Díaz Sotoy Gama, of revolutionary background, announced that he wished to be appointed Rector. An agreement was finally reached between the University Council and the dissenting students, who returned to the classrooms.

International Politics. Mexico was active during the year in world politics. Early in March, taking advantage of Guatemala's claim to British-controlled Belize (see GUATEMALA), the Ministry of Foreign Relations announced its purpose of pressing Mexico's right to that territory, together with Guatemala. At the end of the previous year, President Alemán had told the National Congress that he would safeguard the nation's sovereignty over the territory between the Hondo and Sibún rivers, the title to which they trace back to a Papal Bull of May 4, 1492. This attitude was also stated in the Rio de Janeiro Conference of 1947 and firmly maintained at the Bogotá Conference. It was understood that the Mexican and Guatemalan claims have never conflicted.

Another significant international event was the role played by the country in the Economic Conference of Havana, that began in November 1947,

but extended into the following year. The Mexican delegation, headed by Dr. Ramón Beteta, took a firm stand on many important trade issues, and a number of articles were modified at his suggestion. But where Mexico excelled was in the Ninth Inter-American Conference of American States held at Bogotá in April. There, Minister of Foreign Relations, Jaime Torres Bodet, held a leading role all through the Congress. Long before it convened, Mexico had insisted on the necessity of incorporating all the principles of American international law in one organic document, and this was done by the Conference in the Charter of the American States.

An interesting trend in the foreign policy of the country was the official indication of a movement toward closer relations with Argentina. In the past, the Mexican government had been rather cold toward the Perón regime, and had openly called it a dictatorship. But on May 23, the official broadcasting station devoted its time to speeches made by the presidents of the two countries, stressing the need for future friendship between them. This new policy may mean that Mexico intends to strengthen economic ties with the Latin American bloc, rather than with the United States.

The country's policy of not relinquishing any rights to territory extended to the northern archipelago on the California coast. The administration stated that although a legal decision had not been reached with regard to Mexican sovereignty over these islands, they would keep their claim open.

When a military coup, on November 24, overthrew President Rómulo Gallegos in Venezuela, (see VENEZUELA), Mexico was the first country to express protest by immediately recalling her Ambassador from Caracas.

—MIGUEL JORRÍN

MICHIGAN. An east north central State. Area: 96,720 sq. mi. Population: (July 1, 1948) 6,195,000, compared with (1940 census) 5,256,106. Chief cities: Lansing (capital), 75,753 inhabitants in 1940; Detroit, 1,623,452. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$433,318,000; total expenditure, \$483,348,000.

Elections. The 19 electoral votes, Roosevelt's in 1944, went to Dewey. In the Senatorial race, Republican incumbent Homer Ferguson won by a small margin over Democrat contender Frank Hook. Democrats won 5 of the 17 House seats for a gain of 2. Democrat G. Mennen Williams beat incumbent Kim Sigler for the governorship, and Democrats John W. Connolly and Stephen J. Roth won the lieutenant governorship and attorney generalship, respectively. Republican nominees won the following: Secretary of State—F. M. Alger; Treasurer—D. Hale Brake; Auditor—Murl K. Aten. The voters approved measures to provide increased legislative salaries, constitutional revision, and succession to the governorship in case the governor-elect dies.

Officers, 1948. Governor, Kim Sigler; Lieut. Governor, Eugene C. Keyes; Secretary of State, F. M. Alger, Jr.; Attorney General, Eugene F. Black; State Treasurer, D. Hale Brake; Auditor General, Murl K. Aten.

MIDWAY ISLANDS. A group of two small islands and several sand islets of the Hawaiian group, in the Pacific (177° 23' W. and 28° 13' N.), 1,149 miles northwest of Honolulu. The islands are inside and near the southern edge of a circular reef about five

miles in diameter. Sand Island is about one mile long and one and one-half miles wide, containing about 850 acres. The highest point is only 43 feet above sea level. Eastern Island has an area of 328 acres. To the westward of the lagoon is Welles Harbor which affords a safe anchorage except during the severest weather. Midway is under the jurisdiction of the U.S. Department of the Navy.

MILBANK MEMORIAL FUND. A Fund established in 1905, with assets of \$10,111,392, at the end of 1947. Appropriations for grants and projects in that year totaled \$287,878. The scope of the Fund, while widely diversified, has been principally in the field of public health. At present its special interests in this field are nutrition, housing, population trends, and the appraisal of public health methods and procedures. In 1948 thirty-two organizations received funds. Membership: 10. President, Albert G. Milbank; Executive Director, Frank G. Boudreau, M.D. Office: 40 Wall St., New York 5, N.Y.

MILITARY PROGRESS. Land armies played a dominant role in the armed clashes that continued throughout the year 1948 to plague a world officially at peace. While most of the fighting, as in China, Indonesia, Malaya, the Philippines, Indo-China, and Greece, was officially characterized as governmental action to suppress rebellion or insurgency, it was true nevertheless that most of it was between formally organized (and in many cases very skillfully and efficiently organized) military units. Yet the traditional and conventional land army, without benefit of the more modern methods of mass destruction, and without large scale participation by air components, continued to bear the brunt of the battle and of the losses.

Except for the well-known and generally recognized ability of land armies to seize and occupy territory without first totally destroying it, these events portend no particular trend. It was rather the major powers, maneuvering against each other in an ominous "cold war," who worked feverishly and secretly in the development of unconventional weapons and tactics. The atom bomb, radioactive clouds, biological warfare, psychological warfare, insidious infiltration of agents to bring about destruction and deterioration from within—these and more unmentionable terrors held the attention, and the purse strings, of the great powers.

World Strength. When consideration is given to the sizeable military forces that Soviet Russia, the United States, France, Great Britain, and some components of the British Commonwealth have committed to the occupation of the homelands of their defeated enemies, the sizes of the land forces under arms do not appear to be too enormously exorbitant compared with those maintained prior to World War II. This is the conclusion of the editors of *United Nations World*, which publication, in the absence of the official figures formerly furnished to the League of Nations, made an independent survey of the standing armies of the world. In publishing its figures (June 1948 issue) *United Nations World* commented:

"This roll call of the armies of the world reveals that more than three years after VE-Day, there are still 15,362,899 men under arms in 57 countries. And yet, this is a promising figure. With the exception of Yugoslavia which maintains an oversized army in a high state of preparedness, no country, and certainly none of the major powers, maintains even a fraction of its war manpower potential."

The United States had an actual strength, as of Nov. 28, 1948, of 657,769 men, as compared with an authorized strength of 837,000 and an appropriated strength of 790,000, both plus 110,000 18-year-olds authorized for one-year enlistments.

For the Soviet Union, the *United Nations World* survey gave an estimated effective strength of 1,900,000 excluding the para- and semi-military formations, the militarized police, and the troops of the Ministry of the Interior. For the United Kingdom, the survey placed the British army at 534,000 effectives in April of 1948, with plans to reduce it to 345,000 by March, 1949.

The *United Nations World* survey gave the following strengths for armies of the rest of the world:

- Afghanistan—90,000 officers and men.
- Albania—Standing army of approximately 60,000 men in the process of organization.
- Argentina—National militia of 100,000 officers and men on 1-year active service, then 9 years in active reserve.
- Australia—Permanent force of 35,000 officers and men; militia force of 75,000.
- Belgium—Standing army (est.) of 60,000 officers and men (excluding police under military control).
- Bolivia—Standing army of 15,000 (plus 12,000 police under military control).
- Brazil—Army of 80,000 (plus 38,000 police under War Office control).
- Bulgaria—Peace treaty permits land army of 56,800.
- Canada—Peacetime militia of 18,700.
- Chile—National militia of 25,000.
- China—Kuomintang army's present mobilized strength (est.) 5,000,000 officers and men. Approximately 1,500,000 in Communist armies.
- Colombia—Peacetime strength of standing army is 10,000 (plus 5,500 police under military control).
- Cuba—Standing army of 900 officers and 16,000 men.
- Czechoslovakia—New peacetime army of approximately 150,000.
- Denmark—National army now has 24,000 men.
- Egypt—Army has approximately 100,000 men.
- Ethiopia—New standing army consists of 20,000 effectives.
- Finland—Peace treaty authorizes land army of 34,000.
- France—New standing army is composed of 500,000 men.
- Greece—Army engaged in civil war is estimated at 165,000.
- Hungary—Peace treaty permits land army of 65,000.
- India and Pakistan—The two countries have armies totaling 1,000,000.
- Iran—Army of 90,000 is in the process of reorganization.
- Iraq—Standing army of 30,000.
- Italy—Reorganized Italian Republican Army is estimated at 250,000.
- Mexico—Postwar army of 57,500.
- Netherlands—Approximately 175,000 effectives.
- New Zealand—Standing army of 11,000.
- Norway—National militia of 15,000.
- Paraguay—Military establishment of 350 officers and 5,500 men.
- Peru—Standing army of 2,000 officers and 30,000 other ranks, plus 10,000 militarized police.
- Poland—Standing army of 200,000 effectives.
- Portugal—Army of 3,200 officers and 26,800 other ranks.

Rumania—Peace treaty allows army of 125,000.

Spain—Recent reorganization acts authorize a military organization of 500,000 officers and men.

Sweden—Army of 57,500.

Switzerland—National militia with 46,200 in a rather complex military organization.

Turkey—Standing army of 20,000 officers and 174,000 effectives.

Uruguay—Active army of 26,000 volunteers.

Venezuela—Active army of 10,000 effectives.

Yugoslavia—Standing army of 800,000.

The United States Army. In June, 1948, when Congress enacted the new Selective Service law, the U.S. Army was down to a low strength of 552,000, all but a negligible portion of which was engaged in such essential activities as occupation, military government, administration, overseas garrisons, with little remaining for development of an effective potential for combat. Losses averaged 20,000 a month until the Spring of 1948. Approval of the draft act was followed by a stimulation of enlistments which rose from 20,000 a month to 39,000 in July and 45,000 in August.

These increases in strength were applied primarily to the Mobile Striking Force. Beginning in the last half of the year, the Army endeavored to restore some of its lost combat potential by building its General Reserve of forces within the Continental United States, to compose a Static Defense Force, for the defense and protection of key installations, and the Mobile Striking Force, for immediate deployment overseas. It was planned to bring the Mobile Striking Force to a strength of 228,000 men. The eventual program contemplates 25 fully equipped divisions (including Regular Army and National Guard) plus necessary supporting combat and service troops (including elements of the Organized Reserves).

Functions. Although not a participant in the struggle between the Navy and the Air Force, the U.S. Army was given a more clearly defined list of functions as a result of the Key West conference of the Joint Chiefs of Staff with the Secretary of Defense (see NATIONAL MILITARY ESTABLISHMENT, NAVAL PROGRESS). Section IV of the Key West agreement gave the Army its basic directive upon which its future composition, equipment, and tactics must be based, as follows:

"The United States Army includes land combat and service forces and such aviation and water transport as may be organic therein. It is organized, trained and equipped primarily for prompt and sustained combat operations on land. Of the three major services the Army has the primary interest in all operations on land, except in those operations otherwise assigned herein.

A. Primary functions: 1. To organize, train, and equip Army Forces for the conduct of prompt and sustained combat operations on land. Specifically: (a) To defeat enemy land forces. (b) To seize, occupy, and defend land areas.

2. To organize, train, and equip Army anti-aircraft artillery units.

3. To organize and equip, in coordination with the other Services, and to provide Army forces for joint amphibious and airborne operations, and to provide for the training of such forces in accordance with the policies and doctrines of the Joint Chiefs of Staff.

4. To develop, in coordination with the other Services, tactics, technique, and equipment of interest to the Army for amphibious operations and not provided for in Section V, paragraph A4 and paragraph A 11c (*Functions of the U.S. Navy and Marine Corps*).

5. To provide an organization capable of furnishing adequate, timely, and reliable intelligence for the Army.

6. To provide Army forces as required for the defense of the United States against air attack, in accordance with joint doctrines and procedures approved by the Joint Chiefs of Staff.

7. To provide forces as directed by proper authority, for occupation of territories abroad, to include initial establishment of military government pending transfer of this responsibility to other authority.

8. To develop, in coordination with the Navy, the Air Force, and the Marine Corps, the doctrines, procedures and equipment employed by the Army and Marine forces in airborne operations. The Army shall have primary interest in the development of these airborne doctrines, procedures and equipment which are of common interest to the Army and the Marine Corps.

9. To formulate doctrines, and procedures for the organization, equipping, training and employment of forces operating on land, at division level and above, including division, corps, army, and general reserve troops, except that the formulation of doctrines and procedures for the organization, equipping, training and employment of Marine Corps units for amphibious operations shall be a function of the Department of the Navy, coordinating as required by paragraph A 11c, Section V.

10. To provide support, as directed by higher authority, for the following activities:

a. The administration and operation of the Panama Canal.

b. River and harbor projects in the United States, its territories and possessions.

c. Certain other civil activities prescribed by law.

B. Collateral functions: The forces developed and trained to perform the primary functions set forth above shall be employed to support and supplement the other Services in carrying out their primary functions, where and whenever such participation will result in increased effectiveness and will contribute to the accomplishment of the overall military objectives. The Joint Chiefs of Staff member of the Service having primary responsibility for a function shall be the agent of the Joint Chiefs of Staff to present to that body the requirements for and plans for the employment of all forces to carry out the function. He shall also be responsible for presenting to the Joint Chiefs of Staff for final decision any disagreement within the field of his primary responsibility which has not been resolved. This shall not be construed to prevent any member of the Joint Chiefs of Staff from presenting unilaterally any issue of disagreement with another Service. Certain specific collateral functions of the Army are listed below:

1. To interdict enemy sea and air power and communications through operations on or from land.

2. To provide forces and equipment for and to conduct controlled mine field operations."

Departmental Reorganization. The first major reorganization since 1946 became effective in the Department of the Army on Nov. 15, 1948. Redefining the relationship among a number of Departmental agencies, the changes were promulgated as the first step in a long-range program to simplify and facilitate administration throughout the Army.

The Chief of Staff (Gen. Omar N. Bradley) instead of having one Deputy was given one Vice

Chief of Staff and two Deputies. Gen. J. Lawton Collins, formerly the Deputy, was made the Vice Chief of Staff, while Lt. Gen. Wade H. Haislip was made Deputy for Administration and Lt. Gen. Albert C. Wedemeyer was made Deputy for Plans and Combat Operations.

The duties of the Assistant Secretary of the Army (Gordon Gray) were materially enlarged to include over-all supervision of Army logistics. Four Administrative services—the Adjutant General, the Provost Marshal, the Chaplains Corps, and Special Services—were placed directly under the Director of Personnel and Administration (Lt. Gen. Willard S. Paul).

The Director of Logistics (Lt. Gen. Henry Aurand) was given direct control of seven technical services—Chemical Corps, Medical Department, Signal Corps, Corps of Engineers, Ordnance Department, Transportation Corps, and Quartermaster Corps.

The Finance Department was placed under the Army Comptroller (Maj. Gen. Edmond H. Leavey). The Judge Advocate General's office was transferred from the administrative services to the Special Staff.

The Legislative and Liaison, Public Information, and Army-Air Force Troop Information Divisions were moved from the Special Staff to form a group under the Chief of Information, directly under the Office of the Chief of Staff.

In announcing the new organization the Secretary of the Army (Kenneth C. Royall) indicated it would not require any increase in number or rank of personnel. He felt that it might ultimately result in a savings of staff personnel. Its primary object is to increase efficiency, to expedite business, and to obviate the necessity for any sudden change in an emergency.

Plans for the new organization were worked out in the office of the Army Comptroller, which itself was a development of 1948, having been established in January "in order to improve the modern management techniques in the business administration of the Army, and to more effectively utilize accounting as a tool throughout the Army in the control of operations and costs."

The new Army Comptroller became the Budget Officer, Fiscal Director and Management Engineer for the Department of the Army. First appointee to the new post was Maj. Gen. George J. Richards, who had been Chief of the old Budget Division. He was later succeeded by Maj. Gen. Edmond H. Leavey.

The duties of the Army Comptroller include general supervision and control of all budgetary matters, preparation of budget estimates, formulation and coordination of basic fiscal policy, supervision of use of foreign exchange by the Army overseas, development of cost analysis and control, survey of effective utilization of manpower and of administrative organization, methods and procedures, in the interest of efficiency and economy, and coordination of statistical data. The personnel and functions of the Budget Division, the Manpower Board, the Central Statistical Office and the Management Office of the office of the Chief of Staff, were assigned to the Office of the Army Comptroller.

Ground Forces. A reorganization of the Army Ground Forces became effective on March 15, under which the old office of Headquarters, Army Ground Forces, was converted into the Office, Chief, Army Field Forces. The six field Armies within the continental United States which were formerly commanded by the Commanding General, Army Ground Forces, were transferred so that

they became directly responsible to the Chief of Staff, U.S. Army. All individuals, units, and installations formerly assigned to Headquarters, Army Ground Forces, except the Headquarters itself, were reassigned to the Army in whose geographical area they were located.

End of Horses. On July 1 the Army's Remount Service was transferred to the Department of Agriculture under an Act of Congress sponsored by the Department of the Army. At the time of the transfer, which marked the virtual end of the horse in the United States Army, the Remount Service had 482 stallions, 423 brood mares, 581 riding horses, 41 draft horses, and 280 young horses of four years or younger. There remained in the Army practically nothing of the once proud mounted fighting units. There are now no mounted tactical combat units.

Training. Considerable emphasis was placed upon cold weather training, with exercises in Alaska continuing to occupy most attention in purely ground force maneuvers.

Joint exercises with the Navy and the Air Force were also emphasized under the policies of the National Military Establishment. As in the preceding year, cadets of the U.S. Military Academy joined with midshipmen of the U.S. Naval Academy in Exercise Camid, an amphibious maneuver involving ground, sea, and air forces, held in the Chesapeake Bay area.

The Army and Air Force participated in Exercise Yukon which involved the movement of rifle companies from Ft. Lewis, Wash., to Alaska, and the conduct of field maneuvers, including air-transported operations within Alaska. Exercise Snowdrop at Pine Camp, N.Y., featured Army and Air Force units in battalion-scale airborne maneuvers.

In the late Summer and Fall the Army engaged with the Air Force and Navy and Marine Corps aviation units in Exercise Combine III, centering around Eglin Field, Fla., and involving team work in bombardments, air support, and airborne missions.

Reserve and National Guard. Progress in the growth and training of the Reserve and the National Guard was not satisfactory. The civilian components through their organized associations attacked the Department and the Regular establishment in strong language charging lack of support and cooperation. A large scale study of the Reserve components of all the Armed Services was made by a joint board convened by order of the Secretary of Defense, Mr. James Forrestal, under the chairmanship of Mr. Gordon Gray, Assistant Secretary of the Army (see NATIONAL MILITARY ESTABLISHMENT). Its comprehensive report was the basis on which legislation was being prepared for the 81st Congress. Later President Truman issued an order directing the Departments to increase the efficiency of their reserves.

Foreign Armies. Russia has found no reason to change its policy of first emphasis upon its artillery which it terms the "God of War." Lt. Gen. Anatoli A. Blagonravov, president of the Soviet Academy of Artillery Science, on the occasion of Artillery Day (November 21) wrote an article in the Literary Gazette in which he contended that artillery has supplied the answer to technological developments in arms throughout history.

"With the appearance of armor," he wrote, "there came armor-piercing artillery; with the appearance of aviation there appeared anti-aircraft artillery, and with the tank, anti-tank artillery."

Field Marshal Lord Montgomery, Chief of the British Imperial General Staff, outlined the funda-

mental factors influencing British planning in an address at the annual conference and exercise for Senior Officers at the Staff College at Camberley. He described these factors as:

"(1) The withdrawal from India, which meant that we no longer had to keep a garrison of 40,000 regular troops in that country, but on the other hand produced fresh commitments formerly met by the Indian Army;

"(2) The introduction of national service, with liability to reserve service in the Territorial Army;

"(3) The pace of modern warfare, which demanded a greater degree of preparedness. We could no longer count on having a breathing space at the beginning of another war to build up and train our land forces."

The old conception of two Armies, Regular and Territorial, had not, he said, stood up to the test of modern war. Its place would be taken by a National Army containing regulars, a National Service element, and a Territorial Army. It would be necessary, he said, to keep in hand a well-equipped regular force available to go anywhere at short notice.

Preparations were being made to put into effect Britain's new National Service Act. This Act provides that from Jan. 1, 1949, until Jan. 1, 1954, all male British subjects who have reached the age of 18 and have not reached the age of 26, and who have not served in the Armed Forces before Jan. 1, 1947, will be liable for compulsory service in the Armed Forces. "National Service Men," as they will be called, will serve for 12 months whole-time and for six years in the Reserve, a total of 7 years in all.

The Cabinet of Australia decided to create a special subcommittee to study the effects of ordinary bombs, flying bombs, rocket projectiles, and atom bombs. Its duties are to advise the Government on the latest developments of warfare in these fields.

The Greek Army demonstrated during the year an improvised mine-sweeper such as they are using in the guerrilla country. A magnetized bar is mounted from the front of the vehicle and is so connected that when it passes over metal it automatically stops the vehicle to permit the occupants to dismount and remove the mine or obstacle.

During the year most of the nations outside the Soviet orbit sent military missions, or military "visitors" to the United States, to observe its military schools and training. —LEROY WHITMAN

MINERALS AND METALS. The output of mines in the United States forged ahead in 1948 to an all-time peak value of 15,600 million dollars, 26 percent above the former record in 1947 of 12,400 million dollars, Secretary of the Interior J. A. Krug announced on Jan. 2, 1949.

The prodigious dollar volume of mineral production resulted not only from higher commodity prices but also from a tonnage output surpassing any previous effort in peace or war, the Secretary stated. The tonnage mined in 1948 exceeded that of 1947 by 4 percent, according to preliminary estimates prepared by the Bureau of Mines.

Mineral products were called upon to fuel the Nation's industries and transportation at high gear, to help construct and equip houses, factories, and travel facilities, to maintain a military establishment commensurate with world responsibilities, and to replenish heavily-farmed soils. Most of the great mineral output was needed in the United States, but important quantities were shipped abroad to aid rehabilitation of regions scarred by

war. Fuels made the most impressive gain in 1948 of any mineral group, according to the analysis submitted to James Boyd, Bureau of Mines Director, by the Economics and Statistics Division. The value of mineral fuels produced in 1948 was 30 percent greater than in 1947, partly a reflection of the record quantity of petroleum extracted. Other nonmetallic minerals increased 7 percent, and metals 27 percent. On a physical volume basis, the tonnage of mineral fuels produced in 1948 advanced 4.8 percent, other nonmetallic minerals 4.7 percent, and metals 2.9 percent. Details on 1948 mineral production follow:

Metals. The steel and aluminum industries in 1948 were at levels surpassing 1947, but outputs of the major nonferrous metals—copper, zinc, and lead—were somewhat lower. Large gains quantitatively were achieved for bauxite and molybdenum in 1948, though both were produced at rates a third below those of 1944. The sharpest decline was in mercury, whose annual rate of output in December, 1948, was less than in any year during a century of record-keeping.

Iron and Steel. The steel industry operated at near-peak levels during most of 1948 and made about 88 million net tons of ingots and castings, a 3½-percent gain over the previous year. This was made possible by approximately identical percentage increases in output of iron ore and pig iron, and by an all-time high in scrap consumption. Steel production in 1948 was the third greatest in history. It would undoubtedly have equaled the 1944 peak of 89.6 million tons except for the work stoppage at coal mines in April which curtailed steel output at some furnaces, and with lesser effect, shortages of facilities for transporting coke and pig iron.

Ferro-alloy Metals. Mine shipments of manganese ore dipped 4 percent in 1948, those of chromite more than tripled, and those of tungsten and molybdenum increased 29 and 22 percent, respectively. The United States continued to have to rely on other countries for the bulk of its requirements of ores of all ferro-alloy metals except molybdenum and vanadium. Shipments of ferro-alloys from furnaces are estimated to have surpassed the 1947 total by 9 percent in tonnage and 36 percent in value. Ferromanganese production established a record high in 1948. Late in the year output of ferromanganese was initiated in Montana.

Copper, Zinc, and Lead. Production of copper, zinc, and lead in 1948 was about 1, 4, and 6 percent, respectively, below 1947 tonnages, but prices were raised enough to effect respective increases of 3, 22, and 18 percent in value of output. During the first 8 months of 1948 copper mine production was at the practical capacity rate of about 875,000 short tons annually. A strike of locomotive engineers at the Utah Copper mine at Bingham, Utah—the country's largest copper mine—in the late months of the year interrupted the high production rate sufficiently to reduce national annual output by 5 percent. Similarly, retardation of zinc and lead output was an effect of labor-management difficulties evidenced by work stoppages in the Tri-State district and in Southeastern Missouri.

Light Metals. The United States was obliged to import nearly two-thirds of its bauxite needs in 1948, but the achievement of a peacetime record aluminum production was made possible partly by a peacetime record output of domestic bauxite. Production of magnesium metal was held at a low level, awaiting wider consumer acquaintance with its advantageous properties and absorption of heavy stocks of scrap.

Gold and Silver. Gold mine production was 5 to 10 percent lower in 1948 than in 1947, largely as the result of suspension of marginal operations caught between rising production costs and a fixed price on sales of the metal. The decline in output of base metals of which gold is a byproduct also had a depressing effect. Gold output continued, however, above the other years since 1942. Mine production of silver, responding to the second full year of the higher Treasury purchasing price of 90½ cents an ounce, was 5 percent above that in 1947 and was the greatest since 1943.

Other Metals. Mercury production in 1948 was 40 percent lower than in 1947 and the smallest since 1933. Of the larger producers, only two were in operation in December. Mining of the platinum-group metals in Alaska, the principal domestic source, in 1948 continued at about the same rate as in 1947, but nearly all requirements must be imported. Of the new supply of platinum-group metals in the first three quarters of 1948, a third (mostly palladium) came from the U.S.S.R. Unabated demand for white pigments prompted ilmenite (titanium) production and shipments in 1948 to be larger than ever before. Rutile production fell 17 percent from the record high rate for 1947, but mine shipments reached a new all-time peak. Small decreases in the output of nonferrous-metal refineries were partly responsible for apparent declines in the recovery of byproduct cadmium and bismuth. Production of certain other byproduct metals, particularly indium, tellurium, and gallium, was probably less because of limited demand.

Mineral Fuels. Petroleum and Natural Gas. Production of crude petroleum gained 8 percent in 1948 over 1947 and exceeded 2,000 million barrels for the first time. The output was valued at \$5,200 million, an average of \$2.59 per barrel. Marketed production of natural gas increased 10 percent to 4,870,000 million cubic feet in response to insistent demand, particularly in areas of active competition between the principal fuels. The gas was valued at approximately \$312 million at wells and \$1,170 million at points of consumption. The natural gasoline industry experienced its most successful year in 1948, disposing of a record volume of output at prices materially above the averages of 1947. Production of all light products gained 9 percent over 1947 to 6,020 million gallons, of which 2,110 million were liquefied petroleum gases. The total value of these products at the plants was \$434,200,000.

Bituminous Coal. Production of bituminous coal and lignite in 1948 was estimated at 596 million net tons, a decrease of 5 percent from the record output of 631 million tons in 1947. Decreased production was due to a work stoppage in March and April and to reduced exports and domestic demand during the latter half of the year. The average value per net ton at the mine for soft coal in 1948 was estimated at \$4.87—a new record and an increase of 17 percent over the previous high of \$4.16 in 1947.

Pennsylvania Anthracite. The estimated production of 57 million net tons of Pennsylvania anthracite in 1948 is a slight decline from the 57.19 million tons produced in 1947. Anthracite is primarily a home-heating fuel, and the decline in output can be attributed to the warmer-than-normal weather prevailing in the New England and Middle Atlantic States in November and December. The estimated value of the 1948 production was \$460 million, a slight increase over the 1947 value of \$413 million.

Coke and Coal Chemicals. Production of beehive and oven coke in 1948 reached an all-time high of 74.1 million net tons, a slight increase over the previous record of 74,038,000 tons attained in the war year 1944. The peak 1948 output was achieved despite a decline of 6 percent from 1947 in output from beehive ovens, the decline in beehive production having been more than compensated for by the 2-percent increase in oven-coke output. Total values of coke and coal-chemical materials at producing plants in 1948 were estimated at \$850 million and \$278 million, respectively. These values are the highest ever attained for coke-oven products and are increases of 9 percent and 25 percent over corresponding value data for 1947.

Other Nonmetallic Minerals. Nonmetallic minerals were in strong demand during 1948. All-time record shipments were made of sulfur, lime, salt, phosphate rock, potash, cement, gypsum, stone, kaolin, barite, talc, boron minerals, and vermiculite.

Building Materials. Output of construction materials again increased in 1948. A 16-percent gain in production of gypsum was recorded, and cement sales climbed 7 percent. Stone quarries and sand and gravel pits yielded larger quantities than in 1947. Output was stepped up for pumice, vermiculite, and perlite, which are becoming widely used as lightweight aggregate.

Fertilizers. Continuity of farm income at record levels was reflected in great demand for fertilizer to stimulate raising the tremendous quantities of food needed for world consumption. Output of phosphate rock and potash increased 5 and 7 percent, respectively, in 1948 to reach new records. Supplies of potash, as well as of nitrogen, remained scarce throughout the year, but by the closing months production of phosphate rock appeared to have equaled demand.

UNITED STATES MINERAL PRODUCTION

Product	1947	1948*
Metallic.....	\$ 2,915,000,000	\$ 3,690,000,000
Nonmetallic: Fuels.....	7,843,000,000	10,180,000,000
Other.....	1,635,000,000	1,750,000,000
Total nonmetallic.....	9,478,000,000	11,930,000,000
Grand total.....	12,393,000,000	15,620,000,000

* Preliminary estimate.

Chemical Raw Materials. The minerals used most extensively by the chemical industry are sulfur, salt, and lime—all three of which were shipped in record quantities in 1948. The United States continued to meet the world's expanded requirements of boron minerals. Fluorspar shipments continued at high levels in 1948 but were slightly under the peacetime record established in 1947. Barite purchases by oil-well drillers and chemical manufacturers neared the million-ton mark in 1948.

Other minerals. Increased mechanization of feldspar mines and mills helped effect a greater output in 1948 compared with 1947. Demand for feldspar by potteries and porcelain enamel plants was insistent, but total shipments fell below the 1946 peak principally because of a decline in glass containers manufactured. Production of talc and pyrophyllite exceeded 500,000 tons. Monazite mining in the United States was resumed on a small scale in 1948.

Mineral Production by States. The value of mineral output of the States of the United States for the calendar years 1946 and 1947 (with rank and percent of total value for the United States in 1947) are listed in the accompanying table.

U.S. MINERAL PRODUCTION, BY STATES^a

State	Value, 1946	Value, 1947	Rank (1947)	% U.S. total
Ala.....	\$123,029,000	\$159,788,000	15	1.64
Alaska.....	12,426,000	18,387,000	38	.19
Ariz.....	118,086,000	186,751,000	13	1.92

^a In this table iron ore, not pig iron, is taken as the basis of iron valuation. The many revisions in the 1946 State totals result from the substitution of data for natural gas valued at points of consumption by data for natural gas valued at wells.

See CHEMISTRY, COAL, COPPER, GOLD, IRON AND STEEL, MANGANESE, and ZINC.

MINES, United States Bureau of. (Department of the Interior.) Heavy mineral requirements of America's booming postwar economy and the need for maintaining a strong mineral position in world affairs gave added impetus in 1948 to the Bureau of Mines' efforts to help industry achieve maximum efficiency, safety, and conservation in extracting, preparing, and utilizing the Nation's mineral resources. Despite the steady progress made by the American minerals industries in producing better products from lower-grade ores, heavy wartime demands had seriously depleted domestic mineral reserves—a development which gave special significance to the Bureau's technologic and scientific studies.

Mineral Development. In anticipation of future emergency needs, the Bureau last year carried forward 30 exploration projects. Of these, 11 provided bases for important stock-piling estimates of reserves of strategic minerals, notably, lead, zinc, copper, iron and titania. In addition, the Bureau established two more "core libraries" for the storage of drill cores obtained during Governmental and private projects, and also studied mining techniques, such as boring blast holes with diamond drills instead of percussion drills. Other mineral investigations included a study of the most eco-

nomical and effective method of drilling and blasting taconite—a low-grade iron ore which is available in large quantities in the Lake Superior region—studies of dynamic stresses in rock, and completion of two sets of model studies of pillar stresses in room and pillar mining. Investigations were also started to determine whether the mica, beryl, tantalum minerals, and other valuable constituents of pegmatite deposits in Virginia and South Dakota can be mined separately, or mined together and separated effectively afterwards.

Metallurgical Studies. As during the previous year, the Bureau's metallurgical studies were aimed at four major objectives: (1) developing improved methods of beneficiating and processing low-grade ores; (2) developing new and improved products; (3) developing substitutes for scarce metals and minerals; and (4) recovering by-products and utilizing industrial wastes. Advances were made toward the ultimate use of low-grade iron ores and in separating the iron from titaniferous magnetites and recovering titanium as a by-product. Intensifying its studies of the recovery of lead, zinc and copper from low-grade ores, the Bureau last year also improved processes for producing aluminum from materials other than high-grade bauxite. Increased pilot-plant production of the Bureau-developed light metals, zirconium and titanium, as well as investigations of their alloys, also formed part of the metallurgical-research pattern.

Substantial progress was made in the Bureau's search for synthetic substitutes for sheet mica, essential to the electrical industry, and a method was devised for purifying sand so that it can be used in the manufacture of high-quality glass. The extensive metallurgical research program also included the development of strong, lightweight concrete aggregates, improvement of methods of manufacturing ceramic products from domestic minerals, and a special investigation of the practicability of developing further huge phosphate deposits in Utah, Idaho, Wyoming and Montana.

Research in Coal. Faced with a growing shortage of good-quality coking coal, Bureau scientists last year concentrated on developing methods for upgrading low-grade coals to produce metallurgical coke and sought ways of making greater use of vast deposits of lignite and sub-bituminous coal. The Bureau developed a method for storing lignite to prevent spontaneous combustion and also, on a pilot-plant scale, converted this fuel into gas suitable for reducing iron ore, or after further treatment, for making synthetic liquid fuels. New methods for drying and preparing sub-bituminous coal for safe and economical shipment also were examined. In studying the effect of mechanized mining on the percentage of coal recovered, as well as the development of mechanical equipment suitable for use in steeply-pitching anthracite beds, the Bureau also searched for effective ways of recovering and using fine coal now lost in washing. A site at Schuylkill Haven, Pa., was acquired and plans completed for the Anthracite Research Laboratory for which Congress appropriated \$450,000, and a site at Grand Forks, N.Dak., was selected for a newly-authorized lignite research laboratory.

Synthetic Liquid Fuels. Because of steadily rising American consumption of petroleum and a relatively low rate of discovery of new petroleum reserves, the Bureau's studies in the production of synthetic liquid fuels from coal, lignite, and oil were of special importance. Of the four major installations under construction, the oil-shale demonstration plant of the Naval Oil Shale Reserves near Rifle, Colo., began producing 100 barrels of oil

per day, and new laboratory facilities were completed at Laramie, Wyo., for further oil-shale research. As further indications of the notable progress made last year in the Bureau's synthetic liquid fuels program, a coal-to-oil laboratory was dedicated at Bruceton, Pa., and two demonstration plants for producing liquid fuels by different processes were under construction at Louisiana, Mo.

Work was continued on a 200-barrel-a-day hydrogenation (Bergius process) plant and on a 50- to 80-barrel-a-day gas synthesis (Fischer-Tropsch process) plant. Scheduled for completion during 1949, the latter plant will employ a newly-developed converter unit which can be enlarged to produce 1,000 barrels a day, as compared with the 18-barrel-a-day capacity of German converters. At Morgantown, W.Va., the Bureau investigated processes for economical production of synthesis gas (carbon monoxide and hydrogen), the major cost factor in synthetic fuels manufacture, and the most important single research problem. Bureau research followed three major lines: (1) gasification of coal in place underground; (2) gasification of powdered coal in superheated steam containing oxygen; (3) gasification of powdered coal with oxygen and steam in a vortex reactor.

Petroleum and Natural Gas. Unprecedented peacetime requirements for oil stimulated Bureau research in the development of better methods of extracting petroleum from the ground. To help increase domestic oil reserves, the Bureau undertook a basic study of the surface forces in natural petroleum reservoirs. Similarly, the Bureau completed laboratory research on the recovery of oil from California sandstones, and conducted studies on metals that would resist corrosion in gas-condensate wells.

Helium. Reflecting a growing demand for helium in commercial, medical and industrial enterprises, the Bureau of Mines—exclusive producer of this lightweight, noninflammable gas—delivered more than 15,916,747 cubic feet, or 23.6 percent of the total production of 67,486,567 feet, for non-Federal uses. As a result of research carried on at the Bureau's Exell and Amarillo, Texas, plants, the purity of helium was increased to 99.8 percent—a significant development, since some types of helium-shielded arc welding cannot be done successfully with a less pure gas. Major objectives of Bureau research during the past year were the development of new and better techniques for using this valuable gas in welding and metallurgy, more efficient extraction methods, and expansion of the present use pattern. Peacetime uses for helium now include inflation of airships in private use, as a tracer gas in mapping underground petroleum reservoirs, in hospital operating rooms to eliminate explosion hazards, as well as the treatment and prevention of caisson disease and in treating some respiratory diseases.

Explosives Testing and Research. Minimizing of hazards associated with the manufacture, storage, and use of explosives continued to be a major Bureau research goal, and Bureau investigators last year tested more than 1,600 permissible explosives and blasting devices, special types of explosives, detonators, and hazardous chemicals. In the course of the Bureau's basic explosives research program, new methods were discovered for measuring the rate of detonation of explosives and the temperature in detonation waves. A study of the explosibility of ammonium nitrate, which caused the Texas City, Tex., disaster, revealed that under certain conditions this material can be detonated by heat alone.

Safety and Health Activities. Striving to conserve life and property in the mines and plants of America's vital mineral industries, the Bureau of Mines last year intensified its safety education and coal-mine inspection activities. Two new training courses were conducted—one to instruct supervisory officials in the broad principles of coal-mine safety, and the other to familiarize coal-mine safety committeemen with established safety standards. Also continued were first-aid, mine-rescue, accident-prevention, and other established training.

As a result of Bureau studies of methods of preventing rock falls, a type of roof support which had proved effective in some metal mines was introduced into an increasing number of coal mines. In addition to making thousands of analyses of dust and mine air samples, the Bureau determined the explosibility of many industrial dusts and offered recommendations for reducing hazards. In recognition of the vital role played by the coal-mine inspection program in promoting health and safety in the domestic coal industry, the Eightieth Congress authorized the employment of additional inspectors, bringing the staff to 250. Nearly 4,700 coal-mine inspections were completed in all coal-mining sections of the country, and mine operators, mine workers' organizations, and the public were informed of the results. Although the program was purely voluntary, thousands of inspectors' recommendations for reducing hazards were adopted. A substantial percentage of these recommendations dealt with ventilation, rock dusting and the minimizing of fire and ignition hazards. Statistics on mine accidents gathered and analyzed by the Bureau reveal that in the fiscal year ending July 1, 1948, fewer men lost their lives for every million tons of coal produced last year than in any corresponding period in the Nation's history.

Anthracite Water Problem. To help preserve valuable fuel reserves in the anthracite region of eastern Pennsylvania, the Bureau during the past year conducted investigations to determine the feasibility of Federal participation in construction projects or pumping operations to prevent flooding of mine workings. Additional information was also gathered on damage to property by subsidence owing to lack of backfilling in active mine workings, and the effectiveness of barrier pillars and mine dams in present workings in resisting the pressure of impounded water.

Economic and Mineral Industries. The economic and statistical services of the Bureau of Mines last year supplied basic information on foreign and domestic mineral resources to the Government, mineral industries and the public. Hundreds of periodic reports dealing with all phases of the minerals industries were issued and injury statistics were revised to meet current requirements.

Public Reports. Because of a continuing heavy demand for information on subjects associated with the mineral industries, the volume of publications released by the Bureau during 1948 remained high. The results of Bureau research were made available to all interested parties in many reports and papers published during the past year. Responding to requests from technical organizations, Bureau staff members addressed technical and scientific meetings and contributed to the technical and trade press. Individual chapters of the *Minerals Yearbook*—long accepted as an authoritative text on current developments in the minerals industries—were issued as preprints on completion. A nationwide audience of about 12 million persons saw films from the Bureau's free loan library of educational motion pictures. Sponsored by private in-

dustry and produced under the supervision of the Bureau, the films depict the uses and methods of producing various mineral commodities.

MINNESOTA. A west north central State. Area: 84,286 sq. mi. Population: (July 1, 1948) 2,940,000, compared with (1940 census) 2,792,300. Chief cities: Saint Paul (capital), 287,736 inhabitants in 1940; Minneapolis, 492,370. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$178,212,000; total expenditure, \$163,119,000.

Elections. Truman's majority of about 100,000 over Dewey, Wallace, and others gave the 11 electoral votes to the Democratic nominee. Hubert H. Humphrey, Democratic-Farmer-Labor candidate, beat incumbent Joseph Ball, Republican, in the Senatorial race, while Republicans won only 5 of the 9 House seats for a loss of 3. Most contests for State office were won by Republicans, including: incumbent Governor Luther W. Youngdahl who was reelected over Charles Halstead; C. Elmer Anderson—Lieutenant Governor; J. A. A. Burnquist—Attorney General; Mike Holm—Secretary of State; Julius A. Schmahl—Treasurer. The voters authorized a veterans' bonus.

Officers, 1948. Governor, Luther W. Youngdahl; Lieut. Governor, C. Elmer Anderson; Secretary of State, Mike Holm; Attorney General, J. A. A. Burnquist; State Treasurer, Julius A. Schmahl; State Auditor, Stafford King.

MINT, Bureau of the. A Bureau of the U.S. Department of the Treasury which directs the coinage of money and supervises the activities of the three Mints (Philadelphia, Denver, and San Francisco), the two Assay Offices (New York and Seattle), the gold Bullion Depository at Fort Knox, Ky., and the silver Bullion Depository at West Point, New York. Director: Mrs. Nellie Tayloe Ross.

MISSISSIPPI. An east south central State. Area: 46,865 sq. mi. Population: (July 1, 1948) 2,121,000, compared with (1940 census) 2,183,796. Chief city: Jackson (capital), 62,107 inhabitants in 1940. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$100,148,000; total expenditure, \$93,854,000.

Legislation. The Legislature met in regular session on January 6 and adjourned April 14. Biennial appropriations exceeded, for the first time, \$100 million and included \$35 million for common schools, \$8 million for institutional improvements, \$7.5 million for aid to counties and cities, and \$5 million for hospital construction. Special aid was given to Gulf Coast communities devastated by the September, 1947, hurricane. A new 6 percent natural gas severance tax was one of the few tax changes.

An outstanding event was the adoption of a workmen's compensation law with compulsory coverage, second-injury fund, unlimited medical care, and double compensation for illegally-employed minors. Old-age assistance was increased and a rehabilitation program for the State penitentiary adopted.

The interstate parole and probation and interstate oil and gas compacts were adopted. The State oil and gas board was reorganized and a State aeronautics department created with power to stim-

ulate aviation development and to review all local airport plans submitted under the Federal Airport Act.

Elections. Thurmond won a commanding popular majority over Truman, Dewey, Wallace, and other nominees and won the 9 electoral votes. Senator James O. Eastland, Democrat, was reelected without opposition, and the 7 House seats remained Democratic. There were no contests for State office.

Officers, 1948. Governor, Fielding L. Wright; Lieut. Governor, Sam Lumpkin; Secretary of State, Heber A. Ladner; Attorney General, Greek L. Rice; State Treasurer, Robert W. May; State Auditor, Carl N. Craig.

MISSOURI. A west north central State. Area: 69,420 sq. mi. Population: (July 1, 1948) 3,947,000, compared with (1940 census) 3,784,664. Chief cities: Jefferson City (capital), 24,268 inhabitants in 1940; St. Louis, 816,048. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$191,335,000; total expenditure, \$175,149,000.

Legislation. The session of the General Assembly which convened January 7 was a continuation of that which began in January, 1947. Following prolonged recess, it adjourned December 1.

Tax measures included a 2 percent use tax on vehicles purchased outside the State, and a two-year authorization to St. Louis to levy a payroll tax not to exceed one-half of 1 percent on individual earnings and corporation net profits. Control and operation of the St. Louis Sanitarium and the Training School for Feeble-Minded were transferred to the State to lower costs to the city. Also passed were laws permitting border cities to establish airports in neighboring States, and to create a joint Illinois-Missouri planning commission to foster development of the St. Louis Metropolitan Area.

New school laws provide liberal aid for educating physically-handicapped children, and stimulate reorganization and consolidation of school districts. State equalization school aid was made conditional upon achievement of local school taxing minimums. Restrictions were placed on payment of unemployment compensation to workers who quit without good cause or are fired for misconduct, while workmen's compensation benefits were considerably liberalized.

New insurance regulatory laws were passed and several uniform laws adopted. Constitutional amendments to grant a veterans' bonus and to increase the gasoline gallonage tax from 2 to 3½ cents were initiated but defeated by the voters in November.

Elections. Truman carried his home State over Dewey and Wallace by a majority of 250,000 and won the 15 electoral votes. In House races, Democrats won 12 of the 13 seats, for a gain of 8. Forrest Smith, Democrat, won the governorship over Republican Murray Thompson, and Democrats also won all other major State offices, including: Lieutenant Governor—James T. Blair, Jr.; Secretary of State—Walter H. Toberman; Attorney General—J. E. Taylor; Treasurer—M. E. Morris; Auditor—W. H. Holmes.

Officers, 1948. Governor, Phil M. Donnelly; Lieut. Governor, Walter N. Davis; Secretary of State, Wilson Bell; Attorney General, J. E. Taylor; State Treasurer, Robert W. Winn; State Auditor, Forrest Smith.

MOLYBDENUM. The demand for molybdenum products, principally for steel-making purposes, increased in 1948. Shipments of ferromolybdenum, molybdc oxide, molybdenum salts and metal totaled 17,082,500 lb. of contained molybdenum in the first nine months, compared with 20,744,900 lb. in the year 1947, a postwar high. Production of concentrates was also increased during the year and, despite heavier consumption, stocks at mines and converting plants were built up by 2.3 million lb. during the period, to 25,988,000 lb. of contained molybdenum. Production of concentrates to the end of September totaled 22,074,200 lb. molybdenum content (year 1947: 27,047,000 lb.).

Utah, in which molybdenum is recovered as a by-product from copper mining, was the leading producing State in the first half of the year, but Colorado recovered its primary position in the last half. New Mexico, California, Arizona, and Nevada also produced molybdenum. There were no imports of concentrates or molybdenum products in 1948. Exports of concentrates amounted to 1,725,762 lb. molybdenum content during the nine months, about 60 percent to the United Kingdom (year 1947: 2,989,251 lb.). The Climax Molybdenum Company, a principal producer, announced a price increase in its products averaging 18 percent effective Jan. 1, 1949.

—JOHN ANTHONY

MONACO. A principality on the Mediterranean, surrounded on its land sides by the French department of Alpes-Maritimes. Area: 370 acres. Population: (1946) 19,242. Chief towns: Monaco (capital), La Condamine, Monte Carlo. The main sources of revenue are derived from the tourist traffic and the gambling concession at Monte Carlo. Budget: (1946) expenditure was estimated at 248,929,790 francs. A ministry assisted by a council of state administers the country under the authority of the Prince. Legislative power rests with the Prince and the national council of 12 members elected by universal suffrage for a four-year term. Ruler: Prince Louis II (succeeded June 26, 1922).

MONGOLIAN PEOPLE'S REPUBLIC (Outer Mongolia). A republic, formally established on Jan. 5, 1946. It is bounded by the U.S.S.R. on the north, Sinkiang on the west, and China on the south and east. Area: 580,158 square miles. Population: 900,000, including 100,000 Russians and 50,000 Chinese. Capital: Ulan Bator, 100,000 inhabitants. Buddhist Lamaism is the chief form of religion.

Production, etc. Most of the country is pastoral. Some areas are suitable for the production of wheat, millet, and rye. Livestock included 10,600,000 sheep, 1,500,000 oxen, 270,000 camels, and 1,340,000 horses. All land, natural resources, factories, mines, and public utilities have been nationalized. Caravan route is the principle means of communication.

Government. According to the constitution the highest power is vested in a parliament (the *Great Huruldan*), elected by universal suffrage. From its members 30 are elected to comprise the executive committee (*Little Huruldan*). The committee elects 5 of its members to form a board which administers state affairs.

MONTANA. A mountain State. Area: 146,997 sq. mi. Population: (July 1, 1948): 511,000, compared with (1940 census) 559,456. Chief cities: Helena (capital), 15,056 inhabitants in 1940; Butte, 37,081. See AGRICULTURE, EDUCATION,

MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$32,615,000; total expenditure, \$28,471,000.

Elections. Truman's majority of about 15,000 over Dewey and Wallace won him the 4 electoral votes. In races for Congress, incumbent Democrat James E. Murray won the Senatorial contest, and the 2 House seats remain divided among Democrats and Republicans. John W. Bonner, Democrat, defeated incumbent Sam C. Ford in the gubernatorial race. Democrats won all other State-wide offices: Lieutenant Governor—Paul Cannon; Secretary of State—Sam C. Mitchell; Attorney General—Arnold H. Olsen; Treasurer—Neil Fisher; Auditor—John J. Holmes; Railroad Commissioner—Austin B. Middleton, Superintendent of Public Instruction—Mary M. Condon.

Officers, 1948. Governor, Sam C. Ford; Lieut. Governor, Ernest T. Eaton; Secretary of State, Sam W. Mitchell; Attorney General, R. V. Bottomly; State Treasurer, George T. Porter; State Auditor, John J. Holmes.

MOROCCO, French. A French protectorate comprising the major portion of the Sherifian empire in northwest Africa. Under the French Constitution of 1946, the protectorate forms part of the French Union and is classified as an "associated state." Area: 153,870 square miles. Total population (1947 census): 8,499,997, of whom 324,997 were non-Moroccan (chiefly French). Rabat (1947 pop. 160,800) is the administrative capital. Marrakesh (pop. 237,800), Fez (pop. 200,900), and Meknes (pop. 159,600), are the traditional Moorish capitals. Casablanca (pop. 550,800) is the principal seaport.

Religion and Education. The natives are Moslem except for some 195,000 Jews. The majority speak Moorish-Arabic, but in the back country several Berber dialects prevail. French is the official language. Illiteracy is general and few children get more than a rudimentary education. Koranic schools are numerous and the Kairoween University is highly regarded throughout the Islamic world. In 1947 a total of 132,750 Moslems, 47,750 Europeans, and 19,245 Jewish pupils attended schools. The Institut des Hautes Etudes Marocaines at Rabat had 2,068 students in 1945-46. Jewish instruction is given in 48 schools.

Production. Agriculture is the leading industry with a total of about 7.5 million acres under cultivation. The principal crops are cereals, beans and other legumes, olives, fruits and almonds, and wine. Chief cereal crops (1946) in metric quintals (a quintal = 220.4 lb.) were: barley 8,531,000, wheat 7,518,400, maize 2,182,900. Olive oil yielded 18,000 tons in the 1946-47 season and wine 7.9 million gallons in 1945. Livestock (1946): 6,031,000 sheep, 3,892,000 goats, 1,394,000 cattle, 540,000 asses.

Phosphate, the principal mineral, is exploited under a state monopoly. In 1947 the mineral output (in metric tons) was: phosphate 2,961,000; coal 268,800; cement 218,400; manganese 22,100 (1946); iron ore 153,600 (approx. metal content 50 percent). Production of electric power (1947) totaled 301.2 million kw-hr. In 1946, a total of 50,863 tons of fish were caught.

Foreign Trade. In 1947 imports were valued at 33,312 million francs; exports at 18,312 million francs. France accounted for the greater part of both exports and imports. In 1946, 3,828 vessels of 6,909,625 tons entered and cleared the ports.

Finance. Budget estimates for 1948 place revenue at 22,482,851,000 francs; expenditure at 22,482,783,000 francs. On Jan. 1, 1947, the outstanding state loans amounted to 7,486,653,000 francs.

Government. The reigning Sultan, Sidi Mohammed, belongs to the Alawite dynasty. In theory his power is practically absolute, but in reality its exercise is largely in the hands of France, represented by the Resident-General. The Sultan is assisted by a Makhzen, or cabinet, but this also is under the control of the protecting authorities. Local government is largely in the hands of native officials or chieftains, supervised by French controllers. The hinterland, in the Atlas Mountains and beyond, has been "pacified" only in recent years and is under the effective control of the military. There are French courts in which cases involving foreigners are tried, while native cases are dealt with in religious courts or by local pashas and caids. Only the United States preserves its special capitulatory status.

Events, 1948. The growing inclination of the Sultan Sidi Mohammed to align himself with the nationalist movement, already evidenced on the occasion of his 1947 speech at Tangier (see *YEAR BOOK, Events of 1947*), continued to manifest itself, 1947. On December 3, he addressed a letter to President Vincent Auriol in which he registered various complaints. The exact nature of this communication was the subject of considerable dispute when on January 9 its alleged contents were revealed by Moroccan sources in Paris.

According to these nationalist circles, the Sultan cited a long series of grievances, demanded the recall of the Resident-General, Gen. Alphonse-Pierre Juin, and spoke of Moroccan independence and the abrogation of the protectorate treaty of 1912. French spokesmen, while refusing to give the exact text of the letter, declared that it in reality dealt only with administrative matters and did not take up broader issues. On January 12 it was learned that the French government had made "a technical answer," taking up point by point the matters raised by the Sultan. On January 23 Gen. Juin announced the texts of several reforms he intended to make in the electoral, administrative, judicial, educational, labor, and press set-up in the protectorate. Early in March a short strike of railway workers in Morocco was settled when Juin granted pay increases. He staved off a threatened walk-out by public service workers with similar concessions.

In any event, it was quite clear that His Sherifian Majesty did not relish the manner in which Gen. Juin administered the protectorate with a firm hand and prevented him from attending nationalist meetings and demonstrations. There were those who said that the Sultan's desire to identify himself with the independence party was a spirit of rivalry with the old Riffian leader, Abd-el-Krim, who was organizing the North African liberation movement from Cairo. Despite the Sultan's highly uncooperative attitude toward Gen. Juin, the Paris government showed no signs of recalling him. Early in April he was made commander-in-chief in French North Africa, while continuing to hold his post in Morocco.

According to a special correspondence appearing in *The Christian Science Monitor* on March 30, President Auriol replied to the Sultan only after a three-months delay and then very perfunctorily, thereby annoying His Majesty even further. The net result was said to be that the latter became determined to persuade the Arab League, or one of its members, to bring the Moroccan question be-

fore the United Nations Security Council on the grounds that the French had broken their promise, given in the 1912 Protectorate Treaty, to observe his sovereignty.

Late in March there assembled in Tangier several hundred representatives of the nationalist or independence movements of North Africa to discuss their situation and make plans for the future. The Moroccan delegates took the lead in arguing in favor of taking a positive stand in the event of a third World War in order that they might use such an opportunity to regain their independence (see *TANGIER*). This program did not, however, mean orienting the North African liberation movement toward Moscow (see *ALGERIA*).

One of the reflexes of the struggle in Palestine was the exacerbation of Arab-Jewish feelings in Morocco. For centuries Jewish communities had existed there, many of their inhabitants being the descendants of Jews expelled from Spain under Ferdinand and Isabella. The Jews were forbidden by law to own land and to engage in any except a few restricted trades. They were also for the most part obliged to live in a designated section of town known as the *mellah*, though in recent years some of the more prosperous Jews lived outside these quarters. The Moslems looked down on their Jewish compatriots but found it possible and desirable to live with them in mutual tolerance. At the time of World War II this situation was disturbed by the entry of European Jewish refugees and by the Zionist "menace" in Palestine. As a result, the Moorish nationalists in Morocco became increasingly anti-Jewish, and under the surface a seething mass of discontent merely awaited a spark to set off a conflagration.

Such an incident occurred at Oujda and Djerada, in northeastern Morocco, on June 8, when an argument between a Jew and a Moorish cobbler over a pair of shoes led to disorders in which some 40 Jews were killed. Reports indicated that the Palestine issue had entered strongly into the motivation for the argument and subsequent riots.

When the Jewish victims were buried on the 11th, French and Moslem authorities were present. The local pasha, while attending prayers for the deceased in the great mosque of Oujda, was attacked by a fanatical nationalist and gravely injured with stabs in the neck. Security measures were taken immediately and applied shortly thereafter to all of Morocco. The Sultan sent his Minister of Justice to Oujda, where Gen. Juin also flew to institute repressive measures.

The Sultan in particular was said to have been very angry at the turn of events. Only shortly before the fatal incidents he had issued a strong proclamation enjoining that order be preserved by both sides and recommending that no money be collected in Morocco "for a foreign country." After the Oujda and Djerada incidents, representatives of the Moslem and Jewish populations were called separately before the pashas' courts to hear this appeal read to them.

In October a new through service by train and boat was inaugurated between France and Morocco. A weekend train, the Morocco Express, left Paris early Friday; after a change of cars at the Spanish border, and a steamer crossing from Algeiras to Tangier, the rail journey was resumed; Casablanca was reached late Sunday night.

In mid-November the authorities in the Spanish Zone of Morocco instituted a virtual blockade of Tangier by preventing, under one pretext or another, the shipment of food from the French Zone to the International Zone. The administration of

the latter circumvented these tactics by importing food from Casablanca by sea (see TANGIER).

For further details concerning political affairs and economic conditions in French North Africa as a whole, see the article on ALGERIA.

—ROBERT GALE WOOLBERT

MOROCCO, Spanish. The extreme northern and southwestern portions of the Sherifian Empire. It does not include the five places of Spanish sovereignty, or *presidios*, along the north coast, such as Ceuta and Melilla. Area: 18,009 square miles. Population (1948 est.): 1,082,009, all classed as Moslems except 63,100 Europeans (mostly Spanish) and 14,700 Jews. The principal towns are Tetuán (pop. 73,115), Larache, and Alcazarquivir.

Education. The government operates schools for natives in the principal centers, and two higher institutes in native culture have been set up at Tetuán. The Jewish community maintains schools in Tetuán and Larache. In general most children, especially girls, get little if any formal instruction.

Production and Trade. Much good farming land is not cultivated, but efforts are being made to step up agricultural production. Primitive stock-raising is carried on extensively. Iron ore is mined in the eastern part of the country and some 1,500,000 tons yearly are exported through Medilla. Lead, manganese ore, and antimony also are exported. Foreign trade (1947): imports 526,228,484 pesetas; exports 168,174,275 pesetas. Chief exports are cattle, eggs, and iron ore. Flour, sugar, tea, and wine are the main imports. Most of the trade is with Spain.

Transportation. There are less than 200 miles of railway, the most important line being that from Fez to Tangier. Good roads total 540 miles. There is telephone service between Tangier and Madrid and between Tangier and Lisbon. There is also an official trunk line between the French and Spanish zones.

Government. The budget for 1948 was balanced at 214,723,715 pesetas. The Sultan's deputy in the two Spanish Zones of the Protectorate is the Khalifa, nominally chosen by and responsible to him. In reality the Spanish High Commissioner at Tetuán exercises full powers, subject to supervision from Madrid. British and American citizens are still subject to their own consular courts.

Events, 1948. In general, the Franco regime has sought to appease the Moors in its zone of Morocco without acceding to the more drastic demands of the nationalists. In the long run, of course, the Moroccans' aspirations for independence were bound to collide with Spain's determination to hang on to her North African possessions.

An instance of this inevitable conflict occurred early in February. The Spanish authorities had forbidden two nationalist leaders to enter their zone from Tangier. As a result, a general strike was declared in Tetuán, the chief city and capital, and on February 8 an attempt by demonstrators to deliver a protest to the Pasha's house was resisted by troops with force. Several persons were killed and wounded in the *mélée*, martial law was proclaimed, and fifty or more natives were arrested. Naturally, the Spanish government was concerned to keep this outbreak from spreading, particularly as at that moment an Argentine military mission was visiting the High Commissioner for Spanish Morocco, Gen. José Varela.

No doubt as a consequence of the growing nationalist agitation, Gen. Varela established in mid-February the office of Grand Vizier, who would assume responsibility for the conduct of native

affairs, and would be assisted by Moorish judges who would see that justice was done among the Moslem population.

Another facet of Franco's Arab policy was his obviously anti-Zionist policy in the Middle East. His motives here were far from altruistic, for he wanted among other things the support of the Arab League states in the United Nations. A *New York Times* despatch from Cairo, dated August 26, reported that the Spanish Minister to Egypt had called on Abdul Rahman Azzam Pasha, Secretary-General of the Arab League, to inquire about obtaining such support at the forthcoming League Assembly. Azzam purportedly replied that he would be glad to recommend such a course provided Spain modified the severity of its policies in Morocco, allowed Moroccan exiles to return home, and released political prisoners in the Spanish Zone.

One of the leaders of the Nationalist movement in Spanish Morocco, Abd-el-Khaleq Torraiz, an organizer of the North African Liberation Committee set up in Cairo during 1947 by the former rebel chieftain Abd-el-Krim, returned from Egypt to report at a conference of North African independence delegates meeting at Tangier late in March (see TANGIER).

In November the authorities in the Spanish Zone in effect placed a blockade on foodstuffs passing from French Morocco to Tangier in order, it was surmised, to force the International Zone within the political orbit of Spain (see TANGIER).

—ROBERT GALE WOOLBERT

MOTION PICTURES. The industry of the motion picture struggled, muddled, and puzzled through the difficult year of 1948 and into 1949 with prospect of a continuing period of adjustment, internal and external, and the facing of some revolutionary developments.

The art of the screen did well with the customers in 1948. The estimate from semiofficial sources, including informed guesses from Washington, indicated that the year's box office grosses, the money paid by the buyers of seats, would be only about 2½ percent under those for 1947 with the total for the whole country \$1,046 million.

Seven pictures of the period grossed more than \$4 million each in film rental paid by the theaters, the only obtainable and reliable index to the success of individual productions, the commonly released figures of the industry being as elastic as they are. A list of the important productions follows:

Unconquered—Paramount. Produced and directed by Cecil B. DeMille. The film is in Technicolor. The cast includes Gary Cooper, starred in many DeMille pictures; Paulette Goddard; Howard DeSilva; and Boris Karloff. It is broadly in the pattern of the DeMille historical spectacles. The story is laid in 1763 in the invasion and winning of the great frontier empire west of the Appalachians. It is rich with the adventure and color of the beglamoured rugged colonial period. The final accounting may show it to have been the top-grossing box-office picture of the year.

Green Dolphin Street—Metro-Goldwyn-Mayer. Produced by Carey Wilson and directed by Victor Saville. The cast includes Lana Turner, Van Heflin, Donna Reed, and Richard Hart. It is utterly and flamboyantly "movie" as the story runs around the world, a four-angled plot of loves, kept in motion on sea-tossed schooners. It involves an earthquake in New Zealand and the excitement of capture by natives.

Cass Timberlane—M-G-M. Directed by George Sidney, from the novel of the same title by Sinclair Lewis. In the cast are Spencer Tracy, Lana Turner, and Zachary Scott. The story has the customary sociological approach, garbed in Mr. Lewis's fashion. It is strictly adult in its address to the issues, contrasts, and problems of life on "both sides of the tracks," with involvement of divorce, temptation, fidelity, and orders of justice. This is achieved however within the proper frame of family entertainment.

The Bachelor and the Bobby Soxer—RKO-Radio. Dore Schary producer and Irving Weis director. Sheer and light comedy carried into the ridiculous as a vehicle to exploit the personalities of Cary Grant, Myrna Loy, Shirley Temple, and Rudy Vallee.

Mother Wore Tights—Twentieth Century-Fox. Produced by Lamar Trotti with Walter Lang as director. The cast includes Betty Grable, Dan Dailey, and Mona Freeman. There is more than a touch of backstage and whitewashed burlesque, and considerable song and dance.

Road to Rio—Paramount. Daniel Dare producer and Norman Z. McLeod director. The cast includes Bing Crosby, Bob Hope, and Dorothy Lamour. It is a galloping story of a vaudeville team in mad escape to Rio after setting a carnival on fire, involvement with gangsters, complications with mesmerism, and assorted madcap adventures. All in fun.

The Treasure of Sierra Madre—Warner Brothers. Produced by Henry Blanke and directed by John Huston, from a novel by B. Traven. The cast includes Walter Huston, Humphrey Bogart, and Tim Holt. The background is that of prospecting for gold in wildest Mexico, with a rugged and all but womanless cast, action in the rough, and raw realism. While rated fourth among "the ten best" by the critics of the nation, this picture was considered the best English-speaking picture of 1948 by the New York Film Critics at their annual session of judgment.

Hamlet—Universal-International release. Two Cities Films, for J. Arthur Rank. Produced, directed, and enacted by Laurence Olivier, under the auspices of Filipo Del Giudice, through the year under promotional road-show type and special selected audience engagements and the aegis of the Theatre Guild of New York, institution of the stage, not screen. Toplofty critics complained of invasion of the classic status by too much cinema, and others, clinging rather to the motion-picture tradition, held that *Hamlet* on film was still not motion picture. *Hamlet* thus became a significant manifestation in the exploration of audiences and the stratification and classification of patronage—a long and tediously slow process of the years.

Extravagant box office figures were published by euphemists. The indications were that years would pass before the production returned a profit against its true costs. The picture was in fact made in an earlier period of the J. Arthur Rank enterprises, when he was seeking to make an imposing impression on the world market, especially America. That phase had passed, in the course of evolving international relations, before *Hamlet* reached the American screen.

The divergence between the opinions and tastes of the majority of the customers, and those of the critics, reviewers and commentators of the lay press and radio, is pointed up by the report made by *Film Daily*, New York journal of the industry, addressed to 500 persons. Their selection of "the ten best of 1948," which does not include any of

the top-grossing 7 pictures of the year, follows:

Gentleman's Agreement—Twentieth Century-Fox. Produced by Darryl Zanuck, directed by Elia Kazan, from the novel by Laura Z. Hobson. The cast includes Gregory Peck, Dorothy McGuire, John Garfield, and Celeste Holm. The basic theme is anti-semitism.

Johnny Belinda—Warner Brothers. Produced by Jerry Wald and directed by Jean Negulesco. From the stage play by Elmer Harris. In the cast are Jane Wyman, Lew Ayres, Charles Bickford, and Agnes Moorehead. Melodrama with tragic nuances. Marked by scenic beauty. Not for children.

I Remember Mama—RKO-Radio. Produced by Harriet Parsons and directed by George Stevens. From *Mama's Bank Account*, a stage play by John van Druten. In the cast are Irene Dunne, Barbara Bel Geddes, Oscar Homolka, and Philip Dorn. A story of simple family life with its adventures, mishaps, and joys.

The Naked City—Universal-International. A Mark Hellinger production, directed by Jules Dassin. In the cast are Barry Fitzgerald, Howard Duff, Don Taylor, and Dorothy Hart. This is something between documentary and "movie" in its effective style. It pertains to the operations of the New York Police Department in the solution of a society decorator-beautiful model murder, jewel robberies, and what happens when thieves fall out. Well accepted by critics and audiences alike.

Sitting Pretty—Twentieth Century-Fox. Produced by Samuel G. Engel; Walter Lang director. From a screen play by F. Hugh Herbert. The cast includes Robert Young, Maureen O'Hara, and Clifton Webb. A domestic comedy, done with a broad brush as indicated by the casting of the whimsical Webb as a baby-sitter.

State of the Union—M-G-M, from Liberty. Directed by Frank Capra, from the Pulitzer Prize play by Howard Lindsay and Russel Crouse. The cast includes Spencer Tracy, Katherine Hepburn, and Angela Lansbury. A tale of newspapering and political chicanery, including White House ambitions. It is light-footed and swift.

Call Northside 777—Twentieth Century-Fox. Produced by Otto Lang and directed by Henry Hathaway. The cast includes James Stewart, Richard Conte, Kasia Orazewski, and Lee J. Cobb. A quasi-documentary based on the stories of a Chicago murder and miscarriage of justice recorded for the *Chicago Times* by James P. McGuire, reporter. Vital with the triumph of a believing mother.

The Bishop's Wife—RKO-Radio, from Samuel Goldwyn. Directed by Henry Koster. The cast includes Cary Grant, Loretta Young, David Niven, and Monty Woolley. This is a fantasy comedy, with Grant in the role of a heavenly messenger. Romance reigns and happiness triumphs in the end.

Other Pictures. Among the other productions of the year, not previously described, and variously of note, were:

The Search—M-G-M. Directed by Fred Zinnemann, from an original screen play by Richard Schweizer. This is the story of a war-waif victim of Europe's aftermath. Pictured in Germany and Switzerland. In the cast are Montgomery Clift, Jamila Novotna, and the juvenile star Ivan Jandl. As telling and poignant as the theme suggests. A piece for feeling.

Louisiana Story—Another poetic documentary film from Robert Flaherty, who came to fame with his *Nanook of the North*, shown years before and recently reissued. Like *Nanook* this picture was un-

derwritten, it is said, by influential background interest. In the case of *Nanook* it was a fur company, in the instance of *Louisiana*, it was anonymously an oil company concerned with exploiting the bayou country. The telling covers the experience of a boy, one Joseph Boudreaux, a native "cajun." It is a cinema collector's piece, with an appeal of pensive beauty.

The Red Shoes—Eagle-Lion, from J. Arthur Rank. Written, directed, and produced by Michael Powell and Emeric Pressburger. It pertains to the world of the ballet. The cast includes Anton Walbrook, Marius Goring, Robert Helpmann, and Leonida Massine. It is rich in Technicolor, smooth in its flow, and laden with an over-all rhythm.

The Snake Pit—Twentieth Century-Fox. Under the Darryl Zanuck administration. Produced by Anatole Litvak and Robert Bassler and directed by Mr. Litvak from a novel by Mary Jane Ward. The cast includes Olivia De Havilland, Leo Genn, and Mark Stevens. The trying story is a case history from a mental hospital; bitter, realistic, tense, and shocking. Some critics, while admiring the performance, questioned its fitness as public entertainment.

Paisan—Produced and directed in Italy by Roberto Rossellini, who collaborated on the screen play. In the cast are Carmalia Sazie and Gar Moore. A pungent, sharp piece about war-torn Italy. Held high in critical esteem. Sparsely distributed.

Symphonie Pastorale—Pathé Cinema, in France. From a story by André Gide, and carrying thereby a special degree of literati attention. Produced by M. Gide and directed by Jean Delannoy. The cast includes Michele Morgan and Pierre Blanchard. It is French tragedy in the ironic Gide manner.

The Fallen Idol—Selznick Releasing Organization, from Sir Alexander Korda. Directed by Carol Reed, of fame since *Odd Man Out* and other British works. In the cast are Sir Ralph Richardson, Michele Morgan, and Bobby Henrey. It is a child study of appeal and poignant penetration. Greeted as the film sensation of the year in Britain by the Film Tribunal of the London *Daily Express*, a distinguished committee of authorities in art, drama, and literature. At year's-end it was yet to reach American audiences.

Joan of Arc—RKO-Radio, from Walter Wanger's *Sierra*. Directed by the late Victor Fleming. From a story of complex literary and histrionic origins, including counsel from imported Jesuit authority with access to Vatican archives. At year's-end it was playing concurrently in two theaters in New York, at capacity. The title role, overshadowing all others, was held by Ingrid Bergman. The picture, promising to occupy a dominant position through the year to come, was primarily a spectacle, developed in the feeling and manner of Mr. Fleming who, it is to be remembered, so ably brought story and spectacle together in the direction of the classic *Gone With the Wind*. Critical attention was in general somewhat less than grand acclaim, and there was, among the critics, an impression that there was more picture than dramatic feeling. The public response was in an unreasoned fashion to "something big." The picture's negative cost was \$4,600,000, likely the highest budget of 1948, and likely the highest for years to come. Showmen considered it interesting speculation.

Film Awards. The New York Film Critics, a body of considerable national and international weight, after much travail decided that *The Treasure of Sierra Madre* was the best English-speaking picture of 1948. This was achieved after much

consideration of *Hamlet*. These critics were unanimous in the opinion that Olivia De Havilland did the best female acting of the year in *The Snake Pit*. They gave an award to the Italian *Paisan* as the best foreign-language picture of the year.

Out in the West, the San Francisco Drama Critics Council, the only organized group of theater critics in the United States outside New York, selected *Hamlet* as the best English-language film of 1948, and Jean Cocteau's *Beauty and the Beast* as the best of the foreign offerings. Somewhat gratuitously they decided that *Mourning Becomes Electra*, from the O'Neill play, was the year's worst. That one was made to please the cultural-society program of an executive's wife. It had not been mentioned for months.

The National Board of Review of Motion Pictures annual survey, which, despite the title, is to be taken as another New York metropolitan group, with 300 film reviewers making selections, specified as "on the basis of entertainment": (1) *Hamlet*; (2) *The Search*; (3) *Sitting Pretty*; (4) *Gentlemen's Agreement*; (5) *Johnny Belinda*; (6) *Joan of Arc*; (7) *I Remember Mama*; (8) *The Bishop's Wife*; (9) *The Red Shoes*; and (10) *The Snake Pit*.

The Exceptional Films Committee of the National Board, a sort of recognition that there are at least two levels of public, decided that the best film of the year was *Paisan*, from Italy.

Events, 1948. In the interrogation of the motion-picture exhibitors of the United States and Canada, seeking from some 16,000 theater operators report of their year's experience in 1948, *Motion Picture Herald*, New York and international journal of the industry, reported the "top ten money-makers" as: Bing Crosby (fifth time topmost), Betty Grable, Abbott & Costello, Gary Cooper, Bob Hope, Humphrey Bogart, Clark Gable, Cary Grant, Spencer Tracy, and Ingrid Bergman.

In the same survey the topmost money-making stars of the outdoor Western drama were again Roy Rogers and Gene Autry.

The decade-long anti-trust suit entitled *The United States of America vs. Paramount Pictures, Inc. et al.*—including as defendants the "big five" majors, the concerns engaged in the three branches of production, distribution, and exhibition, and the "little three," the producer-distributors without theater affiliation—was drawing to an anti-climatic close with a series of consent decrees and varying proposals for them. It was the culmination of a movement for control and disintegration of the motion-picture monopoly starting with the Roosevelt Administration and initiated with the devices of the short-lived "Blue Eagle" code of the National Recovery Administration.

Television, whether potential friend or menace, was rising in importance. As of December 1, it was officially calculated that there were 650,000 television sets in homes and that soon there would be a million. There was promise of a 1½ million more this year, in homes. There was evidence of slight panic on the margins, among producers, of uncertain hold on the motion picture's established channels, to rush into television picture production. Meanwhile the Hollywood talent pool, which had so valiantly and so ineffectively sought to protect itself against radio invasion years ago, was again seeking to hold out against television. The end would be inescapably the sort of adjustment which came with radio. The theater, in the opinion of this writer, would continue to be "some place to go," and the people are "goers-out."

In the process of stratification of audiences there

arose conspicuously the Drive-In theater, the establishment where automobile customers could without leaving their cars see a screen performance. The development was sweeping the land in 1948, especially in climatically favoured regions. At the turn of the year there were about 800 such theaters, either operating or under construction. They constituted a remarkable development, involving millions. They also brought problems and rumblings of wide criticism and promise of scandal about "back seats," and conduct therein. There was promise that this would be the next big uproar about the morals of the movies, despite the fact that it had nothing to do with the screen.

More significantly than was recognized in print, the Eastman Kodak Company quietly announced a new non-inflammable film stock of a quality in performance equal to the old standard nitrocellulose stock, which is to be increasingly available to the industry.

—TERRY RAMSAYE

MOTORBOATING. Honors in power-boat racing were more or less divided as daredevil drivers continued their never-ending quest for new records. Danny Foster repeated his 1947 triumph in Gold Cup racing at Detroit when he piloted *Miss Great Lakes*, owned by Albin Fallon, to victory on a raging Detroit River in August. Guy Lombardo, the band-leader, who was another outstanding man all season, had the misfortune of wrecking his *Tempo VI* and breaking an arm in attempting to avoid a collision.

Laurels in the President's Cup regatta on the Potomac went to the Arena brothers, Dan and Gene, who won with *Such Crust*, owned by Jack Schafer of Detroit. Joe Van Blerck, Jr., of Freeport, L.I., scored a surprise by amassing 700 points to capture the national sweepstakes on the North Shrewsbury at Red Bank, N.J. Van Blerck's 225-cubic inch *Aljo V* took first over Lombardo's *Tempo VI*, which this time was dogged by starting and battery trouble.

A record field of 181 started in the 136-mile Hudson marathon from Albany to New York, the winner being John R. Whitehouse of Springfield, Mass. Bill Cantrell of Louisville, Ky., annexed the 28-mile race around Manhattan, his craft *So Long* finishing six minutes ahead of Van Blerck's defending champion *Aljo V*.

—THOMAS V. HANEY

MOTOR VEHICLES. United States automotive plants in 1948, on the basis of preliminary figures, produced 5,282,000 cars, trucks and buses—the second year in history that total production exceeded five million vehicles.

In 1929 an all-time high of 5,358,420 motor vehicles was reached. The record of 1948 was achieved despite limited supplies and materials—principally steel—that restricted output throughout the year.

Total production for 1948, however, was approximately 10 percent greater than the 4,797,820 units built in 1947.

Although still unable to produce near capacity, the industry nevertheless established a number of new and significant records in 1948. Employment in automotive plants averaged a new high of 978,000 persons—a gain of 36,000 over 1947, 324,000 over 1941, and 101,000 over the war peak of 1944. The industry's 780,000 hourly rated employees earned about \$2,700 million for the year. Payrolls were 13 percent above 1947 and 127 percent over 1941. The year's output of about 3,911,000 passenger cars was 10 percent more than in 1947.

Virtually every existing peacetime record in the

trucking field was smashed during 1948. Here are a few: (1) Production of commercial units—trucks and buses—reached a total of 1,371,000, the third time in history that output topped the million mark. It exceeds last year's previous high mark by nearly 11 percent and 1941 by nearly 30 percent; (2) Registrations totaled 7,687,000 units, a 10 percent gain over 1947 and nearly 50 percent higher than 1941. For the first time in history, a single year's registrations of new trucks and buses exceeded the million mark; and (3) Wholesale value of the industry's truck and bus production reached \$2,139 million in 1948. This figure is 25 percent higher than that of 1947, and approximately double 1941 output value. It almost equals the combined wholesale value of both passenger car and truck production in 1939.

A vast increase in the use of trucks was noted in virtually every area of the nation. Eight states show an increase of 70 percent or more in truck and bus registrations over 1941.

A new record was set in replacement parts production, which had a wholesale value of about \$2,600 million for 1948—10 percent above 1947 and about four times the prewar rate.

Wholesale value of passenger cars produced in 1948 was about \$4,800 million; wholesale value of trucks and buses was \$2,100 million.

The number of motor vehicles in use by the end of 1948 exceeded 41 million. They included 33.3 million passenger cars (3.7 million more than in 1941) and nearly 7.7 million trucks and buses (2.4 million more than in 1941).

These vehicles rolled up about 400,000 million travel miles for the year, or 20 percent more than in 1941 and 8 percent more than in 1947.

Special motor vehicle taxes also reached new peaks in 1948, totaling nearly \$3,400 million. They included \$2,100 million in state gasoline and license taxes, \$1,100 million in Federal taxes, and \$180 million levied locally.

In all, 442,000 motor vehicles were exported in 1948. This was nearly 14 percent less than the 512,333 units sent abroad in 1947.

The 442,000 vehicles exported included 240,000 passenger cars, or 6 percent of the 3,911,000 cars turned out, and 202,000 trucks and buses, or approximately 15 percent of the 1,371,000 trucks and buses made in the U.S. for 1948.

Motor vehicles exported in 1948 accounted for 8½ percent of the year's production, as against nearly 11 percent of total production in 1947 and approximately 14 percent in 1929.

South American countries, particularly Brazil, Venezuela, and Argentina, continued among the top importers in the truck field. Mexico and India also were among the leading truck importers.

While South America imported more trucks than any other single continent, it ranked next to last among the continents as an importer of passenger cars. Largest shipments of cars went to the Union of South Africa, Asia, and Oceania.

In Europe, only Belgium and Luxembourg were important importers of U.S. motor vehicles. Because of the move to conserve national currency in foreign nations, American automobile exporters, toward the close of the year, were being forced out of several large markets, notably Sweden and South Africa.

In contrast to the relatively few motor vehicles exported by American manufacturers in 1948, Britain exported 7 out of every 10 passenger cars produced and nearly half of the trucks and buses manufactured. Imports of new cars showed a sharp increase.

Because of the high output of replacement parts since the war, about 24½ million prewar cars remained in service in 1948. Of the 33.3 million passenger cars registered in the nation, about 9 million were postwar models, 10½ million were cars built between 1939 and 1942, and nearly 14 million were automobiles built before 1939.

Since the average car was scrapped at the age of 10 before the war, it meant that nearly 14 million cars in 1948 were beyond the age at which cars formerly were scrapped. The average car age in 1948 was about 8.7 years, compared to a prewar average of 5½ years.

During the year the U.S. automotive industry produced its 100 millionth motor vehicle. This significant milestone was marked by special celebrations in many parts of the nation during the fall months.

During the 55 years it took American manufacturers to produce 100 million motor vehicles, the remaining countries of the world were turning out a total of 24 million motor vehicles.

It was 1925 before the U.S. car, truck and bus manufacturers achieved production of their first 25 million vehicles. The next 25 million were made between 1925 and 1931, an era of high output. It took eight more years, until 1939, for the industry to produce its third 25 million vehicles. The fourth 25 million cars, trucks and buses took nine years to build. However, nearly four of those years saw the U.S. automotive industry entirely devoted to military production—the first time in history that car assembly lines had been completely suspended.

During the past year, the industry moved forward on expansion and modernization programs. Since the end of World War II, 42 major new manufacturing and assembly plants have been added to the industry's capacity. U.S. assembly plants now number 112. They are located in 80 cities of 24 states.

How fully the industry utilizes production capacity in 1949 once again depends upon the supply of steel. With the possibility of record production of steel in 1949, the automotive industry is hopeful that more sheet and strip steel will be available and that 1949 will prove to be the highest automotive production year in history.

—WILLIAM J. CRONIN

MOZAMBIQUE (Portuguese East Africa). A Portuguese colonial possession in southeast Africa comprising the four provinces of Sul do Save, Manica and Sofala, Zambesia, and Niassa. Total area: 302,700 square miles. Population: 5,030,179 natives (1940), 60,115 non-natives (1945), and 31,221 Europeans. Estimated 1947 population: 6,116,000. Capital: Lourenço Marques (pop. 47,390). Education (1946): 878 primary schools with 132,291 pupils, 1 high school with 744 students, and 46 professional schools with 4,768 students. There are three colleges with 122 students.

Production, etc. Principal products (in tons) in 1945 were: sugar 42,573, copra 40,395, bananas 24,619, ground nuts 20,141, and sisal 17,932. Timber, tea, and ivory are also important.

Mineral output includes gold, silver, samarskite, and coal. During 1947, 6 uranium and 3 asbestos deposits were discovered. Foreign trade (1947: 9 mos. actual, 3 mos. est.): imports 1,203,866,000 escudos; exports 1,092,000,000 escudos.

Government. Budget estimates (1946): revenue 892,904,000 escudos; expenditure 839,871,000 escudos. A Governor General heads the administration of the colony and each of the provinces

is headed by a Governor. There is a Government Council (composed of the provincial governors, official elected members, and the commanding general) and an Executive Council. Governor General: Commander Gabriel Teixeira.

MUSCAT and OMAN. An independent sultanate in southeastern Arabia. Area, 82,000 square miles; estimated population, 500,000, mainly Arabs, but with a strong infusion of Negro blood near the coast. Chief towns: Muscat, the capital, 4,200 inhabitants; Matrah, the chief commercial center, 8,500. On the northern coast of the Gulf of Oman is the port of Gwadar which is a possession of the sultanate. Chief products: dates (1945–46 export Rs8,473,200), pomegranates, limes, and dried fish. Camels are raised by the inland tribes. Trade (1946–47): imports Rs18,530,300, exports Rs17,134,500. Trade is mainly with India. Rice, sugar, wheat, and coffee are the principal imports. Muscat is the only port of call for steamers. Pack animals are used for inland transport. There is a motor road connecting Muscat and Matrah and extending to Kalba. Roads suitable for motor vehicles join Hagar, Boshier, and Qariyat with Matrah. The annual revenue is estimated at Rs700,000. Sultan, Sir Saiyid Said bin Taimur.

MUSIC. Few years in recent memory have yielded so rich a crop of new musical works that are likely to acquire a permanent place in the repertory. The most important of the new American works was heard early in the year when Serge Koussevitzky and the Boston Symphony Orchestra performed Walter Piston's *Symphony No. 3*. A work of extraordinary communicative power, it has a wider emotional range than most Piston works, passing from an almost delicate wit to a pastoral-like serenity, from introspective calm to dramatic intensity. Piston's *Symphony* was not slow in receiving the acclaim it deserved. Before many months had passed it won the Boston Symphony Horblit Award of \$1,000 and the Pulitzer Prize in music.

Another *Third Symphony* proved a notable contribution, that of Wallingford Riegger. More modern in its idiom than that of Piston, this work has a forcefulness of speech, a passionate sincerity, and an integration of form which singled it out forcefully from among the new music of the year. Indeed, the Music Critics Circle of New York selected it as the most important new work heard during the 1947–1948 concert season.

Igor Stravinsky's new ballet, *Orpheus*, introduced by the Ballet Society of New York, proved to be one of his greatest scores. The classic story of Orpheus and Euridice inspired him to write simply and directly, to achieve, with the most sparing strokes, a deeply affecting eloquence. A high degree of expressiveness, an almost gentle melancholy, brings to the music a human quality not often encountered in the later Stravinsky.

A work, far different in style and scope, introduced a new creative personality; the *Symphony for Classical Orchestra* by Harold Shapero, performed by the Boston Symphony under Leonard Bernstein. Austere in its style and ultra-modern in its utilization of harmonic and rhythmic resources, this new symphony betrayed an inventiveness of a high order and excellent craftsmanship. A composition, more palatable to the ear, racy in its utilization of jazz rhythms, was introduced on the very same day (January 30) in another city: Henry Brant's *Symphony No. 1*, performed by the Cincinnati Symphony Orchestra under Thor Johnson.

Another symphony worthy of special attention

U.S.S. DES MOINES, the heaviest "heavy" cruiser in the world, which was commissioned during mid-November of 1948.

U.S.S. NORTON SOUND. On the stern are the adjustable rocket launching racks which are capable of launching V-2 type rockets as well as the slightly smaller Aerobee. In her capacity as a floating laboratory, the Norton Sound will be available for use by research agencies of all three branches of the Armed Services—the Army, the Air Force, and the Navy.

Official U.S. Navy Photos

U.S.S. PERCH. A fleet-type submarine converted to a troop transport. The large cylindrical chamber abaft the conning tower (right center of photograph) on the after deck is a water-tight storage space for landing equipment.

TEST FIRE 14-TON ROCKETS. Close-up view of the bridge of the U.S.S. *Norton Sound*. After end of the foredeck landing platform is shown in the foreground.

U.S.S. NEWPORT NEWS, a 17,000-ton heavy cruiser, is equipped with nine completely automatic, rapid firing, 8-inch guns, triple-mounted in three turrets.

ROCKET LAUNCHING. A close-up view of the special rocket launching racks installed on the after deck of the U.S.S. *Norton Sound*. The broad seaplane deck was covered with metal sheathing to withstand the heat created by firing the rockets from their vertical cradle. Also installed were tanks for the special fuel used in rockets.

Official U.S. Navy Photos

U.S. NAVY CARRIER. An artist's drawing of the U.S. Navy's authorized 65,000-ton flush deck aircraft carrier. Her over-all length will be 1,090 feet, waterline beam 130 feet, and maximum fixed width 190 feet. Speed: about 33 knots.

ROCKET TESTS. Bow on view of the U.S.S. Norton Sound, the U.S. Navy's first "Buck Rogers" ship—a large sea-plane tender modified to permit the experimental firing of 14-ton rockets from her broad after deck. Her basic mission is to widen the horizon of upper atmosphere research through rocket firing experiments far out at sea.

LOAD CARRYING CHAMPION, a Martin AM-1 Mauler, the Navy's fastest and most heavily armed carrier-based dive bomber, is pictured carrying a payload of more than 9,000 lb.—3 full-size torpedoes, 12 rockets, and 4 aerial cannon.

TWIN JET FIGHTER, the Chance Vought XF7U-1, U.S. Navy twin-jet fighter, designed for carrier operations, has successfully completed its initial flight testing at the Naval Air Test Center, Patuxent, Maryland. This tailless plane with swept-back wings is capable of speeds up to and exceeding 600 m.p.h.

Official U.S. Navy Photos

MARTIN AM-1 MAULER, another view of the U.S. Navy's Mauler. The payload of destruction pictured on the Mauler (at right) is considerably less than the maximum possible for the single-engine, one-man airplane, which is powered by the 3,250-h.p. Pratt & Whitney Wasp Major.

was Frederick Jacobi's *Symphony No. 1*, which Pierre Monteux directed with the San Francisco Symphony Orchestra. It has pronounced Oriental colorings, with fullsome, buoyant themes and a poignant slow movement.

Other new works by composers in America which were creditable contributions to the year's music were: Samuel Barber's *Knoxville: Summer of 1915*, for soprano and orchestra; Henry Cowell's *Big Sing*; David Diamond's *Symphony No. 4*; Harl McDonald's *Saga of the Mississippi*; Douglas Moore's *Farm Journal*; Nicolas Nabokov's *The Return of Pushkin*, for high voice and orchestra; Karol Rathaus' *Vision dramatique*; Virgil Thomson's *The Seine at Midnight*; and Ernst Toch's *Hyperion*.

One American composer was a victim of the political storms and stresses of the year. Hanns Eisler, who had been composing music in Hollywood for the past six years, and who had been summoned in 1947 to appear before the House Committee on Un-American Activities on suspicions of being a Communist, was during the year convicted for contempt of Congress and for passport fraud. Despite his vehement denials that he was, at the present time, a member of the Communist Party, and despite his protestations that his writing of revolutionary songs was an artistic phase that he had long ago abandoned, Eisler was ordered deported by the Immigration and Naturalization service of the U.S. Department of Justice. He left the country for Paris on March 25. His deportation was prefaced by concerts of his works both in Los Angeles and New York which emphasized that, whatever his political affiliations may have been or still are, he is a brilliant creative personality whose utilization of the atonal style is powerful and original.

The new works by foreign composers heard in this country during the year were equally fertile in number and no less significant in quality than the native products. The year was inaugurated with one of the most important of these new works, on January 1, when the New York Philharmonic, under Charles Muench, presented the American premiere of Arthur Honegger's dramatic oratorio, *Jeanne d'Arc au bûcher*. The Honegger music caught many of the symbolic and mystic nuances of the Paul Claudel text; a great measure of the artistic success of this work is due to the felicitous union achieved between the poem and the music.

A new symphony by England's foremost composer, Ralph Vaughan Williams, is inevitably an event of first importance. His sixth received its premiere in London on April 21 under Sir Adrian Boult and was introduced in this country a few months later by Serge Koussevitzky at the Berkshire Music Festival. This new symphony has closer spiritual kinship with its immediate predecessor, the fourth, than to any other Vaughan Williams symphonies. Like the fourth, a mood of tranquillity and calm are maintained, frequently echoing spiritual overtones. The work has the wisdom and mature contemplation of ripe old age which refuses to be jarred by the surrounding turmoil and chaos but finds refuge in meditation. Mastery of writing is, of course, a foregone conclusion with anything by Vaughan Williams.

A new symphony by still another major European composer was heard: Malipiero's fourth. The world premiere took place in Boston under Serge Koussevitzky. It is a deeply moving work written ostensibly in memory of Koussevitzky's late wife Natalie, but actually as a therapy to war-scarred Italy. World War I had three decades ago inspired

Malipiero to write his masterpiece, *Pause del Silenzio*; and it appears that World War II has affected Malipiero equally profoundly into writing another great work.

One of Richard Strauss' most recent works was heard in this country for the first time by virtue of a nation-wide broadcast: the *Concerto* for Oboe and Orchestra. Nothing of recent Strauss vintage is particularly intoxicating, but the new concerto is, though hardly momentous, at least ingratiating. Its style reaches far back into Strauss' early manhood when he was influenced by the post-romanticism of Brahms. It is melodious, warmly orchestrated, sensuously harmonized. While adding nothing to Strauss' stature, it is at least a welcome addition to the none too prolific literature for oboe.

An event of considerable artistic importance took place in Philadelphia on March 19: the American premiere of the *First Symphony* of Serge Rachmaninoff, long lost. Eugene Ormandy conducted the Philadelphia Orchestra. Though obviously early-Rachmaninoff, the symphony reveals little of the awkwardness and self-consciousness which we usually find in first symphonies. It has considerable melodic interest and, while no masterpiece, is a worthy companion to the familiar second and third symphonies.

Bohuslav Martinu's *Fifth Symphony*, heard here for the first time in a broadcast by the NBC Symphony Orchestra under Ernest Ansermet, can, on the other hand, be designated as a great symphonic work. It is built along noble and spacious lines and is permeated with an engaging charm.

Charm, too, is the dominating quality of the new Khachaturian *Concerto* for Cello and Orchestra, which Edmund Kurtz performed with the Boston Symphony Orchestra. It is beautifully written for the solo instruments, has fascinating contrasts of color and mood, and is rich with exotic atmospheres.

Concert and Operatic Activity. The orchestral picture experienced a few important changes during the year. One of these—possibly the most important—will, however, not become effective until the fall of 1949. On April 8, Serge Koussevitzky announced that at the termination of his silver jubilee season of 1948–1949 he would retire as music director of the Boston Symphony Orchestra. At the same time it was announced that his successor would be Charles Muench.

Change, too, came to the Chicago Symphony Orchestra, accompanied by controversy. In the fall of 1947, Artur Rodzinski had become the new music director. But not many weeks passed after the assumption of his duties before violent disagreements arose between him and the management. His repeated indispositions, necessitating last-minute substitutions at the podium, his indulgence in expensive opera productions, his refusal to adhere to advertised programs, his frequent demonstrations of artistic temperament, all proved too intolerable to the conservative management, which announced with finality, on January 13, that the new conductor would not be re-engaged for the 1948–1949 season. In Rodzinski's place there appeared guest conductors.

Guest conductors replaced Fritz Reiner on the conductor's platform of the Pittsburgh Symphony Orchestra for the 1948–1949 season. Reiner, who had served brilliantly for a decade in Pittsburgh, had decided to transfer his baton to the Metropolitan Opera House in New York.

Two other important American orchestras had new conductors in the fall of 1948. Efrem Kurtz, for many years the successful director of the Kan-

sas City Philharmonic, went to the Houston Symphony, his place in Kansas City being assumed by Hans Schwieger, formerly of the Fort Wayne Symphony.

Two major personalities of the baton made their reappearance on the American scene during the year. Ernest Ansermet, one of Europe's venerable conductors, directed several concerts with the NBC Symphony and appeared as guest with other major American orchestras—his first return to this country in 11 years. His performances revealed his fine intelligence, taste, and mature experience. Victor de Sabata, eminent Italian composer and conductor of La Scala in Milan, appeared with the Pittsburgh Symphony, his first performances in this country since 1927. His return was one of the artistic events of the season. His virtuosity is second to none; his is an enviable talent to bring even to thrice-familiar classics a freshness of viewpoint and an originality of conception.

For a brief period, the storm of controversy raged around Leonard Bernstein, the brilliant young conductor of the New York City Symphony. Compelled by budgetary considerations to curtail the activities of the New York City Symphony for the 1948-1949 season, Bernstein (who receives no pay for his services) finally announced that he could not tolerate retrenchment and would resign his post.

The matter was eventually ironed out, with the orchestral management guaranteeing Bernstein that the funds would be found to carry out the artistic plans of the orchestra in full. However, since in the interim Bernstein had accepted the post of musical adviser of the Israel Symphony Orchestra for 1948, it was announced that the New York City Symphony would abandon its activities for one season, but would return in 1949-1950 under Bernstein's direction.

In the world of opera, the major news of the year was the threatened cancellation of the 1948-1949 season by the Metropolitan Opera Association, brought about by the demands of the unions for higher increases in the salaries of all employees, demands which the management insisted it could not meet. Only the belated consent by the unions to forego their pay increases for the time being enabled the Metropolitan to reconsider its original decision. However, since negotiations were carried on up to Labor Day, the management found it necessary to curtail the season by two weeks, and to postpone its customary early-November opening until November 29.

The threatened closing of the Metropolitan precipitated heated discussions regarding the management and its policies. The severest critic was Billy Rose, the showman, who offered to take over the direction of the opera house and to guarantee its financial security. Rose also devoted a week of columns, syndicated throughout the country, to prove that the Metropolitan was burdened artistically and financially by its stubborn adherence to obsolete methods and policies. The officials of the Metropolitan made no attempt to answer these charges; but some credence was given to the validity of Rose's arguments when Edward Johnson, general manager of the Metropolitan, dispensed with the traditional press conference, prior to the opening of the season.

The Metropolitan premiere of Benjamin Britten's *Peter Grimes* (a production that, though carefully planned, suffered from poor dynamics, sorry diction, and anachronistic staging and costumes), the presentation of Wagner's *Ring der Nibelung* in a completely new staging and with effective new sets

of Lee Simonson, and the successful Metropolitan debut of the tenor Giuseppe Di Stefano were to be considered among the major items of interest at the Metropolitan during the year. On April 13, the Metropolitan visited Los Angeles for the first time in 42 years and achieved such an unprecedented financial and artistic success during its two-week engagement that new impetus was given to the movement, begun a year ago, to create a new opera house in Los Angeles expressly for the future annual visits of this company.

Two new American operas were heard during the year. In New York City, Otto Luening's *Evangeline*, performed at Columbia University, was found to be dramatically weak, though it did possess fine moments of vocal writing. More original and more appealing esthetically was Kurt Weill's *Down in the Valley*, a one-act folk opera, introduced at Indiana University in Bloomington, Ind. A splendid libretto by Arnold Sundgaard, which built up dramatic action through a series of effective flash-backs, combined with a melodious score, built out of American folk-music materials, made for excellent theater.

An important opera revival took place during the summer at the Berkshire Music Festival. It was Rossini's *Turco in Italia* which had not been heard in this country since 1826, presented by the Opera Department of the Berkshire Music Center. Readapted for the stage and boasting a new libretto (in English), the Rossini opera acquired a new lease on life. The score, tampered with only in negligible details, was a joy throughout, in the best traditions of the *opera buffa*, sparkling with wit and effervescence, and containing some of the composer's best ensemble writing. Brightened further by a sprightly and enthusiastic performance, this revival was one of the operatic delights of the year.

There were several new operas heard in Europe during the year, but two seemed to appeal most to the foreign critics. A new opera by Frank Martin, the noted Swiss composer, was heard at the Salzburg Festival—*Le Vin herbe*. Based on the legend of Tristan and Isolde, it utilized the most economical means—limited stage action on a small stage, and an accompanying orchestra of 11 musicians—to achieve its artistic ends. In Berlin, there took place the premiere of a fairy-tale opera by Carl Orff, *Die Kluge*, exploiting a primitive style emphasizing percussive effects. A successful operatic event in London was the new adaptation of *The Beggar's Opera* by Benjamin Britten.

Among the notable new performers heard during the year in this country were Nicole Heniot and Arturo Michelangelo, pianists—the one, from France, the other from Italy—and both, by coincidence introducing themselves with musicianly readings of the Schumann *Piano Concerto*. Aksel Schiøtz, Danish tenor—whose fame preceded him to this country through his remarkable recordings—came here with a voice greatly impaired by a recent serious throat operation. But the aristocratic style that made his rendition of old music and *Lieder* such a joy on records was still in evidence, and made for a pleasurable evening of music-making.

Ebe Stignani, also long known to us through records, made her American debut and reaffirmed the conviction of many music lovers that here is one of the most brilliant coloratura voices of our time. Among prodigies, the most significant was 16-year old Ervin Laszlo, a native of Hungary, who gave astonishing evidence of technical powers and interpretative insight in his debut as pianist. Ferruccio

Burco, the 8-year old conductor who had created a stir in Italy, made an intensive American tour. He has a clear beat, a good rhythmic sense, and a familiarity with the music he conducts; his scope is, of course, limited, and within that scope he fails as yet to give any convincing indication of exceptional musical insight.

Festivals. The festival season at Tanglewood, under the artistic direction of Serge Koussevitzky, had its most successful returns thus far. The total attendance for all the festival performances was more than 170,000, representing an increase of 25,000 over the preceding year. It was a distinguished year from the artistic point of view as well, with excellent orchestral and chamber-music concerts, and several major premieres and revivals. Of these, the American premiere of Ralph Vaughan Williams' *Sixth Symphony* and the revival of Rossini's *Turco in Italia* have already been touched upon. Significant, too, was the world premiere of Hindemith's *Sonata for 'Cello*, presented by Gregor Piatigorsky.

The two most important festivals of Europe were no less successful. In Edinburgh, the second International Festival of Music and Dance, which closed on September 12, attracted more than 250,000 spectators to its varied program of activity. This included ballet performances by the Sadler Wells Ballet Company; orchestral concerts by some of Europe's leading symphonic organizations, led by Eduard van Beinum, Charles Muench, Sir Malcolm Sargent, John Barbiroli, Ian Whyte, and Wilhelm Furtwaengler; solo performances by Yehudi Menuhin, Artur Schnabel, Alfred Cortot, Gregor Piatigorsky, and other world-famous artists; presentations of Mozart operas by the Glyndebourne Opera Company. Both in the wide range of its activities and in the quality of its presentations, it has earned its right to be classified as the cultural rival to Salzburg.

In Salzburg, the world premiere of Martin's *Le Vin herbe*, already commented upon, was the novelty to add spice to the customary musical fare. Performances under the direction of Herbert von Karajan and Wilhelm Furtwaengler brought the artistic quality of this festival back to its lofty pre-war standards.

The International Music Festival at Venice—restored after an interruption of six years—placed considerable emphasis on modern opera, presenting as it did Hindemith's *Cardillac*, Milhaud's *Les Malheurs d'Orphée*, Gian-Carlo Menotti's *The Telephone*, and the world premiere of a one-act opera by Ricardo Nielsen, *L'Incubo*. Other events included an evening of modern ballet, several orchestral and chamber-music concerts, and a program of 15th, 16th, and 17th century Italian sacred and secular choral music.

Two American works were successfully performed at the 22nd festival of the International Society for Contemporary Music which this year took place in Amsterdam: Piston's *Sinfonietta* and Sessions' *Second Symphony*. Of the new works revealed in Amsterdam considerable interest seemed to be inspired by the *Sonata for Two Pianos* by Hans Henkeman and the *Six Symphonic Studies* by Arthur Malawski. A Ravel evening, a mass by Hendrik Andriessen, and a production of gamelan and East-Indian dances were other attractions.

Electronics. The field of electronics made some significant contributions to music during the year. On March 18, James Caesar Petrillo, president of the American Federation of Musicians, signed a new three-year agreement with the radio networks in which the ban long placed by Petrillo against

the use of musicians in television was finally lifted. The ink was hardly dry when both major networks proceeded to make radio history by televising orchestral concerts. On March 20, the first symphonic concert to be televised was broadcast over the CBS-TV network, presenting a concert of the Philadelphia Orchestra under Eugene Ormandy. A half hour later, the NBC Symphony under Arturo Toscanini was seen and heard over WNBT in New York. The first opera ever to be televised from the stage of a regular opera house was Verdi's *Otello*, transmitted over WNBT from the Metropolitan Opera House on November 29, the opening night of the season.

An important development in the field of phonograph recording took place with the public release of the Long Playing Record by Columbia Records, Inc. These microgroove recordings, which can be utilized only on turntables making 33½ rpm instead of the customary 78, reproduce approximately 45 minutes of music on a single disc. This innovation represents a considerable saving not only in storage space of records and in price, but are even an improvement in the quality of high-range reproduction.

Awards and other Honors. The final round of a national piano-playing contest sponsored by the Rachmaninoff Fund two years ago, took place at Carnegie Hall, New York, on April 29. The winner, by a unanimous decision of a celebrated jury of musicians, was Seymour Lipkin. By virtue of this much publicized award he is being launched on a successful concert career. His prize is said to be the largest ever won by a virtuoso in a contest, estimated between \$25,000 and \$50,000, and includes a national concert tour sponsored by two major concert bureaus, guest appearances on nationally sponsored programs, and a recording contract with RCA-Victor. During the summer, Lipkin appeared as soloist with the Boston Symphony under Koussevitzky at Tanglewood, giving an electrifying and mature rendition of the Tchaikovsky *Concerto for Piano and Orchestra*.

The 1948 Pulitzer Prize in music went to Walter Piston for his *Symphony No. 3*. Wallingford Riegger's *Symphony No. 3* was selected by the New York Music Critics Circle as the most distinguished new work of the season, with Stravinsky's *Orpheus* receiving a special citation.

Dean Dixon, Negro conductor, was the recipient of the \$1,000 Alice M. Ditson Fund Award for the most distinguished services during the year to American music. Eugene Ormandy, the conductor of the Philadelphia Orchestra, was also honored for his contributions to American music, with a citation from the National Music Council.

The Metropolitan Auditions of the Air Awards—bringing with them contracts for the Metropolitan Opera House—were won by Marilyn Cotlow, soprano, and Frank Guarrera, baritone.

Obituaries. During the year, death came to Franz Lehar, the celebrated composer of operettas in general and *The Merry Widow* in particular. Lehar died in Vienna. Death took three other composers: Oley Speaks, creator of more than 250 songs, among them the beloved *Sylvia* and *On the Road to Mandalay*; Isidor Achron, pianist, and writer of music for his instrument; and the Brazilian composer, Oscar Fernandez, founder and director of the Brazilian Conservatory of Music.

Other notable musicians who died during the year included: Jacques Gordon, violinist and founder of the Gordon String Quartet; Olga Samaroff-Stokowski, one-time concert pianist and music critic, and more recently famous as a teacher

of the piano and lecturer on music appreciation; Lynden Behymer and Clarence C. Cappel, celebrated impresarios of music, the former in Los Angeles, the latter in Baltimore; John Avery Lomax, famed collector of American folk songs; and Clara Damrosch Mannes, wife of David Mannes, and with him a co-director of the Mannes School of Music.

—DAVID EWEN

NARCOTIC DRUGS CONTROL, International. The Commission on Narcotic Drugs of the Economic and Social Council of the United Nations, organized in November, 1946, held its third annual meeting at Lake Success, New York, May 3 to May 22, 1948. Mr. Stane Krasovec (Yugoslavia) presided, and fifteen nations (the full membership) were present.

The Commission agreed that, although a number of countries have declared their intention to abolish opium smoking monopolies and to suppress opium smoking in their territories in the Far East, the situation in some Far Eastern territories with respect to opium smoking has shown little improvement. It recommended that those Governments which have declared their intention to suppress opium smoking prohibit the import of raw opium into their territories except for medical and scientific purposes.

The Commission took note of a document submitted by the representative of the United States giving full information on the factory built by the Japanese authorities in Mukden for the purpose of manufacturing narcotic drugs to be distributed to the inhabitants of Manchuria. It was estimated this factory could produce 50,000 kilograms of heroin annually, an amount 50 times the annual legitimate needs of the world for this drug. Because narcotic drugs constituted, and may constitute in the future, a powerful instrument of the most hideous crime against mankind, the Commission recommended to the Economic and Social Council that it ensure that the use of narcotics as an instrument of committing a crime of this nature be covered by the proposed Convention on the Prevention and Punishment of Genocide.

International control of synthetic drugs having habit-forming propensities would appear to be assured, since by November 23, 1948, a total of 48 nations had signed the Protocol bringing such drugs under international control.

Colonel C. H. L. Sharman (Canada) was unanimously appointed by the Commission a member of the Drug Supervisory Body, whose main function is to examine the estimates furnished annually by governments, showing their legitimate requirements for narcotic drugs.

Harry J. Anslinger, Commissioner of Narcotics, U.S. Treasury Department, attended the Commission Sessions as the American delegate. He had as advisors John W. Bulkeley, Bureau of Customs, Treasury Department, and George A. Morlock, Department of State. The Permanent Central Opium Board and the Drug Supervisory Body, set up under earlier international conventions, were represented at the Commission sessions by Herbert L. May (United States).

National Control. The fiscal year ending June 30, 1948, saw a continuation in the increase of seizures of illicit narcotics from Europe. Customs officers at New York seized 9½ pounds of pure heroin from a French airplane which arrived from Marseilles. Combined seizures of opium and its derivatives by Customs officers and Narcotics agents amounted to approximately the same as in the previous year. Marihuana seizures increased greatly, being about

twice as much as in the preceding like period. Mexico continued to be an important source of smoking opium. During the early part of 1948 there appeared to be a decrease in the seizures of smoking opium from Mexico, but seizures began to increase again during the late months of that year.

Thefts from legitimate supplies, as well as prescription frauds, continued a major problem in enforcement of the Narcotics laws. Four synthetic narcotic drugs are now covered under the Federal narcotic laws. They are: Demerol, Amidone (Dolophine, Methadon, etc.), Isoamidone and Ketobemidone.

—HARRY J. ANSLINGER

NARCOTICS, Bureau of. A Bureau of the U.S. Department of the Treasury, established in 1930. Commissioner: Harry J. Anslinger. See NARCOTIC DRUGS CONTROL.

NATIONAL ACADEMY OF DESIGN. An organization of American artists, founded in New York in 1825 by Samuel Morse and incorporated in 1828 for the purpose of "cultivation and extension of the arts of design." In 1906 the Society of American Artists merged with the Academy.

The Academy maintains annual exhibitions of painting, sculpture, graphic arts, and water color to which all artists may contribute, subject to jury; various prizes are awarded. It conducted an Art School at which no tuition was charged, and which has been discontinued pending the erection of a suitable building. It administers the Henry W. Ranger Fund for the purchase of paintings to be presented to various museums. Membership (391 in 1948) is limited to professional painters, sculptors, workers in the graphic arts, architects, and aquarellists.

Academicians elected during the year 1948 were: *Painters*—Armin Hansen, Jes Schlaikjer, Zoltan Sepeshy, Ferdinand E. Warren; *Sculptors*—John Angel, Cecil Howard; *Graphic Artist*—Stephen Csoka; *Architects*—Wallace K. Harrison, Edward S. Hewitt, Charles D. Lay, William Platt, Lawrence G. White; *Aquarellists*—Julius Delbos, Eliot O'Hara, John Pike, Donald Teague.

Associates elected during the year 1948 were: *Painters*—Alexander Brook, Peter Blume, Louis Bouche, John Carroll, Edwin Dickinson, Ernest Fiene, Henry Mattson, Henry Lee McFee, Henry V. Poor, Zsissly; *Graphic Artists*—Fiske Boyd, Howard N. Cook, Lewis C. Daniel, Helen W. Heller, Edward T. Hurley, Rockwell Kent, John C. Menihan, Hans A. Mueller, Benton Spruance, Prentiss Taylor; *Sculptors*—Jose deCrefft, Sylvia S. Judson, Henry Kreis, Ivan Mestrovic, Carl Milles, Eleanor Platt, Carl L. Schmitz; *Architects*—Theodore E. Blake, Arthur F. Brinckerhoff, Otto R. Eggers, Alfred M. Githens, Andrew H. Hepburn, Douglas W. Orr, Ralph Walker; *Water Colorists*—Henry Gasser, Hardie Gramatky, Dong Kingman, Emil J. Kosa.

Officers: President, Hobart Nichols; First Vice President, John Taylor Arms; Second Vice President, Adolph Weinman; Corresponding Secretary, Eliot Clark; Recording Secretary, Isabel Bishop; Treasurer, F. Ballard Williams. Headquarters: 1083 Fifth Ave., New York 28, N.Y.

NATIONAL ACADEMY OF SCIENCES. A scientific organization that originated from the need of the U.S. government for technical scientific advice in connection with the Civil War. Its charter, passed by the U.S. Congress and approved by President Lincoln in 1863, provides that it shall investigate, ex-

amine, experiment, and report upon any subject of science or art whenever called upon by any department of the government. The membership of the Academy is limited to 450 citizens of the United States and 50 foreign associates.

The Academy and the National Research Council (q.v.), founded by the Academy, do not maintain scientific laboratories but function through sponsorship of conferences, technical committees, surveys, scientific publications, and administration of funds for research projects and fellowships. Administrative costs of the Academy and Council are charged against the income of a permanent endowment given, together with the building, by the Carnegie Corporation. Financial support of scientific projects is obtained from contracts with governmental and private agencies and from special grants from foundations, societies, and individuals.

The Academy issues the Proceedings, Scientific Memoirs and Biographical Memoirs. An Annual Report is made to Congress and published. Academy officers: Alfred N. Richards, President; Luther P. Eisenhart, Vice President; Detlev W. Bronk, Foreign Secretary; F. E. Wright, Home Secretary; William J. Robbins, Treasurer; Raymund L. Zwemer, Executive Secretary; G. D. Meid, Business Manager. Headquarters: 2101 Constitution Ave., Washington 25, D.C.

NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS.

The government's aeronautical research agency, reporting directly to the President. Its main Executive Committee, appointed by the President, is composed of 17 members selected from military and other government aviation agencies, the aircraft industry, and qualified scientists. All branches of aviation are represented on its subcommittees.

The NACA was established by Congress in 1915 to "supervise and direct the scientific study of the problems of flight with a view to their practical solution" and to "direct and conduct research in aeronautics." The NACA operates three major research laboratories: Langley Aeronautical Laboratory, Langley Field, Va.; Ames Aeronautical Laboratory, Moffett Field, Calif.; Lewis Flight Propulsion Laboratory, Cleveland, Ohio. In addition, a flight research station is maintained at Muroc Lake, Calif. and a pilotless aircraft research station on the Virginia coast. The NACA provides basic aeronautical knowledge through the medium of technical reports to the entire aviation and allied industries, the military services, educational institutions and technical libraries. Chairman: Jerome C. Hunsaker.

NATIONAL ARCHIVES, The. An independent establishment of the U.S. Government, created in 1934, which preserves and services the permanently valuable records of the Government. Holdings: more than 850,000 cubic feet, described in *Guide to the Records in the National Archives*. In June 1948 Dr. Wayne C. Grover succeeded Dr. Solon J. Buck as Archivist of the United States.

NATIONAL BUREAU OF STANDARDS. Established in 1901 by Act of Congress, the National Bureau of Standards is the principal agency of the Federal Government for basic research in physics, applied mathematics, chemistry, and engineering. It has custody of the national standards of physical measurement in terms of which all working standards in research laboratories and industry are calibrated, and carries on necessary research leading to improvement in such standards and measurement methods. In addition to its general responsibility

for fundamental research in the above fields, the Bureau undertakes specific research and development programs for various agencies of the Government, develops improved methods for testing materials and equipment, determines physical constants and properties of materials, tests and calibrates standard measuring apparatus and reference standards, develops specifications for Federal purchasing, and serves Government and the Nation in an advisory capacity on matters relating to the physical sciences.

The Bureau's direct appropriation for the last fiscal year was approximately \$7,900,000. This was supplemented by approximately \$8,900,000 in funds transferred by the Army, Navy, Atomic Energy Commission, and other Government agencies to support special projects undertaken for them. Typical projects of this type include guided missiles, proximity fuzes, optical glass development, and automatic electronic computing machines. Most of the Bureau's work was conducted in its laboratories at Washington, D.C., and the balance at its 17 field stations.

One of the most significant developments of the year was the discovery that frictional forces between solid surfaces and certain types of fluid media can be controlled by means of a magnetic field. This discovery is of fundamental scientific importance; its applications promise to be many. The initial application has been the design and construction of a new revolutionary clutch which consists essentially of a driving and a driven plate or cylinder having a magnetic fluid of iron powder and oil between them. A winding incorporated into the structure permits a strong magnetic field to be passed through the fluid, and the degree of coupling between plates is determined by the variation in strength of the current through the coil. The new clutch affords ease of control, high efficiency, smooth operation, rapid reversal, long life, and simplicity of construction.

The development of what is probably the ultimate standard of length was another striking scientific accomplishment. The new standard is the wave length of the green radiation of an isotope of mercury having mass 198. This isotope is obtained by transmuting gold into mercury 198 by neutron bombardment in an atomic pile. In precision, reproducibility, and convenience, the green line of mercury 198 is superior to both the standard meter and the red line of cadmium. The work in atomic and molecular physics also included investigations of nuclear radiations of radioactive isotopes. Accurate determinations of the energies of radiations from radioactive iodine 131 were made. Radiation standards for cobalt 60, iodine 131, and phosphorus 32 were developed. Research was in progress on standards for sodium 22 and carbon 14.

A unified program was planned in the field of electronic computers in cooperation with the Office of Naval Research, the Bureau of the Census, the Army, and the Air Force. In addition to consummating a contract for a machine for the Bureau of the Census, plans were under way for the construction of a small-scale computer, to be known as the NBS Interim Computer. Input and output systems for high-speed machines were designed.

An important achievement in standardization was the agreement of the United States, Great Britain, and Canada on uniform screw threads. The accord, signed at the Bureau on Nov. 18, 1948, marked the culmination of 30 years of effort by the Bureau, in cooperation with other government agencies, standardization bodies, and industry in the three countries.

Fasteners—screws, nuts, and bolts—enter into almost every modern product, and lack of uniformity has posed serious problems in replacement of such parts in exported and imported goods. Unification was achieved as to angle and thread form, number of threads per inch, and tolerances and allowances, thus permitting interchangeability of parts among the three nations. The most important technical decision here was standardization on the 60 degree screw thread angle, which has been the standard in this country.

A few other typical projects included resistance measurements of high precision, investigation of methods for testing tapes and wires for magnetic recording, measurement of insulating properties of plastics, thermal investigations of gases, research in superconductivity, combustion problems of gas turbines and jet engines, mechanics and thermodynamics of lubrication, x-ray protection studies, field measurements by electron microscopy, atomic energy levels, diverse studies of hydrocarbons, turbulence problems in aerodynamics, the absorption of sound by acoustic materials, supersonic and ultrasonic studies, resin-bonding of paper, analysis of synthetic rubbers, the mechanism of fracture of metals, studies of metal corrosion, studies of the physical structure of concrete, high-temperature ceramics for special applications, electronic miniaturization, electron tubes, and a wide variety of topics in the field of radio propagation.

The test work of the Bureau involved over 250,000 tests and calibrations, having a total fee value of approximately \$1,000,000. This activity included such diversified projects as the testing of 3,000 dry cells and batteries; the sample-testing of over 4 million light bulbs, 100,000 clinical thermometers, and 5 million barrels of cement; testing of a million dollars worth of radium preparations; tests of standard electrical instruments; the furnishing of 18,500 standard chemical samples and of samples of standard oils for calibration of viscometers; and similar services.

The results of the Bureau's research were made available through 3 monthly periodicals (*Journal of Research*, *Technical News Bulletin*, and *Basic Radio Propagation Predictions*) and a series of non-periodical publications. An indexed list of publications (Circular 460, 375 pages, 75 cents) is available from the Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C.

—HUGH ODISEAW

NATIONAL INVENTORS COUNCIL. The Council was created in August, 1940, by the Secretary of Commerce, to act as a central clearing house for inventions and suggestions relating to the national security and welfare. In addition the Council seeks the aid of inventors and engineers on specific problems confronting the Armed Services. Since its creation, more than 250,000 inventions have been carefully examined and evaluated, a surprisingly large number of which have proved meritorious and useful. Dr. Charles F. Kettering, retired president of the General Motors Research Corporation, is Chairman, and other members include eminent scientists, inventors, Government officials, and business men well versed in the application of new devices, all of whom serve without compensation. The Council is assisted by a group of engineers—each a specialist in his own field—furnished by the Office of Technical Services of the Department of Commerce. Secretary of the Council: Lawrence Langner. Address: Office of Technical Services, U.S. Department of Commerce, Washington, D.C.

—JOHN C. GREEN

NATIONAL LABOR RELATIONS BOARD (NLRB). On June 25, 1947, the 80th Congress, over presidential veto, passed into law the Labor Management Relations Act, popularly known as the Taft-Hartley Law. The new statute greatly amended the National Labor Relations Act of 1935 and enlarged its scope of activities.

In essence, the new law reaffirmed the right of employees to self-organization and to bargain collectively through representatives of their own choosing. It retained the unfair labor practices under the Wagner Act which proscribe employer interference, domination, discrimination, and refusal to bargain. To these unfair practices were added union unfair labor practices which regulate such union practices as secondary boycotts, featherbedding, excessive dues, etc.

In addition, the new law separated the prosecuting from the judicial functions by vesting final authority for investigation and prosecution of all unfair labor practice cases in the General Counsel; enlarged the former Board from three to five members; provided the Board with injunctive powers; and added four new types of elections to be conducted by the Board in addition to Wagner Act collective bargaining polls.

Since Aug. 22, 1947, the effective date of the new act, through Aug. 22, 1948, more than 42,000 cases were filed with the National Labor Relations Board. Of these, 30,964 were petitions for union-shop authorization polls, 8,051 were petitions for various types of representation elections, 3,060 involved charges of unfair labor practices filed against employers, and 915 concerned charges of unfair labor practices filed against unions. During the same period the Board conducted a total of 27,558 elections in which over 2½ million valid votes were cast.

Most of the Board's activities during the year were in the field of union-shop elections. It conducted a total of 23,752 such polls in which 2,248,501 valid votes were cast. In 98 percent of these elections employees voted "yes" to the question: "Do you wish to authorize (name of union) to negotiate with your employer for a contract requiring membership in the (name of union) as a condition of employment?"

At the same time, Board officials conducted 3,677 representation polls to determine employee choice of bargaining representatives. 134 of these elections were held at the request of employers. Of the total 3,677 polls conducted, labor organizations won 2,676 and lost 1,001. In addition, the Board held 129 decertification elections—polls to determine whether or not groups of employees wished to unseat a labor organization which had been representing them. In 45 of these elections the union was retained; it was rejected in the remaining 84 ballottings.

Of the 3,060 charges filed against employers 1,778 were filed by unions and 1,257 were filed by individuals. Employers filed 522 of the 914 charges against unions, individuals filed 312 of them and other unions 76. The most common charge filed against unions was that of secondary boycott. This charge was made in 285 out of the 914 cases.

To use the Board's facilities in any type of case, a labor organization must file non-communist affidavits for all of its officers, and the union itself must file financial and other data about its operations. As of Nov. 30, 1948, a total of 106,234 union officials had filed the required non-communist affidavits. As of that date, 176 national unions and 11,078 locals were in full compliance with both these affidavit and financial report requirements.

During the 12-month period, the five-man Board decided a total of 2,626 cases. The bulk of Board rulings were made in representation cases; it issued 1,696 decisions on representation questions as against 217 rulings on unfair labor practices. 713 other decisions concerned union-shop election petitions.

During its first year, the Office of the General Counsel petitioned Federal District Courts for 27 injunctions under the mandatory provisions of the law. In 18 of these, injunctive relief was granted; in four cases it was denied; three were withdrawn; and two are pending. All but one was based upon charges of secondary boycott. The remaining one was based upon a charge that a union continued picketing a store after another union had been certified as bargaining agent there. In addition, the General Counsel sought six injunctions under the Act's discretionary provisions. Of these, 3 were granted, 2 were denied, and 1 was withdrawn because the alleged illegal conduct had ceased.

A total of 3,933 Wagner Act cases were pending on the Board's docket as of Aug. 22, 1947, the effective date of the Taft-Hartley Act. During the following year, more than 42,000 new cases were filed with the agency. By the end of August, 1948, one year later, the Board had disposed of more than 35,000 of these cases, leaving a remainder of 10,371 pending disposition at various procedural levels. Of these 10,371 pending cases, 728, or 7 percent were filed before Aug. 22, 1947. A total of 595 of these 728 Wagner Act cases involved charges of unfair labor practices and 133 involved petitions for collective bargaining elections.

Of the 9,643 pending cases filed after Aug. 22, 1947, charges of unfair labor practices accounted for 1,825 and petitions for various types of elections 7,818 cases. Of the 7,818 election cases pending on August 31, 5,203 involved petitions for union-shop polls; 2,473 were petitions for collective bargaining elections; and 142 were petitions to decertify labor organizations.

With certain exclusions the Taft-Hartley Act covers the same area the Wagner Act did—employees of employers whose operations affect interstate commerce. As regards employees, excluded are supervisors, agricultural laborers, persons having the status of independent contractors, and employees subject to the Railway Labor Act. Employer groups excluded are Federal Reserve Banks, wholly-owned Government corporations, and non-profit hospitals. The Board has its headquarters in Washington, D.C. and maintains 28 regional offices.

—LOUIS G. SILVERBERG

NATIONAL MEDIATION BOARD (NMB). A nonpartisan independent Board of the U.S. Government, created by amendment of the Railway Labor Act in 1934. Its duty is to determine employee-representation and adjust collective-bargaining disputes between common-carrier railroads, airlines, and the express and Pullman companies, and their employees. Headquarters: Room 2018, Federal Works Agency Building, Washington 25, D.C. Chairman: Frank P. Douglass. Secretary: Robert F. Cole.

NATIONAL MILITARY ESTABLISHMENT. The unification of the Armed Services, sought by the President and Congress in the enactment and approval (July 26, 1947) of the National Security Act, had its first full year of experimentation in 1948. It was marked by progress in organization and closer cooperation and coordination, with much more progress in prospect from the studies and planning begun during the year.

However, it was the contrary evidence of differences between the Services which was more frequently in the public eye. Arising out of the pride and self-confidence of the individual services, these differences loomed large in the public mind and aroused wide-spread doubts as to the success of unification. The principal differences concerned air power, its strength in relation to land and sea power, and who was to control it.

Throughout the Second Session of the 80th Congress, the official program of the National Military Establishment, as voiced by Mr. James Forrestal, the Secretary of Defense, was built on what he termed the "balanced establishment." That is, he sought to give relative balance of strength to each of the services within the range of the total appropriations which Congress and the Administration felt justified to make. The original program laid before Congress by Secretary Forrestal provided a strength of 55 groups for the Air Force. However, civilian and military leaders of the Air Force, with the strong backing of the reports of the President's Air Policy Commission and the Congressional Aviation Policy Board, worked vigorously for higher appropriations to start on the way toward attainment of a 70-group force. Secretary Forrestal, supported by Army and Navy leaders, contended that to increase the Air Force to 70 groups and not give corresponding increases to the Army and Navy would throw the Establishment out of balance. Such an Air Force, he told Congress, would require a larger Army to seize and hold the larger bases from which the Air Force must operate, and a larger Navy to keep open the sea lanes to supply them. Subsequently the Secretary met with the Joint Chiefs of Staff and agreed to a plan to support 66 groups for the Air Force. Congress, however, was thoroughly convinced of the necessity for a greatly enlarged Air Force as a first line of defense, and by overwhelming majorities voted the funds necessary to launch the larger Air Force program. This was generally viewed by the public, as well as by Congress, which had so wholeheartedly encouraged it, as a major break of one service away from the over-all policy and control of the legally unified Military Establishment.

The Navy, on the other hand, strove to retain and enhance its position as a large-scale operator of air power, and to that end obtained legislative authority to suspend the construction of a number of modern vessels so as to divert the funds thus saved to begin construction of a new 65,000 ton "super" aircraft carrier. Air Force protagonists retorted that this contemplated the entrance of the Navy into the Air Force's province of strategic air warfare. The Navy subsequently announced that it would take some 3,000 obsolescent aircraft out of storage and organize them into units so as to accelerate attainment of the 14,500-plane strength it contended it needed. Air Force advocates continued to charge that the Navy was engaged in the building up of another air force in duplication of the U.S. Air Force.

Fanning the fire were numerous speeches by ardent Air Force and Navy advocates making broad claims for the effectiveness of their own services and, by implication, belittling the relative effectiveness of the other. These reached such a point that Secretary Forrestal issued an order that speeches of a controversial nature must be submitted to his office for clearance before delivery.

The Key West Conference. As early as March Secretary Forrestal sought to reconcile the differences and stop public criticism by establishing more clearly the functions of the Armed Forces and de-

lineating their responsibilities. To that end he called a conference with the Joint Chiefs of Staff. The meeting was held at the Naval Station at Key West, Florida, and resulted in the promulgation of a paper, "Functions of the Armed Forces and the Joint Chiefs of Staff," which subsequently replaced the original Presidential Executive Order (No. 9877) issued at the time of the approval of the National Security Act. In making this paper public, Secretary Forrestal said that there had been prior agreement on many of the issues which were controversial when the original law was enacted but "there remained certain differences among the services which had not been reconciled by the Joint Chiefs of Staff." He said further, "decisions have now been reached on all controversial points and I believe there is now general accord on practically all matters which were previously unresolved."

In general, the agreement represented little change from the assignment of functions originally determined upon. The major new feature was the assignment of "primary" and "collateral" functions to each service. The primary functions were those in which a specific service had a clear-cut responsibility. These were the ones that had been generally recognized as such before the conference. The collateral functions assigned to each service permitted its forces to be employed to support and supplement the other Services in carrying out their primary functions "whenever such participation will result in increased effectiveness and will contribute to the over-all military objectives."

As an illustration of the new principle, the Secretary pointed out that "strategic air warfare has been assigned as a primary function of the Air Force, and the Navy is assigned as a primary function the conduct of air operations necessary for the accomplishment of objectives in a naval campaign. Provision has been made for naval aviation to participate in the over-all air effort as directed by the Joint Chiefs of Staff. Moreover, an understanding was reached, which does not appear in the 'Functions' paper, that the Navy will not be prohibited from attacking any targets, inland or otherwise, which are necessary for the accomplishment of its mission. Similarly, the Navy has been assigned the primary function of anti-submarine warfare, while the Air Force has been assigned that duty as a collateral function."

The Newport Conference. Subsequently, late in August, Secretary Forrestal called the Joint Chiefs of Staff into another conference with him, this time at the Naval Station at Newport, Rhode Island. Here, as before, the emphasis was on settling the divergent opinions of the Air Force and the Navy over the use and control of air power.

Following the Newport conference a joint meeting of 300 of the senior officers of the three services was held in Washington. Explaining the agreements to them Secretary Forrestal said:

"The topics discussed at Newport included . . . a clarification of some of the decisions reached at Key West last March in the field of assigned functions of each service. In the latter area there was agreement in a clarification of the responsibilities of the Services with respect to their primary missions.

"Specifically, this clarifies the position of the Air Force in the field of strategic air warfare and the position of the Navy in that field.

"Both from the language of the agreement and exchange of oral views between those who carry responsibilities in their respective services, I am convinced that at the top command levels there is a clear understanding of the exclusive role of

the Air Force in the field of strategic air warfare and conversely the intent of the Air Force is not merely to permit but to seek all the help it can get from the Naval Air in the use of airpower, either strategically or tactically.

"Likewise, the Navy is assigned the exclusive role in the field of anti-submarine warfare; and likewise the intent of the Navy is also to invite all the help it can get from the Air Force in carrying out this mission.

"However, these decisions as reached and the spirit of the conversations which took place can only have force and meaning if they are followed through with the aggressive intent to build and not to mar mutual confidence.

"The decisions themselves reflect neither a victory for the Navy nor a defeat for the Air Force. They do reflect my views and, if followed through with sincerity and tenacity, will mean a victory for the country."

Giving his interpretation to the same gathering, Admiral Louis E. Denfeld, Chief of Naval Operations, and a member of the Joint Chiefs of Staff, pointed out that the conference reiterated that strategic air warfare is a primary responsibility of the Air Force, which remains responsible to the Joint Chiefs of Staff and higher authority for making plans for strategic air warfare.

Admiral Denfeld, said, however, that a "significant addition" had been made at Newport: "The Air Force recognizes that the Navy will be able to make significant contributions to any strategic air plan. The Air Force will include Naval contributions in all strategic air plans and in the detailed estimates of over-all force requirements therefor."

Gen. Hoyt S. Vandenberg, Chief of Staff of the Air Force, and also a member of the Joint Chiefs of Staff, discussed the conference in a similar vein, saying, "I believe that this imposes on the Air Force the requirement not only to consider possible contributions of other services to Air Force functions but also to seek out aggressively such contributions when they will add to the effectiveness of the job that we are doing. I propose to be guided by that understanding. Each service, in my opinion, must do the same. I confidently expect that the Army and the Navy will seek our assistance wherever and whenever we can add to their effectiveness in carrying out their primary functions."

Military Air Transport Service. A tangible result during the year was the consolidation of the Air Transport Service (an Air Force agency) and the Naval Air Transport Service. The new organization, utilizing facilities and personnel of both the Air Force and the Navy and, at times, of the Marine Corps, operates directly under the Chief of Staff, U.S. Air Force. Maj. Gen. Laurence S. Kuter, an Air Force officer, was made commander of the new MATS, and Rear Admiral John P. Whitney, of the Navy, was selected to be the vice commander.

The new MATS is responsible for providing domestic and foreign scheduled air transportation for all the Departments of the National Military Establishment and other government agencies as authorized, together with performing certain feeder line service and non-scheduled operations (other than tactical), air evacuation of hospital patients, and other appropriate tasks as assigned. Toward the end of the year Secretary Forrestal announced that in its first four months of operation MATS produced 54 percent more airlift than was accomplished by the Naval and Air Force components in their best pre-merger month. This was achieved

by a two percent increase in transport C-54's, a four percent increase in transport personnel, and a slight decrease in total MATS personnel.

Military Sea Transport. In December, decision was announced to consolidate all military sea transport under the Navy. This action was taken upon recommendation of the Joint Chiefs of Staff. It means that the entire Army water transport service, comprising about 260 vessels, will be transferred to the control of the Department of the Navy, which already operates about 95 such ships in its own transport service. At the same time, Secretary Forrestal stated that the next logical step would be the consolidation of all land transport under the Army.

Recruiting Consolidation. It was also decreed that the recruiting facilities and services will be used jointly by all three Services. This step contemplates joint use of office space, consolidation of medical examining facilities, simplification and standardization of administrative forms, etc.

Legislative and Budgetary Procedures. Progress also was made in the intricate process of coordinating the legislative and budgetary procedures. Earlier, Secretary Forrestal had ordered that legislation proposed by one of the Departments could be sent to the Bureau of the Budget or to Congress only with the concurrence of the two other departments. Later, he appointed Maj. Gen. Wilton B. Persons Director of Legislative Liaison to direct the central agency of contact between the National Military Establishment and Congress. The Secretary ordered that all bills be forwarded through his office, where after clearance each will be assigned to one of the Departments or Boards to handle. Congress and the Bureau of the Budget were advised to address requests for comments to the Office of the Secretary of Defense rather than to one of the Departments as in the past.

The 1950 Budget prepared during the latter part of 1948 for submission to the 81st Congress marked the first time in the history of the Nation that a single coordinated budget had been formulated for all the Armed Services. It represented a stupendous task and a stride forward, for a co-ordinated budget must assume a co-ordinated plan of operations based on integrated military requirements.

Coordinated Procurement. The Munitions Board, one of the agencies within the National Military Establishment, has as one of its primary responsibilities the coordination of activities with regard to industrial matters, including procurement, production, and distribution plans. During the year it reported that more than 80 percent of the dollar value of all purchases by the NME, both in war and peace, has been assigned to single, joint, or collaborative purchase agencies. Food purchase for all the services is now the function of the Army, the Navy buys all the coal, photographic materials are procured by the Air Force, and so on.

Armed Forces Information School. As the result of recommendations made by a joint Army, Navy, and Air Force Committee, a single Armed Forces Information School was recognized for all. The Army Information School at Carlisle Barracks, Pa., became the Armed Forces Information School. The Air Force Information School at Craig Air Base, Ala., closed as of June 1, the students going thereafter to the new establishment. The Navy, which previously did not have a school of its own, now sends students to the joint school.

Civilian Components. The Board for Civilian Components, popularly known as the Gray Board from its chairman, Assistant Secretary of the Army Gor-

don Gray, submitted its report in August. The Board recommended that "the structure of the Reserve forces should be simplified and made common to the three services," thus carrying forward the principles of unification. However, its principal recommendation was that each service have only one Federal Reserve Force. To carry this out it recommended that the National Guard be taken from the States and combined with the Organized Reserves under the name of "The National Guard of the United States," completely under Federal control, and that the Air National Guard and the Air Reserve be combined under the name of "The United States Air Force Reserve," also a completely federalized organization. These recommendations aroused immediate and vigorous opposition of the leaders of the National Guard and the governors of various States. Subsequently, Secretary Forrestal recommended to President Truman that consolidation of the Air National Guard with the Air Reserve be effected.

Other recommendations of the Gray Board for the Reserves of all the Services included:

"The organization, administration, training and supply of the reserve forces of the three services should be completely integrated with the organization, administration, training and supply of the Regular Establishments under the direction of the respective Secretaries and Chiefs of Staff, or Chief of Naval Operations, and the Secretaries and Staffs of the three services should hold the same relation and responsibilities to the Reserve forces as they do to the Regular establishments.

"All organizational, administrative, training and supply functions of the Reserve forces should be handled by the staff sections which handle the same functions in the Regular services and no special organizational structure should be set up.

"The reserve forces of the three services should be fully administered and supplied through normal chains of command, administration and supply utilizing such minimum number of full time personnel in reserve force units as may be required.

"The Budget Staff of the Secretary of Defense should make periodic reports to the Secretary stating the emphasis placed on the Reserve forces in the Budgets of the respective services and setting forth any proposed changes or transfers in the obligation and utilization of funds provided.

"For the purpose of considering, recommending and reporting to the Secretaries of the Army, Navy, and Air Force on Reserve force policy matters, provision should be made in each Service for a policy committee at least half of the members of which shall be officers of the Reserve forces. From the membership of these three service committees there should be established a Joint Interservice Committee to consider, recommend and report to the Secretary of Defense on Reserve force policies and procedures of joint or common interest in the Reserve forces of all the services.

"All service boards authorized in connection with the promotion, discharge, appointment or retirement of Reserve force personnel should be composed of at least 50 percent nonregulars.

"For the duration of any future national emergency or war, members of the Reserve forces should be members of the respective Regular forces."

Medical and Hospital Services. Organization of an Ad Hoc Committee on Medical and Hospital Services of the Armed Forces was completed in January with Maj. Gen. Paul R. Hawley, a retired medical officer of the Army, as chairman. This committee worked throughout the year and some tangi-

ble results were already being shown. Greater interchange of hospital facilities between the various services was coming into evidence. Application of this principle in the Panama Canal Zone permitted the closing of two of the six hospitals there and led to better utilization of the medical staffs of the three services through the creation of a Panama Area Joint Medical Advisory Committee. The chairman of the Joint Advisory Committee serves as Medical Director on the staff of the Commander-in-Chief, Caribbean Command, and thus is in a position to obtain assignment of medical experts of any of the three services for special duty in any medical activity where their skills are needed temporarily. Hospitalization of the personnel of all three services on the Atlantic side of the Canal Zone was assigned to the Navy, while their hospitalization on the Pacific side was assigned to the Army. Indications pointed to further extension of such practices.

Uniform Code of Justice. In July Secretary Forrestal appointed another Ad Hoc Committee to prepare a "modern and uniform code of military justice for the Armed Services," with Professor Edmund Morris Morgan, Jr., of Harvard University, as chairman. It is expected that this committee will prepare for submission to the 81st Congress a code for the Army, Navy, and Air Force to supersede the Army's Articles of War and the Navy's Articles for the Government of the Navy.

Joint Use of Air Bases. Also in July Secretary Forrestal directed the Joint Chiefs of Staff to make a study to determine the feasibility of joint use of air bases by the Air Force and Naval aviation.

Hoover Commission. A further top-level study of the National Security Organization was that undertaken by a committee of the Commission on Organization of the Executive Branch of the Government, which was created by an Act of Congress approved by President Truman on July 7, 1947. Former President Herbert Hoover, chairman of the Commission, appointed Ferdinand Eberstadt, a New York investment banker, as chairman of the committee to study the defense structure with a group of retired Army, Navy, and Air Force officers as advisers on military questions.

In December the Eberstadt Committee made a comprehensive report to the Hoover Commission in which it expressed the belief that "the national security organization, established by the National Security Act of 1947, is, on the whole, soundly constructed, but is not yet working well." The committee announced that it had considered and rejected (subject to dissenting opinions by some of its members) the three major changes frequently suggested as necessary to improve the new organization: (1) A single Military Chief of Staff and General Staff over all three military services; (2) merger of the three military departments into a single department; and (3) merger of the Naval air arm with the Air Force.

Specifically the Committee recommended:

"Its investigations convinced the committee that there are six major areas or aspects in which improvement in the interest of greater efficiency and economy is both possible and necessary.

"They involve: (1) Strengthening central authority in the military establishment; (2) overhauling the military budget; (3) improving teamwork throughout the national security organization; (4) relating scientific research and development more closely to strategic planning; (5) expediting plans for civilian—including economic, industrial, and manpower—mobilization in case of war, and providing for continuous appraisal of

the effect of all national security programs on our national resources, both human and material; and (6) making adequate provision for—and against—new and unconventional means of warfare."

—LEROY WHITMAN

NATIONAL OPINION RESEARCH CENTER. An institution established in 1941 by the Field Foundation, Inc., of New York City, in association with the University of Denver, as the first nonprofit, non-commercial organization in the United States devoted to ascertaining public opinion and to devising and testing new methods of attitude and opinion research. Another purpose of the Center is to review and analyze the results of surveys made by other polling organizations, both in the United States and abroad. The Center's findings and findings of other polls in the United States and abroad are published in *Opinion News*, which is designed for the use of those who follow closely the trends of public opinion. In October, 1948, publication of *Opinion News* was suspended in order that changes in its scope, character, and sponsorship might be worked out.

The 1948 program of the Center, in addition to specific research for clients into attitudes of university alumni toward their universities, attitudes of public school teachers, medical practitioners, and people generally toward the use of live animals for medical research, attitudes of medical men toward various types of public medical service, included: (1) continued research on a grant from the Rockefeller Foundation on interviewer bias and the handling of the interview situation as sources of error in opinion data; (2) initiation of a three-year program of research financed by the Merrill Foundation for the Advancement of Financial Knowledge and done in cooperation with the Bureau of Business and Economic Research of the University of Illinois into the processes by which businessmen's opinions about the future are formed, changed, and incorporated into their policies and practices; and (3) initiation of a study of intergroup tensions with special reference to ethnic groups.

During 1948 also the Center, in cooperation with departments and other research units of the University of Chicago, began the development of an educational program for the training of advanced students in the field of communications and public opinion.

Director, Clyde W. Hart; Director of the NORC Denver affiliate (separately incorporated under the name of Opinion Research Center), Don Cahalan. Headquarters: University of Chicago, 4901 South Ellis Ave., Chicago 15, Ill. Denver affiliate: University of Denver, Denver 10, Colo. Eastern office: Paul B. Sheatsley, 280 Madison Ave., New York 16, N.Y.

NATIONAL PARKS AND MONUMENTS. Increased public use of the national parks, national monuments, and other units of the national park system; the addition to the system of several important historical areas in the eastern part of the United States; Congressional authorization for the establishment of other important historical areas; and acquisition of land for the Everglades National Park in Florida were major developments of the year 1948.

Nearly 30 million persons visited the public reservations administered by the National Park Service during the year. Yellowstone National Park (Wyoming-Montana-Idaho), the world's oldest national park, attracted more than a million visitors, as did also Rocky Mountain National Park

(Colorado), Great Smoky Mountains National Park, (North Carolina-Tennessee), Blue Ridge Parkway (Virginia-North Carolina), and the Lincoln Memorial in the Nation's capital. Lake Mead Recreational Area (Arizona-Nevada) had nearly 1½ million visitors; and more than 2 million persons took advantage of the facilities available at Lake Texoma Recreational Area (Texas-Oklahoma).

Three historical areas were added to the national park system in 1948: Saratoga National Historical Park, lying west of the Hudson about 25 miles north of Albany, N.Y., and containing the site of the battle which marked the turning point of the Revolutionary War; Fort Sumter National Monument in Charleston Harbor, S.C., site of the opening military engagement of the War Between the States; and Hampton National Historic Site, near Towson, Md., containing a fine example of a Georgian mansion erected during the latter part of the 18th century. The Hampton property, designated as a national historic site following its acquisition by the Federal Government with funds provided by the Avalon Foundation, is maintained by the Society for the Preservation of Maryland Antiquities.

Laws were enacted in 1948 for the establishment of three other historical areas after certain conditions have been met. Most significant is the law authorizing establishment of Independence National Historical Park to include certain historic structures and properties in Philadelphia, Pa., associated with the American Revolution and the founding and growth of the United States. This law authorizes the appropriation by Congress of \$4,435,000 for acquisition of the properties involved and the appointment by the Secretary of the Interior of an advisory commission of not to exceed 11 members.

The other two historical areas authorized for establishment in 1948 are the DeSoto National Memorial in the vicinity of Bradenton and Tampa, Fla., to commemorate the discoveries of this famous explorer, and Fort Vancouver National Monument, in the State of Washington, to preserve the site of the original Hudson's Bay Company stockade.

Maintenance of two areas under National Park Service jurisdiction—Atlanta Campaign National Historic Site, marking the significant points on the route of Sherman's march, and New Echota Marker National Memorial, containing the site of the last capital of the Cherokee Indians in Georgia—was taken over by the Georgia Department of State Parks. Protection of another unit of the national park system—Devil Postpile National Monument, Calif., containing a series of symmetrical blue-gray columns believed to be a remnant of a basaltic lava flow—was assumed by the Forest Service of the U.S. Department of Agriculture. The monument, approximately 800 acres in extent, is within the Sierra National Forest. All three of these areas, however, still are units of the national park system.

At the close of 1948 the system had a total of 180 units, classified as follows: national parks, 28; national monuments, 86; national historical, military, and memorial parks, 17; national battlefield parks and sites, 8; national historic sites, memorials, and cemeteries, 31; national parkways, 3; recreational areas, 4; recreational demonstration areas, 2; and the National Capital Parks which are considered as one unit. The national park system covers approximately 23,690,000 acres, of which approximately 813,000 acres are not Federally owned.

Approximately 135,000 acres were purchased in 1948 from the Model Land Company for the Everglades National Park in southern Florida. This ac-

quisition was the third to be made from the \$2 million fund given to the Federal Government for the purpose by the State of Florida when the park was established in June, 1947. This sub-tropical wilderness park has extensive water-courses, saw-grass prairies, mangrove forests, and a variety of birds and animals.

Among other noteworthy developments of the year were the appropriation by the Congress of \$500,000 for the improvement of the Statue of Liberty, universal symbol of freedom and democracy, on Bedloe's Island at the entrance of New York Harbor; completion of a comprehensive survey of concession operations in National Park Service areas by an advisory group appointed by the Secretary of the Interior, and approval by him of a new national park concessions policy; appointment of Bernard DeVoto, author and historian, to membership on the Advisory Board on National Parks, Historic Sites, Buildings, and Monuments; and issuance by the U.S. Travel Division of the National Park Service of a monthly magazine entitled *Travel USA*.

A policy set up early in 1948 for the Travel Division provides that its activities shall be supplementary to those of established State and private travel organizations, not in competition with or a duplication of such programs.

As in past years, the Service had the aid of conservationists throughout the Nation in opposing pressures for the cutting of forests, the grazing of meadows, the damming of streams and lakes, and other destructive uses of the national parks.

—NEWTON B. DRURY

NATIONAL RESEARCH COUNCIL. The Council was founded by the National Academy of Sciences in 1916, and was established on a permanent basis on May 11, 1918, by Executive Order of President Wilson, in order to promote research in the mathematical, physical, and biological sciences, and in the application of these sciences to engineering, agriculture, medicine, and other useful arts, with the object of increasing knowledge, of strengthening the national defense, and of contributing in other ways to the public welfare. The membership of the Council, appointed by the President of the National Academy of Sciences, is composed largely of representatives of approximately ninety of the major scientific and technical societies of the country, together with representatives of certain other research organizations, representatives of government scientific bureaus, and a limited number of members at large. Serving on Committees of the Council are approximately 1,800 outstanding scientists.

The Council does not maintain scientific laboratories but functions through sponsorship of conferences, technical committees, surveys, scientific publications, and administration of funds for research projects and fellowships. As an operating agency of the National Academy of Sciences (q.v.), the Council is called upon frequently by agencies of the U.S. Government for advice and assistance in connection with many problems of research.

Council publications include a series of Bulletins, Reprints, and Circulars. Council officers: Detlev W. Bronk, Chairman; Raymund L. Zwemer, Executive Secretary; G. D. Meid, Business Manager. Headquarters: 2101 Constitution Ave., Washington 25, D.C.

NATIONAL RESEARCH COUNCIL (Canada). Founded in 1916 to have charge of all matters affecting scientific and industrial research in Canada which may

be assigned to it by the Committee of the Privy Council on Scientific and Industrial Research.

In October, 1948, the Council's staff of 2,670, including those employed in several laboratory units operated outside of Ottawa, was grouped in laboratory divisions of applied biology, applied chemistry, mechanical engineering, physics, radio and electrical engineering, atomic energy, information services, building research, and medical research. Outside activities in 1948-49 included a research program of 217 grants for work under the direction of committees, including medical research in various hospital centers, the granting of 226 scholarships for postgraduate research, and the awarding of 122 grants in aid to responsible workers for special investigations.

A Crown company, the Canadian Patents and Development, Ltd., has been formed to make available to industry through licensing arrangements, inventions, new processes, and improvements developed by scientific workers of the Council. Membership of the Council: 20. Officers: C. J. Mackenzie, President; S. P. Eagleson, General Secretary. Headquarters: National Research Building, Ottawa, Canada.

NATIONAL SECURITY COUNCIL. The Council was established, pursuant to Public Law 253, title I, section 101, Eightieth Congress, July 26, 1947, to advise the President with respect to the integration of domestic, foreign, and military policies relating to the national security so as to enable the military services and the other departments and agencies of the Government to cooperate more effectively in matters involving the national security. In addition to performing such other functions as the President may direct, it is the duty of the Council, subject to the direction of the President: (1) to assess and appraise the objectives, commitments, and risks of the United States in relation to our actual and potential military power, in the interest of national security, for the purpose of making recommendations to the President in connection therewith; and (2) to consider policies on matters of common interest to the departments and agencies of the Government concerned with the national security, and to make recommendations to the President in connection therewith.

Under the direction of the Council is a Central Intelligence Agency headed by a Director of Central Intelligence.

The Council is composed of the President, the Secretaries of State, Defense, the Army, the Navy, and the Air Force, the Chairman of the National Security Resources Board, and such of the following officers as the President may designate from time to time: The Secretaries of the executive departments, the Chairman of the Munitions Board, and the Chairman of the Research and Development Board. The Council is assisted by a Staff headed by a civilian executive secretary appointed by the President.

NATIONAL SECURITY RESOURCES BOARD. This Board was created by the United States National Security Act of 1947 to "advise the President concerning the coordination of military, industrial, and civilian mobilization." It comprises a Chairman, appointed from civilian life by the President and confirmed by the U.S. Senate, and such other heads of Government departments or agencies as the President may designate. Acting chairman: John R. Steelman, who succeeded Arthur M. Hill on Dec. 15, 1948. Board members include the Secretaries of State, Treasury, Defense, Interior, Agriculture,

Commerce and Labor. The chairman of the Board is also *ex officio* member of National Security Council.

NSRB is the chief civilian agency charged with the duty of planning for most effective mobilization and use of nation's entire resources—industrial, material and human—in the event of an emergency. During 1948 the Board issued staff studies on electric power, communications, machine tools, scrap iron, and dispersion of industry. Other studies were nearing completion, and an over-all report on mobilization policies and programs was expected to be submitted to the President early in 1949.

NAURU (Pleasant) ISLAND. An atoll in the mid-Pacific (166° E.; 26 miles south of the equator). Formerly a mandate of the League of Nations, Nauru became (Oct. 22, 1947) a United Nations Trust Territory under the joint administration of Australia, Great Britain, and New Zealand. Australia continued to administer the island. Area: 8 square miles. Population (1947): 2,794. Phosphate is the chief product, a total of 102,400 tons being exported in 1946-47. Administrator: Mark Ridgway.

NAVAL PROGRESS. Advancement of the United States Navy during 1948 and an indication of its future development result from decisions reached by the Joint Chiefs of Staff at conferences in Key West, Fla., and Newport, R.I. (see NATIONAL MILITARY ESTABLISHMENT, MILITARY PROGRESS). At these sessions, it was agreed that the Navy should have exclusive responsibility in the field of anti-submarine warfare, now of increased significance as a result of improved undersea craft, equipped with schnorkel breathing devices. Additionally, the JCS said that just as the Air Force was to assist the Navy in combating submarines, so the Navy was given the collateral task of aiding the Air Force in the latter's responsibility for conduct of strategic air warfare.

Because of its importance in the progress of the U.S. Navy, the text of Section V of the JCS agreement is presented here in its entirety:

"Within the Department of the Navy, assigned forces include the entire operating forces of the United States Navy, including naval aviation and the U.S. Marine Corps. These forces are organized, trained, and equipped primarily for prompt and sustained combat operations at sea, and for air and land operations incident thereto. Of the three major Services, the Navy has primary interest in all operations at sea, except in those operations otherwise assigned herein.

A. Primary Functions: 1. To organize, train, and equip Navy and Marine Forces for the conduct of prompt and sustained combat operations at sea, including operations of sea based aircraft and their land based naval air components. Specifically: (a) To seek out and destroy enemy naval forces and to suppress enemy sea commerce. (b) To gain and maintain general sea supremacy. (c) To control vital sea areas and to protect vital sea lines of communication. (d) To establish and maintain local superiority (including air) in an area of naval operations. (e) To seize and defend advanced naval bases and to conduct such land operations as may be essential to the prosecution of a naval campaign.

2. To conduct air operations as necessary for the accomplishment of objectives in a naval campaign.

3. To organize and equip, in coordination with the other Services, and to provide Naval forces, in-

cluding Naval close air support forces, for the conduct of joint amphibious operations, and to be responsible for the amphibious training of all forces as assigned for joint amphibious operations in accordance with the policies and doctrines of the Joint Chiefs of Staff.

4. To develop, in coordination with the other Services, the doctrines, procedures, and equipment of naval forces for amphibious operations, and the doctrines and procedures for joint amphibious operations.

5. To furnish adequate, timely, and reliable intelligence for the Navy and Marine Corps.

6. To be responsible for naval reconnaissance, anti-submarine warfare, the protection of shipping and for mine laying, including the air aspects thereof.

7. To provide air transport essential for naval operations.

8. To provide sea based air defense and the sea based means for coordinating control for defense against air attack, coordinating with the other Services in matters of joint concern.

9. To provide naval (including naval air) forces as required for the defense of the United States against air attack, in accordance with joint doctrines and procedures approved by the JCS.

10. To furnish aerial photography as necessary for naval and Marine Corps operations.

11. To maintain the Marine Corps, which shall include land combat and service forces and such aviation as may be organic therein. Its specific functions are: (a) To provide Fleet Marine Forces of combined arms, together with supporting air components for service with the Fleet in the seizure or defense of advanced naval bases and for the conduct of such land operations as may be essential to the prosecution of a naval campaign. These functions do not contemplate the creation of a second land army. (b) To provide detachments and organizations for service on armed vessels of the Navy and security detachments for the protection of Naval property at naval stations and bases. (c) To develop, in coordination with the Army, Navy, and Air Force the tactics, technique, and equipment employed by landing forces in amphibious operations. The Marine Corps shall have primary interest in the development of those landing force tactics, technique, and equipment which are of common interest to the Army and Marine Corps. (d) To train and equip, as required, Marine forces for airborne operations, in coordination with the Army, Navy, and Air Force in accordance with policies and doctrines of the JCS. (e) To develop, in coordination with the Army, Navy, and Air Force doctrines, procedures, and equipment of interest to the Marine Corps for airborne operations and not provided for in Section IV, Par. A8.

12. To provide forces, as directed by proper authority for the establishment of military government, pending transfer of this responsibility to other authority.

B. Collateral Functions: The forces developed and trained to perform the primary functions set forth above shall be employed to support and supplement the other Services in carrying out their primary functions, where and whenever such participation will result in increased effectiveness and will contribute to the accomplishment of the overall military objectives. The JCS member of the Service having primary responsibility for a function shall be the agent of the JCS to present to that body the requirements for and plans for the employment of all forces to carry out the function. He shall also be responsible for presenting to the

JCS for final decision any disagreement within the field of his primary responsibility which has not been resolved. This shall not be construed to prevent any member of the JCS from presenting unilaterally any issue of disagreement with another Service. Certain specific collateral functions of the Navy and Marine Corps are:

1. To interdict enemy land and air power and communications through operation at sea.

2. To conduct close air support for land operations.

3. To furnish aerial photography for cartographic purposes.

4. To be prepared to participate in the over-all air effort as directed by the JCS."

Translated into terms of ships and men, these decisions mean vigorous emphasis upon development of improved submarines and simultaneously of "hunter-killer" task units to destroy enemy undersea marauders and the training of personnel in new concepts of naval warfare. Because the battleship has little purpose in a submarine fight, its importance has so diminished that only the U.S.S. *Missouri*, aboard whose decks the Japanese surrendered in August, 1945, remains of the dreadnaughts in active service. Replacing the battleship as the capital ship of the Navy is the aircraft carrier. During World War II, naval aircraft flying from flattops proved their effectiveness against submarines in the Battle of the Atlantic. Additionally, because the Navy has been given an ancillary role in strategic air warfare, its plans for a 65,000-ton aircraft carrier—storm center of controversy—gain new significance.

Navy Commanders. Directing progress of the Navy during 1948 were Secretary of the Navy, John L. Sullivan; Under Secretary of the Navy for Air, John N. Brown; Assistant Secretary of the Navy, Mark E. Andrews; Chief of Naval Operations, Adm. Louis E. Denfeld; and Vice Chief of Naval Operations, Vice Adm. A. W. Radford.

Other top admirals include Deputy Chief of Naval Operations (Administration), Rear Adm. Charles Wellborn, Jr.; DCNO (Air), Vice Adm. John D. Price; DCNO (Logistics), Vice Adm. Robert P. Carney; DCNO (Operations), Vice Adm. Arthur D. Struble; DCNO (personnel), Vice Adm. William M. Fechteler; and Chief of General Planning Group, Rear Adm. Maurice E. Curtis.

The Naval Establishment. The Department of the Navy, alternatively referred to as the Naval Establishment, consists of three principal parts: Operating Forces, Navy Department, and Shore Establishment. The Operating Forces are composed of the Atlantic Fleet, under command of Adm. W. H. P. Blandy, and the Pacific Fleet, commanded by Adm. DeWitt C. Ramsey, the former fleet with a subsidiary force under Adm. Richard L. Connolly in the Eastern Atlantic and Mediterranean and the latter with a secondary group of ships in the Far East, commanded by Vice Adm. Russell S. Berkey. The Navy Department, located in Washington, D.C., is the executive part of the Naval Establishment and is responsible for development of overall policy, command, administrative and logistic direction of both the Operating Forces and the Shore Establishment. Marine Corps Headquarters are under the Navy Department. Field activities of the Navy Department are placed under the Shore Establishment and include activities relating to maintaining, supplying, equipping, repairing, overhauling, and rendering similar services to the Operating Forces.

It is upon the Operating Forces, roaming the seas of the world, that rests the broad responsibility

ity of fulfilling the Navy's role in National Defense and of supporting fundamental national policies and interests. Therefore, both the Navy Department and Shore Establishment exist for the purpose of supporting the Operating Forces.

Atlantic and Pacific Fleets. To achieve its standing objective—control of the seas—the Navy divides among its Atlantic and Pacific Fleets a total of 776 active combatant and non-combatant ships. There are one battleship, 11 Midway Class carriers, 3 light carriers, 7 escort carriers, 10 heavy cruisers, 15 light cruisers, 6 anti-aircraft cruisers, 147 destroyers, 13 destroyer escorts, 80 submarines, 54 mine vessels, 50 patrol vessels, 151 amphibious and 228 auxiliary craft. Relegated to the "mothball" or "zipper" fleet and ready for service in event of emergency are 655 combatant and 1,215 non-combatant ships, a total reserve of 1,870 vessels. At the time of the Japanese surrender, the Navy had approximately 1,300 combatant ships and with auxiliary vessels, but excluding small landing craft, the total was 11,000 ships.

Each of the Navy's fleets contains a carrier striking force, an amphibious force, a Fleet Marine Force, a submarine force, units required for naval reconnaissance and anti-submarine warfare, and the necessary carrier air groups and Fleet Air Wings. The Atlantic Fleet, for example, has in active status 9 carriers, 4 escort carriers, 16 cruisers, 83 destroyers, 45 submarines, and 8 destroyer escorts, plus amphibious lift for two Marine Corps Regimental Combat Teams.

From the main fleets, naval forces rotate on outpost duty in the Eastern Atlantic and Mediterranean, in the Western Pacific and Far East. Deployment of these vessels to strategic areas is explained by Admiral Denfeld as part of "our strategy for peace." Thus, the Navy maintains a carrier and supporting ships in the Mediterranean, and cruising in the waters off China is a task group built around two carriers.

Carrier Task Group. Described by Admiral Denfeld as the "core of the Navy's striking power," is the fast carrier task group. Steaming at a speed of 25 knots or faster, its ships can throw up 6,000 shells per second or 200 tons of explosive metal per minute. Navy experts maintain that per square foot of target area no other installation has comparable defense to a carrier. Because of its mobility, the carrier task group can achieve tactical surprise, striking a target at Point X one day and then hitting Y with equal force 600 miles away the next day. Admiral Denfeld has said that "immediate and effective use of sea-air power may well be a decisive factor in a war's initial stages."

The fast carrier task group may be pictured as three series of enormous circles, with each circle representing a ring of ships or planes. At the core of the inner circle typically are four aircraft carriers, separated from each other by more than two miles. Aboard each carrier are approximately 2,000 men. Each carrier has its own fighter, dive bomber, and torpedo planes and varied shops for on-the-spot aircraft maintenance and repair. Surrounding the carriers is a ring of heavy ships, usually at least four or five cruisers, providing a tremendous anti-aircraft fire potential. Circling far outside are about 25 destroyers to protect the task group from submarines. The group is spread so widely that destroyers on the opposite flanks often are out of sight of each other. During World War II, such carrier groups dominated the air in actions across the Pacific.

The Navy's Super Carrier. Given an auxiliary role in the mounting of a strategic air assault against an

enemy, and claiming the carrier's ability to hit initially with surprise and force, the Navy sped ahead in 1948 with final plans for the keel-laying (early in 1949) of the 65,000-ton flush-deck aircraft carrier U.S.S. *United States* to be built by the Newport News, Va., Shipbuilding and Drydock Corporation at an estimated cost of \$124 million. Designated as the CVA-58, and the result of 78 different designs produced since October, 1945, the carrier will be 1,030 feet long, 10 feet longer at the waterline than the SS *Normandie*, and 130 feet longer than the U.S.S. *Midway*, currently the Navy's longest vessel. Waterline beam of the new carrier, which will require approximately four years to build unless placed on "priority order," will be 130 feet, making her the seventh Navy ship too wide to pass through the Panama Canal. Maximum fixed width above the waterline is 190 feet, but temporary structures hinged in place will make her 255 feet wide. The carrier will have an approximate speed of 33 knots and will have a complement of about 4,000 officers and men.

The ship will have no island structure to impede landings and takeoffs; her flag and ship bridges or operation and control centers will be telescopic. Planes weighing as much as 100,000 pounds will be able to take off from the carrier and land on its reinforced deck. The long-range future of the carrier is reflected in the fact that late in 1948 the Navy was conducting tests with the 22,000 pound Martin Mauler, one of the heaviest airplanes ever designed solely for carrier duty. The CVA-58 will be able to handle planes weighing five times as much as the Mauler.

Largest Blimp Also. To further its anti-submarine program, the Navy awarded to the Goodyear Aircraft Corporation a contract for construction of a type "N" blimp, nearly twice the size of Navy blimps used for anti-submarine patrol during World War II. The patrol airship will be 324 feet long, 71 feet wide, and 92 feet high at the tallest point. The double-deck 87-foot car under the blimp will house crew, controls and the two 800-horsepower air-cooled engines. Normal crew will be 14 officers and men. Helium capacity will be 825,000 cubic feet.

Ship Construction. Concurrently with construction of the gigantic carrier and "overstuffed" blimp, the Navy is strengthening the flight decks and increasing the catapult and elevator capacity of two 27,000-ton carriers, the U.S.S. *Essex* and U.S.S. *Wasp*. Ultimately all of the *Essex* Class carriers will be so modified to extend greatly the range and striking power of the fast carrier task forces.

In addition to the carrier phase of the construction and conversion program, the Navy is developing high-speed, deep-submergence submarines, anti-submarine vessels, and ships equipped for polar and picket service. With regard to ship construction, Vice Adm. Earle E. Mills, Chief of the Bureau of Ships, has described the Navy's strategic position as being "unique" in that "we must pursue with equal vigor the perfection of tactics, weapons and devices utilized in both phases of undersea warfare. In the event of emergency," he explains, "we must be prepared to launch a submarine offensive and, at the same time, repel any submarine offensive directed towards our life lines."

The danger of such a submarine offensive is heightened as a result of the German development during World War II, with subsequent improvement by the United States and Russia, of the schnorkel device. This is a pair of breathing tubes which admit air from above the water's surface to

permit undersea charging of submarine batteries and which expel exhaust gases. As a result, new submarines can stay under water indefinitely and can travel at greater speeds than ever before.

In addition to the CVA-58, the Navy's postwar construction program includes 2 anti-submarine cruisers, 4 destroyers, 6 high-speed submarines, and 3 anti-submarine submarines. Simultaneously with construction of the 16 new vessels, the Navy will convert the following ships: 2 Essex Class fleet carriers to carry newer, heavier planes; 2 light carriers for anti-submarine warfare; twelve 2,100-ton destroyers to destroyer escorts; six 2,200-ton destroyers for antisubmarine warfare; 2 destroyer escorts to destroyer escort pickets; 2 submarines to troop-carrying submarines; one submarine to a cargo-carrying submarine; 2 submarines for polar picket service; one submarine to submarine oiler; one cargo ship for polar service; and 2 landing ships dock for polar service. In a year when relations between the United States and Russia were strained, the emphasis upon ships for polar duty is not surprising.

Placed in commission during the year was the U.S.S. *Des Moines*, the world's most powerful cruiser, displacing 17,000 tons and equipped with automatic, rapid-fire batteries of 8-inch guns—its weapons fire four times faster than any guns of the same or larger caliber. The ship's armament includes 12 twin-mount five-inch guns, 20 twin-mount three-inch anti-aircraft guns, and twelve 20-mm machine guns. To divert funds for more critical needs and to await new research studies, the Navy suspended work on the guided-missile bombardment ships, the U.S.S. *Kentucky* and U.S.S. *Hawaii*. Shelved were the battleships U.S.S. *New Jersey*, *Wisconsin* and *Iowa*, while the U.S.S. *Norton Sound*, a seaplane tender, became the first ship specially equipped to fire 14-ton rockets.

Naval Air Program. Side by side with acceleration of its ship construction, the Navy has set its sights on realization of an air arm of 14,500 planes by July 1, 1949. Originally, defense planning called for completion of this expansion by 1954. To reach the 14,500 figure, of which about 10,000 planes will be ready for flight assignments at any given time, the Navy will withdraw 3,000 World War II type planes from storage. During 1949, 1,165 new planes will be built for the Navy, of which 576 will be jet fighters, 454 attack aircraft, 82 patrol planes, 16 transports, and 37 helicopters.

Exercises aboard Navy carriers, particularly the U.S.S. *Boxer* and U.S.S. *Saipan*, proved that jet aircraft are practical for carrier operations and the Navy has ordered complete transition to jet planes for carriers "as rapidly as possible." With regard to air transport, Navy planes were ordered to Europe to assist the Air Force in "Operation Vittles," the supplying of blockaded Berlin by airlift. The huge four-engined Lockheed XR60 *Constitution*, a 180-passenger, 92-ton airplane, successfully completed initial flights. The Navy's JRM-2 *Caroline Mars*, largest flying boat in active service, set a new record when it flew non-stop from Honolulu to Chicago, the 4,200-mile flight being the longest ever made by a seaplane. See AVIATION, MILITARY.

Naval Research. To keep ahead of the rest of the world in weapons and techniques, the Navy is devoting particular attention to research. It is reported that more than 25 percent of all research activities is now being devoted to aspects of submarine and anti-submarine warfare. Navy research contracts, supervised by Rear Adm. T. A. Solberg, Chief of Naval Research, run the gamut of scientific fields—chemistry, physics, medical sciences,

nuclear physics, mathematics, fluid mechanics, geophysics, mechanics, and materials. Among prominent successes of naval research are: achievement of an air speed of Mach number 5.18, or 5.18 times the speed of sound, in the captured and modernized German supersonic wind tunnels now at the Naval Ordnance Laboratory, White Oak, Md.; successful completion of sustained controlled flights by pilotless aircraft powered by ram-jet engines at the Naval Air Missile Testing Center, Point Mugu, Cal.; and the disclosure that there are available unmanned, remote-control craft which can be loaded to capacity with explosives and are capable of being dispatched to demolish underwater beach defenses and of going ashore to blast beachhead defenses. In this program, called "Project Stinger," the Navy readied during World War II drone craft, ranging in size from huge cargo ships to small amphibious seafloats for critical amphibious missions.

Marine Corps. Responsible for the seizure and defense of advanced naval bases, the Navy directs the activities of the battle-famed Marine Corps, authorized a strength of 108,200 officers and men. Appropriations permit a strength of 92,000, and late in 1948 actual strength was 7,017 officers and 76,196 enlisted personnel, plus 2,216 one-year enlistees; a total of 85,425. Of this number, more than 60 percent is assigned to the Operating Forces, principal combat elements of which are the Fleet Marine Forces, one with the Atlantic Fleet and one with the Pacific Fleet.

The Fleet Marine Force, Atlantic, is presently deployed with Force Headquarters at Norfolk, Va.; Second Division Headquarters and three battalion teams are at Camp Lejeune, N.C., and the equivalent of one battalion landing team is in the Mediterranean. Aviation and service elements of the Force are located at Cherry Point, N.C., and at Camp Lejeune.

Units of the FMF, Pacific, are more widely deployed, with Force Headquarters on Oahu, Hawaii; First Division Headquarters and two battalion landing teams at Camp Pendleton, Cal.; two battalion landing teams at Guam under a provisional brigade headquarters, and other forces at Tsingtao, China, under a provisional force headquarters. Aviation units are distributed from the West Coast to China.

Navy Personnel Strength. In addition to the Marine Corps, the Navy is permitted by Public Law 759 to reach a strength of 490,000, of which 50,000 may be officers, 410,000 enlisted personnel, and 30,000 one-year enlistees. Actual strength on Nov. 30, 1948, was 46,010 officers, 375,125 enlisted men, and 8,782 one-year enlistees; a total of 429,917. A nautical precedent was established when women were commissioned as Regular officers in the Navy and Marine Corps. The Women's Armed Service Act permits the Navy 500 officers, 20 warrant officers and 6,000 enlisted women in the next two years. Present strength of the WAVES is 431 officers and 1,710 enlisted women. The Marine Corps is authorized 110 commissioned women officers and warrant officers and 1,000 enlistees during the next two years.

Naval Reserve. For the first time in history, the peacetime strength of the Naval Reserve passed the 1 million mark. Assigned to 764 activated surface and submarine divisions and 23 Naval Reserve air stations on October 31, were 20,784 officers and 161,913 enlisted personnel of the Organized Reserve, 78 percent of the quota of 233,012. These officers and enlisted men attend weekly drill sessions and take annual training cruises. Some ships

are manned entirely by Reservists on the summer cruises. The Volunteer Reserve, whose members are not organized into units but who are qualified or partially qualified for prescribed mobilization assignments, includes 283,132 officers and 560,228 enlistees. The Marine Corps Reserve has 2,790 officers and 34,906 enlistees in the ORC, and 24,758 officers and 55,355 enlistees in the VRC, an overall total of 117,809 as of September 30.

Foreign Navies. Australia: Important additions are the 14,000-ton carriers, *Sydney* and *Melbourne*, the latter to be commissioned in 1949.

Belgium: Added to the fleet of 2 despatch vessels, 8 minesweepers, 2 rapid torpedo vedettes, and a former British boom defense vessel was the 1,430-ton American frigate, *Sheboygan*, renamed the *Lt. V. Billet*.

Canada: The light carrier H.M.C.S. *Magnificent* was commissioned in April and the H.M. *Warrior* was returned to England.

China: In addition to American vessels, including destroyer escorts, the Chinese obtained the light cruiser *Aurora* and the destroyer *Mendip* from England. The U.S. gave China 126 vessels under the ECA program, mostly landing craft.

France: Construction was continued on the 16,700-ton aircraft carrier, PA-28; the *Jean Bart*, bombed during the war, was being completed to replace the *Richelieu*.

Great Britain: The largest sea exercises since the war were held during the summer. The famous battleship, *Queen Elizabeth*, was decommissioned. The reserve fleet included 65 destroyers, 136 frigates, 2 monitors, 31 submarines, 51 minelayers and 3 fast minelayers. The fleet includes 4 battleships, 3 fleet carriers, 5 light fleet carriers, 17 cruisers, 34 submarines, 52 destroyers, and 43 frigates in active commission.

India: The cruiser *Achilles* was transferred from the British Navy to the Royal Indian Navy and was renamed the H.M.I.S. *Delhi*.

Italy: Apportionment of ships of the Italian Navy under terms of the peace treaty is as follows: Russia, 27 warships; France, three 3,362-ton cruisers and a light "tropical cruiser," 4 destroyers, 2 submarines, 6 torpedo ships, and 27 auxiliaries; Great Britain and the United States renounced their allotments and some of the total of 65 warships and 62 auxiliaries went to Yugoslavia, Greece, and Albania.

Japan: Scrapping by the U.S. Navy of the 14,000-ton cruiser *Tone* closed the ledger on Japan's large combat vessels, marking destruction of 34 ships, totaling more than 475,830 tons since January, 1946.

Netherlands: To succeed the *Karen Doorman*, returned to England, the 31,190-ton, 25-knot ex-British carrier H.M.S. *Venerable* was added, while 2 cruisers and 8 destroyers were to be added to the cruisers *Tromp* and *Jacob Van Heemskerck*. Eight submarines also are in service.

Russia: Detailed data has not been revealed officially. It is reported, however, that the former German aircraft carrier, *Graf Zeppelin*, slated for destruction under an Anglo-American-Russian naval agreement, is in "undetermined" status. Reportedly also recently completed are 2 cruisers and several destroyers. However, naval authorities believe that the real potency of the Russian Navy is in its submarines. It is estimated that the Russians have more than 250 submarines, completed or building, many of them equipped with the schnorkel device and with other improvements made by German submarine experts now assisting the Russians. Return of 31 American ships lend-leased to

Russia during the war was promised late in 1948, including the cruiser *Milwaukee*.

—DANIEL Z. HENKIN

NAVAL RESEARCH, Office of. The Office of Naval Research was created by Public Law 588, signed by the President Aug. 1, 1946. To it were transferred all functions, personnel, property and contracts of the predecessor agency, the Office of Research and Inventions, established by directive of the Secretary of the Navy in May, 1945.

It is charged with the duties of encouraging, promoting, planning, initiating, and coordinating naval research, and conducting naval research in augmentation of and in conjunction with the research and development conducted by the respective bureaus and other agencies and offices of the Navy Department. Patents, inventions, trademarks, copyrights, and royalty payments matters are also under the supervision and control of the Office.

It is headed by the Chief of Naval Research (Rear Admiral Thorvald A. Solberg, July, 1948) appointed by the President and confirmed by the Senate.

The Office of Naval Research is composed of three major subdivisions in Washington and six branch offices located in New York City, Boston, Chicago, San Francisco, Los Angeles, and London, England. The Naval Research Laboratory, at Anacostia, D.C., the Special Devices Center at Port Washington, Long Island, N.Y., and the Underwater Sound Reference Laboratory at Orlando, Fla., are field activities under its direction.

Basic research is procured under contract from university, industrial, and government laboratories. There are currently 355 contractors conducting 1,122 projects. Approximately 75 percent of the contracts are with universities and non-profit institutions.

Research programs are now under way in the following physical sciences: nuclear physics, physics, chemistry, electronics, mechanics and materials, geophysics, fluid mechanics, and mathematics. Research in the Medical Sciences includes: physiology, biochemistry, microbiology, psychophysiology, psychology, human ecology, biophysics, and dentistry. Naval Sciences covered are undersea, amphibious and air warfare, power, and armament.

Considerable progress has been made in the second phase of ONR's responsibility for research, namely, the bringing of results to direct application to Navy needs. The program at the Naval Research Laboratory has increased emphasis on basic and applied research. Important contributions have been made and a high standard of accomplishment maintained in carrying developments from the research stage to application. The Special Devices Center emphasizes the development of synthetic training devices for a number of applications, and has become a unique establishment for consideration of the highly important field of human engineering. This field recognizes the necessity of considering the inter-relation between man and the machine or weapon he operates or uses.

In addition to active research programs, ONR during the past year began the development of a technique of scientific analysis for research and development programs known as "program research." Program research is the detailed study and analysis of all scientific fields bearing on the achievement of a stated naval operational objective. It involves reducing the objective to its major components, and then evaluating all scientific fields which bear on each of the components. In this process, gaps and bottlenecks will become easily

apparent. Such analyses will help provide the Chief of Naval Operations and the Material Bureaus with factual and quantitative bases for use in planning their research and development programs.

NAVY, Department of the. See *The Naval Establishment* under NAVAL PROGRESS.

NAZARENE, Church of the. A holiness group organized in Chicago, in 1907, and emphasizing the doctrine of entire sanctification. Its 4,160 ministers serve 3,390 churches with 217,106 members in the United States, Canada, British Isles, and Australia. In addition, there are about 25,000 members or foreign mission fields under the care of 190 missionaries. Eight educational institutions have an enrollment of 4,774 students while 422,832 are enrolled in Sunday schools. The 1948 income from contributions was \$22,096,555; the value of church property increased to \$56,935,285. A Mid-Century Crusade for Souls with a goal of 1,000 new churches within four years was launched by the General Assembly which met in St. Louis, Mo., in June, 1948. Headquarters: 2923 Troost Ave., Kansas City, Mo.

NEBRASKA. A west north central State. Area: 77,510 sq. mi. Population: (July 1, 1948) 1,301,000, compared with (1940 census) 3,784,664. Chief cities: Lincoln (capital), 81,984 inhabitants in 1940; Omaha, 223,844. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$57,853,000; total expenditure, \$60,601,000.

Elections. While the 6 electoral votes went to Dewey, his popular majority over Truman was only about half as large as in 1944. Governor Val Peterson, Republican, was reelected for another term. In Congressional races, Kenneth S. Wherry, Republican, was reelected to the Senate, but the Republicans won only 3 of the 4 House seats for a loss of one. Other State officials elected were: Lieutenant Governor—Charles J. Warner; Secretary of State—Frank Marsh; Attorney General—James H. Anderson; Auditor—Ray C. Johnson; Treasurer—Edward Gillette; Superintendent of Public Instruction—Wayne O. Reed.

Officers, 1948. Governor, Val Peterson; Lieut. Governor, Robert B. Crosby; Secretary of State, Frank Marsh; Attorney General, Walter R. Johnson; State Treasurer, Edward Gillette; State Auditor, Ray C. Johnson; Superintendent of Schools, Wayne O. Reed.

NECROLOGY. The following is a list of notable persons who died during the year 1948.

Achron, Isidor (b. Warsaw, Poland, Nov. 24, 1892—d. New York, N.Y., May 12, 1948). Composer, pianist, and accompanist for Heifetz, 1923–33. Made New York debut at Town Hall, 1923; his last New York recital was in 1946 when he played several of his own works.

Adalbert Ferdinand Berengar Victor, Prince of Prussia (b. Potsdam, Germany, July 14, 1884—d. Montreux, Switzerland, Sept. 22, 1948). Naval officer and third son of the late Kaiser Wilhelm II. Since 1939, he had lived with his family in Switzerland under the name of Count von Lingen.

Alexander, Edward Albert (b. Georgetown, S.C., Jan. 30, 1873—d. New York, N.Y., Dec. 17, 1948). Constitutional lawyer, noted for his prominent role in legal moves leading to repeal of the 18th Amendment. An advocate of international army for the maintenance of peace and author of *World Government Versus Constitution*.

Allen, Viola (b. Huntsville, Ala., Oct. 27, 1869—d. New York, N.Y., May 9, 1948). Famous classical and Shakespearean actress who made her debut in the title role of *Esmeralda* in 1882. Leading lady at Charles Frohman's Empire Theater, 1893–98; retired from the stage in 1918.

Alonso López, Francisco (b. Granada, Spain, May 9, 1887—d. Madrid, Spain, May 18, 1948). Orchestra conductor and Spain's foremost composer of operettas and musical comedies (zarzuelas). His more than 60 works include *Marriage of a Wanderer*, *A Cigarette and My Wife*, and the popular one act *Las Corsarias*.

Anderson, Isabel Weld Perkins (b. Boston, Mass., Mar. 29, 1876—d. Brookline, Mass., Nov. 3, 1948). Author of fiction, plays, and poetry; philanthropist; and world traveler. She was the widow of Larz Anderson, sometime United States ambassador to Japan. Her writings include *The Great Sea Horse*, *Captain Ginger Series*, *The Spell of Japan*, and other travel books.

Andrews, Adolphus (b. Galveston, Tex., Oct. 7, 1879—d. Houston, Tex., June 19, 1948). Vice admiral, USN (retired); commanding officer of the Eastern Sea Frontier, 1942–43; commander of the Fleet Scouting Force, 1938–41. He served as naval aide to three presidents: Theodore Roosevelt, Harding, and Coolidge.

Angelesco, Constantin (b. Craiova, Rumania, 1869—d. Bucharest, Rumania, Sept. 14, 1948). Physician, diplomat, statesman; first Rumanian Minister to the United States, 1918; and Premier of Rumania, 1933–34. A member of the Liberal Party, he held many cabinet posts and was a senator from 1901–33.

Arce y Ochotorena, Manuel (b. Pamplona, Spain, 1879?—d. Barcelona, Spain, Sept. 16, 1948). Archbishop of the Roman Catholic Diocese of Tarragona since 1938, and a cardinal since 1946.

Arinkin, Mikhail Innokentyevich (b. Tshita, Siberia, Russia, 1876—d. Reported by Moscow, Sept. 9, 1948). Scientist widely known for his work in the field of hematology. Faculty member of the Medical Military Academy, Moscow, and the author of some 40 volumes on hematology.

Armat, Thomas (b. Fredericksburg, Va., Oct. 26, 1866—d. Washington, D.C., Sept. 30, 1948). Engineer, inventor, and pioneer in the motion picture industry. His invention of the Vitascope (patented in 1896) was the forerunner of present-day projection machines.

Ashfield, Albert Henry Stanley, 1st Baron of Southwell (b. Derby, England, Nov. 8, 1874—d. London, England, Nov. 4, 1948). Transportation expert; creator and chairman of the London Passenger Transportation Board, 1933–47; since then chairman of the British Transport Commission. President of the Board of Trade (1916–19); an M.P., 1916–20; and from 1919–33, managing director of the Underground Group of Companies. Raised to the peerage in 1920.

Atherton, Gertrude Franklin (b. San Francisco, Calif., Oct. 30, 1857—d. San Francisco, Calif., June 14, 1948). Author of numerous historical and biographical novels, of which *The Conquerors* and *Black Oxen* were most successful.

Atkinson, Joseph E. (b. Newcastle, Ont. Canada, Dec. 23, 1865—d. Toronto, Canada, May 8, 1948). Publisher and owner of *The Toronto Daily Star* and *The Toronto Star Weekly*.

Ayers, Harry Morgan (b. Montclair Heights, N.J., Oct. 6, 1881—d. New York, N.Y., Nov. 19, 1948). Scholar, educator, and a member of the Columbia University faculty since 1908; director of the Summer Session, 1939; acting director, 1942–46, since director of University Extension; and director of Casa Italiana since 1940. His published works include *Beowulf*, *Carroll's Alice*.

Baggot, King (b. St. Louis, Mo., 1880—d. Hollywood, Calif., July 11, 1948). Motion picture director and leading actor of the silent screen. In a film career which began in 1909 he appeared in such pictures as *The Scarlet Letter*, *Dr. Jekyll and Mr. Hyde*, and *Ivanhoe*.

Bailey, Carl Edward (b. Bernie, Mo., Oct. 8, 1894—d. Little Rock, Ark., Oct. 23, 1948). Lawyer, politician, and governor of Arkansas, 1937–41.

Baker, Lee (b. Ovid, Mich., 1876—d. Los Angeles, Calif., Feb. 24, 1948). Well known character actor who made his debut as Menas in *Anthony and Cleopatra* (1909). Appeared in *Strange Interlude*, *Mourning Becomes Electra*, *Song of Songs*, *Richard II*, and *High Tor*. He last appeared in *The Little Foxes*.

Baldomir, Alfredo (b. Montevideo, Uruguay, Aug. 27, 1884—d. Montevideo, Uruguay, Feb. 25, 1948). Soldier, statesman, and president of Uruguay, 1938–42.

Balke, Clarence William (b. Auburn, Ohio, Mar. 29, 1880—d. Highland Park, Ill., July 8, 1948). Metallurgist, inventor, and research director of the Fansteel Metallurgical Company, 1916–46. Holder of some 30 patents, he was developer of tantalum, a rare metal used during World War II.

Barnes, George Emerson (b. Hersey, Mich., May 26, 1882—d. Philadelphia, Pa., Dec. 29, 1948). Clergyman and nationally known leader in the Presbyterian ministry. A Rhodes Scholar (1904–07), he served as Moderator of the Michigan Synod, 1915–16; of the Philadelphia Presbytery, 1936–38.

Barrington-Ward, Robert McGowan (b. England, 1891—d. Dar-es-Salaam, E. Africa, Feb. 29, 1948). Editor of the *London Times* since 1941, and associated with that paper since 1913. From 1919–27 he was assistant editor of the *Observer*.

Baskett, James (b. Indianapolis, Ind., Feb. 16, 1904—d. Hollywood, Calif., July 9, 1948). Negro actor of the

stage, screen, and radio; best known for portrayal of Uncle Remus in Disney's *Song of the South*, for which he won a special Oscar. On the radio he created the role of Gabby in *Amos 'n' Andy*.

Bateman, George Frederick (b. Halifax, England, July 4, 1876—d. New York, N.Y., Jan. 29, 1948). Mechanical engineer; with Cooper Union since 1907 and dean of its school of engineering since 1933. President of the Electrical Society, 1944-46, director, 1940-47.

Beard, Charles Austin (b. near Knightstown, Ind., Nov. 27, 1874—d. New Haven, Conn., Sept. 1, 1948). Historian and author; on the faculty of Columbia University, 1907-17; director of the Training School for Public Service, 1917-22. Rockefeller, Abby Greene Aldrich (b. Providence, R.I., Oct. 26, 1874—d. New York, N.Y., Apr. 5, 1948). Wife of John D. Rockefeller, Jr., in whose philanthropies she took an active part. As an art patron she was co-founder of the Museum of Modern Art (1929) and donated more than 2,000 items to its collections.

Roosevelt, Edith Kermit Carow (b. Norwich, Conn., Aug. 6, 1861—d. Oyster Bay, Long Island, N.Y., Sept. 30, 1948). Widow of the late president, Colonel Theodore Roosevelt, whom she married in 1886. To a marked degree she had shared her husband's activities and interests, and until recently had remained active in Republican Party affairs.

Rosny, J. H., the younger (pseudonym for Seraphim Justin François Boex, b. Brussels, Belgium, 1859—d. St. Brieuc, France, June 16, 1948). Novelist and charter member of the Goncourt Academy, of which he was president in 1940. He wrote more than 50 books in addition to some 30 volumes in collaboration with his brother.

Rossi, Raffaele Carlo (b. Pisa, Italy, Oct. 28, 1876—d. Bassano del Grappa, Italy, Sept. 17, 1948). Cardinal; titular archbishop of the Roman Catholic Diocese of Thesalonika, since 1930; and secretary of the Consistorial Congregation.

Roussy, Gustave (b. Vevey, Switzerland, Nov. 24, 1874—d. Paris, France, Sept. 30, 1948). Medical scientist, particularly in the fields of neurology, endocrinology, and cancer. Recently relieved of his post as rector of the University of Paris and dean of its faculty of sciences following charges of illegal currency manipulations.

Roxas y Acuna, Manuel (b. Capiz, Philippine Islands, Jan. 1, 1892—d. Clark Field, Pampanga, Philippine Islands, Apr. 15, 1948). Lawyer, statesman, and president of the Republic of the Philippines since 1946. Attained the rank of Brigadier General during World War II and served as an aide to General MacArthur. He headed several Philippine Independence Missions to the United States and strove to orient his country towards America.

Ruggiero, Guido de (b. Naples, Italy, Mar. 23, 1888—d. Rome, Italy, Dec. 29, 1948). Philosopher, author, and historian whose best known work is a 16-volume history of philosophy. He was a professor at the University of Rome; vice president of the Italian Delegation to UNESCO; and minister of Education in the post-liberation cabinet. His most recent work to be published in English was *Existentialism, Disintegration of Man's Soul*. Other works include: *History of European Liberalism, Modern Philosophy, and Myths and Ideals*.

Rumanceff, Nicholas A. (b. Moscow, Russia, 1875—d. New York, N.Y., May 21, 1948). Physician and actor, one of the 12 original owner-members of the Moscow Art Theater, where he made his debut in 1902. He brought the group to the United States in 1922 and 1926.

Ruppert, George E. (b. New York, N.Y., Mar. 18, 1875—d. New York, N.Y., Nov. 5, 1948). Board chairman of the Ruppert Brewery since 1945, and president from 1939-45.

Ruth, George Herman (b. Baltimore, Md., Feb. 7, 1895—d. New York, N.Y., Aug. 16, 1948). A leading figure in professional baseball, and the idol of American youngsters, "Babe" Ruth starred in 10 world series and set 54 major league records between 1914-38. He began his major league career with the Boston Red Sox (1914) and was bought by the N.Y. Yankees in 1920 for a reported \$125,000.

Ryan, Tommy (b. Redwood, N.Y., 1870—d. Granada Hills, Calif., Aug. 3, 1948). Boxer, former welterweight and middleweight champion, and a veteran of some 200 bouts. He retired from the ring in 1907, undefeated.

Rybalko, Pavel Semyonovich (d. U.S.S.R., Aug. 28, 1948). Marshal in the Soviet army and commander in chief of the armored tank and mechanized troops, twice proclaimed a hero of the Soviet Union.

Rylands, Sir (William) Peter (b. Thelwall, Cheshire, England, Oct. 23, 1863—d. Thelwall, England, Oct. 24, 1948). Lawyer, manufacturer, and founder and twice president of the Federation of British Industries, 1919-21. He held directorships in many industries and was president of the Iron, Steel Wire Manufacturers Association (since 1900), and sometime president of the Iron and Steel Institute (1926-27).

Salomon, Alice (b. Berlin, Germany, Apr. 19, 1872—d. New York, N.Y., Aug. 30, 1928). Pioneer sociologist, lecturer, and author. She organized and directed the first German school of social work (1899-1925), was a frequent delegate to international conferences, and received high honors for her work in the fields of public health and women and children in industry. Her writings included works on economy, civics, and social-work problems.

Samaroff, (Lucy Mary) Olga Hickenlooper (b. San Antonio, Tex., Aug. 8, 1882—d. New York, N.Y., May 17, 1948). Concert pianist, teacher, lecturer, and author. Following her New York debut in 1905, she toured America and Europe. She was on the faculty of the Juilliard Graduate School of Music (since 1925) and of the Philadelphia Conservatory. Founded the Schubert Memorial, Inc. (1927), the Layman's Music Course, and co-founded the Musicians Emergency Fund (1931). Her writings include *The Layman's Music Book*, *The Magic World of Music*, and *An American Musician's Story*. Divorce terminated her marriage to Leopold Stokowski in 1911.

Sankey, John, 1st Viscount of Moreton (b. Moreton, England, Oct. 26, 1866—d. London, England, Feb. 6, 1948). Statesman, lawyer, and Lord Chancellor of Great Britain, 1929-35. Sometime chairman of the Federal Structure Committee; High Steward of Oxford University; Lord Justice of Appeal; and since 1930 a member of the Permanent Court of Arbitration at The Hague.

Savitt, Jan (b. Leningrad, Russia, 1913—d. Sacramento, Calif., Oct. 4, 1948). Violinist, composer, and orchestra leader; widely known as band leader who evolved the shuffle rhythm. Sometime first violinist with the Philadelphia Orchestra and organizer of the Savitt String Quartet.

Saw, U (b. Burma, n.d.—d. Rangoon, Burma, May 8, 1948). Politician, premier of Burma, 1940-41, hanged for complicity in the murder (July, 1947) of Premier U Ang San and 6 other cabinet members. U Saw was a member of the Burmese delegation to the London conference in January, 1947, at which he refused to sign agreement for Constituent Assembly.

Schweigard, Frederick William (b. Wuerttemberg, Germany, May 3, 1885—d. Albany, N.Y., Sept. 21, 1948). Sculptor widely known for his heroic busts of famous men, including Roosevelt, Einstein, McArthur, etc. He also executed a fountain group, *Youth Triumphant*, and miniature models of the Taj Mahal and the Minaret. Represented in several European and American museums.

Schwellenbach, Lewis Baxter (b. Superior, Wisc., Sept. 20, 1894—d. Washington, D.C., June 10, 1948). Lawyer, banker, and Secretary of Labor since 1945. During his term as United States Senator, 1935-40, he was a member of the Senate Foreign Relations Committee, a staunch supporter of President Roosevelt, and a foe of Huey Long. A liberal Democrat, he was a vigorous spokesman for labor's rights. Between 1940-45 he served as a Federal judge.

Schwimmer, Rosika (b. Budapest, Hungary, Sept. 11, 1877—d. New York, N.Y., Aug. 3, 1948). Feminist, pacifist, and guiding spirit of the Ford "peace ship" in World War I. Following participation in the bloodless Hungarian revolution she became Hungarian minister to Switzerland (1918).

Sebrechts, Joseph Marcel Alphonse (b. Willebroeck, Belgium, Feb. 11, 1885—d. Bruges, Belgium, Mar. 28, 1948). Physician, internationally known as a scientist and practitioner. He was president of the Royal Flemish Academy of Medicine; professor at the University of Louvain; and director of the municipal hospitals in Bruges.

Selig, William Nicholas (b. Chicago, Ill., Mar. 14, 1864—d. Los Angeles, Calif., July 16, 1948). Pioneer motion picture producer who made his first commercial film in 1896. Established the Selig Picture Company, 1909, and invented many technical appliances, including the Selig polyscope. His early pictures included *The Jungle* (1906), *The Count of Monte Christo* (1907), *The Garden of Allah*, and *Coming of Columbus*.

Serot, André Pierre (b. Cregny, Vosges, France, 1896—d. Jerusalem, Palestine, Sept. 17, 1948). Army officer and chief French observer in Palestine, assassinated together with Count Folke Bernadotte. During World War II he was a leader in the French resistance movement.

Sheppard, Samuel Edward (b. Hither Green, Kent, England, July 29, 1882—d. Rochester, N.Y., Sept. 29, 1948). Internationally known research scientist in the field of photochemistry, colloids, and photography; associated with the Eastman Kodak Company, 1912-48. He held some 90 patents, alone or jointly; was the author of some 100 scientific papers and many technical books.

Shiber, Etta Kahn (b. New York, N.Y., Jan. 20, 1878—d. New York, N.Y., Dec. 23, 1948). Author of the best-seller *Paris—Underground*, in which she related her experiences in France during World War II.

Shilloto, Edward (b. 1872—d. Buckhurst Hill, Essex, England, Mar. 11, 1948). Congregational clergyman, poet, and religious journalist. Editor of the London Missionary Society's periodicals; London correspondent of the *Christian Century*; and author of *Life and Work, The Christian Year in Wartime, Poetry and Prayer*, etc.

Sibilia, Enrico (b. Anagni, Italy, Mar. 17, 1861—d. Rome, Italy, Aug. 4, 1948). Senior member of the College of Cardinals (since 1935). He had served as Papal Nuncio in various South American countries, in Spain, and lastly in Austria (1923-35).

Sidgreaves, Sir Arthur Frederick (b. England?, June, 1882—d. London, England, June 7, 1948). Industrialist, managing director of Rolls-Royce, 1929-46, and associated with the firm since 1920. Credited with responsibility for "shadow factory" for aircraft motors.

Sidi Mohammed Al-Mounsaif, Pasha Bey (b. La Monouba, Mar. 4, 1881—d. Pau, France, Sept. 1, 1948). Moslem Bey

of Tunis, 1942-43. Forced to abdicate by the French, he was succeeded on May 15, 1943, by Sidi Mohammed al-Amin, his cousin.

Silberstein, Ludwik (b. Poland, 1873?—d. Rochester, N.Y., Jan. 17, 1948). Physicist, authority on relativity, and a critic of Einstein's theory, for which he evolved a testing method (1921). He was the author of *The Theory of Relativity, The Size of the Universe, Causality*, etc.

Silvers, Earl Reed (b. Jersey City, N.J., Feb. 22, 1891—d. Sarasota, Fla., Mar. 26, 1948). Educator, author, and dean of men at Rutgers University, since 1944. Besides *The Editor Accepts—How To Write Short Stories That Magazines Buy* and *Son of Tomorrow*, he wrote numerous books for boys, including *Dick Arnold of Raritan College*, *Ned Beads, Freshman*, and *Code of Honor*.

Simone, G. F. Edgardo (b. Brindisi, Italy, June 20, 1890—d. Los Angeles, Calif., Dec. 19, 1948). Internationally known sculptor; creator of some 30 monuments in 26 countries since 1919. Also noted for portrait busts and for sculptures for motion pictures, especially for *The Song of Bernadette*.

Simons, Gerard J. M. (b. Bergen op Zoom, Holland, 1877—d. Franklin Lakes, N.J., May 25, 1948). Dutch newspaper correspondent in the United States and co-founder of the Foreign Press Association.

Sisson, Edgar Grant (b. Alto, Wisc., Dec. 23, 1875—d. New York, N.Y., Mar. 12, 1948). Author and journalist. He had variously been editor (1914-17), city editor (1909-11), and assistant city editor (1903-09), of *Cosmopolitan* magazine and managing editor (1911-14) of *Collier's Weekly*. Physicist and leading industrialist; internationally recognized for discoveries which led to development of radio telephony. Researcher with the American Telephone & Telegraph Company and the Western Electric Company, 1913-20; technical adviser to the South African Government since 1920. Founder (1923) and director of the Electricity Supply Commission and the South African Iron and Steel Industrial Corporation (1928); chairman and managing director of the African Metals Corporation since 1937, chairman of the Industrial Development Corporation, 1940-44; director general of supplies (1943-46).

Voge, Richard George (b. Chicago, Ill., May 4, 1904—d. Port Chester, N.Y., Nov. 17, 1948). Rear Admiral, USN (retired), and a specialist in submarine warfare. Graduated from Annapolis in 1925, served as operations officer of submarine fleets in the Pacific during World War II, and won many naval awards for heroism.

Vogüé, Louis, Marquis de (b. 1868—d. Paris, France, Mar. 2, 1948). Chairman of the Suez Canal Company since 1927, president of the French agricultural society, and a director in the Bank for International Settlements.

Vollmoeller, Karl G. (b. Germany, May 7, 1878—d. Hollywood, Calif., Oct. 18, 1948). Playwright, novelist, and screen writer; author of the famous play, *The Miracle*, which starred his former wife, Maria Carmi. Other plays include *Early Gardens*, *Giulia*, *The German Count*, *Anti-gone*, and *Wieland*.

Wachsman, Zvi H. (b. Mrshmar Hayarten, Palestine, 1904—d. Montreal, Canada, Sept. 13, 1948). Author, journalist, and correspondent for several Jewish newspapers. Member of the executive board of the Federation of Polish Jews and vice chairman of Palestine Pioneers Foundation. A linguist and author of books in several languages.

Wallace, George Barclay (b. Detroit, Mich., Sept. 21, 1874—d. New York, N.Y., Jan. 15, 1948). Physician, educator, and researcher noted for his work on the biological effects of stimulants and anaesthesia. Professor emeritus on the faculty of New York University College of Medicine, 1902-46, and founder of the school's Department of Pharmacology.

Wallace, Nellie (b. Glasgow, Scotland, Mar. 18, 1870—d. London, England, Nov. 24, 1948). Music-hall comedienne and one of Great Britain's best-loved troupers. Beginning her career at the age of 12 as a clod-hopper, she made her last appearance in a Royal Variety Program this fall.

Wallenberg, Ernst (b. Berlin, Germany, 1879?—d. New York, N.Y., Aug. 21, 1948). Journalist, foreign correspondent, and editor of the Ullstein publishing house, Berlin, 1906-33. Sometime editor in chief of *B. Z. Am Mittag*, *Vossische Zeitung*, and *Tempo*; American correspondent for Ullstein papers, 1904, 1931; and author of the well-known language textbook series *1000 Words*.

Wasson, Thomas Campbell (b. Great Falls, Mont., Feb. 8, 1896—d. Jerusalem, Palestine, May 23, 1948). United States consul general in Jerusalem, formerly first secretary at the American Embassy, Paris, and from 1942-46, in the Department of State. He died from wounds received from a sniper's bullet.

Watson, Charles Roger (b. Cairo, Egypt, July 17, 1873—d. Philadelphia, Pa., Jan. 11, 1948). Presbyterian clergyman, missionary, educator; authority on the Arab world and Moslem religion. Founder (1914) and president of the American University at Cairo, Egypt, 1922-45.

Watson, Ernest Milton (b. Warwick, R.I., 1884—d. Buffalo, N.Y., Dec. 5, 1948). Noted urologist, consultant at several hospitals, and the author of more than 100 papers on urology, some of which gained him international recognition.

Watson, James Eli (b. Winchester, Ind., Nov. 2, 1863—d. Washington, D.C., July 29, 1948). Lawyer, politician, and Republican majority leader, in the Senate, 1929-33. He served as congressman, 1895-97, 1899-1909; and as a senator from 1916-33.

Watt, Homer Andrew (b. Wilkes-Barre, Pa., Sept. 11, 1884—d. New York, N.Y., Oct. 14, 1948). Scholar, educator, head of the English department at New York University since 1938, and a faculty member since 1916. The author of many college textbooks in Japanese literature and co-author of *Legends of Paul Bunyan*, *Lumberjack*.

Waxman, Percy (b. Australia, 1881—d. New York, N.Y., Jan. 12, 1948). Author, radio commentator, and associate editor of *Cosmopolitan* magazine since 1935. Between 1925-30 he edited the *Pictorial Review*. Written works include *The Black Napoleon* and *What Price Mallorca*.

Netherlands Information Bureau

QUEEN OF THE NETHERLANDS. On September 6, 1948, the new Queen, Juliana, took the oath to the Constitution of the Netherlands and was formally invested in a civil ceremony before a joint session of the States-General.

THE WORLD COUNCIL OF CHURCHES, meeting in an International Assembly at Amsterdam, Holland, attempted a great step toward the reunion of Protestant and Orthodox church bodies. The Council issued a report in 1948 on "The Church and the Disorder of Society," which analyzed and condemned communism and laissez-faire capitalism.

Weaver, Raymond Melbourne (b. Baltimore, Md., July 7, 1888—d. New York, N.Y., Apr. 4, 1948). Educator, author, professor of English at Columbia University since 1947, and a faculty member since 1916. An authority on Herman Melville, he edited the Constable edition of Melville's works and the Colophon edition of *Journal Up the Straits*. He was the author of *Herman Melville, Mariner and Mystic*, etc.

Weaver, Zebulon (b. Weaverville, N.C., May 12, 1872—d. Asheville, N.C., Oct. 29, 1948). Corporation lawyer, politician, and Democratic congressman from North Carolina, 1917-29, 1931-47.

Weddell, Alexander Wilbourne (b. Richmond, Va., Apr. 6, 1876—d. near Otterville, Mo., Jan. 1, 1948). Diplomat; United States ambassador to Argentina, 1933-39; to Spain, 1939-42; and special ambassador to Turkey, 1946. He was a delegate to Pan American conferences in 1933 and 1935. With his wife, founder of the Virginia Museum of Fine Arts.

Wedderburn, Joseph Henry MacLagan (b. Forfar, Scotland, Feb. 26, 1882—d. Princeton, N.J., October, 1948). Mathematician and professor at Princeton University, 1928-45 (since emeritus), where he had taught since 1909. Noted for his work in the field of algebra, he was a fellow of the Royal Society, and of the A.A.A.S., as well as member of many scientific societies. Between 1911-45, he was associated with the *Annals of Mathematics*.

Weidenreich, Franz (b. Edenkoben, Germany, 1873—d. New York, N.Y., July 11, 1948). Physical anthropologist, educator, and author; research associate, American Museum of Natural History, since 1941. Sometime professor at various German universities; visiting professor at the University of Chicago, and the Peiping Union Medical College. Best known for his studies of the Peking man and fossil man generally. Author of *Apes, Giants and Man*.

Weir, John M. (b. Indianapolis, Ind., Sept. 6, 1891—d. Washington, D.C., Nov. 21, 1948). Brigadier General, AUS (retired), and assistant to the Judge Advocate General during World War II. Member of military tribunal before which 8 Nazi saboteurs caught in this country were tried.

Wenyon, Charles Morley (b. Liverpool, England, Mar. 24, 1878—d. London, England, Oct. 24, 1948). Protozoologist, authority on tropical medicine, and director in chief of the Wellcome Research Institute, 1924-44. From the mass of his scientific writings the outstanding contribution to medical literature was the standard *Protozoology*.

Werth, Albertus Johannes (b. Malmesbury, Cape Province, Mar. 6, 1888—d. George, Cape Province, Mar. 4, 1948). Politician and a leader in the South African Nationalist Party. Administrator of Southwest Africa, 1926-33; member of the Union Assembly, 1920-26; sometime minister of finance.

West, James Edward (b. Washington, D.C., May 16, 1876—d. New Rochelle, N.Y., May 15, 1948). Lawyer; chief executive, Boy Scouts of America, 1911-43; and editor of *Boys' Life*, 1922-43. His many activities on behalf of children included organization of the Child Rescue League.

West, Milton H. (b. El Rancho, Tex., June 30, 1888—d. Washington, D.C., Oct. 28, 1948). Lawyer, politician, and Democratic congressman from Texas since 1933. He was a member of the House Ways and Means Committee and took an interest in tariff and tax legislation.

Wetjen, Albert Richard (b. London, England, Aug. 20, 1900—d. San Francisco, Calif., Mar. 8, 1948). Author of adventure and sea stories, awarded the O. Henry prize (1926), for his *Command*. Other writings include *Captains All*, *Fiddlers Green*, *In the Wake of the Shark*, etc. Co-founder of the *Outlander*, and contributor to *The Saturday Evening Post*.

White, Harry Dexter (b. Boston, Mass., Oct. 29, 1892—d. Fitzwilliam, N.H., Aug. 16, 1948). Economist and outstanding authority on monetary questions. Sometime assistant secretary of the Treasury; he entered government service in 1934 and resigned in 1947, as director for the United States on the International Monetary Fund. He was a recent key witness before the Un-American Activities Committee.

White, Newman Ivey (b. Statesville, N.C., Feb. 3, 1892—d. Cambridge, Mass., Dec. 5, 1948). Scholar, author, educator, and chairman of the department of English at Duke University, where he had taught since 1919. Regarded as an eminent authority on Shelley and the romantic movement, he published *The Best of Shelley, Portrait of Shelley*, and a two-volume *Shelley*. He was president of the North Carolina Folklore Society; editor of the forthcoming Frank C. Brown collection of North Carolina folklore; advisory editor of the Modern Language Association on all matters pertaining to Shelley scholarship. *An Anthology of Verse by American Negroes and American Negro Folksongs* were also compiled and edited by him.

Whitlock, Herbert Percy (b. New York, N.Y., July 31, 1868—d. New York, N.Y., Feb. 22, 1948). Mineralogist, regarded as an authority in the field. Curator of mineralogy, Museum of Natural History, 1918-41. Author of two popular volumes: *The Story of the Minerals* and *The Story of the Gems*.

Whitten-Brown, Sir Arthur (b. Manchester, England, 1886—d. London, England, Oct. 3, 1948). Aviator and former Royal Air Force officer, who with Sir John Alcock made the first non-stop flight across the Atlantic, in June, 1919.

Whitty, Dame May (b. Liverpool, England, June 19, 1865—d. Hollywood, Calif., May 29, 1948). Distinguished character actress of the English and American stage. She made her London debut in 1882, New York debut in 1895, and screen debut in 1937. One of her greatest triumphs was in *Night Must Fall* (stage and screen). Recent films in which she appeared were: *Green Dolphin Street*, *If Winter Comes*, and *The Sign of the Ram*. In private life she was Mrs. Ben Webster.

William, Warren (b. Aitkin, Minn., 1895—d. Encino, Calif., Sept. 24, 1948). Screen actor whose real name was Warren William Krech. In a movie career which began in 1932 he became noted for his portrayal of sleuths and was featured in some 60 films, including *The Mouthpiece*, *The Match King*, *Arizona*, and the *Lone Wolf* series.

Willson, Russell (b. Fredonia, N.Y., Dec. 27, 1883—d. Bethesda, Md., July 6, 1948). Vice Admiral, USN, retired; deputy commander in chief of the fleet, 1942-43. An inventor and expert in the field of secret communication, he served on the Joint Strategic Survey Committee of the Joint Chiefs of Staff during World War II.

Wilson, Lewis R. (b. Elwood City, Pa., 1900—d. Baltimore, Md., Nov. 23, 1948). Baseball star and holder of the National League home-run record, who as Hack Wilson hit 56 home runs in 1930. Began baseball career in 1921, played for the Giants, 1923-25, and for the Chicago Cubs, 1926-31.

Wilson, Thomas Webber (b. Coldwater, Miss., Jan. 24, 1893—d. Coldwater, Miss., Jan. 31, 1948). Lawyer and chairman of the Federal Parole Board since 1946; Federal judge in the Virgin Islands, 1933-35; and Democratic congressman from Mississippi, 1923-29.

Wilson, William (b. Preston, England, 1887—d. Raleigh, N.C., May 6, 1948). Physicist, radio engineer, professor of physics at the University of North Carolina, and formerly vice president of the Bell Telephone Laboratories. A specialist in radio, he helped develop the vacuum tube.

Winternitz, Felix (b. Linz, Austria, 1872—d. Cambridge, Mass., Aug. 19, 1948). Violinist, composer, and teacher; a member of the faculty of the New England Conservatory of Music, since 1891. Sometime member of the Imperial Opera, Vienna, and of the Boston Symphony Orchestra. His compositions include *Trotka*, *Dream of Youth*, *Forsaken*.

Wolf-Ferrari, Ermanno (b. Venice, Italy, Jan. 12, 1876—d. Venice, Italy, Jan. 21, 1948). Operatic composer whose best known work was *The Jewels of the Madonna*. Other operas include *Le donne curiose*, *Il segreto di Susanna*, *L'amore medico*, etc.

Wood, Martha (b. Richfield, N.Y., 1892—d. Washington, D.C., Sept. 28, 1948). Child welfare worker of international repute and, since 1945, field director of the social service division of the Federal Children's Bureau. Sometime Pennsylvania field representative for the American Red Cross, and a member of the American Commission to Serbia, 1921-22.

Woods, Albert Fred (b. Belvidere, Ill., Dec. 25, 1866—d. Hyattsville, Md., Apr. 12, 1948). Botanist associated with the United States Department of Agriculture, as educational adviser (1941-47), and as director of scientific work (1926-34). Between 1917-26 he was president of the University of Maryland.

Woodson, Walter Browne (b. Lynchburg, Va., Oct. 18, 1881—d. Coronado, Calif., Apr. 23, 1948). Rear Admiral, USN; naval aide to President Roosevelt, 1936-38; and judge advocate general, 1938-43.

Woolf, Samuel Johnson (b. New York, Feb. 12, 1880—d. New York, Dec. 3, 1948). Artist and writer, noted for his portrait sketches and interviews with famous people. Most of his work appeared in *The New York Times*, earlier work having appeared in *Colliers*. Represented by works in the Metropolitan Museum of Art, the New York Public Library, etc. Written works include *A Short History of Art*, *Drawn from Life*, and *Here Am I*.

Wright, Orville (b. Dayton, Ohio, Aug. 19, 1871—d. Dayton, Ohio, Jan. 30, 1948). Co-inventor with his brother Wilbur of heavier-than-air aircraft. Made first power-driven flight at Kitty Hawk, N.C., in 1903.

Wrong, George Mackinnon (b. Canada, June 25, 1860—d. Toronto, Canada, June 29, 1948). Historian, author, and educator. Professor emeritus of history at the University of Toronto (1894-1927). Author of *The Fall of Canada*, *The Conquest of New France*, *The Canadians: The Story of a People*, etc.

Wynne, John (b. New York, N.Y., Sept. 30, 1859—d. New York, N.Y., Nov. 30, 1948). Jesuit priest and scholar; founder and first editor of *America* (1909-10), and editor of its predecessor, *The Messenger* (1891-1909). He also originated idea for *Catholic Encyclopedia*, which he edited from 1911-12. Served on Cardinal Hayes' Literature Committee and was the author of several religious books.

Yahya Muhammad Hamid el Din (b. 1866—d. Sanaa, Yemen, reported Feb. 19, 1948). Imam (king-priest) of Yemen since 1934, ascended the throne in 1904. Reportedly murdered together with three of his sons. Sayed Abdullah Ibn Ahmed el-Wazir proclaimed Imam to succeed Yahya.

Yonai, Mitsumasa (b. Iwateken, Japan, March, 1880—d. Tokyo, Japan, Apr. 20, 1948). Admiral, statesman, and minister of the Navy, 1937-40, 1944-45. An opponent of Tojo militarists, his premiership in 1940 was of short duration.

Youngman, Elmer H. (b. New Lebanon, Ind., 1861—d. Brooklyn, N.Y., Oct. 13, 1948). Financial writer; editor of *The Bankers Magazine*, 1893–1943; the section on Banking in the *Encyclopedia Americana*, and *History of Banking*, by Knox. He was the author of *Credit Currency, Banks and Banking, Banking in the United States, Private Banks*, etc.

Zaccani, Ermate (b. Montecchio di Reggio, Italy, Sept. 14, 1857—d. Viareggio, Italy, Oct. 14, 1948). A leading character actor who achieved his greatest success, when past 80 years of age, in the role of Socrates in his own adaptation of Plato's *Phaedon*. He introduced Ibsen's dramas to the Italian public, one of his best roles being that of Oswald in *Ghosts*.

Zanardi-Landi, Elizabeth Marie Christine. See *Landi, Elissa*.

Zhdanov, Andrei A'lexandrovich (b. Mariupol, Caucasus, Russia, Feb. 26, 1896—d. near Moscow, U.S.S.R., Aug. 31, 1948). Colonel General of the Red Army; directed the defense of Leningrad in World War II, and the winter war against Finland, 1939–40. A member of the Bolshevik Party since 1915, a party official since 1923, and an outstanding theoretician and propagandist. Until 1940, secretary of the Central Committee of the Communist Party of the Soviet Union; a member of the Politburo, the Presidium, Supreme Council of the U.S.S.R.; and acknowledged leader of the Cominform.

Zilcher, Hermann (b. Frankfurt a/M, Germany, Aug. 18, 1881—d. Würzburg, Germany, Jan. 17, 1948). Concert pianist and composer of choral, instrumental, and orchestral music. Since 1920, director of the conservatory at Würzburg, and famous for his staging at Mozart festivals.

Zimmerman, Orville (b. Glen Allen, Mo., Dec. 31, 1880—d. Washington, D.C., Apr. 7, 1948). Democratic congressman from Missouri, since 1935.

NEGROES. Africa. Economically, the 44 percent of the continent of Africa which is ruled by Great Britain is becoming increasingly important to that country as a source of foodstuffs, raw materials, and strategic defense. This condition, coupled with the fact of a Labor government, may be largely responsible for the more enlightened colonial policies in these possessions. Through British colonial development and welfare appropriations planning, some schools and a few other social services have accelerated progress. In West Africa where local movements for self-government or independence among the native people are strong, the Africans have achieved a majority in the legislative councils. There is also a marked increase in the number of native civil servants. In 1948 there were 322 African students studying in 111 American colleges and universities.

The "modernization" of the African people proceeds unevenly. For example, British East Africa is far behind British and French West Africa in almost every respect when it comes to opportunity and advancement of the native peoples. The French territories continue to make "Frenchmen" of all black subjects of the educated and military class and to incorporate larger and larger blocks of its holdings into the French federated union. There are no Africans in American colleges from the Belgian Congo where vocational training is insisted on and overseas education of any sort frowned upon, nor are there any from Portuguese Africa. These areas do not have a good reputation for helpfulness to the indigenous peoples. A. T. Steele, writing for the *New York Herald Tribune*, said about one part of Africa what could be said about most of it; that the Europeans there "do not want a highly educated, politically conscious [leadership] that might agitate for self rule."

Probably the native Africans' lot is worst in the Union of South Africa where much ground has been lost in recent months. The avowedly anti-native, pro-segregation government of Dr. F. S. Malan has consolidated its control. The limited franchise previously exercised by a few blacks and the Cape Province colored has been further reduced, almost to the vanishing point. Accordingly, the Natives Representative Council has "struck" against continuing its meaningless meetings.

The African National Congress, led by Dr. A. B. Xuma, has made bold to criticize the government's policy, pointing out the inevitable consequences of suffering and violence. These grave predictions have come true, though in a curious form—that is, verbal and physical clashes have broken out between the native Africans and the East Indians who live in South Africa. The Africans charge that the Indian merchants mercilessly exploit them. What they do not say is that the rebellion of the unarmed and poorly organized blacks against the pressures placed on them by the all-powerful whites is turned toward the relatively weak Indians. These outbreaks have broken up the "united front" that African and Indian leaders had effected a few years before and which had enabled them to beat back the efforts of the Union to impose a more definite pattern of racial segregation on its East Indian residents and to annex the mandated territories of Southwest Africa.

West Indies. The Caribbean Commission continued its quiet and systematic work of coordinating the efforts of the various imperialist and resident interests of the region. The republic of Haiti celebrated its 148 years of independence with elaborate ceremonies. The American Negro governor of the Virgin Islands, William H. Hastie, at the close of the year appeared to have established rapport with the dissident groups that have been insisting on local control of the islands' affairs.

United States. Economics and Politics. The general fight for fair employment practices failed to gain a federal law but the principle was incorporated in the procedures of the federal civil service. The Citizens' Trust Company of Atlanta, Ga., became the first Negro bank to be admitted to the Federal Reserve System.

The two Negro members of Congress, Representatives A. Clayton Powell and Wm. L. Dawson, were returned to office. Dawson is the first Negro to head a committee as important as the House Committee on Expenditures in Executive Departments. Attorney Oliver C. Hill was the first Negro to take a seat on the Richmond, Va., city council since Reconstruction days. Negro participation in politics in the border States increased without undue friction. In the deep South, however, such efforts were marked by tension and clashes. Herman Talmadge openly campaigned in Georgia on an anti-civil-rights-for-Negroes platform. Negroes, joined by the few liberals and progressives of Georgia, fought back. They were overwhelmed by the Talmadge landslide.

Social and Cultural Developments. The break between Walter White, Executive Secretary, and W. E. B. DuBois, Director of Research of the National Association for the Advancement of Colored People, was partly personal, partly political and institutional. Dr. DuBois, one of the founders of NAACP, was fired and joined the Council on African Affairs.

The Southern Conference for Human Welfare suspended activity. The newspaper *PM*, highly favorable to the Negro's cause, folded, as did *People's Voice*, a left-wing Negro weekly. The *New York Age*, an important Negro paper for a half-century, was purchased by an Englishman, Richard Bourne-Vannect, for his Negro wife. See *CARIBBEAN COMMISSION; SOUTH AFRICA, UNION OF; etc.*

—L. D. REDDICK

NEPAL. An independent kingdom between Tibet and India. Area: 54,000 square miles. The territory includes Mount Everest (29,002 ft. high). Population (estimated): 7 million. Capital, Katman-

du (pop. 108,805). Gurkhas, Magars, Eurungs, and Bhotias are the chief races. Hinduism is the predominant religion. The economy of Nepal depends primarily on agriculture and livestock. There are many fertile valleys and valuable forests. Rice, jute, hides, cattle, lumber, oilseeds, medicinal herbs, and ghee are the main exports. Imports include cattle, sheep, goats, spices, textiles, metal products, sugar, and salt. The annual gross revenue amounts to 12,500,000 rupees. Nepal's government is a military aristocracy based on birth. All power is in the hands of the prime minister, a member of the ruling family. Ruler: Tribhubana Bir Bikram (succeeded to the throne, Dec. 11, 1911). Prime Minister: Maharaja Sir Mahan Shumshere Jung Bahadur Rana (succeeded Apr. 30, 1948).

NETHERLANDS. A constitutional monarchy of north-western Europe. Capital, Amsterdam; seat of the Government, The Hague. Sovereign, Queen Juliana, who ascended the throne on Sept. 6, 1948 (see *Events*, below). Premier, Willem Drees.

Area and Population. The area, including water belonging to municipal territories, is 15,764 square miles. The population on July 1, 1948, was estimated at 9,782,000. Vital statistics in 1947 (rate per 1,000): births, 27.8; deaths, 8.1; marriages, 10.2. Population of the chief cities, in 1947, Amsterdam, 807,490; Rotterdam, 645,417; The Hague ('s Gravenhage), 534,135.

Production. Agriculture, manufacturing, commerce, and mining are the principal industries. Chief agricultural products in 1947 (monthly averages): milk, 2,338,000 hectolitres; butter, 4,400 metric tons; cheese, 5,400 tons; meat, 16,400 tons. The index of industrial production reached 116 in September, 1948 (1938 = 100).

Foreign Trade. Total imports in 1947 were valued at 4,200 million guilders; exports at 1,900 million guilders. For the first half of 1948, imports were 2,359 and exports 1,178 million guilders.

Finance. The budget for 1949, as announced in September, 1948, anticipates a deficit of 660 million guilders, as compared to a deficit of 1,750 million in 1948. Total expenditure for 1949 is estimated at 3,963 million guilders against 4,592 million in 1948; revenue at 3,303 million guilders against 2,841 million.

Government. The Constitution of 1814, with its various amendments, vests executive power exclusively in the sovereign while legislative authority rests co-jointly in the sovereign and the States-General (Parliament). The States-General consists of an upper chamber of 50 members, chosen by elected representative bodies in the several provinces for terms of six years; and of a lower chamber of 100 members elected for four years by general adult suffrage. In practice the Cabinet is responsible to the States-General and the Premier is normally chosen by the sovereign from a political group commanding a parliamentary majority.

The Constitution was amended on Sept. 20, 1948, to legalize the equal partnership between the Netherlands and the United States of Indonesia as provided for by the Cheribon Agreement of Nov. 12, 1946.

Events, 1948. The most important event of the year was the abdication of Queen Wilhelmina, after a 50-year reign and the accession to the throne of her daughter Juliana.

After having left the realm for six weeks in the hands of Crown Princess Juliana (see *YEAR BOOK* for 1947), Queen Wilhelmina again resumed her royal duties on Dec. 1, 1947. But it soon became apparent that her physical strength no longer was

equal to the task. She was advised by her doctors to retire for good. On the other hand, the Queen, the Crown Princess, and the Cabinet agreed that the change of reign should be postponed until after the Golden Jubilee in early September.

Accordingly, Wilhelmina announced in a radio address on May 12 that she would abdicate immediately after the celebration and that in the meantime another regency would go into effect. Two days later Juliana for the second time in a year was sworn in as Regent. On August 30, her mother, as scheduled, made a brief return as Queen to accept the homage of her nation on the occasion of her 68th birthday (August 31) and of the fiftieth anniversary of her accession to the throne (September 6). The double event, culminating in the installation of the new sovereign was marked by a week of celebrations. On September 4 Queen Wilhelmina signed the instrument of abdication in the Royal Palace at Amsterdam in the presence of the Cabinet Ministers and the leaders of the States-General. Two days later the solemn investiture of Queen Juliana took place at the Nieuwe Kerk of Amsterdam. The ceremony was witnessed by royalty and dignitaries from all over the world. The Queen's consort, Prince Bernhard, was given the title of Prince of the Netherlands.

Juliana took over at a critical period in the history of the Dutch Empire. The unsolved Indonesian problem weighed heavily on all minds. The economic situation of the Netherlands gave rise to a good deal of concern. And the country was facing possibly hazardous commitments as a member of the new Western European Union. In her first speech from the throne, on September 21, the new Queen gave thanks to America for her aid in Dutch recovery.

General Elections. Normally the Parliament elected in May, 1946, should have served for four years. However, in view of the change of Constitution made necessary by the new relationship between the Netherlands Kingdom and the East Indies, the Government deemed it advisable to consult the entire nation on the far-reaching issues involved. Hence the States-General was dissolved in May and a general election was scheduled for July.

Twelve political parties presented candidates in the Lower House election which was held on July 7 in an atmosphere of complete calm and order. The results of the poll were unspectacular, the only change being a light shift to the right. Of the 100 seats at stake, the Catholic Party obtained 32, as before; the Labor Party lost 2, retaining 27; the Calvinist Party again took third place with 13 seats (unchanged); the Communists lost 2 seats and kept 8; the Liberals picked up 2 for a total of 8; and the Christian-Historical Union gained one for a total of nine. The extreme rightist State Reformed Party kept its 2 seats and a dissident Catholic group won one. The distribution of seats in the Upper House, elected on July 8, remained unchanged: Catholics, 17; Labor, 14; Calvinists, 7; Christian-Historians, 5; Communists, 4; Liberals, 3.

New Government. On the day of the general election, the Catholic-Labor coalition Government headed by Premier L. J. M. Beel resigned in accordance with customary procedure. The Catholic Party still being the strongest in Parliament, Princess Regent Juliana again asked the Party leader, Beel, to form a Cabinet. After two unsuccessful attempts to broaden the basis of his previous coalition Government, Beel gave up on July 31. The Regent then turned to the Social-Democratic leader Willem Drees who succeeded in forming a four-

party coalition on August 7. In the new Cabinet, the Catholics hold 6 portfolios, the Labor Party (Social-Democrats) 5, and the Christian-Historical Union and Liberals one each. J. R. H. van Schaick, Catholic leader in the Lower House, was named Deputy Premier. The Foreign Ministry went to Dr. D. U. Stikker, Liberal.

In its declaration of policy, on August 12, the new Government promised to strive for a settlement of the Indonesian dispute acceptable to both sides; to end rationing at an early date; and to strengthen the economic union of the "Benelux" states.

On August 19, Parliament, by a vote of 76 to 22, passed the constitutional amendment granting sovereignty to Indonesia on the basis of equal partnership with the Netherlands. In the course of the constitutional revision, an amendment providing for the transfer of civil authority in the event of an internal threat and another granting a pension to the retiring Queen Wilhelmina also were adopted. The amendments were signed by Wilhelmina on September 3 in her last official act before abdicating. They went into effect on September 20.

Relations with Indonesia. In a broadcast from The Hague, February 3, Queen Wilhelmina declared that "colonialism is dead," and that "a free federated Indonesia is about to take her place among the democratic nations of the world." However the Far Eastern partner referred to by the Queen was the Dutch-sponsored federation of Indonesian states (East Indonesia, Borneo, West Java, etc.) exclusive of what normally should be the most essential element in that federation: the Indonesian Republic in Central Java and Sumatra. For the difficulties placed in the way of integral fulfillment of the Cheribon Agreement by Republican intransigence as well as by the Dutch "police action" of July-August, 1947, continued. Little progress was made during the year toward an effective solution of the tangled problem.

Hubertus J. Van Mook, Dutch Governor General of Indonesia, resigned in October and on November 1 his post was taken over by former Premier Beel. On October 28, the new Dutch Foreign Minister Stikker departed for Java by plane for direct negotiations with the Indonesian Republican Government of Premier Mohammed Hatta. Upon his return to The Hague, Stikker presented to the Cabinet a lengthy report which showed that no immediate solution was in sight yet.

Meanwhile an emergency bill authorizing formation of an Indonesian interim Government had been passed by the two houses of the States-General. It was signed by Queen Juliana on October 30 (see INDONESIA).

The Economic Situation. The economic picture of the Netherlands remained several shades darker than in neighboring Belgium, a condition that of itself was apt to jeopardize the proposed economic union between the two countries. In a move to place the prospective partners on an equal footing, economically speaking, the economic ministers of Belgium, The Netherlands, and Luxembourg held a conference at Château d'Ardenne early in June (see *Events, BELGIUM*). The decisions of the conference were reported to entail, among other things, an almost complete liquidation of the Dutch rationing system before Jan. 1, 1950; abolition of Dutch import subsidies, amounting to 500 million guilders annually; and a material relaxation of Dutch control over prices, imports, and exports. In partial confirmation of these reports, state subsidies were ended on November 8.

A primary source of concern was the continuing

adverse balance in foreign trade. Both in 1946 and 1947 huge deficits had been piled up. In the year under review, imports still were running far ahead of exports, though on a diminished scale. Early in November, Finance Minister Pieter Liefstinck expressed the hope that in 1949 imports would be covered by exports to the extent of 68 percent, against 60 percent in 1948. However, Dutch economists feared that even if their international accounts as a whole eventually would be balanced, the shortage of dollars might persist.

—JOACHIM JOESTEN

NETHERLANDS LITERATURE. Situated in the center of Western Europe, the Low Countries, which form one linguistic province with the exception of Southeastern Belgium, have taken a very active part in the cultural life of the Atlantic region since their first literary endeavors. Influences of the surrounding peoples have had fruitful results; on the other hand, they have served as a spiritual bridge between France, Western Germany, and England. That is why most currents in these countries could make themselves felt here, if they harmonized in any way with the people's character, which is determined by realism and religiosity. This wealth of many-sided culture was a source from which neighbors drew continually.

The rise of the Low Countries coincides with the decline of feudal society. They have scarcely known a separate knightly literature; criticism of the society, ruled by the nobility, existed in the satiric beast-epic *Van den Vos Reynaerde* and the strophic poems of Jacob van Maerlant. Romantic reminiscences of the feudal life reverberated until the 15th century, especially in folk songs (*Halewijn*, *Het daghet en het Oosten* and in the drama *Lanseloet*).

Practical Christianity, as preached by van Maerlant, found in his own time a counterpart in the mystical poetry of the nun Hadewijch and later in the mystical prose of Jan van Ruusbroec. The highest expression of the adoration of the Virgin Mary was found in the legend of *Beatrijs* (poet unknown). The visionary and practical life of faith were combined in the movement of the "Modern Devotion" (15th century), to which Thomas à Kempis also belonged.

Humanism and Renaissance entered the Low Countries from France, at a time (Erasmus) when the struggle between Roman Catholicism and Reformation was at its height. Inseparable from this was the conflict in the chaotic 16th century between the feudal imperialism of the Habsburg world empire and the townspeople ("the burghers"), who, striving for autonomy and led by William of Orange, gained their independence through the foundation and continuance of the Protestant Republic of the United Netherlands. The activity of the hundreds of "Rederijkerkamers," organized after the example of the "Chambres de Rhétorique," reflected very accurately the antithesis of the age. Their literary interest is especially the diligent exercise in and the final mastery of the forms of art produced by the Renaissance. To them belonged amongst others, the author of the Faustian drama *Marieken van Nimwegen* and the morality play *Elckerlyck* (of which *Everyman* is very probably a translation); also the militant Catholic poetess Anna Bijns and her opponent, the prosist Marinus van St. Aldegonde (according to some, the poet of the national anthem *Wilhelmus van Nassouwe*). Such typical protagonists of the Renaissance as Jan van der Noot, Carel van Mander (*Schilderboek*) and Coornhert maintained close

connections with these clubs; their influence was very strong on the poetry of resistance in the struggle for liberty. The notary Valerius collected this poetry in *Gedenckklanken* (for instance, *Wilt heden nu treden*).

After the Southern Netherlands had again been brought into subjugation under the Habsburgs, the literary life became concentrated in the Republic, especially in the Province of Holland (Amsterdam, Leiden). The didactic poem, very generally cultivated in the later Middle Ages in the Low Countries, was continued in classical form by the statesmen Jacob Cats and Constantijn Huygens (father of the physicist Christiaan Huygens). Especially the voluminous, as well as homespun works, of "Father" Cats appealed to the popular taste, as proven by the expensive editions of his *Emblemeta* (illustrated parables). Huygens combined a strict Calvinism with the aspiration for the Renaissance ideal of the "uomo universale." His concise, sometimes obscurely fashioned prosody (closely related to Dunne), his gifts as composer and architect, and his extensive knowledge of the fine arts brought him far on the road to its realization. As Counsellor on the Arts for Stadtholder Frederick Henry, he fashioned his court into a focus of artistic life and in this manner assisted many young artists (Rembrandt). Modestly, he called his collected poems *Korenbloemen* (Cornflowers). To the ruling class of "Regents" also belonged the bailiff of Goiland and Eemland, Pieter Corneliszoon Hooft, refined esthete and humanist, whose sonnets and other poems of pure rhythm, flowing melody, and powerful imagery have set a standard for the lyrics of which Netherlands literature to this very day has a larger store than of any other kind of poetry. His historical tragedies lack the dramatic force in which his realistic comedy the *Warenar* excels. Through his vigorous and finely styled description of the war of independence (*Nederlandse Historiën*), Hooft became the founder of literary prose, which has felt his influence until now.

The genius of Joost van den Vondel rose from a wider base to a greater height. His Christian conception of life and perfect mastery of the classical forms enabled him to create a series of potent Biblical tragedies, encouraged by the admiration of Hugo Grotius. With *Joseph in Dothan*, *Lucifer* (influence on Milton's *Paradise Lost*) and *Adam in Ballingschap*, he continued the line of the mediaeval mystery-play in the luxurious form of the baroque. Among his great and varied works, the passionate political satires and sensitive reactions to everyday life do excel. Bredero, who died young, gave in his comedies (among them *De Spaansche Brabander*) a reflection of Jan Steen. In his religious and amorous lyrics he is simpler and more direct than most of his contemporaries.

It was only on the lesser poets that Spinoza exercised any influence; but his philosophy has so strongly impressed the thinking of his compatriots as to make it possible for the conception of Reason to dominate the Netherlands literature of the 18th century.

The essay and the classical tragedy were practiced by many, but an inclination to imitate France, promoted by politics, smothered domestic talent. This could again breathe freely, under the Napoleonic oppression, with the ingenious but unrestrained Bilderdijk, admirer of the Greeks, although his aptitude was thoroughly romantic. Romanticism following him has caused no revolutions in the Netherlands. Even in its later period, under the leadership of the poet, essayist and critic Pot-

gieter (the monthly *De Gids*), it remained shackled to classicism, although together with the critic Busken Huet he steadily aspired to an idealistic realism. Alone stood the ingenious but undisciplined Multatuli (pen-name of Douwes Dekker), whose novel *Max Havelaar* has exercised great influence on the colonial problem, and whose *Ideeen* inspired the younger generation.

The long servility (since the 18th century) of the literary arts to ethics and reasonableness was finally terminated by the group of the "Men of Eighty," who founded a monthly in 1885 called *De Nieuwe Gids*. They did not create a school: "poésie pur," naturalism, realism and symbolism were represented on equal terms in their circle. After their victory over the older generation they fell apart. Of all these artists, Albert Verwey, who insisted that the poet should be a leader in life, founded a school in the larger sense; in essence he continued in his monthly *De Beveiging* the line of Potgieter. From socialist ranks came the dramatic Heijermans, the lyric poet Herman Gorter, and the mighty poetess Henriëtte Roland Holst. She returned with the generation of 1910 to the transcendental philosophy of life, for which P. C. Boutens in the meantime had created a new classic style of beauty. His magistral poetry is in many respects a contrast to the deeply heartfelt, earthly mysticism of the poet Leopold. The influence on the younger poets has been very profound. While a rich romantic art was developed at this time, first by the plastic phantasy of Louis Couperus, and later by the melancholic realism of Arthur van Schendel, the leadership in poetic art was transferred to A. Roland Holst (germane to Yeats) and M. Nijhoff. The conflict between the glorification of life and the surrender to God, which characterizes the work of the latter, is repeated in the younger poets, most pronounced by the poet and essayist H. Marsman, who died in 1940. It debouched finally in a paganistic faith in culture and this closed in essence the curve toward Bouten's Platonic idealism.

The generation of poets between 1925 and 1940 has not retreated into ivory towers, but has stood militant against the threatening powers of the new "underworld" exhorted in a lashing and severe fashion by the keenly intellectual prosaist Menno ten Braak, who also died in 1940. The war has broken off the evolutionary curve of this literary period. During the Nazi occupation resistance poetry, anonymous because of the circumstances, flourished. In the chaotic world after the liberation, literary life could not resume a steady course. There is a growing vigor in abundance: the year 1948 has yielded a very rich harvest.

Poetry. The experiences of the war produced, of course, aftereffects, directly in *Verzen uit kamp St. Michelsgestel* by Anton van Duinkerken, indirectly in Antonie Donker's *Tondalus' Visioen*. Van Duinkerken's apologetic urge revealed itself in his collection *Tobias met den Engel*, much less significant as religious expression than *En Jezus schreef in 't Zand* by Gerrit Achterberg, who is developing into a leading poet, notwithstanding his amorphous and obscure expression. The deeply penetrating poetry of *De Toovertuin* by Hendrik de Vries excels through severe control over form and rhythm. This volume received an award from the Netherlands Society of Literature, while the award of the municipality of Amsterdam was given to Gerard den Brabander for *De Steenen Minnaar*. The poetess Vasalis again fascinated with *De Vogel Phoenix* by her extraordinarily penetrating use of imagery. The troubadour Bertus Aafjes manipu-

lated enthrallingly and playfully the warp and woof of the sonnet series in *Het Koningsgraf*.

The Essay. In brevity and effective sharpness, D. A. M. Binnendijk undoubtedly leads in this genre, as his third volume, *Tekst en Uitleg*, proves. The poet-critic Victor van Vriesland revealed a mature, philosophical insight in *De grondslag van Verstandhouding*, while Simon Vestdijk delivered a keen analysis of faith with his *Toekomst der Religie*. He limited himself in the volume *De Poolse Ruiters* to esthetic contemplation. A fundamental problem was postulated by Fokke Sierksma in *Poëzie als Ernst*.

The Novel. At present the short story occupies first place. From an abundant production may be selected Rein Blijstra's *Mislukte Isolatie*, *Sophie in de Koestraat* by Amoene van Haerslote, *Bij gaslicht* by F. Bordewijk, and *De wilde groene geur* by Bep Vuyk. Next to these volumes must be mentioned the excellent etching of the environment in the novel *Spel zonder inzet* of A. van Grevelingen, who died young. More concentrated in sphere and psychology, is *Vrouw en Wind* by Anna Blaman. This realism is in sharp contrast to the grubbing sensation-jottings of Simon van het Reve in *De Avonden*.

A remarkable combination of baroque abundance of imagination with almost dogmatic objectivity is revealed in the historical novel by Simon Vestdijk, *De Vuuraanbidders* (religious wars of the 17th century). On the borderline between history and the novel stands the biography of Hugo Grotius, *Vaderland in de verte* by Annie Romein-Verschoor. Concerning the reclamation of the island of Walcheren, A. den Doelard wrote *Het Verjaagde Water* (published in the United States as *Roll Back the Sea*). It was greeted with little appreciation by the literary critics. The prize of Amsterdam was given for the novel *En de akker is de wereld* to Dola de Jong, who lives in New York, as does A. Merlijn, who made a notable debut with his Indonesian novel *Bontorio*.

Drama. Five coordinated theatrical companies, subsidized by the State and the five largest municipalities, have produced but few new homemade plays. Jan de Hartog's *Skipper Next to God* (already produced in New York) was received with considerable reservation. A. Defresne wrote an original pageant for the expression of homage to Queen Wilhelmina, called 1948 *Anno Christi*. It was little appreciated by the critics. The dramas *Djadjadewa* by B. Faddegon and *Het Portret* by Jeanne Van Schaik-Willing appeared exclusively in printed form. Of the foreign repertoire produced by the theatrical companies, *Glass Menagerie*, *Home of the Brave* and *Christopher Blake* were very successful. —BENJAMIN HUNNINGHER

NETHERLANDS WEST INDIES. The overseas possessions of the Netherlands in the West Indies, comprising: (1) CURAÇAO, and (2) SURINAM. Total area: 54,703 square miles. Total population (1947): 340,313.

NEVADA. A mountain State. Area: 110,690 sq. mi. Population: (July 1, 1948), 142,000, compared with (1940 census) 110,247. Chief cities: Carson City (capital), 2,478 inhabitants in 1940; Reno, 21,317. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$14,578,000; total expenditure, \$15,249,000.

Elections. Truman received 30,658 votes to 29,102

for Dewey and 1,464 for Wallace, thus obtaining the 3 electoral votes. There were no races for the Senate, for Governor, or for other Statewide office. In the Congressional contest, Nevada's lone House seat changed from Republican to Democratic.

Officers, 1948. Governor, Vail Pittman; Lieut. Governor, Cliff Jones; Secretary of State, John Koontz; Attorney General, Alan H. Bible; State Treasurer, Dan W. Franks; State Auditor, G. L. Robinson; State Controller, Jerry Donovan. Chief Justice of Nevada Supreme Court: Edgar Eather.

NEW BRUNSWICK. A maritime province of eastern Canada. Area: 27,985 square miles, of which 27,473 square miles are land area. Population (1941 census): 457,401 (est. pop. 1948: 503,000). Leading religious denominations (1941) were: Roman Catholic, 220,454; Baptist, 88,766; United Church, 63,268; Anglican, 55,155; Presbyterian, 15,382. In 1946 there were 16,274 live births; 4,866 deaths; 5,866 marriages. Education (1945-46): 106,052 students enrolled in schools and colleges. Chief cities: Fredericton (capital) 10,062 inhabitants in 1941; Saint John 51,741; Moncton 22,763; Edmundston 7,096; Campbellton 6,748.

Production. The gross value of agricultural production for 1947 was \$50,848,000. Total area of field crops (1947) was 948,000 acres, valued at \$41,426,000. Chief field crops (1947): oats 6,106,000 bu. (\$5,373,000); potatoes 9,457,000 cwt. (\$19,198,000); field roots 1,927,000 cwt. (\$1,638,000). Livestock (June 1, 1947): 208,600 cattle (\$15,486,000); 43,100 horses (\$5,530,000); 92,500 swine (\$2,505,000); 95,100 sheep (\$897,000); 1,879,400 poultry (\$2,370,000). Fur farms in 1946 totaled 383 with value of fur animals estimated at \$467,125. Value of fur pelt production in 1946-47 was \$834,641. Production of fisheries (1946) amounted to \$16,419,983; the three principal kinds of fish being lobster, sardines, and herring. Dairy production included 6,908,000 lb. of creamery butter (1947) with an estimated value of \$3,636,000; factory cheese, 737,000 lb; while total farm value of poultry meat and eggs was estimated at \$5,065,000.

Manufacturing establishments in 1946 numbered 993. They furnished employment to 22,732 persons who received \$33,151,919 in salaries and wages. The gross value of products manufactured was \$170,753,741 from materials costing \$96,389,299. The forests of New Brunswick give a leading place to its pulp, paper, and sawmill industries, although the fish-curing and packing products add to the varied output. There were 411 sawmills in operation in 1946 with gross value of products amounting to \$17,230,075.

Government. Finance (year ended Oct. 31, 1948): net combined revenue was estimated at \$23,774,174 (1947: \$25,574,374); net combined expenditure \$23,543,766 (1947: \$19,226,554). Total direct and indirect liabilities (less sinking funds) \$100,994,000 on Oct. 31, 1945. The executive authority is vested in a lieutenant governor who is advised by a ministry of the Legislative Assembly, the latter consisting of 52 members elected for a five-year term by the voters.

Ten members (all appointed for life) in the Senate and 10 members in the House of Commons represent New Brunswick in the Dominion Parliament at Ottawa. Forty-seven Liberals and five Progressive Conservatives were elected at the last provincial general election. Lieutenant Governor, D. L. MacLaren (appointed Nov. 1, 1945); Premier, J. B. McNair (Liberal; appointed Mar. 13, 1940; re-elected June 28, 1948). See CANADA.

NEW CALEDONIA. A French overseas territory in the southwest Pacific, 850 miles east of Australia. Total area (including dependent islands): 8,548 square miles. Population (1947 est.): 61,250, including 18,510 Europeans, 30,034 native Melanesians and 12,706 Tonkinese and Javanese. Capital: Nouméa (10,466 inhabitants). The dependencies of New Caledonia are: Isle of Pines, Wallis Archipelago, Fortuna and Alofi, Loyalty Islands, Huon Islands, Bélep Archipelago, Chesterfield Islands, and Walpoole.

Production and Trade. Chief agricultural products: coffee, copra, cotton, manioc, maize, tobacco, bananas, and pineapples. Mineral products include nickel (107,944 tons in 1946), chromite (24,946 tons in 1946), cobalt, iron, and manganese. Foreign trade (1946): imports 461,400,000 francs; exports 233,700,000 francs.

Government. Budget (1946): revenue and expenditure balanced at 237,650,000 francs. The territory is administered by a governor, aided by a privy council, and an elected general council. New Caledonia is represented by one delegate in each of the following: French National Assembly, the Council of the Republic, and the Assembly of the French Union. Governor: G. Parisot.

NEWFOUNDLAND. An island lying between the Gulf of St. Lawrence and the Atlantic Ocean. Its dependency, Labrador, lies north of the Gulf of St. Lawrence. Newfoundland, with Labrador, forms a part of the British Commonwealth. Capital, St. John's.

Area and Population. The area, exclusive of Labrador, is 42,734 square miles. Population was estimated at about 320,000 in 1948. Chief cities: St. John's (est. pop., 1948), 45,000; Corner Brook, 18,000. The dependency of Labrador has an area estimated at 110,000 square miles and a population estimated at 5,000.

Education and Religion. The schools are aided by the religious sects and are denominational in character, but are for the most part supported by the state as public schools. Enrollment in 1945-46 was 70,460. Memorial University College enrollment in 1946-47 was 401.

The Roman Catholic Church and the Church of England each included just above 100,000 persons in 1945. The United Church was third and the Salvation Army fourth.

Production. The greater part of the population of the island lives on the returns from fish products, newsprint, and mineral ores. All of these are produced almost entirely for export. Minerals are dominated by the iron ore from Bell Island, output about 1.5 million tons in 1947. The total estimated value of agricultural crops (incl. livestock) was \$15 million in 1946.

Foreign Trade. Exports are of supreme importance to Newfoundland. Total foreign trade in 1947-48 was \$185,519,855, more than \$38,000,000 above the previous year, 1946-47. The United States took \$27 million of exports, Britain \$13 million, and Canada \$11,660,000. The United States took more newsprint than all other countries combined. Canada was the largest supplier of goods (\$55 million) and the United States second (\$35 million). Chief imports in 1946-47 were clothing, coal, and food.

Transportation. In 1947 there were 705 miles of government railroads and 56 miles privately owned. Gander Airport is used by 10 world airlines.

Finance. Budget estimates for 1947-1948 placed revenue at \$35,702,500; expenditure at \$37,574,000. Public debt in 1948, \$72 million. Revenue comes almost entirely from customs.

Government. In December, 1933, as a result of financial difficulties caused by depression in the export industries, Newfoundland's status as a self-governing dominion of the British Commonwealth was temporarily altered. Effective Feb. 16, 1934, executive authority was vested in the Governor and a Commission of six—three Newfoundlanders and three British. The British Government assumed responsibility for Newfoundland's financial obligations and provided a grant-in-aid pending the restoration of the island's financial solvency. In 1946 a National Convention was elected to ascertain whether Newfoundland's finances were restored and to discover the form of government desired by the people. For subsequent developments see *YEAR BOOK* for 1947, pp. 357-8, and *Events*, 1948, below.

Events, 1948. The National Convention on Newfoundland's form of government, after sitting for 15 months, ended on Jan. 31, 1948. The National Convention voted 29-16 to exclude confederation with Canada from the forthcoming referendum, but a decision by the British Government, announced simultaneously in London and St. John's on March 11, provided that the ballot should allow three choices: retention of the existing form of Government by Commission, return of responsible self-government, and confederation with Canada.

In the referendum held on June 3 a small majority (about 6,000 in a poll of some 154,000) voted for responsible government, about 63,000 for confederation with Canada, and 21,900 for the existing commission form of government. Almost immediately thereafter the holding of a second referendum was called for July 22, with only two choices offered: responsible self-government and confederation with Canada.

In the July 22 referendum the vote was 77,814 for confederation and 71,258 for responsible government. The smallness of the majority created delicate problems for the future, but Prime Minister King of Canada, in a formal statement on July 30, said that the Canadian Government welcomed the plebiscite and was consulting with the governments of the United Kingdom and Newfoundland in working out the constitutional procedure. He added that the Canadian Government would be glad to receive authorized representatives of Newfoundland to negotiate the terms of union on the basis of the proposals submitted in 1947.

Terms of Union. Negotiations opened in Ottawa on October 4, with a strong Canadian delegation selected to meet the Newfoundland group headed by Albert Walsh. The negotiations were prolonged, and it was repeatedly rumored that Newfoundland was insisting on improved financial terms. On December 11, however, the terms of union were signed under which Newfoundland was to become the tenth Canadian province and the details were released. One Newfoundland member, Chesley Crosbie, did not sign.

In general Newfoundland's standing as a province will be like that of the other 9 provinces, in that it will have its own legislature and responsibilities for the major services. Its provincial government will be asked to grant to the Federal Government the use of the income, corporation, and succession taxes, in return for which Canada will pay an annual subsidy of \$180,000, plus 80 cents per head of the population, an annual subsidy of \$1.1 million for special problems arising out of Newfoundland's situation, and transitional grants for 12 years. The cost to Canada is approximately \$20 million more than the amount tentatively agreed upon in 1947.

Dissatisfied Newfoundlanders took steps to protest the agreement. While the terms were still pending, Peter Cashin, former Finance Minister, and two others flew to London to protest confederation at the bar of the House of Commons.

—ALZADA COMSTOCK

NEW GUINEA. A large island, north of Australia. It comprises Netherlands New Guinea (151,000 sq. mi.), North East New Guinea (69,700 sq. mi.)—the mainland part of the Australian mandated Territory of New Guinea, and Papua (87,786 sq. mi. excluding islands)—a Territory of Australia (formerly called British New Guinea). Total area: 308,486 square miles. Population: about one million. See **NEW GUINEA, TERRITORY OF; PAPUA.**

NEW GUINEA, Trust Territory of. A territory in the southwest Pacific, formerly a League of Nations mandate (1920-46). On Dec. 13, 1946, it was placed under the jurisdiction of the United Nations Trusteeship Committee. It continued to be administered by Australia. The territory includes: North East New Guinea (also called the Mainland), 69,700 square miles; Bismarck Archipelago (consisting of New Britain 14,600 sq. mi., New Ireland 3,340 sq. mi., Lavongai 460 sq. mi., and Admiralty Islands 800 sq. mi.), 19,200 square miles; and part of the Solomon Islands (Bougainville 3,880 sq. mi., Buka and adjacent small islands 220 sq. mi.), 4,100 square miles. Total area, 93,000 square miles. Total enumerated natives in patrolled areas (June 30, 1941), 684,284, including 34,087 indentured laborers; in addition, there were 4,101 Europeans and 2,228 Asiatics. Rabaul (on New Britain), had 10,174 inhabitants in 1939. Chief towns of North East New Guinea: Aitape, Lae, Madang, Monumbo, Morobe, Salamaua, Vanimo, and Wewak.

Production and Trade. The chief agricultural products are cacao, rubber, coffee, and coconuts. Gold is the most important mineral produced. Other minerals include platinum, osmiridium, copper, iron, sulfur, and brown coal. Timber and fish are important products. Foodstuffs, machinery, tobacco, and chemicals comprise the territory's main imports.

Government. An administrator controls the Territory and advises the Governor General of Australia on legislative matters. Administrator: Col. J. K. Murray (Sept. 13, 1945).

NEW HAMPSHIRE. A New England State. Area: 9,210 sq. mi. Population: (July 1, 1948) 548,000, compared with (1940 census) 491,524. Chief cities: Concord (capital), 27,171 inhabitants in 1940; Manchester, 77,685. See **AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.**

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$31,963,000; total expenditure, \$32,277,000.

Elections. Dewey's 120,000 popular votes gave him a majority of about 12,000 over Truman and Wallace and earned him the State's 4 electoral votes which were Roosevelt's in 1944. Incumbent Senator Styles Bridges, Republican, was reelected. Republican nominee Sherman Adams was elected Governor. The 2 House seats remained Republican. Ernest R. D'Amours was reelected Attorney General and Arthur E. Bean was elected Comptroller.

Officers, 1948. Governor, Charles M. Dale; Lieut. Governor, None; Secretary of State, Enoch D. Fuller; Attorney General, Ernest R. D'Amours; State Treasurer, F. Gordon Kimball; State Comptroller, Stephen B. Story.

NEW HEBRIDES. A group of some 80 islands in the south Pacific, under joint administration of British and French officials. The chief islands of the group are Espiritu Santo, Malekula, Epi, Ambrym, Efate, Erromanga, and Tanna. Total area (est.) 5,700 square miles. Population (1946): 45,000, including 920 Europeans. Capital: Vila. Sugar cane, oranges, bananas, coconuts, coffee, and cacao are the main products. Foreign trade (1946): imports £335,681; exports £235,486. Finance (condominium), 1946: revenue £60,983; expenditure £48,179 (the foregoing figures on finance exclude expenditure on the revenue from the British and French National Services). The British High Commissioner and the French High Commissioner for the region delegate the powers of government for the New Hebrides to Resident Commissioners of the respective nationalities stationed on the islands.

NEW JERSEY. A middle Atlantic State. Area: 8,204 sq. mi. Population: (July 1, 1948) 4,729,000, compared with (1940 census) 4,160,165. Chief cities: Trenton (capital), 124,697 inhabitants in 1940; Newark, 429,760. See **AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.**

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$264,518,000; total expenditure, \$265,236,000.

Legislation. The regular annual and special New Jersey legislative sessions in 1948 implemented the new constitution adopted in 1947. Consolidation of State agencies into 14 departments was about completed at the close of 1948. The judicial system also had been reorganized.

Other enactments included an important, new cash sickness benefits program for workers; new taxes on cigarettes and pari-mutuel betting; repeal of the ban on colored margarine; bond issues for high-speed highways and institutional facilities; a turnpike authority to construct toll highways; and substantial salary increases for State employees and legislators. The legislature upped minimum teachers' salaries to \$2,000; granted \$10 million for local school construction; doubled highway aid to municipalities; and increased municipal powers over building codes, recreational and parking facilities; and authorized a study of municipal governments.

Elections. Dewey won the 16 electoral votes by receiving 973,629 votes to Truman's 894,791 and Wallace's 39,077. Roosevelt's 1944 plurality over Dewey exceeded 26,000. Robert C. Hendrickson, Republican, won the Senate race. The Democrats won 5 of the 14 House seats for a gain of 3. There were no Statewide contests for State office.

Officers, 1948. Governor, Alfred E. Driscoll; Lieut. Governor, None; Secretary of State, Lloyd B. Marsh; Attorney General, Walter D. Van Riper; State Treasurer, Robert C. Hendrickson; State Auditor, Frank Durand; State Comptroller, Homer C. Zink.

NEW MEXICO. A mountain State. Area: 122,634 sq. mi. Population: (July 1, 1948) 571,000, compared with (1940 census) 531,818. Chief cities: Santa Fe (capital), 20,325 inhabitants in 1940; Albuquerque, 35,449. See **AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.**

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$47,257,000; total expenditure, \$51,977,000.

Elections. Truman won the 4 electoral votes by a majority over Dewey and Wallace twice as large

as Roosevelt's in 1944. Democrats won all other Statewide races. Clinton P. Anderson, formerly Truman's Secretary of Agriculture, beat Republican nominee Patrick J. Hurley for the Senate. Democratic Governor Thomas J. Mabry was re-elected. The 2 House seats remained Democratic. Also elected were: Lieutenant Governor—Joe M. Montoya; Secretary of State—Mrs. M. A. Romero; Attorney General—Joe L. Martinez; Auditor—E. D. Trujillo; Treasurer—H. R. Rodgers; Superintendent of Public Instruction—Charles L. Rose; Commissioner of Public Lands—Guy Shepard. Proposals popularly approved provide for the succession when the governor-elect dies, and empower the legislature to call special sessions.

Officers, 1948. Governor, Thomas J. Mabry; Lieut. Governor, Joseph M. Montoya; Secretary of State, Mrs. Alicia Romero; Attorney General, C. C. McCulloh; State Treasurer, Ray Rodgers; State Auditor, J. D. Trujillo; State Comptroller, C. R. Sebastian.

NEWS AGENCIES. A partial list of some of the important news-gathering agencies is presented in the following lines:

Agence France Presse (AFP), founded in September, 1944, for the collection and dissemination of world news. General Manager: Paul-Louis Bret, 13 Place de la Bourse, Paris, France. North American Manager: André Rabache, 11 West 42nd St., New York 18, N.Y.

Associated Press (AP), The, founded in 1848; present corporation formed 1900. Collects and distributes news and newsphotos for newspapers and radio stations. Membership: 1,750 newspapers, 950 radio stations (approx.); also serves 1,300 (approx.) non-member newspapers and radio stations, largely outside the United States. President, Robert McLean; Executive Director, Kent Cooper; General Manager, F. J. Starzel; Secretary, Lloyd Stratton. Headquarters: 50 Rockefeller Plaza, New York 20, N.Y.

Canadian Press (CP), The, founded in 1917 to gather and distribute news for Canadian daily newspapers. Membership: 93. President, Victor Sifton; General Manager and Secretary, Gillis Purcell; Treasurer, C. A. Day. Headquarters: 55 University Ave., Toronto 1, Ont., Canada. Subsidiary: Press News Limited, formed in 1941 to serve radio stations with news. Clients: 82.

International News Service (INS), a world-wide news-gathering agency; founded in 1909. News is distributed over more than 170,000 miles of leased wires in the United States, and through powerful short-wave radio transmitters to foreign clients. INS serves newspapers, radio stations, and television stations. General Manager, Seymour Berkson; Editor-in-Chief, Barry Faris; Managing Editor, Philip G. Reed. Headquarters: 235 East 45th St., New York 17, N.Y.

North American Newspaper Alliance, Inc., an organization that furnishes authoritative stories and articles to newspapers throughout the world. Membership: 90. President, John N. Wheeler; Vice President, Henry M. Snevily; Treasurer, Joseph B. Agnelli; Secretary, Andre F. L'Eveque. Headquarters: 229 West 43rd St., New York 18, N.Y.

Press Wireless, Inc., an organization that furnishes radio facilities for the press of the world and acts as a special press carrier. Founded in 1928. Its main transmitting and receiving stations are located within 25 miles of New York and San Francisco. It is owned by a number of the important newspapers in the United States and operates to all the important countries of the world. It handles

the majority of the country's international press traffic. Wm. J. McCambridge, President and Treasurer; T. J. Reilly, Assistant Treasurer; Alfred G. Greany, Secretary; R. A. Hilferty, Chief Engineer. Headquarters: Times Tower, 1475 Broadway, New York 18, N.Y.

Reuters News Service, an organization for the world-wide collection and distribution of news and news pictures; founded in 1849. Membership: Over 2,000. General Manager: C. J. Chancellor. Directors: H. G. Bartholomew; Lord Layton; R. A. G. Henderson; Malcolm Graham; Viscount Rothermere; J. R. Scott; W. A. Hawkins. Headquarters: 85 Fleet Street, London E.C.4, England. New York Bureau: New York Times Building, 229 West 43rd St., New York 18, N.Y.

United Press Associations (UP), an organization for the collection and distribution of world news for newspapers, and for radio and television broadcasting stations; founded June 21, 1907. President and General Manager: Hugh Baillie. Vice President and General News Manager: Earl J. Johnson. Vice President and General Business Manager: Jack Bisco. Vice President and General Foreign Manager: Joseph L. Jones. Headquarters: 220 East 42nd St., New York 17, N.Y.

NEWSPAPERS. Newspapers shared with other industries in 1948 inflationary pressures on both income and expense. The press enjoyed increasing circulations, at higher rates, and a good volume of advertising as national manufacturers and local merchants sought to obtain the volume of business necessary to maintain profitable operation; but newspaper managements were apprehensive over pay-scale increases greater than those in other businesses. Because the daily press must maintain uninterrupted production, and because savings in operations in publication are difficult to achieve, publishers viewed the coming year with mixed hopes and misgivings. The bright spot was the fact that advertisers would be required to strive for customers in a buyers' market; the darker side was the inescapable high cost of operation.

In news-gathering activities the press admittedly did well in covering the chaotic conditions of a world not at war but certainly not at peace. The newspapers in the United States lost some prestige for failing to forecast the election trends, and some objective observers thought that the editors were more preoccupied with the scare headlines of the communist spy hunt than with the daily reporting of the progress of democracy. But on the whole the critics of the press were less vocal than in recent years; and it would be fair to say that the newspapers attained a better record of recording impartially the events of the year.

An increasing supply of newsprint enabled newspapers to have a good volume of business. Canada, chief source of supply, produced 4,600,000 tons of paper. Imports from other countries seeking American dollars (250,000 tons from abroad, 375,000 from Newfoundland) and manufacture of 825,000 tons in the United States combined to give a total supply of 6 million tons. The price rose to \$100 a ton in New York (and correspondingly higher figures in the other zones of the United States) but the year saw lower and lower prices in the spot market where as much as \$240 a ton had been paid for newsprint. Publishers were concerned whether the ruling of the Federal Trade Commission barring basing point prices might upset the entire newsprint, pricing, and distribution system.

Advertising volume gained some 10 percent to 15 percent over 1947, and generally higher rates

brought the dollar volume up by 20 percent to 25 percent. With manufacturers and local retail stores actively seeking the vast purchasing power of the consumer, the newspaper fared somewhat better in the competition for the advertiser's dollar than in recent years. Radio seemed to face some uncertainty with television an unknown factor in the near future, but the daily press had no such uncertainty in its function as a sales producer.

Circulation rates were advanced in every section of the United States. This continued the trend toward obtaining a greater proportion of revenues from the reader. In New York the tabloid newspapers went from 2 cents to 3 cents a copy on week-day issues, and increases to 5 cents a copy were made in scores and even hundreds of cities and towns. Some 80 percent of daily newspapers, it was estimated, are now 5 cents a copy for the week-day issues. In Los Angeles and San Francisco the price was raised to 7 cents. Such higher prices had a tendency to check circulations in some cities because readers were feeling the pressure of the rising cost of living. But the final figures showed week-day daily newspapers in the United States reaching a total of 52,285,297 copies a day and 46,308,081 on Sundays, according to *Editor and Publisher*.

Most publishers agreed that the rates charged both readers and advertisers were approaching a peak as the year ended. They saw in a period at the year end, with many prices declining, a challenge to render a greater service to both subscriber and advertiser as the best means of maintaining that great volume of business and revenue made necessary by the sobering rise in operation costs.

Small change occurred in the number of daily newspapers in the United States in the year. A few suspensions were noted, none of them of outstanding publications. Several news journals were begun, in areas to which there had been marked population shifts, as at Oak Ridge, Tenn. A move toward joint publication operation in one plant, by competing and independent newspapers in the same cities, gained momentum as a means of reducing expenses. The keynote speech at the Newspaper Controllers' Association convention forecast this trend as the major one in publishing in the years ahead. Newspapers in Madison, Wis., and Augusta, Ga., adopted this plan in the year. In Chicago, the *Sun* and *Times* consolidated, and in Indianapolis the *Star* and *News* came under one ownership.

A notable change in ownership was that of *PM*, in New York, formerly the property of Marshall Field, and an experiment in publication without advertising. Harold Barnes and Bartley Crum acquired *PM*, renamed it the *Star*, and changed it from an evening to a morning paper.

One factor pressing for joint use of buildings and machinery was the vastly increased cost of new plants and of typesetting and printing equipment. Many newspapers had worn out their machinery during the war when replacements were unobtainable. Now the cost of replacements was staggering except for those publishers who had been able to set up large reserves. Many new buildings were pushed to completion in 1948 (the New York *Times* addition, the Louisville *Courier-Journal*, the Dallas *News*, the Portland, Ore., *Journal* among them) but other dailies delayed, because of the price of new construction, the plants urgently needed to take care of growing advertising and circulation. As manufacturers of typesetting and printing machinery caught up with their backlog of orders of long standing, deliveries were being speeded up at the year end.

Labor relations in the newspaper world were not happy. The struggle between the International Typographical Union and the publishers was intensified. The union officers maintained that the purpose of the publisher was to destroy the union, and that enforcement of the Taft-Hartley law would mean the financial ruin of their organization. The typographers insisted on having no written contracts, and the great strike against the Chicago newspapers reached a duration of 13 months as 1948 ended. In New York a strike was threatened, and the newspapers prepared at great expense to use the same methods of typed and engraved copy which Chicago had employed. But a formula, not wholly satisfactory to either side, was achieved.

In a Federal Court decision Judge Swygert held that the Typographical Union and its officers had been guilty of civil contempt of court. The union, Judge Swygert declared, had violated the injunction in offering "form contracts" which in substance required newspapers to discriminate against non-union employees. The proposed contract would have compelled non-union applicants for jobs to prove that they were competent and qualified, and would not have enforced such tests on union applicants. In November the Typographical Union notified the court that it had purged itself of contempt and had ceased all efforts to maintain a closed shop.

What the future of the dispute would be in the event of a repeal of the Taft-Hartley Act was uncertain. Many newspapers continued operations without written contracts, but with the negotiated new and higher scales and had a tacit understanding that all the old conditions of work would continue in effect insofar as they did not conflict with the law. Other unions, pressmen, stereotypers, mailers, and engravers signed contracts. Scales were increased from \$6 to \$14 weekly in cities throughout the country. A general shortage of journeymen was experienced and this condition showed no signs of improving.

After the national elections in November, in which the newspapers had failed so signally to give their readers indication of the popular political thought, there was considerable soul-searching. The public-opinion polls to which the newspapers had given much space, and their own election correspondents had obviously misread the temper of the voters. President Truman's victory was a complete surprise and no explanations would avail. As in most of the elections since 1936 the majority of the newspapers editorially had been opposed to the Democratic Party. But whereas President Roosevelt had enjoyed on the whole a good advantage in the news columns, President Truman had not.

James Reston, of the New York *Times*, summed up the mistakes of the press by saying that they were primarily a failure of reporting; that the correspondents had not left the campaign trains and gone out to learn what the people were thinking. They had not discovered the truth that the Roosevelt influence was still alive, and "were wrong, not only on the election, but what's worse, on the whole political direction of our time." Undeniably the press suffered in public esteem, but the newspapers acknowledged their failure and the experience may have been wholesome in restoring some lost value to the reporter and taking away from the fancied omniscience of the experts and "columnists" of the ivory towers.

In the United States a few minor efforts were made to limit freedom of the press—the Maryland "gag" law restricting publication of certain crime

news was a notable exception—but abroad the cause of a free press suffered. It seemed obvious that in a world in which most governments increased their control over economics, business, and production (this including allocation of newsprint) the drift would be toward greater control of the contents of the press.

In Great Britain newspapers increased in size to six pages daily, thanks to a greater supply of paper, and essential freedom was not hampered. The Royal Commission pursued its inquiry, begun by the Labor government, into charges that newspapers in Britain were being channelled into fewer hands by the owners of great chains. In Argentina the dictator Peron harassed the independent press, and foreign correspondents as well. Russia pushed its curbs on news-gathering into Czechoslovakia, and various restrictions were imposed in Yugoslavia, the Near East, and in China. The licensing of newspapers in Germany was continued and a number of publications were banned. In many countries in which no actual censorship was imposed, difficulties were placed in the way of the correspondents.

The threat of increasing costs of production and of interrupted production by reason of strikes (of which many took place in the year) led to renewed research to find new methods of setting and printing newspapers. The *Yale Daily News* began the use of typed and engraved plates as its regular daily practice. The American Newspaper Publishers Association intensified its research into the fields of printing processes. Little fundamental change in the cumbersome and varied operations of newspaper production has taken place in two generations, except in improving the speed of equipment.

Frank Starzel was made General Manager of the Associated Press in October, 1948, and Kent Cooper, who had held this post for 23 years, assumed the duties of Executive Director of this world-wide cooperative news-gathering organization.

The New York Times announced plans, provided lower air transportation rates could be arranged, to issue a special foreign edition to be distributed by air mail. The New York *Herald Tribune* entered into a contract with the Economic Cooperation Administration to promote the sale of its European edition in bizonal Germany. It was the first such "information media" contract with a newspaper.

Little tangible results were observed from the reports made in recent years by the Commission on the Freedom of the Press of which President Robert Hutchins of the University of Chicago was chairman. It was probable, however, that the long-range results of this critical and scholarly analysis of the newspapers would continue to be felt and that increasing pressure, both from within and without, would tend to make the newspapers more conscious of their social responsibility to democracy in the presentation of the news.

—CHARLES McD. PUCKETTE

NEWSPRINT. The year 1948 saw considerable improvement in the newsprint supply situation in the United States, although a complete balance between demand and supply has not yet been attained. While there were no reports of actual hardship cases among newspaper publishers in 1948—as had been the case in 1946 and to a lesser extent in 1947—many of them reportedly would have used more newsprint had it been available.

Supply. The increase in supply of newsprint available to United States newspaper publishers was due almost entirely to greater imports, since there

was relatively little increase in domestic production. There was further shifting of newsprint capacity in this country to other grades, but this was counterbalanced by installation of new facilities and the more or less temporary conversion to newsprint production of machines formerly manufacturing other kinds of paper. The past year also saw the beginning of building operations on the second mill to produce newsprint from southern pine, which, when completed, will add about 100,000 tons to the annual capacity of the domestic industry.

There was a substantial increase in imports from Canada and Newfoundland which was due in part to inability of overseas consumers—due to dollar shortages—to take all the tonnage previously contracted for. The newsprint thus released found a ready market in this country.

Despite a reportedly pronounced shortage of newsprint in Europe, imports from that source—with the exception of 1937 and 1939—were the greatest on record. Approximately one-half of the imports from Europe originated in Finland, while Sweden, France, and Norway together accounted for practically all of the balance.

The following table gives the sources of newsprint used in the United States in the prewar years 1937–1939 and in the last two years. The figures for 1948 are estimated on the basis of information available at the end of the year.

TABLE 1—SOURCES OF NEWSPRINT USED IN THE UNITED STATES
(Thousands of short tons)

	U.S. output	U.S. exports	Canada	U.S. imports from New- found- land	Europe	Avail- able for use
1937....	946	17	2,895	128	294	4,246
1938....	820	6	1,963	68	243	3,088
1939....	939	13	2,203	99	310	3,538
1947....	826	28	3,631	198	129	4,756
1948....	860(?)	28(?)	3,799(?)	229(?)	256(?)	5,116(?)

Study of the above data indicates the extent to which this country is dependent on Canada and Newfoundland for its supply of newsprint. Nearly

^a Exclusive of the Soviet Zone. ^b Includes Estonia, Latvia and Lithuania. ^c Estimate includes the Soviet Zone of Germany.

80 percent of the tonnage available for consumption in 1948 came from these two countries.

Consumption. A combination of very high newspaper circulations and advertising lineage substantially in excess of all previous records contributed to the all-time high estimated consumption of approximately 5,100,000 tons of newsprint in the United States in 1948. This was equivalent to about 70 pounds per capita and represented an increase of nearly 4 pounds over 1947 and 9 pounds above 1946. Although the 3,780,000 ton consumption of newsprint in 1929 was exceeded in a number of years prior to this country's involvement in World War II, the 62 pounds per capita use reached that year represented a peak which was not topped until 1947, which in turn was surpassed by a substantial margin in 1948.

World Production. The following table is the result of a world newsprint survey undertaken in cooperation with the Office of International Trade, United States Department of Commerce. There was an indicated increase of 8 percent in global output in 1947 compared with 1946, while comparison with the 1937-1939 average shows a decrease of 4 percent.

NEW YORK. A middle Atlantic State. Area: 49,576 sq. mi. Population: (July 1, 1948) 14,386,000, compared with (1940 census) 13,479,142. Chief cities: Albany (capital), 130,577 inhabitants in 1940; New York City, 7,454,995. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended March 31, 1947, total revenue amounted to \$925,200,000; total expenditure, \$907,040,000.

Legislation. The annual session of the legislature convened January 7 and adjourned March 13, having appropriated a record-breaking total in excess of \$800 million. Of this, \$451 million is aid to local governments of which New York City was to receive \$237 million. State school aid was increased by about \$30 million, and temporary aid of \$26 million extended in 1947 was made permanent. Approval was given to establishment of a State university, comprising a series of four-year colleges, two medical centers, and other professional and technical schools.

Few State tax changes were made, except for special personal income and cigarette levies to retire veterans' bonus bonds. New York City received authority to increase the nickel subway fare, double its gross receipts business tax, and impose minor new taxes, while municipalities in the State generally benefit from assumption by the State of maintenance costs of arterial highways.

Other enactments increased unemployment and workmen's compensation benefits; expanded State regulatory control over insurance companies; earmarked \$20 million for pay increases to State employees; doubled salaries of State legislators—to \$5,000 a year; and increased municipalities' powers to provide parking facilities and to stimulate construction of veterans' housing cooperatives.

Elections. Dewey carried his home State's 47 electoral votes—Roosevelt's in 1944—by a narrow margin, receiving 2,837,858 votes to Truman's 2,795,081. Wallace received 508,542 votes, about half of his total in the nation. In races for the State's 45 House seats, Democrats won 24 (a gain of 9), Republicans 20, and American Labor Party 1. One successful Democrat, John J. Delaney—7th District, died before the 81st Congress convened. There were no Statewide contests for Senator or State office.

Officers, 1948. Governor, Thomas E. Dewey; Lieut. Governor, Joe R. Hanley; Secretary of State,

Thomas J. Curran; Attorney General, Nathaniel L. Goldstein; State Comptroller, Frank C. Moore.

NEW ZEALAND. A British self-governing dominion in the South Pacific Ocean, consisting chiefly of two large islands about 1,200 miles east of the southeastern coast of Australia. The dominion has jurisdiction over Western Samoa (a United Nations trusteeship), Tokelau (Union Islands), some islands of Oceania, and the Ross Dependency. Capital, Wellington.

Area and Population. Total area, 103,410 square miles. Population in 1948, 1,804,276, including 108,042 Maoris. The European birth rate in 1947 was 26.4 per 1,000. Chief cities in 1947: Auckland, 281,900; Wellington, 183,100; Christchurch, 159,400; Dunedin, 87,700.

Education and Religion. Primary education in New Zealand is free and compulsory. At the end of 1946 the enrolment in the public primary schools was 218,055. There are a large number of schools of various kinds for secondary education. The University of New Zealand includes 4 colleges and two affiliated agricultural colleges. The latest available figures show religious affiliations as follows: Church of England, 40 percent; Presbyterian, 23 percent; Roman Catholic, 13 percent; and the remainder scattered.

Production. In spite of the rapid expansion of industry, New Zealand's economy still rests upon agriculture as the source of the necessary exports. Wool, dairy products, and meats are the most important agricultural products. In 1947 there were 33,000,000 sheep and 1,700,000 dairy cows. The chief industries are closely connected with agriculture. In 1945-46 meat freezing and preserving was first and butter, cheese and condensed milk manufacture second. Coal production in the first quarter of 1948 was at the annual rate of 2,600,000 tons. Because of the inadequacy of the supply coal is imported from the United States and British Commonwealth countries.

Foreign Trade. For a number of years New Zealand has maintained a surplus of exports over imports, but in 1947 the margin was slight: exports were \$417 million and imports \$415 million. Principal exports are wool, butter, and frozen meat. Exports of wool to all countries, July 1, 1947-Mar. 31, 1948: 925,423 bales; to the United States, 42,026 bales. Principal imports are machine products and textiles.

Transportation. In 1947 there were 3,460 miles of government railway lines open for traffic. The number of overseas vessels entering New Zealand ports in the first 4 months of 1948 was 179, as compared with 158 in the first 4 months of 1947. The New Zealand Airways Corporation operates the nationalized internal air services, with 2,417,679 miles flown in the year ended June, 1947.

Finance. The budget for 1947-48 showed a surplus of £NZ1,786,000. The 1948-49 budget called for revenue of £NZ114,867,000, compared with £NZ117,000 collected in 1947-48. For the revaluation of the New Zealand currency in 1948, see *Events* below.

Government. Executive power is vested in a Governor General, appointed by the Crown for 5 years on recommendation of the Dominion Government. Legislative power rests with a Parliament of two chambers: the Legislative Council with an indeterminate number of members (usually over 30), appointed by the Governor General for 7 years, and the House of Representatives of 80 members, including four Maoris, elected every three years by general male and female suffrage. Labor was

in power in 1948 as a result of the 1946 election. Governor General, Lieut. Gen. Sir Bernard Freyberg. Prime Minister, Peter Fraser (Labor).

Events, 1948. The surface prosperity which continued in New Zealand in 1948 failed to satisfy the Government, to whom the rising spiral of wages and prices was disturbing. The greatest weakness in the economy appeared to be the excess of money in comparison with the goods available.

Revaluation of the Pound. A dramatic step was taken on August 19, when the New Zealand pound, which had been set at 125 to 100 British pounds in 1933, was raised in value to full parity with the pound sterling. The announcement was made suddenly by Finance Minister Walter Nash, as a part of his presentation of the budget to the House of Representatives.

In presenting the case, the Finance Minister said that if the income of the country was to be equitably shared, costs must come down immediately. He discussed the most serious aspect of the change, the effect on the New Zealand farmers whose exports of wool, meat, and dairy produce are vital to the maintenance of the country's international position, and promised guaranteed farm prices if necessary.

Nash reminded the House that when the pound was depreciated to 125 in 1933, the purpose was to obtain foreign sales for these producers by offering the foreign purchasers a cheaper pound. The reverse of that advantage for New Zealand farmers was the higher cost of imported raw materials and other commodities, which affected the farmers as well as the manufacturers and the consumers. The Cabinet, he said in an interview later, reached its decision to return to parity on the afternoon of budget day, without prior consultation with London.

Reaction to Parity. The people of New Zealand responded to the sudden news according to their economic interests. Farmers were critical, in spite of Finance Minister Nash's promise that farm income from butter, cheese, meat, tallow, wheat and many other products would not be adversely affected and that the Government was prepared to guarantee prices for still other products. Manufacturers recognized their gains from lower costs of imported raw materials, but expressed anxiety about foreign competition with finished products and uncertainty about how much import controls could shelter them.

The sharpest foreign issue involved was the attitude of Australia, whose currency ratios had corresponded with New Zealand's. Australian Prime Minister Chifley promptly asserted that Australia would not adjust the exchange rate at that stage, for as an exporting country over a wider range of commodities than New Zealand's, a return to parity would create greater problems. Moreover Australia, as a member of the International Monetary Fund—which New Zealand had declined to join—could not make more than a 10 percent variation in the rate of exchange without first obtaining the approval of the Fund.

In Canada, which was familiar with the experience of revaluing the currency, comment was largely limited to estimating the effects on Canadian foreign trade. It was estimated in Ottawa that New Zealand merchandise would now cost Canada \$3 million more, with the offsetting consideration that Canadian products might have a better market in New Zealand.

Criticism in London. Although official London maintained a diplomatic silence, criticism was heard elsewhere. Some comments follow.

Observer, August 22: "Here is a move of monetary policy of first-rate importance made by one member of the family without any reference to Britain, or, as far as is known, to any of the other Dominions. . . . New Zealand, by her secretiveness, may have cut herself off from wise advice, and may later regret her action."

The Times, City [financial] Notes, August 20: "Memories of how Canada and Sweden lived to regret considerable less drastic upward revaluation are too fresh to allow New Zealand's action to be viewed without uneasiness."

There was something deeper than pique in the disturbance expressed by unofficial Britain. New Zealand food supplies were a mainstay of the non-dollar food imports; and although bulk contracts had recently been negotiated with New Zealand, pressure for renegotiation of contracts was foreseen on the part of both New Zealand farmers and their Government.

Restriction of Imports. The 1949 import licensing schedule was announced on October 19. Import licenses from dollar currency areas were limited to absolutely essential commodities not available from sterling sources, and purchases from the United States and other dollar areas were put on the basis of individual applications. In this connection Finance Minister Nash expressed New Zealand's intention of living within its income from exports.

In connection with the control of exports and imports, New Zealand concluded agreements with specific countries. As a result of a conference in Canberra in June, New Zealand and Australia agreed to coordinate their economic policies so that they would become less dependent on imports from North America and Europe. New Zealand was one of the five British Commonwealth countries to enter into the trade agreement with Japan announced after the conclusion of the Conference of Commonwealth Prime Ministers in London in October. New Zealand agreed to sell Japan goods to the value of \$2,500,000 until June 30, 1949, and to accept imports to the same amount. Wool was scheduled to have a large place in the sales to Japan.

Parliamentary Session. In opening Parliament on June 22 Governor General Sir Bernard Freyberg expressed the hope that the Prime Ministers of the British Commonwealth would soon meet to discuss Western Union and other urgent matters of common concern. When this meeting took place in London October 11-22 Prime Minister Peter Fraser was present. Fraser took an active part in the conferences with Eire relating to the latter's severance of ties with the Commonwealth.

Early in the session (June 30) Parliament ratified the Geneva Agreement on Tariffs and Trade, thus putting into effect the tariff concessions granted to the United States and others at the Geneva Conference of 1947. Sir Bernard Freyberg and Lady Freyberg began a month's visit to Australia in November. New Zealand expanded its plan of granting assisted passages to single British immigrants early in the year, when there were more than 20,000 British applicants waiting for passage. In the autumn homes were offered for 1,000 refugee widows, orphans and old people.

—ALZADA COMSTOCK

NICARAGUA. A republic of Central America. The western highlands slope gradually toward the west and end in the Caribbean lowlands. There are other lowland regions that cross the country diagonally. The Caribbean littoral is wet and humid. Dry winters prevail in the northwest.

Area and Population. Area, 57,143 square miles. Population, 1,140,000 (1947), of which about 68 percent are mestizos, 17 percent of European descent, 10 percent Negroes, and 5 percent Indians. Principal cities: Managua (capital), León, Matagalpa, and Granada.

Education and Religion. The constitution guarantees freedom of worship. Roman Catholicism is the predominant religion. Spanish is the official language. Of the total population over 7 years of age, 62.96 percent are illiterate. During the school year of 1945-46, there were 1,050 elementary and secondary schools, with an enrollment of 84,651 students. There are three universities in Nicaragua, that in 1946 had a combined enrollment of 665 students.

Production. The country's economy depends on agriculture, stock-raising, and mining of gold and silver. Leading agricultural products in 1946 were corn, 58,352,000 pounds; rice, 25,636,000 pounds; sugar, 25 million pounds; coffee, 225,000 bags; and beans, 118,000 bushels. Other agricultural products included sesame, cotton, tobacco, peanuts, and bananas. The cattle industry produced enough for domestic consumption and a small amount for export, which in 1946 came to 41,000 head of cattle and 159,000 kilos of hides and skins. Gold exports the same year were valued at 7,117,000 gold córdobas (córdoba = U.S.\$0.20; 1939-November, 1948). The vast forests of the eastern regions produce timber for domestic use and some for export.

Foreign Trade. In 1947, total exports were valued at \$13.3 million and imports at \$20.8 million. During the first 8 months of 1948, Nicaragua's exports were valued at \$16.5 million; imports, \$14.4 million.

Chief buyers from Nicaragua are the U.S., Costa Rica, Panama, and Great Britain. Principal sources of imports are the U.S., Mexico, Costa Rica, and the Netherlands West Indies.

Transportation. The country has 381 kilometers of railroad and 3,151 miles of highway of all types. Most recent statistics indicate 1,484 motor vehicles, 6,000 radios, and 1,510 telephones.

Finance. In the budget for the fiscal year 1946-47, revenue was estimated at 83,077,031 córdobas, and expenditure at 82,697,268 córdobas. Currency in circulation in July of 1948 was 49.1 million córdobas. Bank deposits (October, 1948) were 33.2 million córdobas, and gold reserves \$3,520,000.

Government. Under the constitution of 1939, Nicaragua is a centralized republic, divided into fourteen departments and one National District. Executive power is vested in a President, elected for a six-year term. Legislative power is exercised by a bicameral Congress composed of a Chamber of Deputies and a Chamber of Senators. In August, 1947, a Constituent Assembly elected Dr. Victor Manuel Román to the Presidency. He is an uncle of Anastasio Somoza, Nicaragua's "strong man."

Events, 1948. Although no change in the government took place, the year was one of turbulent political activity. On the domestic front, action was centered on opposition to the Román-Somoza administration, and beyond Nicaraguan borders, on efforts by exiles to overthrow the regime by force.

Protests and Confusion. Toward the end of April, the press started a campaign against government censorship. Various journals agreed to suspend publication, and the government, in reprisal, cut off the light and telephone service in the building occupied by newspaper *La Flecha*. In July, the administration made a move toward conciliation, with

a conference in the Argentine Embassy, at which President Román and General Somoza met with leaders of the Liberal Party. The government press said this would pave the way to better political relations for the country, but the Liberal Party denied rumors of an agreement with the government, as the circumstances motivating their opposition had not altered.

Cabinet Re-shuffling and Rebellion. At the end of August, General Somoza, Minister of War and Head of the National Guard, offered his resignation to President Román, and his example was followed by other members of the Cabinet. The purpose was ostensibly to open the door to a Cabinet reorganization that might permit the appointment of members of the Liberal Party. Since the resignation was only a gesture and not meant to be accepted, Somoza continued to be "the power behind the throne." A few days later, the government press reported a rebel movement near the borders of Honduras, led by Gen. Carlos Castro of the Liberal Party. The government sent troops of the National Guard under Maj. Anastasio Somoza, son of the *Caudillo*, and the rebellion was crushed.

Inter-American Problems. During the year, the government was much concerned with the activities of the so-called Caribbean Legion, a military force said to be formed by exiles from Nicaragua, Honduras, and Santo Domingo, which was planning to overthrow the governments of those countries. General Somoza publicly denounced the Legion and the aid given them, especially by Guatemala, Cuba, and Costa Rica. These nations denied the charges.

On December 10, Costa Rica was invaded by a rebel group headed by Rafael Calderón Guardia, one of the candidates in the recent presidential elections of Costa Rica (see COSTA RICA). The government of Costa Rica stated that the invasion was organized in Nicaragua and had received Somoza's support. (It was rumored that the invasion was fostered by Somoza in order to prevent Costa Rica's being used as a base for Legion activities against Nicaragua.) The case was referred to the Organization of American States under the Rio de Janeiro Treaty, and a Commission of Inquiry was appointed to investigate the aggression. At the end of the year, the Commission was functioning in Costa Rica.

The Bogotá Conference. Nicaragua attended the Ninth Inter-American Conference of American States held at Bogotá in April (see PAN AMERICAN ACTIVITIES), and became signatory to the Charter of the Americas. —MIGUEL JORRÍN

NICKEL. Shipments of Canadian nickel reached a peacetime peak in 1948 to meet heavy worldwide demand for alloying in steels, irons and nonferrous metals, and for electroplating. The needs of the rearmament program and U.S. stockpiling made it necessary for Canadian producers to limit sales in many cases. Production was restricted by a power shortage in Ontario, the major world producing area, due to inadequate rainfall. Canadian production in the first 10 months was 105,375 net tons (year 1947: 117,781 tons). Production in New Caledonia is estimated to be below the 1947 rate. Cuban production has been discontinued. In July the International Nickel Company advanced the price by 6¼ cents per lb., making electrolytic nickel to contract customers 40 cents per lb., f.o.b. Port Colborne, Ont. The advance was attributed to higher costs, including recovery from lower grade ores.

Nickel oxide sinter, a new product for alloying

of steels, is now in production for sale at 36¼ cents per lb. of nickel contained, f.o.b. Copper Cliff, Ont. Total consumption of nickel by domestic industry in 1947 was 80,757 tons, of which 41 percent went to the steel industry. Production by the U.S.S.R. at Petsamo is not reported. However Russia's payments to the International Nickel Company for its interest in the former Finnish mine are being made, amounting to more than \$12 million by the end of 1948. —JOHN ANTHONY

NIGERIA. A British colony and protectorate in West Africa, including for administrative purposes the United Nations Trust Territory (since Dec. 13, 1946) of British Cameroons. Total area (including Cameroons): 372,674 square miles. Population (1946): 22,980,000. Chief towns (1945): Ibadan 327,284, Lagos (capital) 174,200, Kano 89,812, Ogbomosho 81,740, Oyo 79,340, Iwo 74,764, Oshogbo 59,352. Primitive areas have in general retained ancestral religions, but Christianity and Islam have many adherents. Education has made slow progress, except in the Christian areas. Only about one-seventh of the children of school age are in primary or secondary schools.

Production and Trade. The products of Nigeria include agricultural and forest products, gold, tin, and a variety of other minerals. Palm kernels, palm oil, cocoa (1946 export, 100,186 tons), groundnuts (1946 export, 285,668 tons), hides and skins are important exports. Cotton piece goods are usually the leading import, but iron and steel manufactures are also required in volume. In 1947 imports were valued at £32,466,000; exports £37,155,000.

Government. Budget (1946-47): revenue £14,955,750; expenditure £14,426,830; public debt £22,064,599. The administration is headed by a governor, aided by an executive council and a legislative council of not more than 30 official members and 21 elected or appointed members to represent business and native interests. The legislative council enacts laws for the whole of Nigeria. There is a House of Assembly for the northern provinces, the western provinces, and the eastern provinces. Governor: Sir John Stewart Macpherson.

NOBEL PRIZES. The will of Alfred B. Nobel provided for five annual prizes to be awarded to persons who, in different fields of activity, had made the greatest contributions toward the progress of the world and the welfare of humanity. Prizes are divided equally among recipients for distinguished work in physics, chemistry, physiology or medicine, literature, and in the promotion of world peace. The awards in physics and chemistry are made by the Royal (Swedish) Academy of Sciences, that in physiology or medicine by the Caroline Institute in Stockholm, that in literature by the Swedish Academy, and that in peace by a committee of five elected by the Norwegian Storting. The distribution of the Nobel Prizes takes place every year on December 10, the anniversary of the death of the founder. Awards of the 1948 prizes (each amounting to 159,773 Swedish crowns; about \$44,381) were as follows:

Medicine and Physiology. The prize was awarded to Professor Paul Herman Mueller (born 1899) of Switzerland, director at the scientific laboratories of the firm of Geigy at Basle, Switzerland; "for his discovery of the strong effect of DDT as a compact poison against a number of arthropodes."

Peace. The prize was allocated with one-third to the main fund of the Foundation and with two-thirds to the special fund for this group of prizes.

Physics. The prize was awarded to Professor Pat-

rick M. S. Blackett (born 1897), professor at the University of Manchester, England; "for his development of the Wilson cloud chamber method and his discoveries in connection therewith in the domain of nuclear physics and cosmic radiation."

Chemistry. The prize for 1948 was awarded to Professor Arne Tiselius (born 1902) of Sweden, professor of biochemistry at the University of Uppsala, Sweden; "for his electrophoretic and adsorption analytical researches, especially for his discoveries concerning the complex nature of the serum proteins."

Literature. The prize for 1948 was awarded to Dr. Thomas Stearns Eliot (born 1888) of London, England; "for his remarkable achievement as a pioneer in modern poetry."

NORFOLK ISLAND. An Australian island territory in the south Pacific, 930 miles northeast of Sydney. Area: 13 square miles. Population (1944): 733. The cultivation of citrus fruits, bananas, and coffee is the chief occupation of the people. In 1945-46 imports were valued at £32,402 and exports at £9,024. An administrator, assisted by an advisory council, governs the territory.

NORTH AMERICA. The continent of North America, excluding Mexico and Central America, but including Greenland, Newfoundland, and smaller adjacent islands, has an area of about 7,591,498 square miles (19,662,000 square kilometers) and a population estimated at 143,178,000 on Jan. 1, 1940. The combined area of Mexico, Central America, and the West Indian islands is about 1,073,080 square miles and the population about 40,870,000.

NORTH CAROLINA. A south Atlantic State. Area: 52,426 sq. mi. Population: (July 1, 1948) 3,715,000, compared with (1940 census) 3,571,623. Chief cities: Raleigh (capital), 46,897 inhabitants in 1940; Charlotte, 100,899. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$230,317,000; total expenditure, \$195,341,000.

Elections. Normally Democratic North Carolina gave its 14 electoral votes to Truman whose popular majority over Dewey, Thurmond, Wallace, and others exceeded 100,000. Democrats won all other races: J. Melville Broughton was elected Senator; W. Kerr Scott was elected Governor; and Democrats retained all 12 House seats. State officers elected included: Lieutenant Governor—H. P. Taylor; Secretary of State—Thad Eure; Attorney General—Harry McMullan; Auditor—Henry L. Bridges; Treasurer—Brandon P. Hodges; Superintendent of Public Instruction—Clyde A. Erwin.

Officers, 1948. Governor, R. Gregg Cherry; Lieut. Governor, L. Y. Ballentine; Secretary of State, Thad Eure; Attorney General, Harry McMullan; State Treasurer, Charles M. Johnson; State Auditor, Henry L. Bridges.

NORTH DAKOTA. A west north central State. Area: 70,837 sq. mi. Population: (July 1, 1948) 560,000 compared with (1940 census) 641,935. Chief cities: Bismarck (capital), 15,496 inhabitants in 1940; Fargo, 32,580. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$37,109,000; total expenditure, \$32,593,000.

Elections. Dewey received a popular majority over

Truman, Wallace, and others—including scattered votes for Thurmond—and won the 4 electoral votes. There was no Senatorial race. Republicans retained the 2 House seats. Incumbent Republican Governor Fred G. Aandahl was reelected. Other State officials elected included: Lieutenant Governor—C. P. Dahl; Secretary of State—Thomas Hall; Attorney General—Wallace E. Warner; Auditor—Berta E. Baker; Treasurer—Albert Jacobson. A popular referendum in June approved a bonus to veterans.

Officers, 1948. Governor, Fred G. Aandahl; Lieut. Governor, C. P. Dahl; Secretary of State, Thomas Hall; Attorney General, Nels G. Johnson; State Treasurer, H. W. Swenson; State Auditor, Berta E. Baker.

NORTHWEST TERRITORIES. The northern areas of Canada, extending north from the provinces and Yukon to the North Pole. Area: 1,304,903 square miles (including 51,465 sq. mi. of fresh water). It is divided, for administrative purposes, into the districts of Franklin (549,253 sq. mi.), Keewatin (228,160 sq. mi.) and Mackenzie (527,490 sq. mi.). Population (1941 census): 12,028 (1948 est., 16,000).

Production, etc. Mining, fur trapping, and reindeer herding are the principal occupations of the inhabitants. The estimated value of mineral production in 1947 was \$2,720,988, the value of gold amounting to \$2,188,095. Petroleum, silver, and natural gas are also produced, as are copper, lead, and tungsten ore. There were 488,039 pelts taken in the season 1946-47, valued at \$1,658,754. Marketed value of fish was \$558,264. In the Mackenzie Valley are some 593 acres of arable land possible of economic exploitation, in spite of high freighting and other costs. Finance (1946-47): revenue, \$976,103; expenditure, \$6,742,362.

Government. A Territorial Council, consisting of a commissioner, deputy commissioner, and 5 councillors appointed by the Governor General in Council, controls the administration of the Territories. The seat of government is at Ottawa, Ontario. Commissioner, H. L. Keenleyside. See CANADA.

NORWAY. A European kingdom occupying the western and northern part of the Scandinavian peninsula. Capital, Oslo. King, Haakon VII, who was born in 1872 and was elected to the throne by the Storting (Parliament) Nov. 18, 1905. Premier, Einar Gerhardsen. Norway holds sovereignty over Svalbard (Spitzbergen and adjacent islands) in the Arctic Sea, 240 miles distant from the Norwegian coast (see SVALBARD). Norway also asserts sovereignty over uninhabited Jan Mayen Island in the Arctic Sea, and certain uninhabited areas in the Antarctic.

Area and Population. Covering an area of 124,556 square miles (land area, 119,148 sq. mi.), Norway proper had 3,172,000 inhabitants on Jan. 1, 1948, by official estimate. Vital statistics (rate per 1,000 inhabitants) in 1947: births, 21.7; deaths, 9.4; marriages, 9.2. Estimated populations of chief cities in 1947: Oslo, 300,000; Bergen, 105,000; Trondheim, 55,000; Stavanger, 47,000.

Education and Religion. The state religion is evangelical Lutheran. All faiths are tolerated but Jesuits are barred from the country. Education is compulsory; illiteracy is low. The Norwegian language has two idioms, both of which are used officially.

Production. Agriculture, forestry, mining, industry, fishing, and whaling are the principal occupations. Food production in 1947 was only 83 per-

cent of the average, due to the Europe-wide drought. Cereal crops totaled 269,400 tons against 378,000 tons in 1946. The potato harvest was 918,500 tons; hay, 2,488,600 tons. Whale oil production in the 1947-48 Antarctic season was 935,902 barrels (over 50 percent of the international total), against 903,661 for the 1946-47 season.

Foreign Trade. In terms of money, foreign trade figures in 1947 reached the highest points in Norwegian history. Imports were valued at 3,800 million kroner; exports at 1,900 million. Total imports for 1948 were valued at 3,708,500,000 kroner; total exports 2,062,500,000.

Finance. The budget presented to Parliament on Jan. 19, 1948, for the 1948-49 fiscal year, totals 2,490 million kroner, as compared with 2,203 million for the 1947-48 period.

Transportation. Virtually all of Norway's 2,600 miles of railway are state-owned and operated. The railway system is still suffering from the effects of the German occupation and the need for replacements. Of the 27,000 miles of highways and roads, less than 2 percent are surfaced. Coastal waterways are of prime importance and are highly developed. About 10 percent of the country's merchant marine is engaged in coast-wise shipping. Air service to various parts of Norway; daily or weekly flights to continental points; and regular service to the United States and South America is furnished by Det Norske Luftfartsselskap (DNL).

Government. Under the constitution of 1814, as subsequently amended, executive power is vested in the King, acting through a cabinet responsible to the Storting. The Storting consists of 150 members elected for four years by universal suffrage. It divides itself into two sections of 38 and 112, called the Lagting and Odelsting, respectively. In the elections for the Storting held on Oct. 8, 1945, the following parties were elected: Labor, 76; Conservative, 25; Liberal, 20; Communist, 11; Agrarian, 10; and Christian Popular, 8.

Events, 1948. "Tension among the great powers has retarded reconstruction in Norway, and progress during the coming year will be governed largely by developments abroad," Prime Minister Gerhardsen predicted in his New Year address to Parliament. He went on to say that "developments abroad have resulted in greater economic stress than was originally envisioned. Price rises have struck hard at our foreign exchange reserves, and European exchange shortages are retarding our recovery." This picture did not change materially during the year.

On the domestic political scene, and on the labor front, all was quiet in Norway in 1948. The Socialist Government headed by Gerhardsen maintained itself in office for the third straight year. A minor Cabinet reshuffle took place in July, following the death of one minister and the resignation of another.

There were many rumors of Soviet pressure, with some foundation in fact. On March 17, Foreign Minister Halvard M. Lange confirmed that objections had been raised by "outside sources" (meaning Russia) to the inter-Scandinavian economic conference scheduled to be held at Copenhagen early in April. "It was erroneously reported this conference would discuss military cooperation," he added. The Moscow newspaper *Izvestia* on March 27 sharply criticized the Oslo Government for allegedly "selling out Norway to the United States." The paper charged that Norwegian armaments were being standardized with American models and that plans were afoot to lease Norwegian territory (Svalbard and Jan Mayen) for

American and British bases. This was categorically denied by Defense Minister Jens Hauge.

Norway's position in the East-West conflict was clearly defined in an address by Foreign Minister Lange on April 19 before the Oslo Military Society: "There can not be the least doubt that we are part of western Europe geographically, economically, and culturally and that we are and will remain a western European democracy." He added, however, that "this knowledge must not prevent Norway from maintaining good relations and expanding economic ties with the U.S.S.R. and other eastern European countries."

Spurred on by the events in Czechoslovakia, the Storting on March 16 voted an extraordinary appropriation of 100 million kroner (\$20 million) for national defense. In another move toward strengthening security the House, on April 9, set up a special committee for Defense and Foreign Affairs questions from which the Communists were excluded. Generally, Communist influence, never very strong in Norway, was reduced to insignificant proportions as public opinion turned sharply against the followers of Moscow.

On June 4, a policy clash between the Defense Ministry and the Army Command was revealed as the Cabinet voted to remove Lt. Gen. Olav Helset from his post as commander in chief and demoted him to major general. On the same day, Foreign Minister Lange in a speech at Malmö, Sweden, indicated that Norway would welcome military co-operation with Denmark and Sweden. This and other Norwegian feelers brought a noncommittal reaction from Stockholm where the view prevailed that Norway was leaning too strongly to the West and that Sweden's position was too exposed to go along. Nevertheless both Sweden and Denmark agreed to consult with Norway on a coordination of Scandinavian defense measures and a conference on this subject was held at Oslo on October 15-16. The conference was attended by the Ministers of Defense of the three powers as well as by numerous military experts.

Toward the end of the year, it was apparent that Norway would not turn down an invitation to join in the North Atlantic Pact proposed by the Western European Union and the United States. "We must join openly, honestly, and fearlessly in the international cooperation aimed at preserving those freedoms and rights which are in themselves the foundation for our existence as a free people," wrote the Government organ *Arbeiderbladet* of Oslo on November 10, concluding that "hence we must regard with sympathy and understanding the establishment of a North Atlantic Pact."

Economic Affairs. Norway's economic situation in 1948 strongly reflected world trends. The universal dollar shortage and the general rise in prices imposed adoption of an "austerity program" on the British model. Drastic import restrictions improved the foreign trade balance but hit the consumers hard, especially in clothing, textiles, and automobiles. Industrial production in 1948 was maintained at generally high levels, with little unemployment. The harvest was considerably better than in 1947, as were the yields of the fishing industry.

Norway's adherence to the Paris accord on the Marshall Plan was approved by a 108 to 11 vote of the Storting on July 3. Immediately afterwards the agreement was signed by Foreign Minister Lange and U.S. Ambassador Charles U. Bay.

—JOACHIM JOESTEN

743 square miles are land area and 325 square miles fresh water. Population (census 1941): 577,962 (est. pop. 1948), 635,000. Religious affiliations include (1941): Roman Catholic, 188,944; United Church, 124,301; Anglican, 103,393; Baptist, 89,272; Presbyterian, 47,415. In 1946 there were 17,914 live births; 6,046 deaths; 6,549 marriages. Education (1945-46): 138,332 students enrolled in schools and colleges. Chief cities: Halifax (capital), 70,488 inhabitants in 1941; Sydney, 28,305; Glace Bay, 25,147.

Production. The gross value of agricultural output in 1947 was \$42.5 million. Value of field crops in 1947 totaled \$21,579,000 from 544,000 acres. Chief field crops (1947): oats 2,250,000 bu. (\$2,048,000); potatoes 1,828,000 cwt. (\$4,186,000); field roots 2,010,000 cwt. (\$2,010,000). Livestock (June 1, 1947): 203,100 cattle (\$16,606,000); 32,800 horses (\$5,024,000); 59,900 swine (\$1,630,000); 138,000 sheep (\$1,299,000); 2,681,900 poultry (\$3,361,000). In 1946 there were 350 fur farms. Value of fur pelt production in the season 1946-47 was \$716,009. Fisheries production in 1946 reached a marketed value of \$34,270,761; chief commercial fishes caught were cod, lobsters, haddock, herring, swordfish, pollock, and mackerel. Creamery butter produced in 1947 amounted to 6,617,000 lb. valued at \$3,487,000; estimated total farm value of poultry meat and eggs was \$7,041,000. The value of fruit crops (1947) was placed at \$2,779,000. The value of lumber sawn in 1946 amounted to \$14,519,554 from 617 sawmills in operation.

Government. Budget estimates for 1947-48: net combined revenue \$30,119,430; net combined expenditure \$27,473,310. Total direct and indirect liabilities (less sinking funds) \$105,779,633 on Nov. 30, 1946. The executive authority is vested in a lieutenant governor who is advised by a ministry of the House of Assembly, the latter comprising 30 members elected for a five-year term by popular vote (28 Liberals, and 2 Cooperative Commonwealth Federationists were elected at the provincial general election of Oct. 23, 1945). Ten members (appointed for life) in the Senate and 12 members in the House of Commons represent Nova Scotia in the Dominion Parliament at Ottawa. Lieutenant Governor, J. A. D. McCurdy, M.B.E. (appointed Aug. 12, 1947); Premier, Angus L. Macdonald (Liberal; appointed Sept. 8, 1945). See CANADA.

NUCLEAR ENERGY. Progress in 1948 in the field of nuclear energy or, in popular terms, atomic energy, began to show tangible results in the use of radioisotopes in chemical, biological, medical, and other investigations leading to new knowledge of natural processes and some applications. The predicted ability of radioisotopes to implement the solving of many kinds of problems which are unsolvable by other techniques was amply demonstrated. The production of atomic weapons continued, and the Atomic Energy Commission announced that tests at Eniwetok of atomic weapons of improved design were successful. While work on the development of atomic power equipment continued and expanded, the fact that many years of intensive work must precede its commercial application became more generally recognized and accepted.

Much of the emphasis in atomic energy continued on the construction of facilities for research and development and the training and assembling of technical manpower. Characteristics peculiar to experimental work in atomic energy, compared to work in other fields, require extensive and special

NOVA SCOTIA. An eastern maritime province of Canada. Area: 21,068 square miles, of which 20,-

facilities, and make the conduct of experimental work most time-consuming. Extension of fundamental physical measurements beyond their present scope requires tremendous "atom smashers," each new higher energy unit requiring several years of design and construction (See PHYSICS). Chemical work with radioactive materials in greater than tracer amounts takes elaborate laboratory facilities to protect workers from injurious radiation. Experiments must be handled by remote control with operators separated from equipment by thick shields. Data on material stability against radiation within a nuclear reactor require special packaging of the sample, then exposure in a nuclear reactor (there are only a few in the country) and finally ingenious devices for making measurements after exposure because the sample will itself be radioactive. These examples are indicative of why so much effort must continue on the more preparatory phases of the atomic energy program, and why progress may appear slow to those unfamiliar with the special characteristics of the field.

Atomic Power. For a careful assessment of the foreseeable technical and economic problems which we now know must be solved before atomic power can be a factor in the world's power economy, we have the report to the Atomic Energy Commission by its General Advisory Committee issued during 1948 (in the *Fourth Semiannual Report*) which concludes, "We do not see how it would be possible under the most favorable circumstances to have any considerable portion of the present power supply of the world replaced by nuclear fuel before the expiration of 20 years." Some authorities feel that even this statement is optimistic in view of the uncertainties of international politics and unknown economic conditions.

Regardless of what dates are forecast for commercial application of atomic power on any substantial scale, the following observations appear reasonable:

1. Technical problems set an irreducible minimum time and although individual estimates vary, the order of magnitude suggested by the General Advisory Committee to the AEC seems generally accepted.

2. If atomic power does become widely used, its growth will be gradual and it will supplement rather than supplant power from other fuels.

3. For atomic power to become a major factor in the world's power economy, it must become sufficiently competitive to have a strong economic incentive, and we now know less about the future cost of atomic fuels and power plants than about any technical aspect.

4. There are no known technical obstacles which appear to be insurmountable.

5. Atomic power plants will probably be applied first where some strong incentive other than economy exists. An example is the propulsion of naval ships where the possibility of long cruising range without refueling provides a major incentive.

Atomic Fuel. The close relationship between the production of fuel and power became more apparent to the public in 1948 with the announcement that the "breeding" of new fissionable material appeared to be theoretically possible. In a controlled nuclear reaction, there are neutrons in excess of those required just to sustain the reaction and release power. Some of these excess neutrons are used now to produce plutonium, a synthetic atomic fuel, from uranium in laboratory reactors. If a reactor can be designed so that the losses of excess neutrons by unprofitable absorption are very low and the rest are used to produce new fission-

able material, it may be possible to make more new fissionable material than that which is burned. Such a process is called "breeding."

The profound effect which this might have on the future of atomic power can be visualized when it is realized that a major success of "breeding" in atomic power plants might make relatively plentiful Uranium 238 and Thorium the sources of fuel in place of relatively rare Uranium 235, the only known natural fissionable isotope. Such possibilities have yet to be demonstrated. For the "breeding" process to have great economic importance, both the amount of the margin produced over equal replacement of that burned, and the rate of burning up the fuel invested in the reactor must be large for the net gain in a given time to be significant.

Radioisotopes. Progress in 1948 in the manufacture and use of radioisotopes was reviewed in the above mentioned report of the Atomic Energy Commission. The following excerpts suggest the great scope and variety of useful applications which are already in progress.

"Using tracer isotopes, the scientist and engineer can observe atoms as they take part in basic organic and inorganic reactions, much as though the atoms were visibly tagged or labeled. For the first time, it becomes possible to follow in intimate detail . . . such processes as photosynthesis, metabolism, and the chemistry of hydrocarbons . . .

"The most surprising fact revealed has been the extreme rapidity with which life processes take place. By 'tagging' salt (sodium chloride) with sodium 24 and injecting it into the human body, investigators have found that salt is diffused through the walls of the veins, transported to the sweat glands, converted into sweat, and carried to the surface of the body, all in less than one minute's time.

"In hospitals today, physicians are using radioisotopes to diagnose various circulatory disorders, to locate malignant tumors, to measure how sick thyroid glands are functioning, to find out how much iron the red blood cells of anemic patients can take up, and to diagnose various unhealthy internal body changes that they could not identify without the radioactive tracers to follow and report on the movement of materials in the body.

"Using radioisotopes, plant scientists have been able to follow through the soil, into the rootlets, and to their final disposition in the plant, minerals such as zinc, copper, and manganese, all of which are available to the plants in amounts of less than an ounce per acre.

"Already, in field experiments conducted by the U.S. Department of Agriculture and State agricultural experiment stations and by the fertilizer industry in all parts of the nation, radioisotopes are answering very specific questions: such questions as where, when, and how plant foods are most effectively applied to different crops; what forms of fertilizer return the most in production; when and how the plant utilizes them; and how much expensive plant food is likely to go unused in today's fertilizing methods.

"The powerful signals emitted by radioisotopes have been used to follow and measure a variety of industrially important substances otherwise untraceable, from the impurities in a batch of molten steel to the invisible coating on a wisp of thread. Manufacturers of steel, machinery, rubber, gasoline, oil, plastics, rayon, chemicals, drugs, and a rapidly growing list of other products are looking to these researches to bring better and more economical production.

"The entire field of metallurgy is certain to be greatly influenced by tracer investigations already under way on the structure, manufacture, alloying, durability, corrosion, and friction of metals."

—B. R. PRENTICE

NYASALAND. A protectorate of Great Britain, in central Africa. Area: 37,374 square miles. Population (1946): 2,230,500, including 2,400 Europeans and 3,100 Asiatics. Chief towns: Zomba (capital), Blantyre, Lilongwe, Mlanje, Salima, and Fort Johnston. The chief industry of the people is agriculture. Among the important products are tobacco, tea, cotton, pulse, groundnuts, and tung oil. Imports include cotton goods, vehicles, manufactures of wood, and timber. Foreign trade: imports £2,050,176; exports £2,364,970. Budget estimates (1947): revenue £1,077,865; expenditure £981,441. Nyasaland is administered by a governor, aided by executive and legislative councils. Governor: Geoffrey Colby.

OATS. The 1948 production of oats in the United States reached a total of 1,491,752,000 bushels, according to the estimate (as of December, 1948) of the U.S. Dept. of Agriculture. This compares with the 1947 output of 1,199,422,000 bu. and the 1937-46 average of 1,231,814,000 bu. Yields of the chief producing States (in bushels) were: Iowa 266,445,000; Minnesota 206,338,000; Illinois 182,078,000; Wisconsin 126,148,000; South Dakota 104,252,000; Nebraska 72,744,000; North Dakota 62,132,000; Indiana 59,469,000; Michigan 56,672,000; Ohio 54,090,000; Missouri 48,592,000; Pennsylvania 29,146,000; New York 28,320,000; and Kansas 26,312,000.

World Oat Production. According to the December, 1948, report of the Office of Foreign Agricultural Relations, U.S. Department of Agriculture, the 1948 world output of oats was estimated to total 4,335 million bushels, compared with 1,195 million bushels in 1947. The total area sown was estimated at 136.29 million acres for 1948. Yields of the chief producing countries for 1948 were (in bushels): United States 1,492,957,000, U.S.S.R. (Europe and Asia) 820,000,000 (in 1947), Canada 357,703,000, France 235,000,000, Great Britain 202,930,000, Denmark 59,938,000, China 55,883,000, Eire 54,000,000, Sweden 53,785,000, Argentina 44,000,000, Finland 42,300,000, Spain 38,000,000, Belgium 36,500,000, Italy 36,000,000, Australia 27,500,000, Netherlands 21,700,000, Turkey 21,000,000, Austria 20,000,000.

In the foregoing statistics of production those for Northern Hemisphere countries are based on revised estimates, those on Southern Hemisphere countries are based on preliminary forecasts. The figures on the total output of oats in Germany were not available.

OHIO. An east north central State. Area: 41,122 sq. mi. Population: (July 1, 1948) 7,799,000, compared with (1940 census) 6,907,612. Chief cities: Columbus (capital), 306,087 inhabitants in 1940; Cleveland, 878,336. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended Dec. 31, 1946, total revenue amounted to \$425,027,000; total expenditure, \$372,305,000.

Elections. The 25 electoral votes, which went in 1944 to Dewey by about 11,000 votes, were won by Truman by a small margin. Republican incumbent Governor Thomas J. Herbert lost his race for reelection by the man he defeated in 1946, former

Governor Frank J. Lausche. There was no Senate race. In contests for the 23 House seats, Democrats won 12 for a gain of 8. State officers elected included: Lieutenant Governor—George D. Nye; Secretary of State—Charles J. Sweeney; Attorney General—Herbert S. Duffy; Auditor—Joseph T. Ferguson; Treasurer—Don H. Ebright.

Officers, 1948. Governor, Thomas J. Herbert; Lieut. Governor, Paul M. Herbert; Secretary of State, Edward J. Hummel; Attorney General, Hugh S. Jenkins; State Treasurer, Don H. Ebright; State Auditor, Joseph T. Ferguson.

OIL AND GAS DIVISION. Under direction of the Secretary of the Interior the Division is authorized to coordinate and unify policy and administration with respect to the functions and activities relative to oil and gas carried on by the several departments and agencies of the Federal Government; to serve as the channel of communication between the Federal Government and the petroleum industry; to serve as liaison agency of the Federal Government in its relations with the appropriate State oil and gas bodies; and to review technological developments in the field of petroleum and synthetic hydrocarbon fuels and coordinate Federal policy with respect thereto. It also assists the Secretary of the Interior in administering the Connally law, which prohibits the shipment in interstate and foreign commerce of petroleum or its products produced in excess of the amount permitted by State law.

OKLAHOMA. A west south central State. Area: 70,057 sq. mi. Population: (July 1, 1948) 2,362,000, compared with (1940 census) 2,336,434. Chief city: Oklahoma City (capital), 204,424 inhabitants in 1940. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$179,618,000; total expenditure, \$161,729,000.

Elections. Truman's plurality of about 200,000 votes over Dewey was about double Roosevelt's in 1944, and won the Democratic candidate the 10 electoral votes. In the Senatorial contest, former Governor Robert S. Kerr, Democrat, beat Republican Ross Rizley. In House contests, Democrats won all 8, picking up 2 formerly held by Republicans. There were no Statewide races for State office.

Officers, 1948. Governor, Roy J. Turner; Lieut. Governor, James E. Berry; Secretary of State, Wilburn Cartwright; Attorney General, Mac Q. Williamson; State Treasurer, John D. Conner; State Auditor, A. S. J. Shaw. Chief Justice of Oklahoma Supreme Court, Thurman S. Hurst.

OLYMPIC GAMES. Renewal of these international contests, last held at Berlin in 1936, provided the most colorful and successful sports show of the year. This XIV Olympiad, in which 59 nations competed, resulted in a sweeping triumph for United States athletes and the finest display of the spirit in which the games were conceived since their revival in 1896.

A gathering of 82,000 filled Wembley Stadium in England to hear King George in the opening ceremony on July 29 and from then on through August 14 the pageant rolled from one set of impressive figures to another. An estimated 1.5 million persons attended the 134 events in 17 sports in which more than 5,000 men and women competed. Receipts ran to approximately \$2 million, well above any previous total for this great athletic meet.

Exceeding the brilliant exploits in various stadia was the sportsmanship of the athletes and of the crowds. Except for a bit of argument in the progress of the boxing, which resulted in the removal of a succession of judges, and except for the temporary disqualification of the winning American 400-meter relay team, harmony and good-will marked the games.

Disqualification of the United States in the relay, removed three days later when movies revealed that passing of the baton had been done legally, became an occasion for the finest show of Olympic spirit. England, second in the race, had been moved up to first and was overjoyed that the home forces finally had gained their only track victory. But when pictures revealed that the judges had erred and an injustice had been done the Americans, the British relinquished their gold medals as the crowd cheered the invaders.

Gaining 38 first places—11 in men's track and field—for a total of 547.5 points in the unofficial team scoring table, the United States squad finished far in front. American athletes registered an unprecedented sweep in men's diving and swimming, with Japan barred from the games, and scored the most triumphs in women's swimming and diving despite stern opposition from Dutch and Danish naiads. The University of California eight won in rowing, as did the University of Washington's four with coxswain. John B. Kelly Jr., counted as an almost certain victor, lost in the semifinals of the single sculls, which event was taken by Mervyn Wood of Australia. The United States dominated basketball; triumphed in weightlifting; won two firsts in wrestling; two in yachting, along with team honors; captured the top prize in shooting; tied with the Czechs in canoeing; and won the trying 3-day team event in the equestrian tests.

Eight track and field records for men were broken and two tied despite rain that fell day after day at Wembley. Mal Whitfield, Bill Porter, Roy Cochran, and Wilbur Thompson of the United States each set a new standard for the Olympics, while Harrison Dillard tied the mark for the 100-meter dash. Bob Mathias, Tulare, Cal., schoolboy, was one of the outstanding heroes, the 17-year-old capturing the decathlon after two days of punishing competition against the world's best.

The marathon, prize race of the ancient games, was won by Delfo Cabrera of Buenos Aires, a comparative unknown. Another hero was Emil Zatopek, who annexed the 10,000-meter run in record time. And in the 5,000-meter race, the young Czech Army officer put on an unforgettable sprint to finish only one-fifth of a second behind Gaston Reiff of Belgium as both bettered the Olympic standard.

Mrs. Fanny Blankers-Koen, 30-year-old Amsterdam housewife and the mother of two children, became the greatest woman athlete the Olympics have known in winning four gold medals in track. The slender star took the 80-meter hurdles in world-record time of 0:11.2 and led the Netherlands girls to team honors. Alice Coachman established a new mark in winning the high jump for the only United States victory in women's track and field.

United States male swimmers made four new Olympic marks, Walter Ris, Bill Smith, Joe Verdeur and the 800-meter team of Ris, Wallace Wolf, Jimmy McLane, and Smith setting new standards. Ann Curtis was the only American to win one of the four individual races for feminine swimmers. The California beauty set an Olympic record in the 400-meter free style and anchored the winning 400-meter relay team. Mrs. Victoria Draves cap-

tured both the low and high diving events for the United States to become the first woman to achieve that feat in Olympic competition. See OLYMPIC GAMES, WINTER. —THOMAS V. HANEY

Results of the XIV Olympiad. The final placings in the XIV Olympiad, according to the Olympic Results issue of *World Sports* (September, 1948), are listed in the accompanying table.

BASKETBALL		
1 U.S.A.	3 Brazil	5 Uruguay
2 France	4 Mexico	6 Chile
BOXING		
FLYWEIGHT		
P. Perez (Argentina) beat S. Bandinelli (Italy) on pts.		
Third place: Soo Ann Han (Korea) beat F. Majdloch (Czechoslovakia) on pts.		
BANTAMWEIGHT		
T. Czík (Hungary) beat G. Zuddas (Italy) on pts.		
Third place: J. Venegas (Puerto Rico) beat A. Domenech (Spain) on pts.		
FEATHERWEIGHT		
E. Formenti (Italy) beat D. Shepherd (S. Africa) on pts.		
Third place: A. Antkiewicz (Poland) beat F. Nunez (Argentina) on pts.		
LIGHTWEIGHT		
G. Dreyer (S. Africa) beat J. Vissers (Belgium) on pts.		
Third place: S. Wad (Denmark) w.o.; W. Smith (U.S.A.) withdrew.		
WELTERWEIGHT		
J. Torma (Czechoslovakia) beat H. Herring (U.S.A.) on pts.		
Third place: A. d'Ottavio (Italy) beat D. du Preez (S. Africa) on pts.		
MIDDLEWEIGHT		
L. Papp (Hungary) beat J. Wright (Great Britain) on pts.		
Third place: I. Fontana (Italy) w.o.; M. McKeon (Eire) withdrew.		
LIGHT HEAVYWEIGHT		
G. Hunter (S. Africa) beat D. Scott (Great Britain) on pts.		
Third place: M. Cia (Argentina) beat A. Holmes (Australia) in 3rd round.		
HEAVYWEIGHT		
R. Iglesias (Argentina) k.o. N. Nilsson (Sweden) in 2nd round.		
Third place: J. Arthur (S. Africa) w.o.; H. Muller (Switzerland) withdrew.

HOW THE NATIONS FINISHED *

- | Country | Points | Country | Points |
|----------------|--------|--------------|--------|
| United States | 547.5 | Argentina | 60.5 |
| Sweden | 308.5 | Belgium | 58 |
| France | 206 | Austria | 44 |
| Hungary | 183.1 | Canada | 38.1 |
| Italy | 166 | South Africa | 36 |
| Great Britain | 162 | Mexico | 35.5 |
| Finland | 153.75 | Egypt | 33.25 |
| Switzerland | 135.6 | Jamaica | 26 |
| Denmark | 129 | Uruguay | 17 |
| Netherlands | 107 | Yugoslavia | 17 |
| Australia | 82 | Korea | 15.6 |
| Czechoslovakia | 80.5 | Spain | 14.5 |
| Turkey | 72.8 | Iran | 12.1 |
| Norway | 65.75 | Poland | 10 |

* The table shows the unofficial national placings at the XIV Olympiad: 7 points are awarded for 1st place, 5 for 2d, 4 for 3d, 3 for 4th, 2 for 5th, and 1 for 6th. Scores of 9 points and less were made by 14 other nations; 17 nations scored no points.

OLYMPIC GAMES, Winter. A series of controversies threatened the fifth Winter Olympic Games, but after many hot verbal exchanges and a little com-

promising on the part of the more cool-headed authorities, the contests got under way at St. Moritz, Switzerland, on Jan. 30, 1948. Despite the plague of changing weather that brought hot sunshine and snowstorms on alternate days, the championships were run off successfully and came to a peaceful conclusion on February 8.

The hockey championship, one of the big prizes of the games, was not decided until the closing day, when Canada defeated Switzerland, 3-0, thereby gaining enough points to give Canada first place on a goals-average basis. The United States Amateur Hockey Association six, center of most of the dissension, lost to the Czechs, 4-3, in its final game. The real trouble started when the Amateur Athletic Union and the Amateur Hockey Association became involved in a battle as to who was entitled to represent the U.S. in the Olympics. For a time the A.A.U. threatened to withdraw all of its competitors, a move that caused the St. Moritz mayor to say he would cancel the games if Uncle Sam's athletes did not compete. Then the tempest settled when officials got together and announced that the A.H.A. six would represent the United States on the schedule, although its points would not figure in the final standings.

HOW THE NATIONS PLACED *

Country	Firsts	Seconds	Thirds	Points
Sweden	4	3	3	70
Switzerland	3	4	3	68
United States	3	4	2	67½
Norway	4	3	3	57
Austria	1	4	4	48
Finland	1	3	2	46
France	2	1	2	33
Italy	1	0	0	22
Canada	2	0	1	18½
Belgium	1	1	0	15
Great Britain	0	0	2	15
Czechoslovakia	0	1	0	10
Hungary	0	1	0	10
Netherlands	0	0	0	6
Poland	0	0	0	1

* The scale of values is based on 7 points for the winner, and 5, 4, 3, 2, and 1 points for the following five competitors.

A surprise scorer for the Americans was Mrs. Gretchen Fraser of Vancouver, Wash., who won from Europe's best feminine skiers in the women's slalom. Mrs. Fraser also tallied in the women's Alpine combined event, when she placed second to Trude Beiser of Austria by only thirty-seven one-hundredths of a point.

Richard Button of Englewood, N.J., waltzed off with the men's figure skating award while Canada's Barbara Ann Scott was queen of the women competitors. The four-man bobsled team of Francis Tyler, Lake Placid, N.Y.; Pat Martin, Lake Placid; Ed Rimkus, Schenectady, N.Y., and Bill D'Amico, Lake Placid, added to the United States scoring with first place.

—THOMAS V. HANEY

ONTARIO. A Canadian province lying between Quebec on the east and Manitoba on the west. Area, 412,582 square miles, including 49,300 square miles of fresh water. Population (1948 estimate): 4,297,000, compared with (1941 census) 3,787,655. Principal religious denominations (1941) were: United Church, 1,073,425; Roman Catholic, 882,369; Anglican, 815,413; Presbyterian, 433,708; Baptist, 192,915; and Lutheran, 104,111. In 1946 there were 97,446 live births, 39,758 deaths, and 46,073 marriages. Education (1945-46): 798,934 students enrolled in schools and colleges. Chief cities: Toronto, 667,457 (1941); Hamilton, 166,337; Ottawa, 154,951; Windsor, 105,311; London, 78,264; Kitchener, 35,657; Sudbury, 32,203; Brantford, 31,948; Fort William, 30,585; St. Catharines,

30,275; Kingston, 30,126; Timmins, 28,790; Oshawa, 26,813.

Production. The gross value of agricultural production for 1947 was \$601,106,000. Gross farm value of all major field crops produced on 8,108,000 acres in 1947 amounted to \$277,874,000. Chief field crops (1947): oats, 41,490,000 bu. (\$37,341,000); wheat, 18,299,000 bu. (\$25,985,000); barley, 6,930,000 bu. (\$6,440,000); fall rye, 1,444,000 bu. (\$3,697,000); dry beans, 1,262,000 bu. (\$6,903,000); soy beans, 1,110,000 bu. (\$3,397,000); buckwheat, 3,192,000 bu. (\$3,543,000); mixed grains, 25,312,000 bu. (\$23,793,000); flaxseed, 674,000 bu. (\$3,653,000); shelled corn, 6,430,000 bu. (\$12,153,000); potatoes, 9,100,000 cwt. (\$21,658,000); field roots, 9,938,000 cwt. (\$8,845,000); hay and clover, 6,154,000 tons (\$87,941,000). Livestock (June 1, 1947): 2,875,000 cattle, including 1,252,600 milk cows (\$267,471,000), 451,200 horses (\$44,624,000), 2,244,700 swine (\$57,001,000), 667,500 sheep (\$8,695,000), 30,744,600 poultry (\$34,751,000).

Manufacturing. The premier position in manufacturing is maintained by Ontario with a gross value of products of \$3,754,523,701 in 1946. There were 11,424 establishments employing 498,120 persons. Salaries and wages paid amounted to \$845,216,547 and the cost of materials was \$2,001,900,592.

Government. Finance (year ending Mar. 31, 1949): combined ordinary and capital revenues were estimated at \$210,858,000 (1948: \$241,297,000); expenditures at \$228,647,000 (1948: \$208,505,000). The executive authority is vested in a lieutenant governor who is advised by a ministry of the Legislative Assembly. There is a single chamber in the Legislative Assembly comprising 90 members elected for a five-year term by popular vote. At the provincial general election held on June 7, 1948, there were elected 53 Progressive Conservatives, 21 Cooperative Commonwealth Federationists (C.C.F.), 14 Liberals, and 2 others. Ontario is represented in the Dominion Parliament at Ottawa by 24 members (appointed for life) in the Senate and 82 elected members in the House of Commons. Lieutenant Governor, Ray Lawson (appointed Dec. 26, 1946); Premier, Thomas L. Kennedy (Progressive Conservative). See CANADA.

OPHTHALMOLOGY. Chemotherapy has proved of value in the treatment of ocular infections, especially the sulfonamides, because of their bacteriostatic and bactericidal properties. In the superficial lesions, topical applications are effective, and in the deeper seated processes such as orbital cellulitis, cavernous sinus thrombosis, etc., parenteral administration is indicated. These drugs are frequently combined with penicillin with happy results.

Antibiotics. Of the antibiotics, the calcium and potassium salts of penicillin have found extensive use. Infections of the eye caused by the staphylococcus, streptococcus, pneumococcus and the gonococcus respond remarkably well. Penicillin in the form of eye drops or as ointment is used pre- and post-operatively. Massive doses, 300,000 units, intramuscularly are effective in many intra-ocular infectious processes. Another antibiotic, streptomycin, has given encouraging results in infections with the pyocyanus colon, Pasteurella tularensis, brucella and staphylococcus aureus organisms.

Some encouraging reports of the employment of streptomycin in tuberculous ocular disease have appeared, and as the preparations are improved and the indications better understood, it appears likely that this substance will prove of great benefit.

The use of penicillin drops in the prophylaxis of ophthalmia neonatorum has been quite thoroughly studied and, on the whole, the results have been as good as the original Credé's method. It is, however, necessary to employ the penicillin every few hours for several days as against the use of silver nitrate but once. Hence it must be proved that penicillin is more effective than silver nitrate before it can claim to be superior. Two new antibiotics which give promise of being valuable are bacitracin and aureomycin. In the treatment of conjunctival infections and superficial corneal lesions 30 percent sulfacetamide is very effective.

Uveitis. In the treatment of uveitis, the use of fever therapy in the form of typhoid-para-typhoid vaccine has become recognized as standard. The removal of foci of infection is, of course, indicated. Atropine and neo-synephrine to maintain dilatation of the pupil, hot moist compresses, and dionin in the later stages, aid recovery. Immune globulins have been used with apparent benefit.

Glaucoma. In the treatment of congenital glaucoma (buphthalmos) the operation of goniotomy, as proposed by Dr. Otto Barkan, has yielded the best results in the hands of several surgeons. In chronic simple glaucoma, D. F. P. (di-iso-propyl fluorophosphate) has definitely found a place in our list of drugs. It is the most powerful miotic that we have and, in spite of the discomfort which it sometimes causes because of the intense muscular spasm, it reduces intra-ocular tension in many cases more efficiently than other preparations.

As a diagnostic test in cases of suspected early glaucoma, the so-called "lability" test has been found valuable. A cold stimulus is produced by immersing the hand in ice water for one minute while the sleeve of the blood pressure apparatus is fastened about the neck and inflated to 40 mm. The intra-ocular tension is recorded at the end of the minute and a rise of 10 or more mm. over that measured before the test is considered evidence of ocular hypertension. The possibility of an emotional factor in this test cannot be overlooked.

Beta Rays. The use of beta rays has become more widely accepted. Since these rays penetrate only 3 mm. they are suitable for the treatment of non-malignant lesions of the eyelids and of the anterior segment of the eye, especially for tuberculous conditions, for vernal conjunctivitis and lesions of the cornea, particularly recent vascularization. In the operation of keratoplasty, applications of beta rays are made routinely to prevent the formation of new vessels. No damage to the lens has been observed, either clinically or in experimental animals, from therapeutic doses of the rays.

Retro-Lental Fibroplasia. Reports of cases of retro-lental fibroplasia continue to appear, and while there is little or no treatment which is helpful, it is most important to recognize this condition and to differentiate it from retinoblastoma. In the past, many eyes have been needlessly removed because of failure to recognize the former, which occurs in premature infants. Retro-lental fibroplasia is characterized by the presence of embryonal connective tissue behind the crystalline lens. Often branches of the tunica vasculosa lentis are to be seen. The condition has been observed to occur from 2 to 5 months after the premature birth, and in the originally normal fundus angiomatous dilatations of the retinal vessels are observed. This was followed by massive retinal exudate and the formation of the membrane posterior to the lens. Retinal folds and detachment are often associated with, or are a part of, the condition.

Transplantation of Vitreous. This has been prac-

ticed with some success and pools of vitreous are now being formed to be drawn upon when needed. The procedure is indicated when the vitreous is densely clouded by blood of long standing or other vitreous opacities. In place of new vitreous, after withdrawal of the clouded fluid, the needle may be left in place and some of the patient's own spinal fluid introduced. Quite satisfactory results are reported.

Ophthalmic Surgery. As an aid to ophthalmic surgery, the anesthesia induced by the intravenous use of Pentothal sodium has been of great value. Sufficiently deep narcosis may be obtained and quickly modified and can be maintained for as long as needed. The rapid loss of consciousness and the fact that the anesthetist is not in the operator's field are helpful. A hypodermic of atropine and morphine should be administered 45 minutes before the induction of the anesthesia.

Pentothal is especially adapted for use in the cataract operation upon highly nervous and unstable patients. The operation of corneal transplantation continues to find favor and the knowledge of what type of corneal pathology is best suited to the operation is more clearly defined. Improvements in technic have assured better results, and experience has taught how better to deal with the complications which occur. The operation is being performed by more and more surgeons who have acquired their training through the Eye Bank Foundation.

Iontophoresis. This is used to obtain a greater concentration of drugs than can be secured by medicaments in water, powder or ointment form. From 3 to 15 times greater concentrations are thus obtainable in the tissues of the conjunctiva, cornea and the anterior segment of the eye. Especially since the advent of the sulfonamides and the antibiotics, whose specific affinities are more or less clearly defined, the use of iontophoresis is clearly called for.

Allergy. Any part of the eye or its adnexa may be subject to allergic reaction. The more superficial structures, the lids, conjunctiva and cornea are frequently involved, but the sclera, uveal tract and the nervous structures of the eye are also known to react to different allergens. Frequently these tissues react in association with more remote tissues, such as the nasal mucosa or the gastro-intestinal tract.

Several anti-histaminic drugs have been introduced and have been used in diseases of the eye. One of these, called Antistine, has afforded relief in a variety of allergic conditions. It is of low toxicity, accumulates in the tissues and is strongly active against the histaminic substances, especially of the ragweed type. Benadryl hydrochloride and Pyribenzamine, which are effective against some forms of allergy, seem not to have proved so reliable as Antistine. Vernal catarrh responds well to this preparation.

—EUGENE M. BLAKE

OREGON. A Pacific State. Area: 96,981 sq. mi. Population: (July 1, 1948) 1,626,000, compared with (1940 census) 1,089,684. Chief cities: Salem (capital), 30,908 inhabitants in 1940; Portland, 305,394. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$106,763,000; total expenditure, \$99,596,000.

Elections. Dewey won a popular majority over Truman, Wallace, and other candidates, and received the 6 electoral votes which also were his in 1944. Incumbent Republican Senator Guy Cordon

was reelected. All 4 House seats remained Republican. In races for State office, Republican nominee Douglas McKay won a first term as Governor; Earl T. Newbry was reelected Secretary of State and Auditor; George W. Neuner was reelected Attorney General; Walter J. Pearson became Treasurer.

Officers, 1948. Governor, John H. Hall; Lieut. Governor, None; Secretary of State, Earl T. Newbry; Attorney General, George W. Neuner; State Treasurer, Leslie M. Scott; State Auditor, Earl T. Newbry.

ORGANIZATION OF AMERICAN STATES. The 21 American republics are members of the Organization of American States, on a basis of absolute equality. Each country has one vote in the decisions taken at meetings of the Council of the Organization. The list of member countries follows:

ARGENTINA	DOMINICAN REPUBLIC	NICARAGUA
BOLIVIA	ECUADOR	PANAMA
BRAZIL	EL SALVADOR	PARAGUAY
CHILE	GUATEMALA	PERU
COLOMBIA	HAITI	UNITED STATES
COSTA RICA	HONDURAS	URUGUAY
CUBA	MEXICO	VENEZUELA

The Organization accomplishes its purposes by means of:

1. The Inter-American Conference, meeting every five years, at which representatives of the member governments decide matters pertaining to their relationships and to the general action and policy of the Organization;
2. The Meeting of Consultation of Ministers of Foreign Affairs, held to consider problems of an urgent nature and of common interest to the American republics and to adopt decisions in matters covered in the Inter-American Treaty of Reciprocal Assistance; it is assisted by an Advisory Defense Committee, composed of the highest military authorities in the member countries and meeting whenever it is considered advisable to study questions of collective self-defense;
3. The Council of the Organization, with headquarters in Washington, composed of one Representative of each member nation especially appointed by the respective governments, with the rank of Ambassador, its function being to supervise the progress of the Organization, acting either directly or through the following technical organs:
Inter-American Economic and Social Council, with permanent headquarters at the Pan American Union, in Washington;
Inter-American Council of Jurists, and the Inter-American Cultural Council, the latter two meeting periodically at places chosen by themselves;
4. The Pan American Union, the central and permanent organ of the Organization, with headquarters in Washington, which performs the duties assigned to it in the Charter of the Organization and such other duties as are assigned to it in other inter-American treaties and agreements;
5. The Specialized Conferences, meeting to deal with special technical matters or to develop specific aspects of inter-American cooperation;
6. The Specialized Organizations, inter-governmental organizations established by multilateral agreements to discharge specific functions in their respective fields of action.

Officers of the Pan American Union: Secretary General—Alberto Lleras (Colombia); Assistant Secre-

tary General—William Manger (United States); Director, Dept. of Economic and Social Affairs—Amos E. Taylor (United States); Director, Dept. of International Law and Organization—Charles G. Fenwick; Director Dept. of Cultural Affairs—Jorge Basadre (Peru); Director, Dept. of Administrative Services—Lowell Curtiss (United States).

Events, 1948, etc. On April 14, 1890, representatives of the American republics meeting in Washington at the First International Conference of American States adopted a resolution creating what is today the Pan American Union. This international organization's object was to foster mutual understanding and cooperation between the nations of the Western Hemisphere. Since that time, successive Pan American conferences have greatly broadened the scope of work of the Pan American Union, new specialized inter-American agencies have been created, and it gradually became evident that the effective operation of the full-grown inter-American system called for greater integration of its various parts.

This led to the adoption on Apr. 30, 1948, by the Ninth International Conference of American States, at Bogotá, Colombia, of the Charter of the Organization of American States, a significant step in inter-American relations because it coordinated the work of all the former independent official entities in the inter-American field and defined their mutual relationships. The Organization of American States serves the cause of the United Nations as a regional agency devoted to the pacific settlement of disputes in the Western Hemisphere and to the promotion of inter-American understanding.

With the signing of the Pact of Bogotá at the Ninth Conference, the Pan American Union was designated as the central organ and general secretariat of the Organization. The functions of the Union in relation to the other organs of the system were greatly enlarged and more clearly defined, and provision was made for an augmentation of its office facilities to permit it to discharge all its duties efficiently. Four administrative departments were set up to deal with matters falling in the following fields: economic and social affairs; international law and organization; cultural affairs; and office services. The Directors of the first three of these departments were made, ex officio, Executive Secretaries of the corresponding organs of the Council, i.e., the Inter-American Economic and Social Council, the Inter-American Council of Jurists, and the Inter-American Cultural Council, for greater coordination of the work in these fields.

The Pan American Union serves also as the permanent secretariat of the Inter-American Conferences, the Meetings of Consultation of Foreign Ministers, and the Specialized Conferences. It acts as adviser to the Council and its organs in the preparation of programs and regulations for these conferences, offers technical assistance and necessary personnel to the governments of the countries in which they are held, acts as custodian of documents and archives of the conferences, as well as depository of instruments of ratification of inter-American agreements, and submits reports to the Council and to the inter-American conferences on work accomplished by the various organs.

In addition to these duties to the member governments and their official agencies, the Pan American Union renders a wide variety of services through its information offices to the citizens of the American republics. It answers inquiries on every conceivable phase of life and culture in the Americas received from individuals and associa-

tions, secures needed material and information on request, makes arrangements to bring together persons and institutions with like interests, and in general serves as a clearing house for information on all the member countries.

The Secretary General and the Assistant Secretary General are elected by the Council of the Organization, for ten-year terms. The Secretary General appoints the Department Directors, as well as the lesser personnel of the Union. The Council approves the annual budget for the Organization, which is financed by quotas contributed by the member governments.

PACIFIC ISLANDS, Trust Territory of the. The territory in the Pacific, formerly mandated to Japan by the League of Nations in accordance with the Treaty of Versailles, 1919 (see below under *Government*). It comprises some 2,146 islands, islets, atolls, and reefs, extending over an area 1,200 miles north to south and 2,500 miles west to east. There are three main groups: (1) Marianas (less Guam), 14 islands, including Saipan, Tinian, Rota; (2) Carolines, 577 islands, including Yap, Koror, Pelelieu, Angaur, Truk, Uliithi, Ponape, Kusaie; (3) Marshalls (60 islands), including Kwajalein, Majuro, Bikini, Eniwetok, Rongerik, Ujelang. The total land area of the Trust Territory is 715 statute square miles and the total over-all area of land and water is 3,121,722 nautical square miles.

Population. The indigenous population is of the Micronesian race, except on a few islands inhabited by Polynesians, a race closely akin to the Micronesian. At least three different dialects are spoken in different parts of the Trust Territory. Total population (1948): 51,532. Population by districts: Saipan 6,074; Marshalls 10,543; Ponape 9,591; Truk 14,368; Palau 10,956.

Education. In 1948 there were 148 public schools in the Trust Territory with a total of 9,411 students. Enrollment in the district teacher training schools totaled 313.

Health. During 1948 a total of 75 dispensaries with a capacity of 382 beds were maintained for the use of the indigenous people. Schools for medical practitioners, dentists, and nurses are maintained on Guam. A medical officer makes regular inspection trips to each island to administer treatments and to supervise the work of the local medical practitioner. Persons requiring hospitalization are transported to district headquarters or to Guam by ship. In 1948 a medical survey ship, the U.S.S. *Whidby*, was assigned to the territory. This floating clinic, which is now proceeding from island to island in the area, makes possible the accomplishment of chest X-rays for all islanders and other examinations of health and sanitation conditions on even the most remote island.

Production and Trade. The natural resources of the Trust Territory are meager and for the most part the soil is unproductive. Because of the remote location and distances involved in inter-island shipping the problem of sea transportation is acute. An effort is being made to revitalize the island economy. Principal products for export are: copra (dried coconut), handicraft, trochus shells, and phosphate. Exports for the first 9 months of 1948 were valued at \$1,771,710; imports at \$804,581.

Government. In World War II, beginning in early 1944, the islands comprising what is now the Trust Territory were either wrested from the Japanese military forces or were isolated from further effective participation in the war. From the time of the expulsion of the Japanese until July 18, 1947, these islands were under military government ad-

ministered by the U.S. Navy. On that date the President of the United States approved the trusteeship agreement between the United States and the Security Council of the United Nations for the Trust Territory of the Pacific Islands (former Japanese mandate). The President, also on July 18, by Executive Order 9875 delegated to the Secretary of the Navy the responsibility for the civil administration of the Trust Territory, on an interim basis and until such time as a civilian department or agency should be designated to have permanent supervision of the government of the area. Pursuant thereto Admiral Louis E. Denfeld was commissioned as U.S. High Commissioner of the Trust Territory and Rear Admiral Carleton H. Wright was appointed Deputy High Commissioner. The present seat of government for the Trust Territory is at Guam. The Trust Territory for purposes of administration has been divided into the following districts: Saipan, Kwajalein, Majuro, Ponape, Truk, Yap, and Palau. In so far as possible, consistent with the fundamental principles of democracy, the indigenous people of the area have been encouraged to retain their traditional forms of government and to assume responsibility for the conduct of their own local affairs. Legislation to provide an organic act and local citizenship for the Trust Territory was submitted to the Congress of the United States in 1948 but no action was taken.

PAKISTAN. A self-governing dominion of the British Commonwealth of Nations. Pakistan was constituted on Aug. 15, 1947, in accordance with the Indian Independence Act passed by the British Parliament on July 18, 1947. The Dominion consists of two blocks of territory separated by 700 miles of the territory of the Union of India. The section in northwest India includes the former provinces of Sind, Baluchistan, Northwest Frontier Province, and West Punjab. The northeastern region includes East Bengal and the Sylhet District of Assam. Capital, Karachi.

Area and Population. Pakistan includes about 361,007 square miles, or almost one-fourth of the area of undivided India. The population is estimated at 70 million, of whom some 50 million are Moslems, 19 million Hindus, and the remainder Sikhs and others. Chief cities (1941 census): Lahore, 671,659; Karachi, 359,492; Dacca, 213,218. Education is not advanced and the percentage of illiteracy is high.

Production. The country is essentially agricultural, with an export surplus in normal times. Rice acreage is 26 million, yielding 9 million tons; wheat acreage 10 million, yielding 3.5 million tons. Cotton, much of which is long-staple, is estimated at 1.4 million bales for 1948-49. Annual production of hides and skins is about 9 million pieces.

The industry of Pakistan was dislocated by partition. The country has three-fifths of the jute production of undivided India but no jute mills. The textile industry includes 13 spinning and weaving mills and one small cooperative mill, with a capacity estimated at 100,000 bales in 1948. Pakistan has no steel or paper plants. Coal is inadequate, but there are potential petroleum and water power resources. Power is lacking for the establishment of the 27 industries proposed by the Industries Conference of December 1947.

Foreign Trade. Statistics are available only for the port of Karachi. The totals for the first 5 months of 1948-49 showed exports at 305.8 million rupees and imports at 304.6 million, giving a slightly favorable balance of trade. This made it possible to grant licenses for the import of woolen goods,

hardware, and electrical appliances from the United States.

Transportation. Pakistan has a railway mileage of 15,542 and a highway mileage of 49,863. By an agreement with India signed June 23 Pakistan was given two air lines, Orient Airways and Pak Air. Passenger and cargo maritime services from Pakistan ports were begun by British companies in 1948.

Finance. The State Bank of Pakistan came into operation July 1, 1948, to act as Government banker and to control the currency and foreign exchange. Indian currency remained legal tender until September 30, at which time Pakistan notes were required. Subscriptions to Government loans to May 24 were 420 million rupees.

Government. The legislative body remains that at the time of partition, the Constituent Assembly. Governor General to September 11, Quaid-i-Azam Mohamed Ali Jinnah (See *Events* below); after November 12, Khwaja Nazimuddin, acting Governor General in the preceding two months; Prime Minister, Minister of States and Defense, Liaquat Ali Khan.

Events, 1948. Pakistan, like its sister dominion of India, lost a revered leader in 1948. On September 11 the first Governor General, Mohamed Ali Jinnah, died unexpectedly in Karachi at the age of 71. After breaking with the Congress Party in 1921 Jinnah worked actively for the Moslem cause and in 1940, at the annual meeting of the Moslem League, he proposed an autonomous Moslem state comprising all the provinces of India with Moslem majorities. He became the first Governor General of Pakistan on Aug. 15, 1947, and in March 1948, he resigned as chairman of the Moslem League.

Dispute with India. In several other ways the year was a troubled one for Pakistan. The dispute with India over Kashmir, the northern province populated largely by Moslems whose Hindu ruler agreed to join India, remained serious throughout the year.

Recommendations of the United Nations Security Council early in the year for a neutral administration in Kashmir, the conduct of a plebiscite and Pakistan's withdrawal of fighting tribesmen from the area produced little result. A United Nations commission was sent to the area; on August 13 it proposed a cease-fire agreement to the Prime Ministers of Pakistan and India and suggested consultation about the arrangements for a plebiscite.

No progress was made, and the fighting appeared to increase in intensity. Conferences between the Prime Ministers of the two Dominions at the time of the Conference of Commonwealth Prime Ministers in London in October also had no visible effect. The United Nations Security Council's Kashmir Commission, rendering its report on November 22, admitted that it had "temporarily exhausted" the possibilities of negotiation, but added that its work would go on. The Commission took note of India's acceptance of its August 13 proposals while Pakistan attached conditions.

On December 15, at the end of an inter-Dominion conference, the two Dominions announced substantial agreement on a number of subjects, excluding Kashmir. Another conference was scheduled for Jan. 10, 1949.

Refugee Problems. Information released about the conference made no mention of the large movements of refugees still going on, particularly the evacuation of more than a million Hindus from East Bengal in Pakistan to West Bengal in India. Such migrations had caused great difficulty and hardship since movements of religious groups be-

gan immediately after independence was attained on Aug. 15, 1947. Pakistan maintained that the migration from East Bengal occurred in part because of pressure from groups in India.

After Pakistan had tried for a year the method of dealing with the refugee problem in West Punjab at the provincial level, it was decided that the Dominion Government should use its emergency powers. One of the last acts of Governor General Jinnah was to invoke these powers on August 27 because "the economic life of Pakistan was threatened." West Punjab had resettled nearly 5 million Moslem refugees, but at the cost of great overcrowding and some opposition from the residents of the already crowded areas.

The Dominion Government, through the Central Refugee Council, at the end of August ordered the various provinces and states to take assigned numbers of refugees, thus relieving West Punjab. In the province of Sind, which was dominated by big landlords, opposition was particularly vigorous, but the growing prestige of the Government and the Moslem League indicated that the program could be carried through.

Economic Problems. The problems and plans of a country whose viability was doubted in India, now that many of its enterprises had been truncated by partition, occupied a large share of the attention of the Government. "Pakistan," wrote the London *Times* correspondent in Pakistan on August 16, "is a paradise for planners. . . . Five and 10-year plans for vast hydro-electric schemes, coal mines, oil fields, shipbuilding yards, even model chicken farms which will guarantee every Pakistani his morning egg are envisaged. . . . The air in Karachi is made heady and exhilarating with such dreams and hopes."

An important statement on industrial policy, issued on April 2, contained an invitation to foreign capital to come to Pakistan, with the opportunity of subscribing 51 percent of the capital in some industries and 30 percent in others. Assurance was given that a "reasonable proportion" of profits could be taken home. With the central government as the chief planning agency, encouragement was to be given particularly to the fabrication of jute, cotton, and hides and skins.

The April announcement was further clarified on September 13, when the Pakistan Government published a communiqué interpreting "reasonable proportion" (of profits) as meaning that no restriction would be imposed except the usual limitations on foreign exchange transactions. It was also explained that the minimum Pakistan capital prescription did not apply to existing business or to foreign companies engaged in trading only.

Daily life in the Pakistan territory had its dreary side, even while the Government's ambitious plans found approval. In May only about one-half of the country's requirements of 1,000 million yards of cotton cloth was on hand. Pakistan's sugar production of 25,000 tons was one-tenth of the amount needed by householders. Shortages of coal, petroleum, iron, and steel caused delays and stoppages in transportation. Even the granary of India, West Punjab, which was beset by floods in 1948 and the influx of millions of refugees, had to ask, through the Dominion Government, for 60,000 tons of grain from the United Nations Food and Agriculture Organization.

—ALZADA COMSTOCK

PALESTINE. A former British mandate (10,640 square miles) at the eastern end of the Mediterranean, with an early 1948 population of about two million, two-thirds Arab (mostly Sunni Moslem) and

one-third Jewish. Chief cities: Jerusalem (originally capital), Haifa (port and oil pipe-line terminal), Tel Aviv (port, largest Jewish city in the world), and Jaffa (port).

For information on British mandatory government and communications and education before 1948 fighting, see YEAR BOOK. EVENTS OF 1947. For details of 1948 United Nations deliberations and Palestine fighting see the *Middle East Journal* quarterly chronology. (See also ARAB LEAGUE AFFAIRS, ISRAEL, UNITED NATIONS, and articles on Arab countries in this Year Book.)

Production. In spite of a serious water shortage Palestine has been primarily an agricultural country, thanks to good irrigation and subterranean water supplies. Citrus growing is highly developed (1948-49 crop was 7 million boxes, less than half the last prewar crop, because of the fighting) with other fruits, grains, vegetables, and olives also grown. Pond, lake, and sea fish are an important product. Industrial production developed with the advent of large numbers of Jewish immigrants and Jewish capital and received a tremendous impetus during the recent world war which cut off outside supply sources. Although Arab manufacturing concerns are small and limited, Jewish industry ranges from the Palestine Electric Corporation and the Palestine Potash Company holding the Dead Sea concession (with apparently inexhaustible supplies of potash, bromine, magnesium, common salt, etc.) to Haifa oil refineries, leather and metalwork factories, and the new rapidly growing diamond-polishing business. The figures of electric power production in thousands of kilowatts provide an index of the growth: 1939—77,227; 1946—209,230; 1947—256,826.

Foreign Trade. Principal exports include citrus fruits (four-fifths of total), cereals, olive oil and other food, wool, hides and skins, gas oil and fuel oil, polished diamonds, and a number of articles, mainly manufactured, including clothes, machinery, novelties, and leather. Imports include wheat, food, furniture, textiles, building materials, coal, and machinery. Over the war years other Middle Eastern countries provided a third to over a half of the imports and absorbed a third to over half of Palestine's exports—a significant factor in any post-partition economic arrangements. Other exports went to the United Kingdom, the United States, and other countries, and imports came from the United Kingdom, the United States, and other countries. In the first nine months of 1947 exports amounted to £P21 million, and imports £P67 million. Both imports and exports had risen since 1946 and the prewar years.

Finance. For the fiscal year 1946-47 government revenue totaled £P25,716,636 (a steady increase since 1939), whereas expenditure amounted to £P22,547,025 (an increase since 1939 except for a 1945-46 drop). Currency in circulation in November, 1947 totaled £P40,958,000. The wholesale price index in November, 1947, stood at a high of 357 (1939 = 100), having been 336 a year earlier. The Palestinian pound was equivalent to the pound sterling. By the year's end no announcement had been made of the reentry of all or part of Palestine to the sterling bloc or of the allocation of Palestine's sterling balances in London.

Events. UN Activity following Partition. The United Nations' November, 1947, vote for Palestine partition between Arabs and Zionists, its first unequivocal decision on a world problem, was made possible by active American and Soviet support in the face of the opposing opinions and votes of the

Middle Eastern states from Greece to India and Turkey to the Yemen. The UN Palestine Commission, charged with setting up the provisional governments, held its first meeting on Jan. 10, 1948, with Denmark, Panama, Bolivia, Czechoslovakia, and the Philippines represented. But a week later the Palestine Arab Higher Committee rejected Arab representation on the Commission. By the middle of February the Commission had to call for prompt UN Security Council action in providing armed assistance "which alone would enable the Commission to discharge its responsibilities." Within a week after its March arrival in Palestine the Commission's Secretariat stated there was insufficient agreement to make peaceful implementation of partition possible.

When the UN Security Council considered the question in the middle of February American concern over the threat to peace was stronger than its interest in creating a Zionist state. This concern was reflected in: (1) the American Delegate's February 24 statement that any Council action must be directed only to preserving peace and not to enforcing partition; and (2) his March and April efforts in behalf of trusteeship (opposed by the Soviet Union) and a recall of the Assembly to consider a new solution.

An April 14 Security Council resolution advocating a military and political truce was accepted by the Arabs with provisos. The Jewish Agency, objecting to all major points, presented other recommendations which the Arabs refused. As the result of a Council vote of 9 to 0 (Soviet Union abstaining) a special meeting of the UN General Assembly convened on April 16 and discussed various suggestions including the trusteeship proposal, cease-fire orders, plans for administering Jerusalem, and British suggestions for carrying on essential administrative services after their withdrawal.

British Withdrawal. These UN debates were reflecting the developing crisis in Palestine. Immediately following the partition vote both Jews and Arabs mobilized and December clashes mushroomed into fighting and bombing. Having announced that its mandate would end May 15, Great Britain was faced with the twofold task of maintaining security while withdrawing its personnel, including troops. Evacuation of British administrative personnel, starting in March, was accompanied by the suspension of mail, money orders, and all insured services.

Following the death of 30 British soldiers in a train explosion the Palestine government issued an official statement condemning the Jewish Agency for condoning terrorism. By April the fighting was full-fledged, significant among the battles being those for the Old City of Jerusalem and the Jerusalem-Tel Aviv road. Fighting in Jaffa at the end of April was ended under threats of force, but by May 13 the former Arab city was an open city policed by Haganah. On May 15 the British High Commissioner left, thereby ending the British Mandate. The State of Israel was declared and immediately recognized by the United States, and two Egyptian columns invaded Palestine.

UN Mediation. After the Assembly disbanded the Palestine Commission, the Big Five on May 20 unanimously agreed to appoint Count Folke Bernadotte UN Mediator for Palestine. Two days later the Council voted a resolution urging "all governments and authorities" to abstain from "hostile military acts" in Palestine. Egyptian and Jewish planes went into action, and the seven Arab League nations initially rejected the cease-fire order on

the basis that it would only give advantage to Jewish "terrorist bands." However, as the UN Mediator arrived in Palestine, both Arabs and Jews accepted the Council's request for a four-week cease-fire order under threat of UN sanctions. On June 9 both sides unconditionally accepted a truce to start June 11. After four days of truce the Mediator, reporting occasional violations, expressed satisfaction with its effectiveness and began informal conferences with leaders of both sides.

On June 28 the Mediator submitted tentative proposals to Israel and the Arab states, including the following: (1) A Palestine union embracing Transjordan to be composed of two states; (2) Israel and the Arab state each to exercise full control over their own domestic and defense problems; (3) both states to solve mutual economic and defense problems through a Central Council; (4) immigration to be within the competence of each state, subject to the Central Council's review after two years; (5) Jerusalem to be under Arab rule, subject to some local government by a municipal council representing the 100,000 Jews there; (6) the Arabs to receive part or all of the Negeb (southern triangle); (7) the Jews to receive part or all of Western Galilee; and (8) Haifa to be a free port and Lydda a free airport.

Before a week passed both Arabs and Jews rejected the proposals. In spite of the Mediator's efforts toward extension the cease-fire order expired on July 8 and fighting started again. An additional ten-day armistice was refused by the Arabs. While the Mediator discussed the situation with the Security Council, the Council's Truce Commission, consisting of the consuls in Jerusalem of France, Belgium, and the United States, reported Jerusalem's international character was gravely threatened by Israeli actions and statements. The Council voted a truce and cease-fire resolution to which both Arabs and Israelis agreed, effective July 18. Two days after an Israeli-Arab signing of a boundary agreement establishing the limits of Jerusalem's Arab and Jewish areas, Israel's General Zionist Party adopted a resolution demanding that Jerusalem be included in Israel. Much UN discussion followed on both the demilitarization of Jerusalem and its eventual status. Although on September 2 both Jews and Arabs agreed to another cease-fire, on September 9 Israel rejected the Mediator's proposals for gradually broadening Jerusalem's demilitarization. Reports of truce violations by both sides poured in and firing broke out in Jerusalem again. Then, on September 17, UN Mediator Bernadotte was shot and killed by an unknown Zionist terrorist.

Bernadotte's Final Report. Immediately following his death the General Assembly released the Mediator's final report which said, among other things: (1) Peace must be restored by any means possible; (2) Israel exists, and there are no sound reasons for assuming it will not continue to do so; (3) the original partition boundaries must be revised to produce "geographical homogeneity"; and (4) displaced persons must be assured the right to return home, or adequate compensation if they cannot or will not return. Suggested territorial changes included: (1) the Negeb to be Arab territory; (2) Galilee to be Israeli territory; and (3) Jerusalem to be under UN control.

The U.S. Secretary of State announced full support of these recommendations, as did Great Britain. However, Israel opposed any plan separating any part of the Negeb from the state of Israel. Another UN Security Council cease-fire order, effective October 22, theoretically accepted by both Egypt and Israel, was accompanied by well-

planned Israeli attacks on Iraqi and Egyptian bases. Israel refused to withdraw from areas under its army's control, but finally decided on a cease-fire as of October 31. As Egyptian troops withdrew, UN observers reported Israel forces in Lebanon to a depth of two to three miles. A November 4 Council resolution called upon Egypt and Israel to withdraw from positions taken since October 14, to conduct direct negotiations, and to establish permanent truce lines and neutral zones. Egyptian troops continued to withdraw but Israel announced it awaited proposals for new military lines in the Negeb before taking action on the resolution. More UN discussions followed as to neutral zones and Bernadotte's final plan. A November 30 armistice providing for a "complete and sincere cease-fire" in Jerusalem was signed by Arab and Israeli commanders.

UN Conciliation Commission. In early December the Assembly gave a new Conciliation Commission a free hand to work out a permanent settlement, but without military power to impose that settlement. As of December 21, with the air still tense and stormy, UN observers were reduced from 350 to about 200. Only about 60,000 Arabs remained in Israel, but the latter's population was being increased by nearly 25,000 Jewish immigrants monthly. Israel officials refused permission for entry into certain strategic areas by either UN observers or newsmen. On December 23 UN observers reported a full-fledged Israeli offensive. A British charge of Israeli invasion of Egypt produced a December 29 cease-fire order by the Security Council.

Refugees. One of the ironies of the situation was the displacement of hundreds of thousands of Arabs by the establishment of a Zionist state, intended to provide a home for European Jewish refugees (175,000 as estimated by an International Refugee Organization official in the summer). By early May 175,000 to 200,000 Arabs were reported to have fled from Zionist-occupied areas. As all the Arab governments attempted to alleviate their plight, Israeli Foreign Minister Moshe Shertok, disclaiming Israeli responsibility for their departure, announced in August that Israel would discuss their return only as part of the final peace treaty. Shortly following a substantial British gift of medical supplies and tents the UN Mediator requested help for 337,000 refugees.

On October 29 the UN International Childrens' Emergency Fund voted six million dollars for Arab aid. By December 11 there were at least 700,000 refugees, most of them destitute. A UN Palestine refugee organization was set up under the direction of American Ambassador to Egypt Stanton Griffis, with the American and International Red Cross and the Society of Friends participating. The International Refugee Organization was scheduled to consider the problem at its January meeting.

—DOROTHEA SEELYE FRANCK

PALMYRA ISLAND. An atoll in the Pacific (5° 5' N. and 162° 5' 55" W.), 960 miles south by west from Honolulu and 362 nautical miles north of the Equator. It comprises 52 small islets having a total area of 250 acres. By Executive Order dated Dec. 19, 1940, Palmyra Island was placed under the control and jurisdiction of the Secretary of the U.S. Navy. The island is an important station on the Hawaii-Samoa air route. On May 12, 1947, the Supreme Court of the United States in *U.S. v. Fullard-Leo*, held that title to Palmyra Island is vested in the Fullard-Leo family by reason of a grant in favor of their predecessors in title from the government of Hawaii before United States annexation.

PANAMA. A republic of Central America. The land west of the Canal is a highland range; a second mountain range follows the shore of the Caribbean, and a third is in the southwest. The Caribbean coastland is humid and hot; along the Pacific coast the climate is healthier.

Area and Population. Area: 28,576 square miles. Population (excluding the Canal Zone which had 47,352 inhabitants in 1947): 701,000 (1947 est.); of whom 65 percent were mestizos, 13 Negroes, 11 of European descent, 9 Indians, and 2 percent members of other ethnic groups including Asiatics. Chief cities: Panamá (capital), 111,893 inhabitants in 1940, Colón, and David.

Education and Religion. The constitution guarantees freedom of worship. Roman Catholicism predominates. Only about 70 percent of the population excluding Indians is literate. In the school year of 1947-48, there were 812 elementary schools and 47 pre-schools with a total enrollment of 92,707. At the same time 9,336 students attended secondary schools, and 1,219 the University of Panama.

Production. Panama is predominantly agricultural, 53 percent of the gainfully employed being engaged in agriculture. The economic life of the country is influenced by and dependent upon the commercial life of the Canal Zone. Principal commercial crops (with 1947 production figures) are: abacá fiber, 11,455,625 lb.; bananas, 3.5 million stems (5 million in 1946); cacao, 5,138,186 lb., with the 1948 production expected to approximate that of 1947. Chief food crops are: rice (1947), 1,151,042 quintals (of 101.43 lb.); corn, 85,600,000 lb.; sugar, 171,000 quintals; coffee, 2,500,000 lb.; and coconuts, 18 million. At the end of 1947 there were 563,956 heads of cattle and 183,487 hogs.

Industrial production is limited to consumer goods, of which the most important are beverages (21,057,314 liters in 1947); distilling (1 million liters rectified alcohol); footwear (325,000 pairs); evaporated and condensed milk (55,000 cases); and soap (11 million lb.).

Foreign Trade. Panama is a net importer of goods and services, the major source being the United States. Imports in 1948 (10 mos. actual, 2 mos. est.) were valued at 66.36 million balboas (balboa equals one U.S.\$); exports at 7.68 million balboas. The comparative figures for 1947 were \$75,568,225 for imports; \$8,349,408 for exports.

Transportation. There are 531 miles of railroad of which 134.7 are in the Canal Zone; and 1,090 miles of different types of roads. Shipping under Panamanian registry totaled 500 ocean-going vessels (2 million gross tons) on Dec. 31, 1946. By October, 1947, it had increased 50 percent. Air service is rendered by important international lines; daily services operate between Panama and New York, and connect with other South and Central American countries.

Finance. The budget for 1948 estimated expenditure at \$34,638,742; revenue at \$33,138,974. Of this budget, \$7 million will go to Education and nearly half a million for the construction of a University City. The public debt on June 30, 1947, was \$23,468,029 compared with \$19,898,469 on Dec. 31, 1946. Currency in circulation at the end of 1947 was 82.6 million balboas; bank deposits 32.6 million balboas.

Government. Under the constitution of 1946 (the third since 1903), Panama is an independent republic of nine provinces and one *Intendencia*. The legislature is a unicameral National Assembly of 32 Deputies elected for 6 years; Executive power

is vested in a President (elected for 6 years) assisted by a Cabinet of 7 Ministers. On Oct. 1, 1948, Domingo Díaz Arozamena was inaugurated as President. (See *Events* below.)

Events, 1948. The year was one of high political tension. Elections were held and results were contested. The question relating to the return of the United States bases still attracted public attention; while the general unrest that prevailed throughout Central American nations perturbed the Government of Panama.

Campaign Highlights. In January, there were already six names mentioned as candidates for the elections to be held on May 8. Most important were ex-president Arnulfo Arias Madrid, backed by the *Partido Nacional Revolucionario (Auténtico)*, and Domingo Díaz Arozamena, nominated by the *Unión Liberal*. In February, Arias' nomination was challenged before the National Electoral Jury on technical constitutional grounds. He was considered such a strong candidate that his opponents felt it important to eliminate him. In March, some of the minor candidates waived their nominations and their parties decided to back Arias. Political tension was later aggravated by the attempted assassination of the attorney representing the case against Arias.

Outcome of Elections. The elections were held on May 9, with early reports indicating Arias' victory. Reportedly, a large number of women cast their ballots for him. On May 28, Arias was said to be ahead of Arozamena, 73,459 to 71,897, but these results were not considered official since the National Electoral Jury had not as yet decided upon Arias' eligibility. Many other cases were filed claiming fraud in several electoral districts. The stalemate was prolonged for nearly two months, and clashes occurred between the followers of Arias and of Arozamena. Arias took refuge in the Canal Zone, stating that the government, together with his opponents, was plotting to "steal his victory."

Arozamena's Legal Victory. The National Electoral Jury finally rendered a decision in favor of Arozamena, who had won, according to them, by 1,116 votes. Arias refused to accept the decision and departed for Colombia. Arozamena took office on October 1, outlining the following program: (1) continuation of the policies of President Jiménez—stressing good relations with the United States, but always defending the sovereignty of Panama; (2) expansion of education, development of agriculture, and commerce; (3) intensive public-works program and fulfillment of all international economic obligations. Political circles expected President Arozamena to meet with difficulties in Congress, since none of the political parties had a majority.

International Front. Early in the year, the question of the return of United States bases to Panama was still pending. The American Government returned 11 of the 13 bases and promised to return the last two at a later date. Another issue was raised as a result of the civil war in Costa Rica. Many citizens of that country entered Panama, and the Government was forced to station troops near the border.

Panama attended the Ninth Inter-American Conference of American States held at Bogotá in April (see PAN AMERICAN ACTIVITIES), and became signatory to the Charter of the Americas.

—MIGUEL JORRÍN

Atlantic and Pacific oceans. By the Hay-Bunau Varilla Treaty concluded in 1903, the Republic of Panama granted to the United States in perpetuity the use, occupation, and control of the Canal Zone for the construction, maintenance, operation, sanitation, and protection of the Canal. The treaty provided for the payment to Panama of a lump sum on the exchange of ratification of the treaty, and also an annual payment (which is an annuity and not rental) beginning nine years after the date aforesaid. A new treaty was signed on Mar. 2, 1936, which makes various amendments and additions. Total area of the Canal Zone is 648.01 square miles including 275.52 square miles of water. Balboa Heights is the administrative center.

Population. The 1940 United States census reported 51,827 persons in the Canal Zone of whom 32,856 were white. According to the annual census of the Canal Zone taken in April 1948, the population was 47,462, of whom 22,787 were United States citizens. On June 26, 1948, the force employed by the Panama Canal-Railroad Company numbered 5,020 employees paid at United States rates (chiefly U.S. citizens) and 17,716 employees paid at local rates (chiefly natives of the tropics).

Economic Conditions. The Canal Zone is in effect a United States government reservation, the principal industry being the maintenance and operation of the Panama Canal, including auxiliary enterprises to provide adequately for the needs of shipping and of the Canal operating forces. The Canal Zone is populated largely by employees and personnel of The Panama Canal-Panama Railroad Company organization and the armed forces, together with families of these groups. Transits of the Canal by ships in the fiscal year ended June 30, 1948, totaled 6,999.

Panama Canal Finances. For the fiscal year ended June 30, 1948, there was a net revenue from tolls and other sources of \$2,622,673. The net capital investment in the Canal, after depreciation, as of June 30, 1948, was \$516,332,328.

Government. A civil government was authorized by Congress by the Panama Canal Act of 1912. Administration rests in the hands of a Governor appointed by the President, by and with the advice and consent of the Senate, for a period of four years, but by Executive Order of Sept. 5, 1939, the provisions of Section 13 of the Panama Canal Act were invoked as an emergency measure, and since that date the Commanding General, Panama Canal Department (now Commander in Chief, Caribbean), United States Army, has exercised final authority over the operation of the Panama Canal and all its adjuncts, appendants, and appurtenances, including control and government of the Canal Zone; and the Governor of the Panama Canal has been subject to that authority and orders issued under it. Subject to such superior authority the scope of government goes much beyond the functions of the government in the other territories. The Governor's duties can be compared to those of an executive in the management of a vast business organization.

Events, 1948. The President of the United States, by Proclamation No. 2775, signed Mar. 26, 1948, prescribed for the Panama Canal a revised schedule of rates of toll, effective Oct. 1, 1948. (Note: The effective date was later changed to Apr. 1, 1949 by Presidential Proclamation No. 2808 signed Sept. 7, 1948.) The revised schedule is as follows: On merchant vessels, yachts, Army and Navy transports, colliers, hospital ships, and supply ships, when carrying passengers or cargo, \$1.00 per net

vessel-ton of 100 feet of earning capacity; on vessels in ballast without passengers or cargo, 80 cents per net vessel-ton; on other floating craft, including warships other than transports, colliers, hospital ships, and supply ships, 55 cents per ton of displacement. The current rates, which became effective Mar. 1, 1938, are 90 cents per net vessel-ton on laden vessels, 72 cents per net vessel-ton on vessels in ballast, and 50 cents per ton of displacement for other floating craft.

Bibliography. *Annual Report of the Governor of the Panama Canal*, Government Printing Office, Washington, D.C.

PAN AMERICAN ACTIVITIES, Bogotá Conference. The focal point of all Pan American activity during the year was the Ninth International Conference of American States, which met in Bogotá, Colombia, from March 30 to May 2. It was probably the most eventful and most fruitful in the series that began in Washington in 1889. After the conference was under way, an outbreak of mob violence occurred on April 9 following the fatal shooting of a popular leader of the Liberal Party of Colombia, Dr. Jorge Eliécer Gaitán, by an obscure fellow-countryman.

Much of the early destruction by the crowd was in the Capitol itself, seat of the conference; this fact, together with the general upheaval that ensued throughout the city and country, threatened for a time the very continuance of the conference. However, the delegations from the 21 republics were united in their determination to complete the essential parts of the program.

The concrete results of the conference are measured in terms of the instruments signed, which include the following: Charter of the Organization of American States; Economic Agreement of Bogotá; American Treaty of Pacific Settlement; Inter-American Convention on the Granting of Civil Rights to Women; Inter-American Convention on the Granting of Political Rights to Women; and Final Act of the Ninth International Conference of American States.

The Charter, already in provisional effect, furnishes the first constitution ever to be adopted jointly by the 21 independent countries of this hemisphere. Containing very few innovations, it brings together most of the basic principles and proven practices that had grown up during the past half century, and adds others needed to bring it up to date. The basic Economic Agreement is a statement of broad principles to guide the members in the conduct of their mutual economic relations, and presumably it will be implemented by a more specific program to be adopted at the special Inter-American Economic Conference scheduled to be held in Buenos Aires in 1949.

Application of the Rio Treaty. Another outstanding event occurred toward the end of the year, when on December 3 the Ambassador of Costa Rica deposited the ratification by his Government of the Inter-American Treaty of Reciprocal Assistance signed at Rio de Janeiro Sept. 2, 1947. That ratification, which completed the necessary two-thirds, enabled the Mutual Defense Treaty to enter into force.

By coincidence, Costa Rica became the first republic to invoke the terms of that treaty. On December 12 the Chairman of the Council of the Organization of American States called a special session and read to them the terms of the note in which the Government of Costa Rica requested the Council to call a Meeting of Consultation of the Ministers of Foreign Affairs, charging that the Government of Nicaragua had permitted an armed

invasion to proceed from its territory into that of Costa Rica for the purpose of overthrowing the established government. The Council voted to call such meeting but left the time and place in abeyance.

The Council held meetings on December 12, 14, 15, 17, 24, and 28, most of them as the Provisional Organ of Consultation, in accordance with terms of the Rio Treaty. A Committee of Information was named by the Council and dispatched to Costa Rica and Nicaragua to investigate the situation, and upon its return it recommended a series of steps which the Council adopted. These called upon the two governments to suppress any military activity in their respective territories that might constitute a threat against the other. The Council also appointed a Military Committee, which proceeded to Central America for the purpose of observing the extent to which the two parties carried out the measures of the Council to which they had agreed.

Peaceful Settlement Between Cuba and Dominican Republic. Several months earlier, and before the entrance into force of the Rio Treaty, another inter-American agency had persuaded two American republics to resume normal diplomatic means to settle a dispute that had arisen. The Government of the Dominican Republic requested the Council of the Organization to convoke the Committee on Methods for the Peaceful Solution of Conflicts, provided for by a resolution of the Second Meeting of Foreign Ministers held at Havana in 1940. While originally constituted by one representative each from Argentina, Brazil, Cuba, Mexico, and the United States, this was the first time that it was called upon to take specific action.

During a series of meetings that began on July 31 it considered certain charges brought by the Dominican Republic against the Government of Cuba respecting matters that the former claimed could not be settled by ordinary diplomatic means. After the meeting held on October 26, the Committee was able to announce agreement by the two parties to resume direct negotiations and to settle their mutual problems peaceably. While the elements making up these negotiations were not of a sensational nature, the success of this inter-American body in securing the peaceful solution of a regional dispute must be considered noteworthy.

Other Events. As a result of action taken at the Bogotá Conference, the permanent executive body of the inter-American system was converted from the Governing Board of the Pan American Union into the Council of the Organization of American States. To the casual observer, the quiet transformation of this 21-man body at the May 18 meeting in Washington went unnoticed.

Personnel changes during the year brought in these replacements: Captain Colón Eloy Alfaro became Special Representative of Ecuador on January 7; on March 8 Dr. Enrique Finot became the Special Representative of Bolivia, and Dr. Ismael González Arévalo, as new Ambassador of Guatemala, the Representative of that country; new Ambassadors attending the meeting held on May 18 were Dr. Ernesto Jaén Guardia, Dr. Juan Félix Morales, and Dr. Mario Esquivel, representing Panama, Paraguay, and Costa Rica respectively; while on July 30 the Council welcomed Dr. Silvio Villegas as Special Representative of Colombia, Dr. Octavio Vallarino, new Ambassador of Panama, Dr. Enrique V. Corominas, Special Representative of Argentina, and Paul C. Daniels, Special Representative of the United States.

At the meeting held November 3 the Special

Representative of Argentina, Ambassador Enrique V. Corominas, was elected Chairman, and the Ambassador of Haiti, M. Joseph D. Charles, Vice Chairman of the Council, replacing the Delegates of Peru and Uruguay respectively.

The following distinguished visitors were officially received at the Pan American Union by the Governing Board or its successor, the Council: on January 6 the Minister of Foreign Affairs of Ecuador, Dr. Antonio Parra Velasco; on July 2 the newly elected President of Venezuela, Dr. Rómulo Gallegos; on September 7 Dr. Rómulo Betancourt, ex-President of Venezuela; on December 9 Dr. Carlos Prío Socarrás, President of Cuba.

An outstanding statesman of the hemisphere, Foreign Minister Jaime Torres Bodet of Mexico, was elected Director General of UNESCO in November. The Inter-American Conference for Conservation of Renewable Natural Resources was held Sept. 7-20, 1948, in Denver, Colo.

During the course of the year considerable progress was made on plans for the operation of the Leo S. Rowe Pan American Fund, a bequest contained in the will of the late Director General of the Pan American Union for use in making loans to Latin American students who wish to study in the colleges and universities of the United States.

—PAUL R. KELBAUGH

PAPUA. An Australian territory, comprising the southeastern portion of the island of New Guinea (87,786 sq. mi.) and the islands of Trobriand, Woodlark, D'Entrecasteaux, Louisiade groups (2,754 sq. mi.). Total area: 90,540 square miles. Population (1947 est.): 302,000, including 2,000 Europeans. Capital: Port Moresby. The principal products are coconuts, rubber, sago, gold, silver, and osmiridium. Administrator: Col. J. K. Murray.

PARAGUAY. A republic of South America. The eastern third of the country is a plateau, and west of it there are low plains. The vast alluvial plain of the Gran Chaco stretches westward from the Paraguay River. The climate is subtropical and variable, depending on whether the air masses come from the tropics or the subpolar regions.

Area and Population. Area: 150,500 square miles. Population: 1,225,000 (1947 est.), of whom about 97 percent are mestizos and the rest of European descent. Chief cities: Asunción (capital) 210,000 inhabitants, Villarica, and Coronel Oviedo.

Education and Religion. The Constitution guarantees freedom of worship. Roman Catholicism is the established state religion. Spanish is the official language, but the majority of the people speak Guaraní as well. According to official reports, practically the entire population over 10 years of age has a rudimentary knowledge of reading and writing. The most recent educational statistics (1947) show 1,293 elementary schools with 176,465 pupils; 14 secondary schools with nearly 6,000 students, and a National University with an enrollment of 1,600 in 1944.

Production. The economy of the country is predominantly agricultural and pastoral. Chief agricultural production in 1947 (metric tons) was: tobacco, 12,500; sugar, 15,511; corn, 114,636; peas, 31,218; seed cotton, 37,300 and lint cotton, 57,300 bales. Industrial production: tannin, 44,914; flour, 27,830; sugar, 17,921; preserved meats, 10,967. Stock-raising is an important industry. Estimated livestock (1945): over 4 million cattle and 170,000 sheep.

Foreign Trade. Total imports in 1947 amounted to 68,087,000 guaraníes (a guaraní equals U.S.

\$0.52); exports to 65,703,000 guaranies. Largest exports go to Argentina, Great Britain, Uruguay and the United States; imports come from Argentina, the United States, Great Britain, and Uruguay. Exports for the first quarter of 1948 were reported to be 9 percent below those of the same period of the previous year, Argentina still taking 75 percent of the whole.

Transportation. There are 713 miles of railway and 4,122 miles of highways of all kinds. Air services are supplied by five airlines.

Finance. The budget estimates for 1947 placed revenue at 46,929,000 guaranies; expenditure at 56,129,000 guaranies. Internal funded debt at the end of 1947 reached 42 million guaranies. Gold reserves in June, 1947, were 1,870,000 guaranies; foreign exchange holdings 33,697,000 guaranies. The cost of living index in December, 1947, was 319 (1937 = 100). In September, 1948, the new government presented a bill to float an internal loan of 20 million guaranies, to be devoted entirely to a public works program.

Government. Under the Constitution of 1940, Paraguay is a centralized republic of 12 departments. Legislative power is exercised by a unicameral Congress. Executive power rests in a President, assisted by a Council of Ministers and a Council of State. On February 15, Natalicio Gonzalez was elected President and took office on August 15.

Events, 1948. Paraguay, like nearly half of the Latin American republics, had a change of government in 1948. Domestic politics were influenced by the electoral campaign; economic life was affected by the postwar inflation, and international relations disturbed by the economic dependence of the country on Argentina.

Elections. On February 15, presidential elections were held. Only one party went to the polls, and its candidate, Natalicio Gonzalez, was elected. The president-elect was closely connected with Moríño's dictatorial regime, in which he held the portfolio of Finance. The Colorado Party, which nominated Gonzalez, also won a substantial majority in the Congress. The other parties refrained from voting as a sign of protest. After the elections, the political climate was far from favorable. There were serious divisions among the *Colorados*, and several members of Moríño's Cabinet resigned in protest. The armed forces showed symptoms of unrest.

The President Resigns. The "lame duck" period between Gonzalez' election and his inauguration, scheduled for August 15, proved to be difficult for President Moríño. Members of the opposition were imprisoned, and the North American press accused the Government of having turned the country into a large prison camp. In spite of desperate efforts made by the President, the opposition grew stronger and the leaders of the *Colorados*, in order to avert trouble, demanded Moríño's resignation. The President yielded and his place was taken by the President of the Supreme Court, Juan Manuel Frutos, who was to continue in office until Gonzalez' inauguration.

New Administration. President Gonzalez took office on the date scheduled, and kept the same Cabinet appointed by Frutos. The inaugural ceremonies were conducted with pomp, and outstanding intellectuals of the continent were invited to attend. The new administration endorsed a liberal program, and spoke of the necessity of a more democratic constitution for the country.

Army Rebellion. On October 25, the cadets of the military academy at Asunción attempted a revolt to overthrow the Government. The movement was

headed by Colonel Carlos Montanado, but police forces, after a brief struggle, succeeded in checking it until the army took over and captured most of the revolutionists. In political circles, it was rumored that the rebellion was backed by dissatisfied members of the Colorado Party. Later, President Gonzalez tried to prevent future trouble by issuing a decree to the effect that all armed forces should be under the direct command of the President.

Paraguay attended the Ninth Inter-American Conference of American States held at Bogotá (see PAN AMERICAN ACTIVITIES) and became signatory to the Charter of the Americas.—MIGUEL JORRÍN

PATENT OFFICE, United States. Applications for patents filed for the fiscal year ending June 30, 1948, totaled 80,708, compared to a figure of 86,749 for the preceding fiscal period. Patents granted totaled 24,617, including designs and reissues, an increase of 2,428 over the 22,189 issued for the corresponding period in the preceding year, and the first year there was an increase in the number of patents granted since 1941.

The total number of applications for patents pending on June 30, 1948, was approximately 244,000, an increase of some 28,000 cases over the figure at the close of the previous year. Of the cases pending, about 156,000 were awaiting action by the Office, slightly under 4,000 were involved in appeals and interference proceedings, and the remainder, about 84,000 were under rejection, awaiting response by applicants.

The inaugural year of operations under the Trade Mark Act of 1946 was one of expanded activity, with the Office registering and renewing 16,115 trade marks, an increase of 2,402 over the 13,713 figure for the preceding year. On June 30, 1948, approximately 57,000 applications for registration, renewal, and republication were pending before the examiners, with some 20,000 additional pending cases awaiting response by applicants. New Rules of Practice in Trade Mark cases were promulgated coincident with the effective date of the 1946 Act, on July 5, 1947.

Patents granted since 1836, when the consecutive numbering was begun totaled 2,444,411 on June 30, 1948. Some 25,000 of these had been placed on the Register of Patents available for license or sale since 1945, when the Register was established in the Patent Office. The Office sells printed copies of patents for 25 cents each, designs and trade marks for 10 cents each. During the year ended June 30, 1948, more than six million copies of patents were distributed, almost a half million going to libraries, and nearly two million to foreign countries under exchange agreements.

A program of improvements designed to render additional and better service to the public was continued: the roster of attorneys and agents registered to practice before the Office was revised; a comprehensive list of patents owned by the United States Government was compiled; a proposed revision of the Patent Rules of Practice was printed and widely distributed in June for solicitation of comments and suggestions; and a project to perfect the patent copy reference collection maintained for public use in the search room was initiated.

Net receipts for the fiscal year were \$5,651,585, an increase over the preceding year of \$836,325, and obligations incurred under all Patent Office appropriations amounted to \$8,603,032 as compared with \$7,262,472 for the preceding year.

—LAWRENCE C. KINGSLAND

PENNSYLVANIA. A middle Atlantic State. Area: 45,333 sq. mi. Population: (July 1, 1948) 10,689,000, compared with (1940 census) 9,900,180. Chief cities: Harrisburg (capital), 83,893 inhabitants in 1940; Philadelphia, 1,931,334. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended May 31, 1947, total revenue amounted to \$499,638,000; total expenditure, \$491,263,000.

Elections. The 35 electoral votes went to Dewey who received 1,901,160 votes to Truman's 1,751,186 and Wallace's 54,603. Roosevelt's 1944 plurality over Dewey was 105,400. There was no contest for Senate or Statewide office. In races for House seats, Democrats won 16 and Republicans 17, a Democratic gain of 11.

Officers, 1948. Governor, James H. Duff; Lieut. Governor, Daniel Strickler; Secretary of Commonwealth, Charles M. Morrison; Attorney General, Thomas McK. Chidsey; State Treasurer, Ramsey S. Black; Auditor General, G. Harold Wagner.

PERMANENT JOINT BOARD ON DEFENSE—United States and Canada. A Board set up by President Roosevelt and Prime Minister W. L. Mackenzie King in pursuance of a joint communiqué dated Aug. 17, 1940, to "commence immediately studies relating to sea, land, and air problems including personnel and material" and "consider in the broad sense the defense of the north half of the Western Hemisphere." Chairman: Canadian Section, Gen. Andrew G. McNaughton; United States Section, vacant since Spring 1948.

PERU. A republic of South America. The country is divided into three natural regions, Costa, Sierra, and Montaña. The Costa is a lowland, the Sierra, highlands and gentle slopes, and the Montaña heavily forested slopes eastward of the Andean mountains. Climate on the coast is cloudy and cool; in the highlands it ranges from very wet to very dry, according to the seasons.

Area and Population. Area: 482,258 square miles. Population: 7,246,000 (1948 est.) excluding inhabitants in the jungle areas. About 45 percent are Indians, 7 of European descent, another 45 mestizos, and the rest Asiatics and Negroes. Chief cities: Lima (capital), 628,821 inhabitants, Callao, and Arequipa.

Education and Religion. The Constitution guarantees freedom of worship. The Roman Catholic Church is protected by the State. Spanish is the official language, but Quechua and Aymara are spoken among the Indians. 42 percent of the total population is estimated to be literate. In 1947, Peru had 8,898 public primary schools with a total enrollment of 808,860. There are also private elementary schools, and 87 kindergartens. 165 secondary schools in 1944 had an enrollment of 22,474. There are five universities.

Production. Peru's economy is dependent on agriculture, stock-raising, and mining. Manufacturing contributes somewhat to the national occupation. The two principal export crops in 1947 were sugar (411,723 metric tons) and cotton (1.3 million quintals of 101.43 lb. each). The cotton crop was unsatisfactory due to labor shortage and drought. Production of sugar in 1948 was forecast at 450,000 metric tons. Oil production has been increasing every year, and in 1947 amounted to 12,763,807 barrels, an increase of 2.5 percent over the previous year. Other important mining products are copper, silver, lead, tungsten, and gold. Industrial production is centered around beer, leather goods, cotton

and wool textiles, and silk goods. Livestock industry provides for local markets and exports of wool from sheep, alpaca, llama, and vicuña.

Foreign Trade. Total exports in 1947 amounted to \$154.3 million; imports to \$168 million. Imports for the first six months of 1948 were valued at 568.9 million soles; exports at 489.2 million soles (a sol equals U.S.\$0.15), an indication that the country would continue to have an unfavorable balance of trade.

Transportation. Peru has 3,348 miles of railroads and 20,663 miles of highway of all types. Air transportation is provided by international lines as well as domestic companies.

Finance. In the absence of congressional action on the 1948 budget bill, a decree of Jan. 1, 1948, promulgated a budget balanced at 927 million soles. In the 1947 budget estimates, revenue and expenditure were balanced at 946 million soles. Currency in circulation at the end of 1947 was 653 million soles; bank deposits 931 million soles; gold reserves \$20 million.

Government. Under the Constitution of Mar. 29, 1933 (amended 1936, 1940), Peru is a centralized republic divided into provinces and departments. Legislative power rests in a Senate of 49 members and a Chamber of Deputies of 52, all elected to serve a 6-year term. Executive power is vested in a President and two Vice Presidents, similarly elected. An Economic Council composed of specialists in various fields serves the President in an advisory capacity. The President exercises his functions through a Cabinet of Ministers. On October 27, a military coup overthrew President José Luis Bustamante and appointed a provisional government headed by General Manuel Odria.

Events, 1948. Early in the year, the political crisis caused by the withdrawal of the APRA party from the government (see YEAR BOOK, *Events* 1947), appeared to lessen in tension, and public attention was focused on economic problems, i.e., inflation and the scarcity of foreign exchange. Haya de la Torre, APRA leader, came to the United States, his trip being interpreted as an attempt to obtain economic assistance for Peru from the U.S. Government.

APRA Congress. Between May 27 and June 2, an APRA congress was held at which important resolutions were taken, principally a recommendation for the creation of a Ministry of Economic Planning; support of the recently organized Inter-American Federation of Workers (CIT); a statement of position against the European colonies in Latin America; and the demand for expulsion of Communists from Government posts. APRA support of the CIT was criticized in labor circles as dangerous to the workers unions of the continent, and as being definitely partial to the American Federation of Labor, which appears to have backed the new labor organization.

Rebellion at Juliaca. The city of Juliaca witnessed a military rebellion early in July, headed by Alfonso Llosa of the rightist *Union Revolucionaria* party. The uprising was rapidly quelled, and the leader fled to Bolivia. It appeared that the military revolt was caused by the political deadlock created by the 21 Senators belonging to the *Alianza Nacionalista* party, who declared a strike and refused to attend the sessions of Congress, thereby hindering the legislative functions of the Government.

The Senators' behavior, which is a continuation of their last year's policy, was directed toward hampering Bustamante's coalition Government. The President cancelled the convocation of the Congress, and the APRA issued a manifesto against

his decree, stating that he was recognizing the Senators' right to strike. The APRA recommended legal action against the Senators for abandonment of their functions.

Conflicts between the APRA and Bustamante. The Administration decided to convoke a Constituent Assembly to modify the Constitution and solve the problem of the Senate strike. Again, the APRA protested because the Constitution, according to the document itself, could not be amended by a plebiscite, only by an act of Congress. Furthermore, Bustamante's decree provided that the Constituent Assembly should later function as a regular Congress, and the Apristas who have a majority in the present Congress, considered a new election a real risk. Neutral observers commented that the purpose of the Government was to oust the Apristas by means of a legal subterfuge. In spite of the tense situation, the administration held to its idea.

Rebellion at Callao. On October 3, the naval forces of the port of Callao turned against the Government and aided by groups of civilians, took over the Armory, the Naval Academy, and various ships. Again the administration acted rapidly and crushed the revolt. In the brief struggle, there were more than 100 dead and numerous wounded. There were minor skirmishes in Lima and Arequipa. The Government blamed the uprising on the Apristas, immediately suspended constitutional guarantees, and by decree outlawed the APRA. Many Apristas were arrested, but their leader Haya de la Torre, Luis Alberto Sanchez (Rector of the University of Buenos Aires), and other Peruvian intellectuals, managed to escape.

Government Is Overthrown. On October 27, an important military rebellion started at Arequipa, led by General Manuel Odría. President Bustamante ordered the Lima troops to march against the rebels, but on the 29th the Army chief of Lima refused to obey, and asked for the President's resignation. Bustamante fled the country, but refused to resign, and the army took control of the capital; the officers forming a military Junta to rule the country. One of the first measures taken by the new Government was to outlaw the Communist Party. As this article is being written, Peru is being governed by this Junta, with no formal announcement having been made of a return to a constitutional status.

Peru attended the Ninth Inter-American Conference of American States held at Bogotá in April (see PAN AMERICAN ACTIVITIES) and became signatory to the Charter of the Americas.

—MIGUEL JORRÍN

PETROLEUM. The 1948 output of crude petroleum in the United States amounted to 2,051,433,000 barrels, a gain of 195,326,000 bbl. over the 1947 output of 1,856,107,000 bbl. The yields of the chief producing States in 1948 were (in thousands of bbl.): Texas 923,227 (819,427 in 1947), California 345,333 (333,102), Louisiana 189,972 (160,219), Oklahoma 154,680 (141,019), Kansas (including Nebraska and Missouri) 108,017 (105,631), and Illinois 64,032 (66,459). Table 1 lists the production of crude petroleum, by States, for the years 1947 and 1948. (Source: *Oil and Gas Journal*, Jan. 27, 1949.)

Total United States imports of petroleum during 1948 were estimated at 184 million bbl. (10 months actual; 2 months estimated). This included 128 million bbl. of crude petroleum, 49 million bbl. of heavy fuel oil, and 7 million bbl. of other products. Exports from the United States of crude pe-

of the United States) rose to an estimated 3,775,100 bbl. daily in 1948, of this amount Venezuela and the Middle East accounted for 65 percent of the total. Venezuela's output increased nearly 12 percent in 1948 to total 1,330,000 bbl. daily. Kuwait's daily average production was placed at 125,000 bbl. for 1948. Late in the year this small sheikdom was producing 200,000 bbl. daily from its single Burghan field, now ranked as the world's largest oil reservoir with reserves of nearly 11,000 million bbl.

As a result of the development of the Leduc field in Alberta, the 1948 Canadian output of crude petroleum amounted to 30,500 bbl. daily, an increase of 50 percent over the 1947 daily average. Table 2 shows the estimated world output (excluding that of the United States), in thousands of bbl. daily, for the years 1947 and 1948. (Source: *Oil and Gas Journal*, Jan. 27, 1949; p. 236.)

PHILANTHROPY. A very considerable increase in American philanthropy during the year 1948 is indicated in the annual study of publicly announced gifts and bequests in eight large cities, made by The John Price Jones Corporation of New York.

Total publicly announced gifts and bequests in the eight cities studied reached \$362,194,204 in 1948, as compared with \$232,191,062 in 1947, and \$275,853,339 in 1946. The study, carried on as one index of philanthropy, has been in progress for 18 years. It does not represent total philanthropy but only that giving which has been made public in the cities studied—New York, Baltimore, Boston, Chicago, Los Angeles, Philadelphia, St. Louis, and Washington, D.C.

The 1948 total is 55.09 percent greater than the total for 1947. Gifts, which amounted to \$256,889,942, were 31.44 percent greater than in 1947. Bequests showed a very marked increase of 184.85 percent, from \$37,157,798 in 1947 to \$105,845,262 in 1948. The greatest increase in gifts and bequests in 1948 was shown in the field of education which had total gifts and bequests of \$109,315,656 in 1948 as compared with \$46,715,619 in 1947. Organized social work and foreign relief were other fields of philanthropy which showed sizable increases in 1948.

PHILIPPINE ALIEN PROPERTY ADMINISTRATION OF THE U.S. Shortly after the liberation of the Philippines from the Japanese invaders, the Office of Alien Property Custodian of the United States began to administer the Trading With the Enemy Act in the Philippines Islands, taking control of all enemy alien property located in the Islands. On July 4, 1946, the Philippines became an independent nation; however, the taking of enemy alien property was not yet complete. Anticipating this, the U.S. Congress, on July 3, 1946, passed the Philippine Property Act of 1946 which continued in operation the Trading With the Enemy Act, after independence, and authorized the President of the United States to create an agency to administer it.

On Oct. 14, 1946, by Executive Order, President Truman created the Philippine Alien Property Administration and on Dec. 9, 1946, appointed James McI. Henderson, formerly Special Assistant to the Attorney General, and Legal Advisor to General Douglas MacArthur, as Philippine Alien Property Administrator. The functions of the Administration are to (1) vest, i.e., take title in the name of the United States and administer enemy alien property; (2) transfer to the Philippine Republic such vested properties, or the proceeds thereof in accordance with the Philippine Property Act; and,

(3) adjudicate claims for return of property and/or payment of debt.

Up to Dec. 7, 1948, 850 vesting orders were issued, 704 claims filed, and 151 claims heard.

PHILIPPINES, Republic of the. Archipelago and sovereign state in western Pacific Ocean, lying south-east of the continent of Asia; a republic since July 4, 1946, by mutual and legislative agreement with the United States, to whom the islands had been ceded by Spain for \$20 million in accordance with terms of Treaty of Paris, Dec. 10, 1898.

Area and Population. Extending 1,152 statute miles north to south and 688 statute miles east to west at the widest point, the total land area is 115,600 square miles. Area of principal islands (in sq. mi.) follows: Luzon, 40,420; Mindanao, 36,537; Samar, 5,124; Negros, 4,903; Palawan, 4,500; Panay, 4,448; Mindoro, 3,794; Leyte, 2,799; Cebu, 1,695; Bohol, 1,534; and Masbate, 1,255.

The population totaled 19,234,000 according to the census taken during October 1948. Population of Manila, capital and principal city (see *Political Changes*, below), was 1,024,557 by final count. Other chief cities and their population prior to the Japanese invasion are: Iloilo (on Panay), 94,300; Cebu, 155,100; Zamboanga (on Mindanao), 137,700; Davao (on Mindanao), 103,100; Baguio (in Mountain Province), 27,000.

Education and Religion. Public schools in 1946 numbered 11,791 with an enrollment of 3,085,245 pupils. The state-supported University of the Philippines accommodated 7,567 students in 1941. Approximately 90 percent of the population are Christian, chiefly Roman Catholic; 5 percent are Mohammedan.

Production. The most important subsistence crops are rice, corn, and sweet potatoes; the important commercial crops are coconuts, abaca (Manila hemp), sugar-cane, and tobacco. The 1947-48 rice crop was 1,415,000 metric tons of cleaned rice as against an average of 1,500,000 tons per year before the war. Sugar crop for 1948-49 was estimated at 867,000 tons as compared with 430,000 tons in 1947-48. Copra production in 1948 was estimated at 800,000 long tons (1.1 million tons in 1947). Production of abaca in 1947 was 109,000 short tons as against a yearly average of 190,000 tons before the war. Tobacco output for the crop year ended June 30, 1947, was 17,655 metric tons (1935-39 yearly average was 36,135 tons). Cigar manufacture (1947) was 56 million units, compared with prewar annual average of 300 million units. Gold production for 1948 was estimated at \$15 million at the fixed rate of \$35 per ounce (production totaled \$38,282,000 in 1940). Principal manufactures are textiles (6,370,000 meters of woven cotton fabrics in 1947); shoes; Buntal hats; pearl buttons; cement (134 million metric tons in 1947 as against 166.8 million tons in 1938); soap; tin cans; matches; proprietary medicines; and furniture.

Foreign Trade. Imports in 1947 were valued at 1,022,710,000 pesos; exports, 528,920,000 pesos. In 1946 imports totaled 591,720,000 pesos; exports, 128,400,000 pesos. In 1939 imports were 245,160,000 pesos; exports, 244,080,000 pesos. Principal exports are sugar, copra, coconut oil, abaca. Imports are mainly textiles and food products.

Finance. For the fiscal year ending June 30, 1949, governmental revenue was estimated at 250 million pesos; expenditures at 619 million pesos (Peso equals U.S. \$0.50). The budget for the year ended June 30, 1948, showed revenue of 190 million pesos; expenditure of 243,472,000 pesos.

Transportation. Public highways (1946) extended 15,053 miles; railroad trackage, 567.5 miles. Regular air travel connects Manila with the United States, Tokyo, Hong Kong, Bangkok, Shanghai, Singapore, and Batavia. Domestic air travel connects 30 airports throughout the islands. There are six commercial radio stations functioning plus a station operated by the Department of Foreign Affairs and a relay station operated by the U.S. Department of State. A commercial station was under construction in Davao in 1948. Telephone service during 1948 was still virtually limited to Manila. Six companies provided telegraph and wireless service at 354 offices as compared with 567 offices before the war.

Government. The executive power is vested in a President (elected for 4 years); the legislative power in a Congress; and the judicial power in a Supreme Court and inferior courts. The Congress is composed of two chambers—the Senate with 24 members (elected for 6 years), and the House of Representatives with 98 members (elected for 4 years). President: Elpidio Quirino, who succeeded Manuel A. Roxas on the latter's death on Apr. 15, 1948.

Events, 1948. Political and economic progress in the Philippines during 1948 was interrupted by a series of man-made difficulties and natural disasters that aggravated the normal growing pains experienced by the young republic. Civil strife and bloodshed of ideological origin were rampant throughout the greater portion of the year and took a toll of several thousand lives, mostly in the center of Luzon, the home and spawning area of Filipino Communism; typhoons, floods, and earthquakes destroyed persons, homes, and foodstuffs, including rice crops; and disrupted or impeded the industrial production of the land. Against this background, the sudden dissolution of the national administration and the establishment of a new Government, coincident upon the death of President Manuel A. Roxas and the elevation of Vice President Elpidio Quirino to succeed him, were minor incidents in the national life.

Hukbalahap Rebellion. Despite an absolute amnesty accepted by its members in general and its leader, Communist Luis Taruc, in particular, the guerrilla organization known as the Hukbalahaps continued to harass the Government of the new republic throughout much of 1948. After two years of intermittent and bloody warfare, a short-lived peace between this organization, known as the "People's Army Against the Japanese," and the Philippine Republic began on June 21 when President Elpidio Quirino issued a proclamation of pardon to all members of the Hukbalahaps for "crimes of rebellion, sedition, illegal association, assault upon, resistance to and disobedience to persons in authority, and for illegal possession of firearms."

The amnesty, which was conditional upon surrender of all firearms to the Government within 20 days, was accepted on behalf of the Hukbalahaps by their leader, Luis Taruc, who in consequence was installed as a duly elected member of the Philippine House of Representatives (June 25), taking a seat that he had won in the election of 1946 but which had been denied him on the grounds that it had been acquired by fraud.

The Hukbalahaps were a Communist-led wartime guerrilla group that inherited the prewar Socialist Party movement in central Luzon and advocated collectivization of farm lands and abolition of tenant farming. The group had seized virtual control of the government machinery in large areas in the central Luzon provinces, had ap-

pointed mayors and police forces, exacted taxes, and solemnized marriages. After the war with Japan, it inaugurated a two-year regime of terror against landlords and against adherents of other guerrilla groups which had operated in the vicinity, notably the guerrilla group headed by American and Filipino members of the USAFFE (United States Air Forces of the Far East).

When with the passing of days it became evident that the Hukbalahaps were willing to accept the amnesty but were unwilling to surrender their arms, President Quirino journeyed personally to the remote village of Bahay Pare in central Luzon in a fruitless effort to obtain a token of surrender. Addressing 5,000 Hukbalahaps, he said that the amnesty was complete and "unconditional" and that a program of land and governmental reform would be accomplished. Accompanied by three other members of his Government, and protected only by three motorcycle policemen, he told the crowd: "I am in your hands now. You can even kill me if you want to. I am very sure that you will not, for if you do you will lose the greatest advocate of the cause of the masses in this country."

President Quirino's plea was silently but firmly rejected by the rebels and, in spite of several extensions of the period of grace in which the revolutionaries were invited to lay down their arms, the situation rapidly deteriorated. By late August open warfare flared anew, with constabulary (Government) forces clashing with large concentrations of Hukbalahaps in central and southern Pampanga Province 20 to 30 miles north of Manila.

Driven northward by relentless pressure of Government forces under Brig. Gen. Mariano Castaneda, the rebellious "Huks" made a determined stand in the Candaba swamp area, 75 miles north of Manila on the borders of Bulacan and Pampanga Provinces, but were overpowered and defeated in a series of swift engagements. Toward the close of the year it was believed that the back of the resistance had been broken and on December 12 President Quirino announced that mopping up operations were being conducted by Government troops. The whereabouts of Communist Luis Taruc, leader of the rebels and member of the Philippine House of Representatives, constituted a major mystery at the close of the year.

Volcanic and Other Disturbances. Troubles deriving from the civil conflict were further intensified by volcanic disturbances, typhoons, tidal waves, and earthquakes that took thousands of lives, caused millions of dollars' damage, disrupted the economy, and seriously reduced the life-giving rice crop. A devastating earthquake consisting of 72 distinct shocks, with concomitant landslides, struck the island of Panay during the period of January 25 to February 4, causing uncounted deaths and considerable damage to industrial facilities. Recovery from this catastrophe was complicated by an overabundance of rainfall in the early summer that resulted in flood conditions which reduced or destroyed extensive quantities of the rice crops and washed away buildings and homes on the island of Luzon.

A typhoon blew in from the sea on August 31 and September 1, swept down trees and houses in Manila, inundated 70 percent of the city, and disrupted transportation and communications within the islands. This disaster was followed almost immediately by volcanic eruption and earthquakes on the island of Camiguin off the northern coast of Mindanao. Dormant since Apr. 30, 1871, and generally considered extinct, the cone on the 5,620-foot mountain of Hibok-Hibok on Camiguin

reacted to violent localized earthquakes on September 1 by spouting fire and lava that blanketed and desolated the island.

Local shipping craft and U.S. Army transports were dispatched to the scene and removed 45,000 of the 50,000 inhabitants. Eruption of the volcano continued for 11 days. On December 10 the city of Manila was visited by still another earthquake, whose consequences, however, were measured in terror and inconvenience rather than in appreciable physical damage to the municipality.

Economic Conditions. The damage wrought by these disasters and by the civil war were reflected in the national economy. Partly as a result of the January earthquake and partly as a result of the typhoons that swept the islands in 1947, it became necessary on August 9 to ration rice among the populace. Acute hunger was manifest throughout the islands, with farmers reportedly eating only one meal a day and supplementing this diet with herbs and roots extracted from the forests. Heavy monsoon rains in August damaged the 1948 rice crop and it was reported that much of the nation's corn crop was under water and useless. The situation was further aggravated by cancellation of expected shipments of rice from Burma because of a threatened revolution in that land.

Although President Manuel A. Roxas on February 10 submitted a national budget balancing approximately in the neighborhood of 250 million pesos, it became increasingly apparent that hope of this accomplishment would have to be abandoned in the face of demands on the public purse for assistance to the homeless and foodless; and on June 30, the Philippine Congress passed appropriations totaling 619 million pesos. As a means of bolstering the national economy, the Government formulated plans toward the end of the year for the reduction by 20 percent of all imports of automobiles, cosmetics, jewelry, and other foreign-made commodities classified as "luxuries."

Political Changes. Manuel A. Roxas, first President of the Philippine Republic, collapsed and died on April 16 after delivering a speech at Clark Field, United States air base. He was succeeded by Vice President Elpidio Quirino, who in general continued to pursue the policies of his predecessor. Other political developments of the year were the proclamation by Congress of an amnesty for more than 1,000 alleged collaborators, including Jorge B. Vargas and José P. Laurel, the latter having been puppet President under the Japanese; and the formal designation on July 17 of Quezon City as the new capital of the Philippines instead of Manila, of which it is a suburb.—HAROLD J. COOPER

PHILIPPINE WAR DAMAGE COMMISSION, U.S. The United States Philippine War Damage Commission, created under the Philippine Rehabilitation Act of 1946 as a demonstration of good will for the assistance given the United States by the Philippines in time of war, and to assist in the economic recovery of the new Republic, provides for payment of claims for public and private losses caused by the war, and occurring between Dec. 7, 1941, and Oct. 1, 1945. The Act is historically unprecedented. Authorization of \$400 million for private claim payments and \$120 million for restoration of public buildings and public services is provided. All of the former and \$57 million of the latter fund are allocated to the Commission.

The agency is headed by three Commissioners, Chairman Frank A. Waring, of California; Commissioner John A. O'Donnell, of Pennsylvania; and Commissioner Francisco A. Delgado, of the Phil-

ippines. The law requires that one member of the Commission must be a Filipino. Headquarters are in Manila although an office is maintained in Washington, D.C.

Under Title I of the Act, which pertains to private claims, the Commission is required to complete its work by April, 1951. It began to receive claims on Mar. 1, 1947. At the end of the period for filing claims on Feb. 29, 1948, a total of 1,256,977 claims with a claimed value of \$1,214,272,106 had been received. A total of 383,393 claims had been adjudicated as of Oct. 29, 1948. Payments amounted to \$71,388,027.

With regard to public claims, the Commission, in cooperation with the Philippine Government, devised a system of priority allocations to several broad categories of projects under which schools and hospitals ranked first. Approvals on public claims amounted to \$40,027,354 as of Oct. 29, 1948 and preliminary payments totaled \$22,464,695. With the funds already allotted, work is well under way on extensive rehabilitation of schools, hospitals, and waterworks, as well as on reconstruction of other projects vital to the welfare of the Philippines.

Estimates of war damage in the Philippines range from \$1,000 million to \$1,500 million at prewar replacement costs, and at least three times that amount based on cost estimates in 1947.

PHOTOGRAPHIC PROGRESS. The keynote of the year for photography was its steady, useful growth in the fields of business, industry, education, and science. Only about one-third of all photographic materials and equipment manufactured were used by the amateur whereas 67 percent represented items for professional and technical use. The analysis of this latter group was about as follows: commercial and industrial uses, 33 percent; motion picture, 12 percent; reproduction, 11 percent; X-ray, 8 percent; publishing, 3 percent. Professional users of photo materials in the United States include some 15,000 commercial and portrait studios, 35,000 X-ray laboratories, 4,000 photo-finishing plants, 3,000 photo departments in industry, 3,500 graphic arts establishments serving the printing industry, 500 motion-picture producing firms, and 600 newspapers having photographic laboratories.

According to the *Wall Street Journal* of Jan. 13, 1948, a revolution in printing processes was in progress which will affect methods of typesetting and making engravings. Four Florida weekly newspapers were being printed by the Perry process whereby typewritten copy, headlines, and illustrations are photocopied and the resulting negative is reproduced directly onto a magnesium printing plate which is then bent to fit the press. All methods of preparing copy with special typewriters, however, were said to suffer by comparison with present typesetting machines from the standpoint of the availability of type sizes and styles, but for many types of work this was unimportant.

In recent years a number of photo-typesetting machines were built for composing type matter as a photographic image on film from which offset lithographic printing plates could be made. One of these machines, the Fotosetter made by the Intertype Corporation, was placed on the market during the year. Manipulation of the keyboard of this machine released matrices (each matrix having one master character, a photographic negative image, positioned securely) and assembled them in lines of the desired length. After justification, the line was photographed, character by character, on sensitized paper or film. The film-receiving container

could then be removed from the machine at any time for processing the film before the offset printing plate was made from the film record.

In October at the Detroit meeting of the Optical Society of America, a new printing process called Xerography was demonstrated with which documents can be reproduced quickly and without the use of wet chemicals or inks. A metal plate having a photoconductive coating was given a uniform electrostatic charge and then exposed to light through a negative or in a camera. The parts of the surface that are shielded from light retain the electrical charge while those areas exposed to light become a conductor and the charge leaks away. A finely ground pigment is then dusted over the surface and it adheres to the area where the electrostatic charge is retained. The plate is then covered by a paper, metal, textiles glass, or ceramic material and passed under the electric charging device whereupon the pigment is attracted to the paper or other surface without the application of pressure and after a brief heat treatment, the image becomes fused and permanent. The printing plate can be recharged and duplicates made by repeating the procedure (*U.S. Camera* 11: 46, December, 1948).

A year ago it was predicted that new methods for the rapid transmission of messages and photographs may open up a new era in communication. Further progress was noted in this field as evidenced by two demonstrations of facsimile transmission. On Oct. 21, 1948, in Washington, D.C., the Ultrafax system of the Radio Corporation of America was used effectively to transmit the entire 1,037 page novel, *Gone With the Wind*, a distance of three miles in about two minutes. Rapid processing equipment made by the Eastman Kodak Company was used to develop the transmitted record on 16-mm film. The other demonstration was given by Western Union Telegraph Company in Washington, D.C. on November 17 when a facsimile telegram was sent and an answer received in a matter of seconds using equipment that worked on the same principle as Ultrafax.

The principle of the Ultrafax system is as follows: (1) each message is photographed on special heat-resistant film and processed in a rapid-developing machine; (2) the processed film is sent through the Ultrafax television system at 30 messages a second (1,800 pages per minute); (3) the transmitted images on the television receiver tube are photographed on 16-mm or 35-mm film and then developed in a rapid-processing machine. Widely diversified types of information can be transmitted by this system at rates up to a million words a minute. The system is thus endowed with potentialities for greater speed and volume than any existing method of transmitting information and intelligence (*Collier's* 122: 13, Oct. 30, 1948).

Geographers have known for many years that great geological areas of subterranean mountains and plains exist under the sea. But most of this area is eternally dark since sunlight does not penetrate the sea more than a few hundred feet. For at least 14 years, Dr. Maurice Ewing of Woods Hole Oceanographic Institute, Woods Hole, Mass., has made photographic studies of the ocean. Last summer during a 20,000-mile cruise in the ketch, *Atlantis*, he made successful photographs at depths never before seen; the greatest depth recorded was 3½ miles where spongelike formations on the floor of the mid-Atlantic could be seen clearly. His camera and synchroflash in watertight containers were attached to a pole and lowered to the bottom where a trigger released the flash and made the exposure.

Cameras were transported again into the upper air over the earth and new exploratory studies were made with them. For the first time, a sequence of photographs was taken with automatically operated cameras installed in V-2 type and U.S. Navy Aerobee rockets. In one mosaic of seven photographs made with exposures of 1/500 second at f/8 and taken at 1½ second intervals, a 2,700-mile arc of horizon was revealed in the 60-mile high record representing the largest segment of the earth's circumference ever photographed.

Another 7-picture sequence made from a height of 70 miles showed an hourglass-shaped panorama, 1,400 miles wide from the south horizon in Mexico to the north horizon in Nebraska. Landmarks such as an airport, a railroad, the Rio Grande River, mountain ranges, and towns can be recognized on these remarkable photographs. The rockets were fired from launching sites near White Sands, N. M. Cameras and other equipment attached to parachutes were released as the rockets began their descent when an explosive charge blew off the rocket head. (*Life* 25: 40, Oct. 25, 1948). A discussion of equipment used and problems encountered in the photographic tracking of guided missiles was published by Biberman, Dorsey, and Ewing (*Electronics* 21: 92, July 1948).

High Speed Photography. Hardly a year passes that new equipment is not made for the photography of events that happen too fast to be detected by the human eye. Last year an all-electric camera having the fastest shutter yet devised for microtime research was built and tested by the U.S. Navy at Inyokern, Calif. The instrument was called the Zarem camera after Dr. A. M. Zarem who designed it. It was said that the shutter of this camera could be operated at a frame rate of 10 million exposures per second with an individual exposure time as short as 100 millionth of a second. The shutter is essentially an electro-optical Kerr cell (glass tube filled with nitrobenzene with two immersed electrodes) mounted between crossed polarizing filters. Normally the second filter blocks the light passed by the first filter. On application of about 5,000 volts across the electrodes of the cell, the fluid becomes birefringent and rotates the plane of polarization of the light entering it through the first polarizer so that the second polarizer then passes the light and an exposure is made. The practical value of this ultra-rapid shutter was understood to be still under investigation (*Ibid.* 21: 164, July, 1948).

Two other high speed cameras were announced by the Navy as designed by Dr. I. S. Bowen of Mt. Wilson Observatory and known respectively as the RC-4 and the RC-3 cameras. With the former instrument 76 pictures, each about one-half inch square, could be taken on a strip of 35-mm film at a maximum rate of 400,000 exposures per second. A rotating mirror illuminates each of 76 stationary f/1.6 lenses. The RC-3 camera consists of a field lens, a narrow slit, a condenser lens, and a rotating mirror. The film, 4 inches wide by 42 inches long, and slit are conjugate so that the object focused on the slit is also focused as a narrow line across the film (*Amer. Cinemat.* 29: 207, June, 1948).

High speed photography was used in studies by the U.S. Army in their new "flexible-throat" wind tunnel at the Aberdeen Proving Ground in Maryland. A Schlieren camera recorded the shadowgraphs of models showing the shock waves that are produced by the impact of the air stream at speeds as great as four times that of sound or, in scientific terms, at "Mach Number Four." (*Life*,

25: 79, Sept. 6, 1948). Other studies were reported by J. Winckler on the Mach interferometer applied to studying an axially-symmetric-supersonic airjet. Photographs illustrating the performance of the instrument were included (*Rev. Sci. Instr.* 19: 307, May, 1948).

The speed of operation of Fastax cameras was reported to have been increased as follows: 13,000 pictures per second for the camera using 8-mm film; 6,000 pictures per second for the 16-mm camera, and 7,000 pictures per second for the 35-mm camera. High speed cameras winding 16-mm film at a rate of 500 pictures per second were used by the U.S. Air Force at Muroc, Calif., to measure the speed of jet airplanes over a three kilometer speed course (*Tech. Data Digest* 13: 11, Nov. 15, 1948). A high speed camera of the optical compensator type was described by C. D. Miller which used a rotating drum (6,500 r.p.m.) with the film in a closed loop around the inside of the drum (*P.S.A. Journal* 14: 669, November, 1948).

Color Photography. The public demand for color films for amateur and professional use continued unabated. Production of color materials was reported to have been greater than had ever been achieved before but it was still somewhat inadequate to satisfy the customer. One analyst reported that about 85 percent of the amateur motion-picture film used was in color, more than 25 percent of the 35-mm still photography, but a much lower percentage of the roll-film market used color materials. The customer could take his exposed color films to any one of about 75 firms for processing and making color prints. Although this number seemed small in comparison with the nearly 4,000 photofinishers in the United States, it still represented a marked increase over the number of such plants offering color-processing services a few years ago.

A larger percentage of the reproductions in magazines and books were printed in color than heretofore. The use of color by newspapers was increasing. The August 5 issue of the *Milwaukee Journal* contained 31 pages in color and the September 12 issue of the *New York News* reproduced 13 color photographs on the editorial page that were chosen from over 200 color pictures taken at the national political conventions in Philadelphia. In general the quality of color reproductions was somewhat better, probably because of better paper stock being used, and of greater skill in the application of masking techniques when working with color transparencies. This improvement was especially noteworthy when it was obtained in such well-known weekly publications as *Saturday Evening Post*, *Collier's* and *Life* which have very large printings of each issue. The quality of color reproductions in the *National Geographic Magazine* has been of a high standard for many years. In the March issue, a very interesting series of circus action-color photographs made with flashtubes was reproduced (*Nat. Geog. Mag.* 43: 305, March, 1948).

The major portion of the world's color motion pictures was still being made by the Technicolor Corporation who have constantly held to a high production standard for many years. A goal of 320 million feet per year of color prints was being approached by the end of 1948. Increased capacity and improved laboratory procedures were claimed by the Cinecolor Corporation who were said to be the largest producer of commercial color prints by a two-color motion-picture process. During the year this company announced that feature films could be made in Cinecolor at a cost of but 10 percent above that for ordinary photography. Maga-

zines of 1,000 feet capacity for the bipack film and a post-exposure or latensification treatment of the exposed negatives were reported as useful features of the improved process (*Amer. Cinemat.* 29: 373, November, 1948). In the Trucolor process introduced about two years ago by Republic Pictures color couplers are used to form a blue-dye image on one side and a red-dye image on the other side of the film (*Ibid.* 29: 79, March, 1948).

The Polacolor process consisted of a single-layer film having three separate color images which had been printed from three-color separation negatives (*Nat. Photo Dealer* 14: 75, January, 1948). Several color cartoons were made by this process and shown in the theater. It was reported in October that the Denham (England) Laboratories were being equipped to process Ansco Color, an integral tripack film. The first picture to be released by the laboratory would be color prints of *Alice in Wonderland*, a puppet cartoon with live characters which was made in Ansco Color in France (*Kinemat. Weekly* 380: 21, Oct. 14, 1948).

Gevacolor was said to be the Gevaert counterpart of the German Agfacolor process with color couplers in each emulsion layer of an integral tripack film (*Le Photographe*, Nov. 20, 1947, p. 333). The Rouxcolor process of A. and L. Roux, French opticians is an additive system having a lens that forms four images on the area of one frame of a standard negative. Four color filters, deep red, yellow, green, and violet, one over each lens component, are required in both the camera and the projector. During projection, the four images are superposed to form the final color image (*Photo-Cinema* 28: 136, September, 1948).

Aerial Photography. The experience gained in aerial photo-mapping and survey studies during the war was being used in many ways for peaceful purposes. Extensive use was made of aerial photography in surveying for new highways, establishing not only the best route, but permitting accurate estimates to be made of equitable compensation for landowners, and of the quantity of earth that would need to be moved. The location of possible oil and mineral deposits was determined by aerial surveys. Still other surveys were devoted to identification and estimation of timber, wild life management studies, traffic surveys, and investigation of archeological sites. The U.S. Navy reported that a survey of 30,000 square miles of Alaskan territory had been completed with tri-metrogon equipment during the summer in cooperation with the Department of the Interior and other government agencies.

An experiment in supersonic aerial photography resulting in a remarkable group of pictures was described by A. D. Keough of the Photographic Laboratory, Engineering Division, Air Materiel Command, U.S. Air Force (*Tech. Data Digest* 13: 11, Nov. 15, 1947). The flight tests were based on using the combined speeds of two P-80 jet aircraft each flying in opposite directions at 500 m.p.h. 500 feet above one another; thus, a simulated speed of 1,000 m.p.h. was obtained by the low flying plane as viewed from the other plane or vice versa. Two S-7 Aerial Strip cameras, one with a 6-inch lens and the other with a 24-inch lens were in the top airplane and the movement of the film past the slit in each camera was synchronized to record a plane speed of 1,000 m.p.h. In the six passes of the two planes, one nearly perfect photograph was obtained with the 24-inch-lens camera and six pictures with the 6-inch-lens camera. The dimensional accuracy was well within two percent in the direction of the flight.

Another interesting test was conducted on September 1 when an XR-12 type photo-reconnaissance airplane was flown nonstop by the U.S. Air Force, a distance of 2,700 miles from Santa Barbara, Calif., to New York City. A tri-metrogon camera installation was used with three K-17 type cameras fitted with 6-inch lenses and 400-foot film magazine loads. With the plane flying at a nearly constant altitude of 40,000 feet, each camera made 390 individual exposures and used 326 feet of film. The exposures were automatically controlled with an intervalometer at intervals of 50 seconds. The three cameras covered an area about 490 miles wide. The resulting continuous strip of photographs, 192 feet long, was stated to be the first one to have been made on a nonstop flight across the country. (*Life* 25: 12, Nov. 29, 1948).

An excellent summary of recent advances in aerial photographic equipment and the applications to reconnaissance was published by A. H. Katz (*J. Opt. Soc. Amer.* 38: 604, July, 1948).

Motion pictures at normal speed and with high speed cameras are frequently taken to record airplane performance tests and to obtain a permanent record of instrument dials during flight maneuvers. All Lockheed experimental airplane take-offs and landings at Burbank, Calif. were recorded by photographing them through a special wire grid, 64 feet long by 9 feet high, on which vertical wires spaced off 100-foot runway sections and horizontal wires marked altitude in 25-foot sections. Examination of individual frames permitted accurate calibration of each airplane's performance. Similar installations were being set up at Wright Field, Dayton, Ohio, and at the Air Base at Muroc, Calif. Four motion-picture cameras were installed in a P-80 jet drone plane of the U.S. Air Force used in tests which were considered too hazardous for a pilot to undertake. The cameras were operated by remote control from the ground or from a mother plane. One camera photographed a special instrument panel in the nose which was also scanned by a television camera, another camera recorded the regular instrument panel, and each of the other two cameras photographed the wing tips. A fifth camera located in the ground control truck photographed the television receiver screen (*Electronics* 21: 126, October, 1948).

A new type stabilized camera mount for use in aircraft was described by A. D. Keough. It made use of a gyro, an erecting system which places and holds the gyro in a vertical position, an optical pick-off, and a servo electro-mechanical system. The device was said to be promising for use in high speed aircraft (*Tech. Data Digest* 13: 13, Oct. 1, 1948).

Motion Pictures and Television. The 25th anniversary of the 16-mm reversal process was observed by several trade announcements and articles published during the year. The first public demonstration of the process took place in East High School, Rochester, N. Y., on the evening of Jan. 8, 1923, when Dr. C. E. Kenneth Mees gave a lecture entitled, "Motion Picture Photography for the Amateur." In the quarter century that has elapsed since that date the interest in amateur motion pictures has grown steadily until in 1948, it was estimated that there were more than a million families in the United States who owned amateur movie cameras and about 950,000 families who owned projectors. The ratio of those owning 8-mm equipment to those owning 16-mm equipment was nearly $2\frac{1}{2}$ to 1. (*Photo Developments* 23: 64, July, 1948).

A rapid growth in the use of 16-mm pictures for educational and industrial use was noted since

1945 which was stimulated in large part by the extensive use that was made of visual aids during the war. Central film libraries were set up at state universities and colleges for common distribution. Indiana University was reported to have over 7,000 prints of 2,326 different films, and Chicago University had more than 8,000 prints of 700 films. By 1950 the U.S. Office of Education expects that more than 8,000 film subjects will be available. An increasing percentage of the films being made were in color (*Coronet* 24: 149, June, 1948).

Although a large percentage of industrial and educational films contained sound, it was generally recognized to be an expensive operation to make a sound film. Interest was aroused therefore in several methods of magnetic tape recording for which claims of good fidelity were made at moderate cost. The use of magnetic tape also permitted quite satisfactory sound to be recorded for 8-mm projection (*PSA Journal* 14: 181, April, 1948. *ibid.* 14: 424, August, 1948).

Substantially improved quality in 16-mm sound film was said to be obtainable by J. A. Maurer by the use of an optical one-to-one ratio printer. Various defects introduced by contact printing of 16-mm sound tracks were described and the requirements for satisfactory optical printing were analyzed. (*J. Soc. Mot. Pict. Eng.* 50: 458, May, 1948).

On Jan. 1, 1948, a total of 5,000 persons in the Los Angeles Shrine Auditorium saw a direct instantaneous projection of the Rose Bowl football game on an 18-foot screen. A few months later in New York, on April 14, large-screen television using a film recording system was given its debut in the Paramount Theatre where an audience of 3,000 saw a boxing bout that was actually in progress across the East River in Brooklyn (*Life* 24: 49, May 3, 1948).

The televised image as received on the cathode-ray tube at the theater was photographed on 35-mm film and developed ready for projection within 66 seconds. With improved equipment and better technique, the total elapsed time was cut down subsequently to 22 seconds (*Mot. Pict. Herald* 172: 13, Sept. 18, 1948; also *Video*, Sept. 27, 1948). Additional shows were given at the Paramount Theatre during the balance of the year, and it was announced that similar installations would be made in Chicago and Los Angeles.

The electronic and camera equipment for recording television sight and sound on film directly from the cathode-ray tube were described by Goldsmith, Jr. and Milholland (*J. Soc. Mot. Pict. Eng.* 51: 107, August, 1948). Optical problems in large-screen television were enumerated by Maloff (*ibid.* 51: 30, July, 1948). The development of theater television in England was reviewed by West (*ibid.* 51: 127, August, 1948). A broad historical sketch of the progress of television was presented by Lankes (*ibid.* 51: 223, October, 1948).

The use of motion-picture film for nearly instantaneous projection of a televised event would use only a small quantity of film compared with feature pictures and topical short subjects made especially for television. It was reported that several of the well-known film producers, such as Jerry Fairbanks, had signed contracts to make several hundred feature television films each year. The "Public Prosecutor" series was the first to be scheduled for production and several subjects of this series were completed. New techniques required for films to be used for television were discussed by Foster who pointed out that the prints should have very high key quality (*Amer. Cinemat.* 29: 229).

Nearly one million television receivers were understood to be in use in the United States by the close of the year, and about one-quarter of these were installed in the metropolitan area of New York. It was estimated that film time might run as high as 50 percent of air time; if this percentage is realized it would mean a substantial increase in the consumption of film (*Video*, Aug. 16, 1948).

Applied and Scientific Photography. The microfilming of books, newspapers, checks, and other documents is a well-known time saver and cost-cutter for industry. Each year many new firms install copying cameras and readers handling microfilm and thereby effect a substantial saving in storage space as well as obtain valuable copies. The State of Arizona began a microfilm project in 1948 whereby all old state records will be copied and about 3,000 square feet of floor space released.

Some progress was reported on the problem of microprinting of books and pamphlets on small cards, 100 pages to a card. One firm was reported to have worked out a method of reproducing 100 or more pages by photographic printing on a small card.

Twenty cameras adapted for the new British Technichrome bipack film were used to make a feature color film of the XIV Olympiad which was produced by the J. Arthur Rank Organization. A grand total of some 500,000 feet of color negative was exposed by 75 cameramen. Several thousand feet of Technicolor Monopack film were made of the winter sports at St. Moritz, Switzerland; other scenes were photographed in Greece. A great many camera positions were established in advance at the Wembley Stadium, others were made from moving trucks and by cameramen on foot. Underwater color shots of the aquatic events were made with a Newall camera fitted with a Cooke f/1.3 lens (*Amer. Cinemat.* 29: 374, November, 1948). The finish lines of the track events and the cycling races were photographed using a special camera having a moving film behind a narrow slit. The speed of movement of the film was set before the race, based on the estimated speed of the contestants. Rapid processing in solutions at 110° F. permitted prints to be delivered to the judges within 60 to 90 seconds after the finish (*Brit. J. Phot.* 95: 311, July 30, 1948).

A radar navigation chart of 344 miles of the Ohio River was made early in the year from a mosaic of photographs of the radar scope images. The Mirar camera developed by the Fairchild Camera and Instrument Corporation for use with all makes of ship-borne radar equipment was said to record radar scope images automatically. The film magazine held 100 feet of 35-mm film (*Popular Phot.* 23: 126, July, 1948). Various equipment for photography of the electronic image as used by the U.S. Navy during the war was described by Clasby and Koch (*J. Soc. Mot. Pict. Eng.* 50: 189, March, 1948).

An event of paramount importance in the scientific world, the dedication of the great 200-inch-diameter reflecting telescope on Mt. Palomar in California, took place on May 3, approximately 20 years after active work began on the project. The instrument was given final tests during the latter half of the year and it was expected to be used for planned photographic work late in the year.

Direct observation through the telescope, while possible, will be uncommon. Photographic records are permanent, the photographic emulsion with long exposure can integrate the light and record images that cannot be seen directly. Such records can be studied and measured by many scientists.

A spectroscope will frequently be attached to the telescope to measure various characteristics of the stars. (*Westinghouse Eng.* 8: 99, July, 1948). A color motion picture, *The Story of Palomar* was finished during the year and was being distributed through the California Institute of Technology (*Amer. Cinemat.* 29: 312, September, 1948).

The first successful photographs showing sludge in blood cells were made by F. W. Goro using a camera he built of 100-inch focal length which fitted over the microscope objective. A stroboscopic lamp was used to make 43 exposures over a period of 21 hours of the blood stream of a dying frog (*Life* 24: 49, May 31, 1948).

New frontiers of knowledge were explored with the aid of special photographic plates during the year. Emulsions of high silver halide content and low background fog were used to record the tracks of charged particles which move at high velocity through space.

In England in 1947, two types of mesons, one from cosmic rays and the other from the decay of the first type, were recorded by Powell and his colleagues (*Nature* 106: 453, 486, 1947). This year at the Radiation Laboratory of the University of California, Gardner and Lattes created mesons artificially by bombarding various substances with helium nuclei in the great cyclotron (*Science* 107: 270, Mar. 12, 1948). A year ago it was doubtful that electrons could be registered at all by the photographic emulsion. This year with much improved plates, electron tracks were identified unmistakably both at the Kodak Research Laboratory in Harrow, England, and at Rochester, N.Y. From the length and curvature of the track and the grain spacing, data were obtained of the electron's speed and other properties (*Physical Rev.* 74: 511, Sept. 1, 1948). In December, plates having ultrasensitive characteristics were announced by Kodak Research Laboratories which may prove of great value in future nuclear research.

The physical principles and techniques of autoradiographs were discussed by G. A. Boyd (*J. Biol. Phot. Asso.* 16: 65, December, 1947). In this new field of medical photography gross anatomical or histological sections, from animals which have been fed or injected with substances having radioactive elements, are placed in contact with a special photographic plate. The emitted radiation produces a heavy exposure in localized areas. Photomicrographs of the stained tissue then reveal exactly the location of the radioactive substance. The study of cancer and other diseases, it is hoped, will be facilitated with autoradiographic technique. For much of the work with microsections it was expected that phase contrast microscopy would be used. J. Magliozzi defined this subject as a special method of controlled illumination, ideally suited for the observation of thin highly transparent objects, whose structural details vary slightly in thickness and refractive index (*Educational Focus* 19: 6, February, 1948).

Physical Measurement and Standardization. It was pointed out by F. E. Washer of the National Bureau of Standards that the present system of marking lens diaphragm stops in terms of the geometric f number is subject to serious deficiencies. Decisions regarding the proper exposure to use at selected stop openings may be in error by ± 10 percent or more, depending on whether the lens surfaces are coated or not; the error being greater with coated lenses. A method was described by Washer whereby a lens can be calibrated by a light meter in terms of an ideal lens by passing light of known spectral quality (noon sunlight)

through the lens and measuring the transmitted light at the image plane (*J. Soc. Mot. Pict. Eng.* 51: 242, September, 1948). This method known as the T system was recommended by a subcommittee of the American Standards Association as a better system than the present f system. (*Pop. Phot.* 23: 87, October, 1948).

Fourteen additional American standards on motion pictures were accepted by the American Standards Association on recommendation of its Sectional Committee on Motion Pictures Z22. The completion of this work brought to 49 the number of new and revised standards in this field (*J. Soc. Mot. Pict. Eng.* 51: 534, November, 1948). A short article by I. C. Gardner pointed out how standards on photographic lenses would aid in their purchase and use (*Ind. Standardization* 19: 43, May-June, 1948).

In their fourth paper on the subject of photographic granularity and graininess, L. A. Jones and G. C. Higgins reported on further work on the manner in which the visual system functions in the perception of various test objects. It is believed that the knowledge gained from these studies will lead to a better theory of the visual process, which in turn will aid in finding a method of measuring granularity that will yield values in agreement with graininess measurements (*J. Opt. Soc. Amer.* 38: 398, April, 1948).

In a paper on absolute sensitivity measurements on single-grain-layer photographic plates for different wavelengths, J. H. Webb said that about 40 light quanta must strike a single grain of silver bromide to make it developable. Of the 40 quanta, probably not more than 10 are actually used in the formation of the silver speck before the grain can be developed (*ibid.* 38: 312, April, 1948).

Photographic Materials and Apparatus. Of paramount significance to the motion-picture industry was the announcement by Eastman Kodak Company of an improved safety motion picture support, the result of much research extending over a period of nearly 30 years. The new support was said by C. R. Fordyce to be a highly acetylated cellulose acetate having improved physical properties and better aging characteristics than commercial safety film in previous use (*J. Soc. Mot. Pict. Eng.* 51: 331, October, 1948). It was reported that enough of the new safety stock was available near the end of the year to make every fourth picture on it in 1949. Only two feature pictures were known to have been printed on the new stock during 1948. It was predicted that a complete changeover to safety film from nitrate film would be possible by 1952 (*Motion Pict. Herald* 173: 27, Nov. 27, 1948).

The number of new sensitized products for amateur and professional use that were introduced were small and included the following materials: Ansco Strip Paper and Velox Unicontrast Paper, both in 1,000-foot rolls for strip printing on continuous machines; Cykora Paper (Ansco); Rembrandt Chlorobromide Contact and Projection Paper (Remington-Rand); Separation Negative Plates, Type I (Kodak); Highlight Masking Film (Kodak); Super-X and Super-XX Blue Base Reversal Films (Kodak). Photographic plates on very thin (0.040-inch) glass were supplied by Eastman Kodak Company for the 48-inch Schmidt-type telescope on Mt. Palomar; the glass could be bent into a section of a sphere.

Although the principle of printing photographs on textiles has been known for some time; until recently no practical method had been adapted to continuous operation. Late in 1947, two processes were announced that appeared to have commercial

possibilities. These were known as the Leize process (Foto-Fab, Inc.) and the Photone process (Ross-Smith Corp.) and with them it was estimated that about six million yards of textiles would be printed during 1948.

At least 125 still-camera models built by some 50 different companies could be purchased on the American market (*Fortune* 37: 138, March, 1948). Several new models of cameras were added to the list including three models by Ansco called the Flash Clipper, the Speedex, and the Titan; the Busch 4 by 5 Pressman; four new Kodak cameras called the Tourist; the Kodak Duaflex; the Perfex, Series 100 Camera; the Kalart camera; and the Bell & Howell Foton camera. Safety devices were said to prevent blank exposures or a premature flash when using the Kalart camera. With the Foton camera, a spring drive was claimed to make possible 12 double-frame exposures within a second on 35-mm film. The focal-plane shutter was of novel design and consisted of four metal leaves, two behind the lens and two at the film plane. The Cooke lens was calibrated in T stops, the first camera lens to be marked with this system (*PSA Journal* 14: 551, October, 1948; also *Fortune* 38: 92, July, 1948). In November at the PSA meeting in Cincinnati, a commercial model of the Land One-step camera was demonstrated; a finished print was produced in about one minute after making the exposure.

The Beattie Portricon Camera was stated to permit 326 pictures ($2\frac{1}{2}$ by $3\frac{1}{2}$ inch. in size) to be made on each 100-foot roll of 70-mm film. The exposure was made with electronic synchroflash, an identification number was printed and the film advanced—all from a single pressing of a button.

In the 16-mm field, the Cine Kodak Special, Model II had a lens turret added and other improvements. The Revere 16-mm Sound Projector was announced in April and their Model 48 Projector for 16-mm film in October. Two new 8-mm projectors were marketed by the DeJur Ansco Corporation. Considerable interest was aroused in a complete new series of seven Cine Ektar Lenses; the fastest lens being the 25-mm, f/1.4 (*PSA Journal* 14: 425, August, 1948).

Bausch and Lomb Optical Company described a new series of 16-mm projection lenses at the S.M.P.E. meeting in October. Wollensak announced a new fast lens called the Cine Raptar of f/1.5 aperture. An extremely wide angle lens for aerial mapping, known as the Pleon lens, was developed in Germany during the war. Designed to utilize large amounts of distortion for a wider field of view, the focal length is only $2\frac{3}{4}$ inches but the outer lenses are about one foot in diameter with a view field of 130 degrees (*Amer. Cinemat.* 29: 154, May, 1948).

Items of miscellaneous equipment were numerous and included the following: Argus PA-200 Projector for 35-mm slides; the Spectra, a direct-reading color temperature meter; Kodaslide Table Viewer for examining 2 by 2-inch slides which by a simple movement of a metal plunger are projected on a $7\frac{1}{2}$ by $7\frac{1}{2}$ -inch daylight screen; and Kodak Color Densitometer. The use of an auxiliary device called the Invercone converted the Weston Master II reflection type lightmeter into an incident lightmeter. The Kodak Studio Speedlamp permitted the use of lens apertures as small as f/16 and included a power unit with sufficient power for three flashtubes for balanced portrait lighting. A very compact enlarging unit was known as the Federal Store-Away Enlarger. The SEI Exposure Photometer (Ilford, Ltd., London) was claimed

to permit accurate light measurements ranging from 0.01 to 10,000 foot lamberts.

In line with the trend for continuous processing apparatus for photofinishing of prints, two concerns introduced equipment for this work. The Kodak Continuous Paper Processor machine handled long rolls (1,000 feet) of paper, used automatic solution feed and replenishment, and had a stated capacity of 2,400 oversize prints per hour. The Fotopak machine was said to have about the same capacity and to be adaptable for use with modified commercial printers and dryers. New roll-printing heads for use with such equipment were announced for two models of Kodak semiautomatic printers.

The Photographic Process. Chemicals in packages, bottles, and packets continued to be popular with amateur and professional users of photographic materials. A small heat-sealed metal foil envelope was used by one firm for dispensing developers, stop baths, fixers, and a few other chemicals for amateur use. Ansco Ardol and Vividol package developers replaced respectively their 103 and 105 Prepared Developers.

Positive transparencies could be made directly on film exposed in the camera or duplicates printed from negatives or positives by a one-bath reversal process described by H. A. Miller. A developer containing hypo in addition to the usual components is used, and the image is given a light-fogging treatment (*PSA Journal* 14: 103, February, 1948). Details for reversal processing of Gevaert films were published by H. Verkindern (*Brit. Kinemat.* 13: 37, August, 1948). Processing directions for use with Kodak Blue Base Reversal Films were made available.

A method of gold and mercury latensification and hypersensitization of images for direct and physical development was described by T. H. James, W. Vanselow, and R. F. Quirk. With latensification emulsion speeds were obtained on physical development that were about equal to those found with direct development (*PSA Journal* 14: 349, June, 1948). Another paper by W. Vanselow, R. F. Quirk, and J. A. Leermakers gave further information on this subject and described latensification studies with sodium perborate (*Ibid.* 14: 675, November, 1948).

The sources, prevention, and removal of scums, sludges, and stains were discussed by J. I. Crabtree and R. W. Henn who included several useful tables in their article for handy reference (*Ibid.* 14: 201, April, 1948).

Bibliography. A biweekly newspaper called *Photo Industry*, was started in New York in March. A list of the more significant books published is as follows: *Fun with Your Camera*, J. Deschin (McGraw-Hill, N.Y.); *Making Your Pictures Interesting*, E. Theisen (Ziff-Davis Publishing Co., Chicago); *Camera and Lens*, A. Adams (Basic Photo Series No. 1, Morgan & Lester, N.Y.; also *The Negative*, A. Adams (No. 2); *Camera Art as a Means of Self-Expression*, M. Thorek (Lippincott Co., Philadelphia); *La technique photographique*, L. P. Clerc (P. Montel, Paris, 4th ed.); *Magic Shadows: The Story of the Origin of Motion Pictures*, M. Quigley, Jr. (Georgetown University Press); *The Miracle of the Movies*, L. Wood (Burke Publishing Co., London); *Color Photography for the Amateur*, K. Henny (McGraw-Hill, N.Y. Rev. ed.); *Color Photography in Practice*, D. A. Spencer (Pitman & Sons, London, 3rd ed.); *An Introduction to Color*, R. M. Evans (Wiley & Sons, N.Y.); *How To Take Industrial Photographs*, M. H. Zielke and F. G. Beezley (McGraw-Hill,

N.Y.); *Photography in Law Enforcement* (Eastman Kodak Company, Rochester, N.Y.); *Aerial Photographs in Forestry*, S. H. Spurr (Ronald Press, N.Y.); *Fundamentals of Photographic Theory*, T. H. James and G. C. Higgins (Wiley & Sons, N.Y.); *Australian Photography*, Edited by O. L. Zeigler (Sydney, Australia); *Sound and the Documentary Film*, K. Cameron (Pitman, London).

—GLENN E. MATTHEWS

PHYSICS. Cosmic Radiation. Most important among the advances in physics in the year 1948 were those in the field of cosmic ray research.

The elusive atomic particle, called both meson and mesotron, has been created artificially for the first time in the largest of the University of California cyclotrons by bombardment with alpha particles, accelerated to energies of 400 million electron-volts, an event that promises better understanding of the atomic nucleus, and of the forces that hold it together. There are theoretical grounds for hoping that the meson can blast energy out of heavy elements even more effectively than the neutron. The future may bring a meson atomic bomb, now that the scientists can create mesons under control.

Actually there are probably more than four varieties of particles, all called mesons. The most usual one found in cosmic ray bursts is about 200 times the weight of the electron. All of the kinds of mesons are intermediate between the electron, lightest subatomic particle, and the proton, heart of the hydrogen atom. The proton and the neutron are each about 2,000 times the weight of the electron.

Now that mesons can be made in the Berkeley giant "atom smasher" much more should be learned about them. Although mesons live only a fleeting fraction of a second, they can be studied and used as experimental tools once they are created at will. Theoretical physicists suspect that mesons are a sort of go-between in allowing neutron and proton to turn into one another. They have evidence for this strange performance but do not yet understand what happens. The closest picturization would be the meson being passed back and forth like a ball between two basketball players.

Evidence that there are heavy nuclei in cosmic radiation was gathered in the Office of Naval Research project called "Skyhook" during which balloons carrying recorders have been sent above the roof of the atmosphere.

Atomic debris or "cinders of creation" are being rained upon the earth in much the same way that remnants of past planets fall on the earth as shooting stars. Tracks of heavy particles were captured when physicists of the University of Minnesota and the University of Rochester sent cloud chambers and special photographic plates aloft in free balloons. In the University of Minnesota group are Drs. F. Oppenheimer, E. P. Ney, E. J. Lofgren and Phyllis Freier, while the University of Rochester group includes Drs. H. L. Bradt and B. Peters.

The top of the earth's atmosphere for the cosmic rays that bombard us from outer space was discovered by scientists who put their instruments into a captured Nazi V-2 rocket that was fired up to 100 miles over the White Sands, N.M., Proving Ground in July. The discovery was announced by Dr. J. A. Van Allen of the Johns Hopkins University Applied Physics Laboratory and Dr. H. E. Tatal of the Carnegie Institution of Washington.

Some 34 miles above the earth's surface, the

intensity of the cosmic ray bombardment begins to become constant. This is the beginning of the "cosmic ray plateau." From this high-altitude region out into space the cosmic radiation is believed to remain virtually constant. A Geiger counter was placed in the rocket fired at White Sands, July 29, 1948. As the rocket shot up to an altitude of 100 miles, the scientists received a record of the cosmic ray count by means of a radio telemetering system. The rocket's flight gave them counts of cosmic rays at the highest altitudes at which the mysterious rays have been studied.

The intensity of cosmic rays in the space out from the earth is two to three times greater than scientists had calculated on the basis of lower altitude observations. Below 55 kilometers, or approximately 34 miles, the cosmic rays varied from one or two counts a second at sea level to a peak of 49 counts per second in the neighborhood of 12 miles above the earth. But for the highest 66 miles of the flight, the cosmic ray count was steadily a little more than 22 counts per second.

Atom smashers. Research in nuclear physics will receive material aid from tremendous new atom smashers which will provide physicists with energies up to at least seven thousand million electron-volts, plans for which were formulated during the year.

Two new gigantic accelerators, or electronuclear machines, both of which promise to operate at thousands of millions of electron-volts in the energy range of the cosmic rays, were planned to be built in the next few years with \$11 million of Atomic Energy Commission funds. The largest, a 110-foot diameter cyclotron, will be at the University of California's Radiation Laboratory at Berkeley. The other, a 60-foot diameter synchrotron, will be built at the Brookhaven National Laboratory, Upton, Long Island, N.Y.

Enough energy to exceed the most powerful cosmic rays from the depths of the universe, six to seven thousand million electron-volts, will be produced by the \$9 million Berkeley cyclotron, to be completed in four to five years. This will multiply about 15 times the power of the largest cyclotron now operating, the 184-inch atom smasher also at Berkeley, in which mesons were produced artificially. The new machine will be 110 feet in diameter with a circular housing around the rim. Atomic particles will speed around it under the influence of 10,000 tons of magnet. Protons, the hearts of hydrogen atoms, will be fed into the machine. Mere men operating it will be dwarfed by the apparatus.

W. M. Brobeck, who did the engineering design of the present world's largest cyclotron, determined that it would be feasible to build and operate a great proton accelerator at the ten thousand-million electron-volt level. Dr. Ernest O. Lawrence, whose invention and operation of the cyclotron won him the Nobel Prize, will direct it. The magnet will be divided into four segments, the four gaps providing access to the accelerating chamber for such equipment as vacuum pumps and the high frequency equipment which accelerates the protons. As protons pass the accelerating electrode point on each trip around the magnet, they will be struck by a high frequency charge of either 2,500 or 5,000 volts. With 5,000 volts on the accelerating electrode, each particle would make more than one million trips around the chamber before reaching six thousand million electron-volts. Operation of the great atom smasher will be pulsed; that is, it will operate for about two seconds at a time, then will be turned off for a few minutes.

Two to three thousand million electron-volts will be the energy of the protons to be accelerated in the 60-foot diameter machine to be built at Brookhaven National Laboratory in about three years at a cost of \$3 million. In the operation of the machine, the protons will travel repeatedly around a fixed orbit consisting of four quadrants of a circle 30 feet in radius, alternating with four straight lines about 10 feet in length. The path the protons will follow will have the appearance of a circle flattened at four equally spaced points around its circumference. The total distance travelled in one revolution will be about 230 feet and a proton reaching its peak energy will make about 3.5 million revolutions, a distance of about 150,000 miles. It will travel this distance in less than a second. Design of the Brookhaven machine was by a group headed by Dr. M. Stanley Livingston, on leave of absence from Massachusetts Institute of Technology.

The world's most powerful linear accelerator, a high voltage apparatus that works on a principle different from the cyclotrons, was authorized for Stanford University, to be financed by the Office of Naval Research. Instead of speeding heavy atomic particles in a merry-go-round whirl as in the cyclotron, the linear accelerator shoots electrons in a straight line, sending them down a tube on the crest of radio microwaves, such as used in radar.

Dr. William W. Hansen, director of the Stanford Microwave Laboratory, will direct the building of the 160-foot accelerator. A 12-foot pilot model of the accelerator has already produced electrons of 6 million volts. Experiments upon the fundamental nature of matter and creation of artificial cosmic rays are possibilities through use of the thousand-million electron-volt energies to be reached by the new accelerator. Dr. Hansen believes that it may be possible to create protons and neutrons, the components of the atomic nucleus, through the use of such high energies.

Neutron Beam Diffraction. New knowledge about the structure of crystals was made possible with the discovery that the neutron, the particle that triggers the atomic bomb, can be used to study crystals with results surpassing those of either electron or X-ray diffraction.

For the first time scientists have actually been able to see how hydrogen atoms tie up to the oxygen atoms in a piece of ice. Drs. E. O. Wollan, C. G. Shull and W. L. Davidson of the Oak Ridge National Laboratory in Oak Ridge, Tenn., have found that hydrogen atoms are not stay-at-homes, fixed in one position, as proposed by some scientists. Instead, the hydrogen atoms are restlessly jumping from one position to another in the crystal structure of ice. Since hydrogen is present in all of our foods, fuel, clothing, and many other materials, such studies are of great potential importance.

The Oak Ridge scientists photographed the pattern produced by a stream of neutrons when scattered by passing through an ice-crystal. The pattern is like a shadow picture of the atomic structure of the crystal. A wide variety of other substances in addition to ice have been studied by the neutron beam technique. Production of diffraction patterns with neutrons is much more difficult than getting the patterns with electrons and X-rays.

Research Instruments. The development of important new instruments for physics research opened the door to whole new areas of scientific discovery.

Color "staining" with light waves without killing

the living cells is a new microscopic technique that is expected to reveal much about important life processes. This new kind of microscope, a further development of the phase microscope, will permit man to observe cells as they grow, multiply and carry on their important life functions. It will let scientists see in color, for the first time, both normal and cancerous growth, and may help them discover what the abnormal growth is.

But this latest development in microscopy is still very much in the experimental stage. Many refinements may be expected before instruments of this type are made available to scientists for important research. The instrument, reported to the National Academy of Sciences meeting, was developed by Dr. F. Zernike, a Dutch physicist who visualized and made the first phase microscope. Dr. Zernike, professor of physics at the University of Groningen, the Netherlands, was visiting professor in physics at the Johns Hopkins University during 1948.

The ordinary phase microscope uses two transparent rings to reveal, in black and white, details heretofore unknown concerning delicate cell structure. Two optical companies are now making instruments of this type available commercially in America. The phase ring separates a small portion of light and distributes it over the whole field. It works because it takes advantage of the fact that light travels in waves. This separated light, spread over the whole image, promises an evenly illuminated background. The image appears bright where the phase of the direct light is the same as that of the background light so that it is reinforced. It shows dark when the phases of the two light parts are different so that by interference they destroy each other. In the new color phase microscope, the ring works in an opposite way in the red than in the green end of the spectrum, giving some details more red light, others more green, depending on their thickness.

Invisible infra-red light, or heat waves, were detected by sound too high-pitched for the ear to hear through use of the acoustical interferometer. It has practical as well as laboratory applications, such as the detection of invisible light signals, and perhaps to detect the short radio waves in radar.

The acoustical interferometer consists of two quartz crystals, such as those used in radio, with a gas confined between them. A transmitter sets one crystal into vibration, and a receiver detects the ultra-sonic vibrations carried by the gas to the other crystal. When infra-red rays strike the gas they affect the passage of the sound through the gas. The new instrument, developed by Prof. W. J. Fry and his associates, can be used with carbon dioxide containing water vapor, or some other gas.

If invisible infra-red radiation passes through the gas, it has an effect on the sound vibrations in it, and the gas molecules are changed so that they absorb less of the sound waves passing between the two crystals, and this may be instantly detected.

The microwave spectroscopy uses waves of the same length as radar to detect even tiny amounts of chemical elements, making it possible to trace chemical elements in some parts of the body without the use of hazardous radioactive isotopes. Stable isotopes of elements, which differ only in atomic weight from the usual form of the element, can be fed to humans, animals or plants. The element may end up in the skin, hair or nails of an animal being tested, or in any part of a plant. It must be in some part that can be cut off since the spectroscopy can only be used on a small specimen that

is destroyed in the process. Gas or vapor, produced chemically from the specimen, is placed in the spectroscopy where it will intercept microwaves and cancel out those frequencies corresponding to the isotopes of elements it contains. Development of the microwave spectroscopy is the result of work done at the Research Laboratory of Electronics of the Massachusetts Institute of Technology.

During microwave research for the war, scientists working on radar discovered that certain wavelengths used in radar were absorbed by gases in the atmosphere. At the Radiation Laboratory at M.I.T. and at Columbia University, projects were started to find out what gases interfered with what wavelengths. It was found that water vapor and oxygen absorbed microwaves in such a way that they defined the limits of usable radar waves. After the war these discoveries led to work in the detection of gases by microwave spectroscopy and from there to the use of these waves in exploring matter.

Movements of as little as a hundred-thousandth of an inch can be detected with the "transducer," developed at the National Bureau of Standards. This device, which consists of a coiled spring whose turns separate one by one when the ends of the spring are pulled apart, is being studied by W. A. Wildhack and his associates.

When the spring is closed, it has the same resistance as a solid tube of metal. But when it is completely open, it has the resistance of the total length of the coiled wire. Since the change in resistance when the spring is stretched may be hundreds of times greater than the change in length of the spring, the transducer is a very sensitive way of measuring small displacements. An electrical instrument which measures resistance precisely is simply hooked up to the transducer and the change in resistance read. The transducer may be very useful both in industry and science in such things as strain gages, pressure elements, accelerometers, electric weighing devices, automatic temperature controls, direct current-alternating current inverters, and voltage regulators.

A new instrument for science and industry has given wavelength measurements in a previously unknown range of the invisible infra-red spectrum. Measurements of infra-red wavelengths up to 39 microns—a micron is .00003937 inch—were made at the National Bureau of Standards in Washington, Dr. Earle K. Plyler reported. A prism made of thallium bromide and thallium iodide was used for the study. The thallium bromide-iodide prism has extended the wavelengths in the infra-red region from approximately 25 microns for potassium bromide prisms and about 15 microns for sodium chloride (common salt) prisms.

The new prism gives scientists a new tool for studying materials in a range of the infra-red spectrum which they have not been able to explore before. It is not now available commercially, but it may find important industrial applications in the future for analyzing materials.

Photographic Techniques. A new and special kind of photographic plate was used to take pictures of mesons, small cosmic ray particles.

A new Ilford photo emulsion was developed to photograph the trail of these elusive particles in the laboratory of Dr. C. F. Powell, Bristol, England. This emulsion contains eight times as much silver bromide as older emulsions in order to magnify the path of a particle on the photographic plate. It also is loaded with boron, which prevents the tracks left by the particle from fading and makes the emulsion less sensitive to light.

Since prewar days it has been possible to take pictures of protons, deuterons, alpha particles and fission fragments on photographic emulsions, but until recently it has been very difficult to distinguish between the tracks left by the different particles. In addition, very light particles could not be traced because they did not have enough energy to leave much of a trail in the emulsion. Since cosmic rays are believed by scientists to come from outside the atmosphere of the earth, perhaps from the stars, plates to catch the traces of these rays in the form of mesons are exposed on the tops of mountains. Only when the meson actually ends up in the emulsion can one be sure that the trail in the emulsion is due to a meson and not any other particle. The plates after exposure are examined under strong microscopes by the scientists. By studying the plates they are able to determine the mass of the meson, evidences of nuclear degeneration and other facts which increase our knowledge of the hitherto little known cosmic rays.

Estimation of the amount of atomic energy elements, uranium and thorium, in rocks was done by photography. Dr. J. H. J. Poole and J. W. Bremner of Trinity College placed special nuclear research photographic plates in contact with flat surfaces of rocks cut with a diamond saw and left them there for one to three weeks. Stars with two to five rays appear in the photographs, caused by the alpha particles or the hearts of helium atoms that are given off from the radioactive elements.

Distribution of radioactive elements in rocks is shown to be very sporadic, especially in coarse-grained rocks like granites. The photographic method was originally suggested two years ago by Mme. Irene Curie-Joliot, Nobelist herself and daughter of the Curies who discovered radium.

Electrons, known as particles of electricity, are the commonest of the fundamental bits of matter, and scientists work with them daily. Yet only now have electron tracks been definitely photographed. Eastman Kodak scientists have announced that tracks about two thousandths of an inch long—less than the thickness of this piece of paper—have been captured in a special photographic emulsion.

New Particle. A new subnuclear particle, this one bearing a magnetic charge instead of the more familiar plus or minus electrical charge of the proton or electron, was predicted by Dr. P. A. M. Dirac, the British mathematical physicist.

The new particle has yet to be observed in the laboratory, since its generation by an artificial atomic collision would require energies greater than provided by any present atom smashers. Neither has it been observed in cosmic ray studies, probably because no one was looking for it. Prof. Dirac once before, in 1931, predicted the existence of and properties for an unknown particle. That particle was the positron, and it was then actually discovered about a year later in a cloud chamber photograph by Dr. Carl D. Anderson of the California Institute of Technology.

Why add a new particle to the present long list, especially when the particles now known are so incompletely explained? Prof. Dirac raised that question, and then answered it by saying that the new particle is needed for theoretical reasons. It is needed, he said, in order to help explain why all electrons carry the same unit amount of negative charge. That electric charges, such as those on the electron, proton or meson, do occur in even multiples of the same electronic unit charge has been known experimentally for a long time. Still, there has been no adequate explanation of this even-multiple type of regularity.

Prof. Dirac now surmises that there is no explanation for the regularity apart from the existence of magnetic particles on the subatomic level. Moreover, if there exists even one of these particles in the universe, his theory requires all electric charges to be even multiples of the electronic charge.

The particle could be created in an artificial collision having an energy of 500 million electron-volts, it is estimated. This puts it out of range of even the 184-inch cyclotron at Berkeley, Calif., with its 400 million-electron-volt particles, which artificially created mesons. Thus, for the moment, search for such a magnetic particle will have to be made through cosmic ray studies, until the thousand-million-volt generators are completed.

What will it look like? In a cloud chamber, it should give a heavy track of uniform density through its path. This will help distinguish it from such tracks as those of alpha particles, which get denser as the particle slows to a stop. Also, in a strong magnetic field, the new magnetic particle should be deflected toward one of the pole-pieces, instead of running in circles as electrons and protons do.

Nobel Prize. Winner of the 1948 Nobel Prize for physics was Prof. P. M. S. Blackett, of Manchester University, England, "for discoveries in the field of cosmic radiation."

Last year Prof. Blackett presented to the Royal Society of London a mathematical relationship between electromagnetism and gravitation that arises out of the rotation of such massive bodies as the sun, earth and stars. This formulation was hailed as possibly as significant as the Einstein relationship between mass and energy which was given such powerful reality by the atomic bomb. Like $E = mc^2$, the Blackett formula has a cryptic appearance. In it there are: P, the strength of the magnetic field; beta, a constant near unity; G, the gravitational constant; c, the speed of light; and U, the angular momentum or spin of a revolving body. In some laboratory at the present time an experimental test of this relationship may be under way, since Prof. Blackett proposed an experimental test. It would consist of revolving a large sphere quite rapidly and measuring its magnetic field.

Whether or not the Blackett formulation proves to be the basic connection between magnetism and gravitation, the earlier researches recognized by the Nobel award made important contributions to the understanding of the constitution of matter and radiation.

Surface Depth Measurement. A scientific instrument for the study of surface layers of metal less than a quarter-millionth of an inch thick may aid in the development of longer-wearing metals for aircraft engines and other products. Known as an electron diffraction instrument, the device was built by the general engineering and consulting laboratory of the General Electric Company. A beam of electrons, the negatively charged bits of atoms, is shot through the thin sheet of metal. The image made by the electrons is captured on a fluorescent screen or photographic film for study. Surface conditions such as corrosion and crystal structure are revealed by the image from the beam. Dr. J. G. Hutton predicted that the instrument will be important in metallurgical studies for electrical equipment and for research on a wide number of industrial products. The electron diffraction instruments are now in use in various laboratories.

To determine the depth of a liquid surface, scientists at the Stanford Research Institute developed an instrument, as yet without a name, which measures the minute distortion of polarized light re-

flected off them. This depth is not a matter of purely scientific interest; it has a practical value in the fields of lubrication, oil exploration, and biology, in fact wherever the reaction of liquid surfaces in contact with other materials is a factor. The method of measuring the depth of a liquid surface was carried out by Stanford scientists working on a Naval Research contract under Dr. A. Paul Brady, research director, and the over-all supervision of Dr. J. W. McBain, consultant on research. Two others who assisted were Dr. J. C. Henniker and Dr. Frank A. Lucy.

Classical mathematical theory assumed liquid surfaces had no depth. General scientific opinion for the past several decades thought the depth to be a thousand-millionth of an inch rather than the one-millionth now claimed. This belief was based on the assumption that attraction between molecules in the liquid was effective only over this very short range. The new research is claimed to prove that molecular attraction takes place over a wider range than ever proved before. Dr. McBain explains the action by comparison with that of the ordinary magnet. It has a short direct attraction on a cluster of nails, but can pick up a series of them, one hanging to another. Molecules in a liquid surface, he believes, polarize several neighbors and these in turn polarize others. This chain-like relayed action extends over what he calls an "impressive distance."

Semi-conductor. A bit of semi-conducting germanium metal that amplifies or oscillates current without the complexity of plates and wires in an airless bulb and is called a transistor should make possible more stable and durable radios, television sets, and electronic devices. Radios may be made smaller when the new cylinder, slimmer than a pencil and less than an inch long, comes out of the development laboratories into production. Because the new device has no filament that must heat up before it operates, it goes into action instantly. It will do some things that conventional vacuum tubes can not do. This means new electronic devices.

Invented at Bell Telephone Laboratories, the transistor's operation is possible because the ability of a semi-conductor to carry electrical current can be controlled. This is done by changing the electronic structure of a small bit of material under the influence of the incoming current, fed to it through a fine "cat's whisker" wire. The current coming out of the other wire, just about two thousandths of an inch away, is boosted in volume a hundred-fold.

Dr. John Bardeen and Dr. Walter H. Brattain made the key investigations in the Bell Telephone Laboratories that produced the transistor, while the program was initiated and directed by Dr. William Shockley.

Since electrical speech waves traveling between telephones can be amplified, the transistor will probably replace the vacuum repeater tubes now used on long distance and other telephone lines. A superheterodyne radio set with about a dozen transistors instead of conventional tubes has been demonstrated and probably is the forerunner of a new family of radios. Because it can oscillate as well as amplify, the transistor will be used to produce standard frequency tones and for other similar uses. Germanium metal specially treated is the semi-conducting material used, but other semi-conductors include silicon, some metallic oxides and other compounds. Semi-conductors have electrical properties intermediate between those of the metals and insulators.

Semi-conductors, copper oxide and selenium

have been used previously to rectify alternating to direct current, and silicon has been used as a detector, particularly for microwave radio apparatus. The transistor as now developed has a frequency limitation of about 10 million cycles per second, but it is quite satisfactory in the television ranges.

By knocking holes of positive electricity in the unusual metal germanium with an atom-smasher, Purdue University physicists have created a new kind of substance that promises to be useful in rectifying electricity and converting light into electrical effects. Dr. K. Lark-Horovitz reported that with the Purdue cyclotron new types of electrical "semi-conductors" have been produced which promise to have varied applications in the field of radio, radar, and microwave.

Very pure germanium metal was bombarded with deuterons accelerated to 10 million volts. Although the attack was for only a few seconds, lasting changes were produced in the metal, and the resistance of the metal was increased tenfold. "Holes" which behave like electrons that are positive electricity, instead of the usual sort of negative electricity, are created by the bombardment and this leads to new phenomena which allow the use of the bombarded material as rectifiers, photosensitive devices, and for other possible uses.

The bombardment dislocates permanently atoms from their regular positions in the metal, and when these atoms are dislocated they are able to take up electrons from the internal structure of the metal and produce in this way some holes that for all practical purposes behave like positive electrons. Half of a piece of the metal can be bombarded and made to conduct electricity by means of the positive holes and the other half can be left alone, conducting in the ordinary manner. This makes a rectifier that can yield direct current from alternating current. The sharp boundary between the positively and negatively conducting regions is extremely photosensitive and can be used to convert light into electricity, particularly in the invisible infra-red regions of the spectrum.

Other nuclear particles are being tried in a similar way for their effects on germanium and other substances. The hearts of helium atoms, called alpha particles, have already been found to produce strong effects. Drs. E. Bleuler, R. Davis, and D. Tendam were members of the Purdue cyclotron group making the experiments.

Magnetic Clutch. Magnetic oil is the key to a new automobile fluid clutch revealed by the National Bureau of Standards. Its development is a discovery of number-one importance. The oil contains millions of tiny particles of iron dust or other magnetic material. The car electric system magnetizes them as needed.

This new magnetic fluid clutch is very simple. It has three elements only; a driving shaft with a plate at its end, a driven shaft and plate, and the iron-saturated oil between. When a magnetic field is established between the two parallel plates, the magnetic particles form chains which bind the two plates together as tightly as if they were held by strong spring clamps. Operation of the clutch is described as extremely smooth and without "chatter." The locking force is practically constant, and the bond between the two plates is a function of the gradual increase of the magnetic field, which is electrically controlled. The relation between the amount of magnetization and the bond between the plates is independent of speed. There is no point at which the clutch suddenly tightens to produce a jerk. Slippage is completely eliminated.

This magnetic oil may be used in brakes as well as in clutches, but according to its inventor, Jacob Rabinow of the Bureau staff, it has other applications which may be even more important. These are in servo-mechanisms, instruments to translate electronic "information" into appropriate action in purely mechanical equipment. Such devices are used for power steering of large trucks, tanks, steamships and airplanes. They are also used in printing presses, power machinery, for the control of radar antennas, gun direction control, and in high-speed electronic computers.

Since the amounts of electric power required to control the magnetic fluid clutch are small, it is a simple matter to interlock the electrical circuits with the speed, throttle setting, and power demands. It has been found by experiment that the nature of the oil used has relatively little bearing on performance. Hence silicone liquids may be employed with excellent results, enabling the clutch to operate at both very low and very high temperatures.

Bibliography. Among the new books on physics published during 1948 were: John G. Wilson, *About Cosmic Rays* (Sigma); Samuel A. Goudsmit, *Alsos* (Schuman); Sir George Thomson, *The Atom* (Oxford); Karl K. Darrow, *Atomic Energy: Being the Norman Wait Harris Lectures Delivered at Northwestern University* (Wiley); Department of State, *Atomic Impasse 1948: A Collection of Speeches by Frederick Osborn, Deputy United States Representative to the United Nations Atomic Energy Commission* (Govt. Printing Office); U.S. Atomic Energy Commission, *Background Material on Activity in First Year of Distribution of Pile Produced Radio-Isotopes* (Gov't Printing Office); David O. Woodbury, *Battlefronts of Industry: Westinghouse in World War II* (Wiley); *Charts on Nuclear Physics* (Westinghouse Research Laboratories); Burton, Grayson-Smith and Quinlan, *College Physics* (Pitman); Henry A. Perkins, *College Physics* (Prentice-Hall); Newman and Miller, *The Control of Atomic Energy: A Study of Its Social, Economic, and Political Implications* (McGraw-Hill); Norbert Wiener, *Cybernetics: Or Control and Communication in the Animal and the Machine* (Wiley); Daniel Lang, *Early Tales of the Atomic Age* (Doubleday); Charles F. Meyer, *Electromagnetic Waves and Light: An Introductory Physical Discussion, First Part* (Ulrich's Book Store); V. E. Cosslett, *The Electron Microscope* (Sigma); D. Gabor, *The Electron Microscope: Its Development, Present Performance and Future Possibilities* (Chemical Publishing Company); Carl F. Eyring, *Essentials of Physics* (Prentice-Hall); U.S. Atomic Energy Commission, *Fourth Semi-annual Report* (Govt. Printing Office); James and Higgins, *Fundamentals of Photographic Theory* (Wiley); Konrad Bates Krauskopf, *Fundamentals of Physical Science* (McGraw-Hill); James Jeans, *The Growth of Physical Science* (Macmillan); Charles D. Hodgman, Ed., *Handbook of Chemistry and Physics* (Chemical Rubber Publishing Co.); Hull, Cook and Kohr, *Handbook of Scientific and Technical Societies and Institutions of the United States and Canada* (National Research Council); Harvey F. Girvin, *A Historical Appraisal of Mechanics* (Int. Textbook); Douglas M. Considine, *Industrial Weighing* (Reinhold); Department of State, *International Control of Atomic Energy: Policy at the Crossroads: An Informal Summary Record of the Policy Developments Concerning the International Control of Atomic Energy, October 15, 1946 to May 17, 1948* (Govt. Printing Office); William Mayo Venable, *The Interpretation of Spec-*

tra (Reinhold); W. Boas, *An Introduction to the Physics of Metals and Alloys* (Wiley); Newton Henry Black, *An Introductory Course in College Physics* (Macmillan); Berkner and Wells, *Ionospheric Research at Watheroo Observatory, Western Australia, June, 1938-June, 1946* (Carnegie Institution of Washington); Robert E. Hage, *Jet Propulsion in Commercial Air Transportation* (Princeton University Press); Hamilton, Knipp, and Kuper, *Klystrons and Microwave Triodes* (McGraw-Hill); E. M. McMillan and others, *Lecture Series in Nuclear Physics* (Govt. Printing Office); Pierce, McKenzie and Woodward, Eds., *Loran: Long Range Navigation* (McGraw-Hill); H. F. Johnston and others, *Magnetic Results from Huancayo Observatory, Peru, 1922-1935* (Carnegie Institution of Washington); H. F. Johnston and others, *Magnetic Results from Huancayo Observatory, Peru, 1936-1944* (Carnegie Institution of Washington); Wolfgang Pauli, *Meson Theory of Nuclear Forces* (Interscience); The National Council of Teachers of Mathematics, *The Metric System of Weights and Measures* (Bureau of Publications, Teachers College); J. M. DallaValle, *Micromeritics: The Technology of Fine Particles* (Pitman); George B. Collins, *Microwave Magnetrons* (McGraw-Hill); S. N. Van Voorhis, *Microwave Receivers* (McGraw-Hill); George L. Ragan, Ed., *Microwave Transmission Circuits* (McGraw-Hill); Biochemical Research Foundation, *Neutron Effects on Animals* (Williams & Wilkins); David Bradley, *No Place to Hide* (Little, Brown); Powell and Occhialini, *Nuclear Physics in Photographs; Tracks of Charged Particles in Photographic Emulsions* (Oxford); Lapp and Andrews, *Nuclear Radiation Physics* (Prentice-Hall); Irvin Stewart, *Organizing Scientific Research for War: The Administrative History of the Office of Scientific Research and Development* (Little, Brown); Women's Bureau, *The Outlook for Women in Physics and Astronomy* (Govt. Printing Office); *Papers Presented at the Naval Ordnance Laboratory Magnetic Materials Symposium* (U.S. Naval Ordnance Laboratory); *The Patent System—Law and Contemporary Problems*, Vol. XII, No. 4 (Duke Univ.); Brainerd Currie, Ed., *The Patent System II* (Law and Contemporary Problems); Max Mark Frocht, *Photoelasticity, Volume II* (Wiley); Robert Livingston, *Physico Chemical Experiments* (Macmillan); Fonda and Seitz, Eds., *Preparation and Characteristics of Solid Luminescent Materials* (Wiley); M. J. Zucrow, *Principles of Jet Propulsion and Gas Turbines* (Wiley); Taylor and Westcott, *Principles of Radar* (Cambridge, Macmillan); Lipson and W. M. Murray, ed., *Proceedings of the Society for Experimental Stress Analysis*, Vol. V, No. 1 (Addison-Wesley Press); Navy Department Bureau of Ordnance and Harvard University, *Proceedings of a Symposium on Large-Scale Digital Calculating Machinery* (Harvard University Press); John Burchard, *Q.E.D.—M.I.T. in World War II* (Wiley); Orrin E. Dunlap, Jr., *Radar: What Radar Is and How It Works* (Harper); John S. Hall, *Radar Aids to Navigation* (McGraw-Hill); Arthur Roberts, Ed., *Radar Beacons* (McGraw-Hill); J. L. Hornung, *Radar Primer* (McGraw-Hill); W. M. Cady, M. B. Karelitz and Louis A. Turner, Eds., *Radar Scanners and Radomes* (McGraw-Hill); Shapley, Wright, and Rapport, *Readings in the Physical Sciences* (Appleton); Alfred North Whitehead, *Science and the Modern World* (New American Library); Crowther and Whiddington, *Science at War* (Philosophical Library); Sam F. Trelease, *The Scientific Paper: How to Prepare It, How to Write It* (Williams and Wilkins); Noah D. Ger-

shevsky, *Scientific Russian Reader: Selected Modern Readings in Chemistry and Physics* (Pitman); *The Second Report of the United Nations Atomic Energy Commission to the Security Council, Sept. 11, 1947* (Govt. PITCAIRN ISLAND. A British island colony in the Pacific, midway between South America and Australia (25° 3' S. and 130° 8' E.). Area: 2 square miles. Population (1946): 126. Pitcairn was originally settled in 1790 by mutineers from H.M.S. *Bounty*. Included in the district of Pitcairn are the islands of Ducie, Henderson, and Oeno. Agricultural products: yams, taro, maize, sweet potatoes, bananas, pumpkins, oranges, melons, pineapples, arrowroot, sugar, and coffee. The administration of Pitcairn is under a chief magistrate, subject to the High Commissioner for the Western Pacific.

PLANNED PARENTHOOD. Growing awareness of vanishing resources and soaring birthrates was responsible for international as well as national interest in an expanded Planned Parenthood program. One indication was the International Congress on Population and World Resources in Relation to the Family held in Cheltenham, England, which drew leaders in three fields: (1) scientific and social inquiry, (2) biological and medical research, (3) organizational activity in the promotion of Planned Parenthood. Mrs. Margaret Sanger was chairman of the American Committee for the Congress.

Mrs. Sanger described the purpose of the Congress as a united effort "to seek an alternative method of population control to nature's old standbys of war, famine and epidemics. Delegates from many nations are meeting under the auspices of the British Family Planning Association to exchange information and discuss policies which must be adopted to restore some sort of sane balance between numbers of people and food resources."

At the final session of the conference a committee to promote birth control on an international basis was formed. It was planned to have the committee consist at the outset of the representatives from the chief birth control organizations of the United States, Great Britain, Sweden, and the Netherlands with headquarters in London. The committee was formed to "promote research and education for the furthering of human welfare through planned parenthood and progressive sex education."

A major step towards worldwide birth planning was made possible as the first comprehensive program on research in human reproduction began its active work. Nine research studies were started on factors governing fertility control and problems of infertility in laboratories across the United States.

The research studies were recommended by the National Research Council's newly formed Committee on Human Reproduction to the Board of the National Committee on Maternal Health. The Planned Parenthood Federation of America is one of the three collaborating organizations. Funds for the research were largely raised through its efforts.

As a result of the dearth of scientific work in fertility control many of the applications from scientists so far have been related to infertility studies and to fields other than conception control. Plans were made however, for a scientific conference in 1949 sponsored by the National Research Council. Since it is the first such national meeting to be held in the United States on this subject, it should help to stimulate the interest and support of scientists in developing conception control research.

According to a poll representing the opinion of over three million women that was conducted by the *Woman's Home Companion*, three-fifths favored making birth-control information available to all adults without legal restrictions. Nearly all the rest according to the magazine "are either for making the information available to all married women or else for legally permitting doctors to give out such information whenever they think it's needed to safeguard a patient's health. Only three percent, not even a twenty-fifth, say birth control should be legally forbidden to everybody."

The birth control referendum to allow physicians to prescribe contraceptives to married women whose health in the judgment of the physician required it, was defeated in the 1948 Massachusetts election. The vote was Yes—806,829; No—1,085,320; blank ballots on this issue—263,168.

The aim of the measure was to place contraceptive advice in the hands of the medical profession. It was endorsed by more than one thousand Protestant and Jewish clergy and by a majority of the resident members of the Massachusetts Medical Society. Four thousand volunteers in 300 local committees campaigned to repeal the State law.

Two days after the election, Mrs. Walter E. Campbell, president of the Massachusetts League issued this statement: "We are confident that it will not be long before this merciless law is amended, for Massachusetts cannot fail to demand the same skilled medical advice for its mothers that is now available in 46 other States; family life is too sacred to let anything stand in the way of its highest fulfillment. Massachusetts citizens have too much respect for the wisdom of the medical profession to allow our doctors to remain shackled . . . a firm foundation has been built upon which we shall unite in our continuing fight to implement the civil right of every individual and every religious group to follow the dictates of their own conscience."

In order to broaden the use of conception control in public health, a demonstration was developed to evaluate the practical efficiency of existing, simple contraceptive methods. This project has met with the acceptance of a cross-section of private medical opinion and State health departments. The need for such a study was indicated since approximately only five percent of patients attending pre- and post-natal public health clinics receive contraceptive information.

The fourth annual Lasker Awards in Planned Parenthood went to Dr. John Rock, Harvard Medical School and Director of the Fertility and Endocrine Clinics and to Dr. Richard N. Pierson, former Federation president and chairman of the Medical Committee.

In 1948 the Planned Parenthood Federation was the national agency and clearing house for 15 State leagues and 166 local committees. The birth control clinics in the United States numbered 557. These services were in 242 public health clinics, 62 hospital clinics, 210 extra mural clinics and 43 referral services. Of the 58 fertility clinics in the United States listed with the Federation, 13 were under Planned Parenthood direction. The special contribution of the extra mural clinic supported by expanding public education, was revealed in a patient load far in advance of the combined totals for both hospitals and public health clinics. The 183 hospitals and public health clinics which reported gave a total of 10,457 patients while the 165 extra mural clinics reporting exceeded the figure by 115,539.

—CHARLES E. SCRIBNER

PLASTICS. There are several significant factors in plastics' growth that should become more distinctive in the immediate future. Although molding and extrusion compounds are now the dominant factor insofar as chief outlet is concerned, the sum total of all other uses may grow even faster than the molding branch. Applications in adhesives, laminating, calendaring, coating, and uses of resin or cellulose for textile and paper treatment as well as with wood waste, could eventually become the plastics industry's greatest contributions to the nation's welfare.

In the molding and extrusion industry alone, great significance attaches to the ever-growing prominence of thermoplastics which in 1948 exceeded thermosetting molding-compound consumption for the first time in history.

According to statistics published by *Modern Plastics* magazine, the estimated production of synthetic resins in 1948 totalled 1,400 million lb. Phenolics, with a 300 million lb. total, again led the plastics industry in total consumption but with a slight decline from 1947. Vinyls of all types showed a healthy increase of from 184 million lb. in 1947 to 230 million lb. in 1948. Polystyrene came along fast, particularly at the end of the year, to approach 150 million lb., a 55 percent increase over 1947. The entire plastics industry moved ahead by a little less than 10 percent in 1948 over 1947.

A new thermosetting molding-compound based on a polyester type resin was introduced during 1948. This compound embodies several features which make it extremely attractive to molders seeking high-speed production. It is extremely fast curing and requires relatively low pressures for molding. Its outstanding properties are dimensional stability, resistance to heat, and extraordinarily high arc resistance.

Styrene-butadiene copolymers made with a high proportion of styrene were developed by several firms. These are horny substances which at ordinary temperatures have none of the elastic qualities of rubber. They are compounded with rubber to produce compositions characterized by toughness, high impact strength, and heat resistance. Primary applications are in shoe soles, floor coverings, golf ball cover stock, football helmets, shipping containers, and carrying cases.

New copolymers of styrene and isobutylene produced by low temperature polymerization were announced during 1948. They exhibit rubberlike elastic properties in addition to their thermoplastic characteristics. They have a broad softening range, mix well with waxes, are easily processed on conventional equipment, and have low permeability to moisture and gases. Their films are especially

suitable for the packaging of fresh and dried fruit which require retention of moisture and controlled transmission of oxygen and carbon dioxide during prolonged storage.

Polystyrenes with improved light stability, toughness, and heat resistance were announced at the National Plastics Exposition. The first is directed toward resistance to yellowing when used indoors or when the product is not exposed directly to the weather, as in automobiles. The impact strength of the new tough styrene-type resin is three to five times greater and the elongation 10 times greater than the corresponding values for regular polystyrene. The increase in heat resistance of one type of polystyrene is attributed to more precise control of molecular chain forms in the polymer as a result of the application of principles discovered in the course of fundamental research.

Commercial production in limited quantities of polymonochlorotrifluoroethylene (Kel-F) was announced. It combines chemical inertness and toughness over a wide temperature range (-320 to 390°F.) with ready fabrication in conventional equipment. With production capacity for polyethylene more than tripled during the year (from 15 million to approximately 55 million lb.), interest in this versatile plastic continued to mount. It possesses an unusual combination of desirable qualities; namely, high dielectric strength, light weight, flexibility at low temperatures, chemical resistance, low water-vapor permeability, freedom from taste and odor, non-toxicity, transparency, and ease of fabrication without plasticizer.

Although rubber and plastics compete for many markets, the trend toward using the two materials in combination to achieve superior performance continues. A polyblend stock made by colloidal blending of polyvinyl-chloride resin and butadiene-acrylonitrile rubber possesses properties heretofore obtained only by mill mixing. By varying the ratio of nitrile rubber and polyvinyl chloride, products ranging from hard plastic materials to soft rubberlike compositions are produced. Thermoplastic tubing and hose can be made which are superior to plasticized elastomers in dimensional stability when aged at high temperatures and, in addition, are not subject to stiffening because of plasticizer extraction. Such tubing can be used for transferring beverages, gasoline, oils, solvents, and industrial chemicals.

The development of a flame-resistant cellulose acetate molding compound meeting Underwriters' Laboratories requirements was announced. This material is based on high acetyl cellulose acetate and is in use for electric mixer and shaver housings, blanket switches, vacuum cleaner parts, and the like.

Phenolics. A sharp slump hit the phenolic molding industry in the late spring and summer, with the result that molding-powder consumption for the year dropped off from almost 200 million lb. in 1947 to 180 million lb. in 1948. All other phenolic classifications held about even with 1947. Consumption was back up to around 16 million lb. in the fall. The mild shock administered to phenolic molders by this slump will probably serve as a stimulant to developing new business. In the shortage years, new uses did not grow, but now healthy growth of uses will further develop the industry.

Indications that new products are under way can be found in tool shops where molds are under construction, but most of them are still in the confidential stage. One that points up the tendency to mold larger pieces is a dresser-drawer to be mold-

ed from wood-filled compound. The same thing was tried unsuccessfully years ago, but new techniques now make it look practical. From dresser-drawers to other pieces of furniture and large-size moldings is only a step. A kitchen cabinet for attachment to walls is another probability.

Work on molded laminates is also progressing nicely, with such items as window frames and stair tread and riser covers under consideration. Even a small piano with a molded soundboard is a possibility. These things may be out of line for most compression molders, but it has been a frequent incident in this industry to have new products come from the hands of men who "didn't know it couldn't be done."

There are, of course, many possibilities in the phenolic field aside from molding. These include such things as brake linings and abrasive bondings which have grown so large that the materials manufacturers have set up separate departments to handle them. Mineral wool bonded with phenolic liquid resin is now manufactured by more than 10 companies. Floor coverings frequently employ a phenolic binder. Honeycomb cores for laminating to aluminum or plywood for structural panels haven't gone as far ahead as expected but are still a promising possibility.

Most exciting of all current possibilities is the use of phenolics with wood. A phenolic-treated paper for surfacing plywood that will withstand severe weathering was announced during the year. Its structural use seems assured. Then there is a wood laminate coming along that may fit in particularly well in the construction and furniture fields. It consists of a core of Southern pine, a cross-wise layer of a phenolic-impregnated paper, and a layer of aluminum with a phenolic-paper coating on each side, the entire structure being faced with wood veneer of any type desired. The resulting laminate will compete price-wise with any material intended for similar uses.

Still another, and perhaps eventually the biggest, use of phenolics in the wood field is in combination with sawdust and scrap. It is claimed that a product employing 10 percent or less resin can be made for 6 cents a board foot, or about \$60 per M board feet, and can be used as lumber in most any application where wood is needed. Resin producers estimate they will be selling at least 1 million lb. of resin a month for this material by the end of 1950.

Vinyls. Capacity has skyrocketed to an estimated 250 million lb. annual production of vinyl resin—some researchers say even more. Improvements in vinyl materials and technique are matters of almost week-to-week development. Research on plasticizers is continuing to solve problems of brittleness at low temperature, migration, and spewing. Better stabilizers to improve heat and sunlight resistance are promised for the near future. Heat sealing of vinyl film is not yet foolproof, and there is considerable difference of opinion as to where the most improvement can be made.

One of the outstanding examples of better heat-sealing techniques is found in raincoat production. Sewing of vinyl film was never particularly successful because fabricators were slow to learn that vinyl required a different technique than fabric—that round needles, long stitches, and nylon thread should be used. Sewn under-arm seams and button-holes pulled out. Heat sealing lessens the tendency for seams to open up. One raincoat manufacturer eliminated all sewing; used snaps or zippers instead of buttons and double layers of vinyl to reinforce the pockets, zipper, or snaps; sealed on a hanger strip at the back of the neck; used the new

metallic colors to give style and newness—and sold 200,000 raincoats in the first five months of 1948. Each raincoat required about 1 lb. of compound.

There has been a tendency for vinyl-coated fabric to move into more competition with unsupported sheeting now that the fabric is in better supply and cost is down slightly. There are authorities who insist that the trend toward coated fabric will become more noticeable in 1949, especially in the upholstery field where some upholsterers claim they want the added strength imparted by fabric. Unsupported sheet boosters, on the other hand, insist that proper technique in applying the sheet will eliminate tearing and that coated fabric does not have the drape or luxurious feel of unsupported sheet.

It seems quite obvious that pyroxylin-coated fabric is now suffering from the impact of vinyl and will suffer more. It has been further estimated that the upholstery market would use a total of some 40 million yards of vinyl material and less than 8 million yards of pyroxylin-coated cloth in 1948. The automobile industry, however, still seems to be using about 50 percent pyroxylin-coated material for inner linings, trim, tops, kick plates, etc. Estimators figure that every automobile in the country averages about 2 yards of coated or unsupported material; taxis may average 8 to 10 yards. Pastes and plastisols are growing in acceptance in the vinyl part of these applications, with coated fabric running a close race to catch up with unsupported sheet.

Vinyl treatment or coating of paper dropped off in 1948 because of the resurgence of oilcloth for which vinyl-coated paper had been pinch-hitting. However, the latter is on the market to stay. Consumers still like it as shelf paper, etc., but competition is at work. This category is expected to increase again in 1949 when vinyl-coated paper window drapes make their impact on the market.

The molding and extrusion division of the industry is still dominated by wire and cable insulation. Extrusions such as belts and garden hose may account for 10 million or 12 million lb.; some 30 percent of all garden hose produced in 1948 is estimated to be vinyl.

Polystyrene. Record-breaking consumption of around 15 million lb. of polystyrene a month in the latter part of 1948 presages another record-breaking year in 1949. The near 150 million lb. total in 1948 represents a 55 percent increase over 1947 and that year was 42 percent over 1946.

An important factor in the big poundage for 1948 was the steadily-increasing size of molded pieces. The refrigerator industry in particular is using large numbers of crispers, baffles, throat pieces, and other fixtures, with one baffle reported as containing 30 oz. of polystyrene and having an area of 364 square inches. Refrigerators now frequently employ at least 8 to 10 lb. of polystyrene each; they now account for the largest poundage of polystyrene, with housewares running second.

Among other large moldings are pastel-colored toilet seats. They are not cored out like many other plastics seats, but are solid pieces weighing almost 5 lb. A 9½ lb., one-piece battery case is another large-size article. Polystyrene producers insist that their material has permanently taken over a good portion of the radio cabinet business. Color is a deciding factor in many cases. Higher heat-resistant polystyrene has been helpful because it allows more flexibility of design; but if good ventilation is incorporated in the design, standard polystyrene is adequate.

Molding powder still accounts for over 90 per-

cent of polystyrene production, but other things are beginning to develop now that material is available for experimentation. Extruded polystyrene, which may currently account for from 2 percent to 5 percent of all consumption, is developing slowly but apparently with promise. Filaments for brushes and brooms have been on the market for some time—improved technique will undoubtedly increase uses and volume within the next year or so. Large-size extruded sheets are now being tried as over-lays on refrigerator inner-door panels and have also been suggested as wall board to replace tile, as dashboards in automobiles, and in other sizeable pieces. A polystyrene paper-base laminate is also a possibility, not for table tops, but possibly for walls.

Cellulosics. Confronted with serious competition from other materials, cellulosic molding materials fell off again in 1948, but producers feel confident that the spurt evidenced in the latter part of the year will continue on into 1949 and beyond. Even though other thermoplastics also spurted at the same time to indicate a general uplift in all injection-molded products, the cellulosic increase in the fall to around 4.5 million lb. a month (exclusive of ethyl cellulose) from a low of 3.4 million lb. in June and a high of 4 million lb. in March indicated that cellulosics were in a stronger position.

Pointed out as typical applications for cellulosics in the toy field, for example, are miniature vehicles which are required to take a lot of banging around—motor housings for toy building sets, dolls, gun stocks—anything that must withstand the punishment resulting from youthful exuberance. Further, as another example, butyrate is now the most commonly used plastic in telephone bases. Other cellulosics are under experiment for the handpiece, and the possibility of using colored cellulosics for both molded base and handset suggests a possibility for employment of big poundage. A variation of this is found in colored acetate and butyrate sheaths for phenolic phone-set bases.

Development of a flame-resistant acetate to meet Underwriters' Laboratory specifications is expected to be a boon to acetate, particularly for use in housings. Housings and parts for electric shavers, lightning arresters, Christmas-tree lights, cake mixers, and vacuum sweepers have already been successfully molded of this material.

By and large, the acetate and butyrate producers expect to get a larger percentage of the injection-molding-material business than they did in 1948 and are confident that it won't be long before their poundage surpasses the record 1946 figure of 83 million lb. Producers of acetate have no hope of ever approaching the polystyrene total poundage figure, since that material has captured many markets never fitted for acetate. Nevertheless, there is a belief that the acetate situation will improve in both price and properties.

Probably the decline or standstill in film and sheeting was more disappointing to the cellulosics industry than the decline in molding material. It is probably explained by the accident which incapacitated a principal producer's plant early in the year, but still there has not been the expansion expected in this branch of the industry.

Saran. Sales of saran, vinylidene chloride polymers, increased around 100 percent in 1948 over 1947. Screen cloth, woven from saran monofilament, was reported to have taken from 30 to 40 percent of the total output. Volume of sales for the year ending June, 1948, was approximately the same as the corresponding period for 1947. Extruded saran pipe is making slow, steady gains,

but usage thus far is limited primarily to chemical and industrial plants and generally only when corrosion is a problem. Problems in molding and in the larger-size extrusions, due to the specific gravity of saran, along with fabricating difficulties, are still holding up any large-scale development for molded and extruded parts.

Polyethylene. A "sleeper" in the plastics industry may well be polyethylene, or Polythene, as it is called by one producer. It has been held back because there was not enough material to supply demand. But the 17 million or 18 million lb. available in 1948 will probably be advanced to more than 50 million lb. in 1949 if expanded facilities which were completed in 1948 are operated at normal rates.

A versatile material with some properties that eclipse other plastics, polyethylene has wide ranges of usefulness. It is the lightest in weight of all plastics; it will float on water; electrical properties are superb; chemical resistance is high. In fact, the latter two properties are handicaps in some cases because of their excellence. The electrical resistance is so great that polyethylene cannot be electronically heat sealed; its solvent resistance makes it difficult to adhere to other material or to print on. It has very low moisture absorption and remains flexible at low temperature.

First, and still most important outlet for polyethylene is in the electrical insulation field. Somewhere near 2.5 million lb. a month may soon be used for that purpose if present applications continue to expand. Best known is the $\frac{3}{8}$ -in. diameter disk used as coaxial cable-spacers—there are as many as 506,000 disks per mile in a typical cable.

The largest potentiality of all in some estimators' opinions is polyethylene film. Extruded in thicknesses of from 1 mil up and as wide as 54 or 72 in., the 2 mil film can be sold at 75 cents a lb., or 1,000 sq. in. for about 5 cents, in comparison to 1,000 sq. in. of moisture-proof cellophane in 1.4 mil thickness at from 4.8 to 5.6 cents per M sq. in. In cast film, the polyethylene cost would be about \$1.00 per lb. Extruded tubing and pipe with molded valves and joints is also a growing business for polyethylene. Ease of processing and chemical resistance make such products ideal for chemical, paper, and textile plants where corrosion is a problem.

Acrylics. The poundage of acrylic in comparison to the total poundage for the entire plastics industry is small, yet acrylic is so popular and its uses are so spectacular that the trade names Plexiglas and Lucite perhaps symbolize "plastics" to the public more than any other coined names.

Acrylic production today is probably less than half of wartime consumption, when it was slightly over 30 million lb. Acrylic molding material used primarily for automotive applications, high-style boxes and ornaments, brush backs, high-grade costume jewelry, and similar "class" applications, probably totals less than 1 million lb. a month. At least 50 percent of present usage is reported as being in automotive applications—horn buttons, escutcheons, radiator ornaments, stop-light lenses.

An interesting new molded application is in letters used by oil companies for signs for stations and trucks. One producer is molding letters that are $\frac{1}{8}$ in. thick and vary from 6 to 15 in. in height. They can be molded at less cost than fabricated because of the quantity needed. The biggest letter reported uses around 12 oz. of material and is molded on a 16-oz. injection press.

Urea and Melamine. The 1948 pattern for urea-molded products did not show much change from

former years. One of the first jobs since molding powder came into free supply has been to get back whatever end-products may have been lost to other materials when urea was difficult to obtain. Radio cabinets, molded containers or boxes, and various types of housings should soon be appearing again in urea, more frequently than in the past three or four years.

Buttons and closures now require an estimated 40 percent of the urea and melamine output, with buttons alone accounting for 25 percent. Such items as scales, business machines, instrument and clock housings, electrical apparatus, children's toys, dishware, and stove hardware seem firmly established in urea or melamine.

Probably the biggest news in melamine molding during 1948 was the increased popularity and sales of melamine dishware for both commercial and home use. There are a few complaints from users about various difficulties, but none of them seems without remedy. A cafeteria survey, where the dishes had been on test for nine months, reports a tableware replacement of 0.0013 cents per meal, or around \$700 for that period, for melamine dishes, compared to a replacement cost of from \$1,500 to \$1,700 a year on china. Many of the replacement losses on melamine were suffered when the dishes were carried off by customers!

Use of melamine and urea in wet strength paper has increased at least 20 percent over 1947. Bags, toweling, blueprints, crate liners for vegetable shipping containers, and paper drapes are some of the chief outlets. Melamine laminates increased for decorative purposes during 1948 and are due for further expansion when builders learn that the higher initial cost of laminated window sills, doors, trims, etc., is soon paid for by low maintenance cost. Television sets, furniture, and elevator cars are good volume potentials for laminates. In one factory as many as 1,000 tables a day have been made with melamine laminated tops.

Use of melamine in textiles for shrinkage control, water repellence, and wrinkle resistance, continued to advance. Shrinkage resistance in wools is presently limited to woven goods such as shirts. A kindred application is in felt belts for paper mills where treated felt will last some 13 days in comparison to a former life of 7 days.

Nylon. Development of nylon as a more widely used injection-molding material was held back several years by scarcity, price of \$1.60 a lb., and lack of interest by molders who were busy with other things and thought they didn't have time to learn new techniques. But 1948 witnessed a revision of molders' opinions. Today there are at least 50 molders who can or have molded nylon products successfully.

Molded nylon coil-forms no more than 0.005 in. thick will withstand the tension of electrical wire wrappings and the heat used to bake an insulating varnish over the finished coil. Millions of coil-forms are produced annually. They range in size from tiny ones that might be placed three on a thumb-nail to some that are 4 in. in diameter. One molder is now selling them for less than other plastic forms. His economy comes from injection molding and a paucity of rejects—he can mold to minute tolerances.

Nylon dishware in use in State and government institutions can stand abuse and can be sterilized. Similar applications in restaurants and homes might logically follow this development but have not as yet. Nylon monofilament for brushes, fishing leaders, sutures, tennis-racket strings and even harp strings, is not quite equal to molding powder on a

poundage basis, but is constantly growing. The market for all bristles, animal or synthetic, has grown rapidly. From 2 million to 3 million lb. of bristles were imported before the war and about 6 million in 1947, according to one authority. Four million lb. are used for paint brushes in a year. Nylon bristles are now employed in about 10 percent of all master paint brushes.

—CHARLES A. BRESKIN

POLAND. A central European republic, established Nov. 9, 1918. It was invaded by Germany Sept. 1, 1939, partitioned between Germany and the U.S.S.R. by the treaty of Sept. 28, 1939, and completely occupied by German forces after the outbreak of the Russo-German war on June 22, 1941. The liberation of Poland, begun early in 1944, was completed in the spring of 1945.

Area and Population. The territorial limits of the new Poland have not yet been finally drawn. Within the provisional boundaries fixed by the Yalta and Potsdam Agreements, the country occupies an area of 121,131 square miles, with an estimated population of 24,200,000 on July 1, 1947 (23,929,800 according to the census of Feb. 14, 1946). Capital, Warsaw (est. population on Mar. 1, 1948: 585,470). Populations of other important cities in 1947: Lodz, 596,000; Cracow, 303,000; Poznan, 268,000; Wroclaw (Breslau), 201,000; Gdansk (Danzig), 170,000; Katowice, 128,000.

Education and Religion. Elementary and secondary education, up to the age of 18, is compulsory and free. In 1947, there were 3,260,000 pupils in elementary schools; 225,200 in secondary schools; and 97,755 students (32,904 of them women) at universities and other institutions of higher learning. The population is chiefly Roman Catholic.

Production. In the new Poland, agricultural and industry are fairly balanced as the principal sources of national income. An important exporter of foodstuffs before the war, Poland was a food deficit country in 1945-47, but made a good start toward regaining its former role in 1948. Bumper crops of wheat, rye, barley and oats were harvested in 1948, bringing the total cereal yield to about 11 million tons, as compared with 4 million tons in 1947. Poland now ranks as one of the world's foremost coal-producing and exporting countries. In 1947, the output of coal was 59,130,335 tons, as compared with 47,288,000 tons in 1946 and 20,183,000 in 1945. The target figure for 1948 was set at 80 million tons. In the first six months of the year, 33,400,000 tons were produced. Poland is also an important producer of iron and steel. The output of raw steel, in the first half of 1948, was 926,600 tons, compared to 1,220,000 tons for the whole year of 1946.

Foreign Trade. According to official estimates, Poland's foreign trade in 1948 exceeded the \$1,000 million mark, almost doubling the country's 1947 share in the international exchange of goods.

Government. A permanent new constitution has not yet been drawn up. By and large the original constitution of 1921 is being applied, with some important modifications. Theoretically the Sejm, or parliament, is the supreme organ of the state. In the 444-man Sejm, elected on Jan. 19, 1947, the (Communist-controlled) Government bloc holds 383 seats. Since March, 1947, a five-man state executive council, headed by the President of the republic, has been empowered to rule by decree between parliamentary sessions, subject to the Sejm's approval of the laws thus passed. President, Boleslaw Bierut, elected Feb. 5, 1947, for a term of seven years; Premier, Józef Cyrankiewicz.

Events, 1948. Three international developments left a strong imprint on Polish affairs in the year under review: the exacerbation of the East-West conflict; the Communist coup in Czechoslovakia; and the Tito "heresy" in Yugoslavia.

In all three cases, Poland slavishly adhered to the Moscow line, though not without some internal convulsions. By the end of the year, there was hardly any shred of doubt left as to Poland's complete domination by the Communists of strict Muscovite observance.

Poland's primary importance in the "Molotov Plan" for European Economic Recovery, as opposed to the Marshall Plan, was highlighted by a state visit to Moscow early in 1948 and the comprehensive Russo-Polish treaty that sprang from it. On Jan. 13, Premier Józef Cyrankiewicz, Vice Premier Władysław Gomułka, Minister of Industry Hilary Minc, and his deputy Ludwig Grossfeld departed for Moscow where they spent two weeks conferring with Soviet leaders on political, economic and international problems. They were joined later by Marshal Michał Rola-Zymierski, Polish Minister of National Defense and Commander in Chief of the Army, indicating that military topics were also under consideration. The only announced outcome of these talks was a five-year trade treaty providing for a total turnover of \$1,000 million and granting Poland an investment credit of \$450 million for capital goods to be purchased from Russia in the period 1948-56. It was pointed out that this figure represented the largest credit ever granted by the Soviet Union to a foreign country.

Rapprochement with Czechoslovakia. The Communist coup in Prague, in February (see CZECHOSLOVAKIA, under *Events*, 1948) opened the way for close political and economic cooperation between Poland and Czechoslovakia. Such a rapprochement of the two countries, which in the past often had been rivals, had long been sought by Moscow as a means of strengthening the Soviet satellite system in Eastern Europe. Previously, however, the different political hues of the regimes in Warsaw and in Prague had been an obstacle; the Czechs thought Poland was a bit too strongly tied to Russia's apron-strings, while the Poles were not sure of Czechoslovakia's undivided loyalty to the Soviet orbit.

One of the first actions of the new Czechoslovak Foreign Minister Vladimír Clementis was to pay a visit to Warsaw, on March 13. A comprehensive accord on economic cooperation resulted from his talks with Polish officials. Potentially the most important feature of the agreement was a plan for the joint establishment and operation of an East European "Ruhr district" in Upper Silesia. Detailed plans for this huge industrial venture were announced on August 8 in a communique of the Polish-Czechoslovak Economic Cooperation Council.

The new industrial combine is to be centered in the area between Katowice in the Polish, and Moravská Ostrava in the Czech portion of Silesia. The arrangement envisages the construction, within the next twelve years, of a number of large new steel works and power plants. According to some reports, an annual steel production of 4 million tons—largely based on iron ores imported from Sweden—is being aimed at. The two countries also announced that they intended to coordinate their foreign trade policies, in order to avoid "unhealthy competition" in foreign markets.

The Warsaw Conference. Several international meetings and rallies were held in Poland during the year. The most important of these was the For-

eign Ministers' conference on Germany which convened at Wilanów Palace near Warsaw on June 24. Organized in open opposition to the Western powers' London Conference on Germany (see GERMANY, under *Events*) the Warsaw meeting was attended by the foreign ministers of the eight "Soviet bloc" states: Albania, Bulgaria, Czechoslovakia, Hungary, Poland, Rumania, the U.S.S.R. and Yugoslavia. The communique issued at the close of the conference was devoted mainly to a sharp attack on the London decisions, which "do not aim at preventing the possible recurrence of German aggression, but rather at transforming the western part of Germany, and especially the heavy industry of the Ruhr Basin, into an instrument for rebuilding the military potential of Germany . . ."

In line with current Soviet policy, the Warsaw communique deplored the "breaking up and dismembering of Germany" by the Western Allies, a policy which was said to "make impossible the conclusion of a peace treaty with Germany, without which there can be no end to the prolonged state of war and the occupation regime in Europe." The communique was silent, however, on plans for the establishment of an East German government, which the Russians were reported to be favoring, while the Poles were said to be opposed at this time.

In connection with the Warsaw Conference, the Polish Government on June 18 formally protested in Washington, London, and Paris against the six-power decisions on Germany, contending that these decisions violated the Potsdam Agreement and that they failed to take Polish interests into consideration. The American and British Governments simultaneously rejected these protests on July 7. The American note pointed out that Russia, not the Western powers, was responsible for the breakdown of quadripartite control over Germany and advised the Polish Government that its complaint "should more appropriately be addressed to the occupying power responsible for the present deplorable division of Europe and Germany."

On a different level, the East-West feud was waged with no less bitterness at the "World Congress of Intellectuals" which was opened at Wrocław (Breslau) on August 25. Western representatives were in a decided minority at this convention, which engaged in denunciations of alleged American imperialism and warmongering.

Gomułka's Fall from Grace. On the domestic political scene, Tito's rebellion against the Kremlin had unexpected and far-reaching repercussions. As in Yugoslavia, the Polish Communist party had been divided for some time into two rival factions, one of which put unquestioning loyalty to Moscow above all other considerations, while the other had the national interest at heart. The former group was headed by Hilary Minc, Minister of Industry, the latter by Vice-Premier Władysław Gomułka, the secretary general of the Workers' (Communist) party.

The struggle between the two factions came to a head in August, after completion of the break between Tito and the Cominform. At a meeting of the Communist party's central committee, in mid-August, a new political program was drawn up which in all respects followed the Cominform line. Among other things, it was decided to organize a new drive against "rich peasants," and to bring all small and medium farmers into cooperatives. On this, as on other points of the program, Gomułka was in frank opposition to the party majority. At first an attempt was made to gloss over the dispute, but when Gomułka refused to recant,

his ouster from party leadership became inevitable.

On September 3, a statement issued by the central committee admitted publicly that there was a "rightist and nationalist deviation" in the party. At the same time it was announced that the committee had called on President Bierut—who hitherto had been ostensibly a non-party man—to "return to active political work" in the party and that the President had agreed. This move foreshadowed the dismissal of Gomulka from his post as Secretary General, which was made public on September 5, when the central committee, after a new denunciation of the dissidents, named Bierut to the key party post.

Gomulka, realizing that he had lost the battle, capitulated. On September 6, he publicly admitted his "errors" and promised to abide by the new party line. Although he had previously opposed his party's denunciation of Tito, he now announced that there was no room in the Polish Workers' party for "Yugoslav-like apostasies." In return, he was allowed to keep his posts as Vice-Premier and Minister for the Western Territories.

The Communist purge, which also involved numerous lesser party officials throughout the country, led to a similar crisis in the Socialist party. Since early in the year, plans had been afoot to merge the two parties—whose differences in viewpoint and policies gradually had become almost imperceptible—in a single United Workers party. Those plans were nearing completion at the time of the Gomulka affair. Now the new Secretary General of the Communist party, President Bierut, demanded that the Socialist partner reform as thoroughly before the fusion project could become effective.

Accordingly, on September 22, the central committee of the Socialist party purged itself and the subordinate National Council of 16 members charged with nationalism, right-wing tendencies, and hampering unity with the Communists. Among those removed from the central committee was former Premier Edward Osobka-Morawski. The victorious left-wing faction was led by the party's secretary general, Premier Cyrankiewicz. Thus toward the end of the year, a virtual one-party rule was established in Poland. —JOACHIM JOESTEN

POLO. The mallet-swinging stars enjoyed one of their biggest years in 1948 when efforts were made to make the sport more popular with the general public. More contests were played indoors and the admission cost to big outdoor games was cut with result that many sports fans saw polo for the first time. One innovation was the introduction of the game to the Orange Bowl in Miami, Fla., where teams using indoor rules played through most of the Winter.

Laddie Sanford's Hurricanes, led by the ten-gal Cecil Smith, captured the big event of the campaign, the national open championship on International Field of the Meadow Brook Club at Westbury, L.I. Riding with Captain Sanford and Smith were Larry Sheerin and Peter Perkins. The same team added to its laurels with a convincing triumph in the Monty Waterbury Cup tourney. Texas came through to the title in the National League's outdoor campaign.

Arlington Farms of Chicago took national open indoor honors, the junior crown falling to the Milwaukee Shamrocks. The University of Miami team of Florida rode off with the national intercollegiate trophy and the Chicago Black Hawks triumphed in the Sherman Memorial tournament.

—THOMAS V. HANEY

POPULATION. The most fundamental statistics of any geographic area are the statistics of its population—the count of the number of persons who live in the area—since it is through these persons that the area acquires importance, either as a market or as a source of production or as a factor in the non-economic affairs of the nations. For some areas the best population statistics available, even now, comprise no more than rough estimates of the number of inhabitants, without classification, while in other areas there have been painstaking counts of the population classified by age, sex, marital status, education, occupation, income, and other characteristics.

World Population. The earliest date for which generally acceptable estimates of the population of the world have been made is around 1650, or about 300 years ago. Even now no more than two-thirds or three-fourths of the world's population is covered by actual censuses; and some of the censuses are far from meeting the highest standards. Estimates for dates from 1650 to 1933 are presented in Table 1. From 545 million in 1650, the world population increased, according to these estimates, to 728 million in 1750—a gain of 33 percent in 100 years; by 1850 the figure had grown to 1,171 million, an increase of 61 percent; and in 1947, at the end of almost another hundred years, the figure was about twice that of 1850. The speeding up in the rate of increase which has thus been noted has resulted in part from improvement in health conditions effected by governmental activities in the field of public health, in part from the greatly increased per capita output attained through the use of modern methods in both agriculture and manufacturing, and in part from the facility with which modern transportation brings food to an otherwise famine-stricken area and carries food products from surplus areas to deficit areas.

* From A. M. Carr-Saunders, *World Population*, London, 1937.

In the more highly industrialized areas, where public health activities long ago brought about significant reductions in the death rate, the birth rate also has gone down significantly in recent decades, so that the excess of births over deaths is no more—perhaps even less—than it was 100 or 150 years ago when both rates were high. In these countries the Malthusian menace of population overtaking food supply is no longer a source of worry. In other countries, however, where the reduction in the death rate through governmental health activities is recent, the birth rate is still maintained at its earlier level; and we have cases where, as in Puerto Rico, a death rate of 13 is accompanied by a birth rate of 43, with a resulting 3 percent annual increase in the population—which, in Puerto Rico, is already twice as large as the land can well support.

The latest available population figures are shown, by continents, in Table 2, with corresponding areas and population densities. In the matter of growth since 1933, there are no outstanding differences among the continents, and the minor

differences in favor of the "newer" continents may reflect nothing more than the relative imperfections in the data.

Even in the matter of population density—the number of persons per square mile of area—the differences are not as spectacular as between one entire continent and another, since every continent contains rather large areas of thinly settled territory and relatively small areas with the extreme densities represented by such areas as the Netherlands (717), Belgium (713), or Puerto Rico (628).

Population of the United States. The population of the United States in 1790, when the first census was taken, was just short of 4 million. Each sub-

^a Revised figure. ^b Preliminary estimate for July 1.

sequent decennial census up to 1860 showed an increase of about one-third over the preceding census. From that date to 1910 the decennial increase was around 20 or 25 percent, and for the decades ending in 1920 and 1930, respectively, 15 or 16 percent, while between 1930 and 1940 the popula-

Because of frequent additions of thinly settled areas to the territory of the United States between 1790 and 1850, there were no marked increases in the population per square mile. Between 1850 and 1900, however, the population density increased from 7.9 to 25.6, and continued to increase rapidly, amounting to 44.2 in 1940 (and 49.2 in 1948).

Estimates of the population of the United States as a whole have been made month by month since 1940 on the basis of current records of births and deaths (adjusted for under-registration) and net immigration. The estimates for July 1 of each year are presented in Table 4, together with the data on births, deaths, and net immigration on which the estimates are based.

The population of the United States for July 1, 1948, including persons in military service abroad, was thus estimated at 146,571,000, which represents an increase of 2,538,000, or 1.76 percent, over the estimate for July 1, 1947. The increase during the preceding fiscal year (2,799,000), a year in which nearly 4 million births were recorded, was appreciably larger, but the increase for the year ending June 30, 1948, was larger by many hundreds of thousands than the increase in any year prior to 1947.

The estimate for 1948 represents an increase of 14,902,000, or 11.3 percent, over the 1940 census. This 8-year period thus added almost twice as much to the population as the entire decade between 1930 and 1940; and the complete decade from 1940 to 1950 bids fair to record an increase decidedly larger in absolute figures than any earlier decade.

This situation, which represents a reversal of a long-time trend toward slower and slower population increase, is difficult to interpret; and experts in the population field are in disagreement as to whether it is a purely temporary result of war conditions or may foreshadow population increase at a higher level over a long period of time.

The sources of the increase between 1947 and 1948 may be analyzed as follows. There were during the year ending June 30, 1948, 3,700,000 births, from which may be subtracted 1,458,000 deaths, leaving a natural increase of 2,242,000 which represents the major part of the population increase. The remainder was made up of net civilian immigration amounting to 296,000, including about 30,000 persons coming into continental United States from the territories and possessions.

Among these factors, the number of births is the one which has changed materially during the past 30 years, first declining from a maximum of 2,956,000 in 1921 to a minimum of 2,275,000 in

TABLE 4—ESTIMATES OF THE POPULATION OF CONTINENTAL UNITED STATES INCLUDING ARMED FORCES OVERSEAS: 1940 TO 1948

July 1, 1946.....	141,235,000	1,649,000	1.18	2,897,000	1,440,000	1,457,000	192,000
July 1, 1947.....	144,034,000	2,799,000	1.98	3,997,000	1,428,000	2,569,000	230,000
July 1, 1948.....	146,571,000	2,538,000	1.76	3,700,000	1,458,000	2,242,000	296,000

tion increased only 7.2 percent, or less than half the smallest previous decennial increase. The data for the sixteen censuses are given in Table 3, together with the population per square mile on each census date.

1933, and then increasing, first slowly to 2,553,000 in 1940, and then more rapidly to the figures quoted above. The number of deaths was 1,442,000 in 1920, 1,457,000 in 1930, 1,474,000 in 1940, and 1,460,000 in the calendar year 1948. Immigration

averaged around 300,000 per year between 1920 and 1930, slightly less than zero between 1930 and 1940, and in 1948 was again approaching 300,000 a year.

^a A minus sign (-) denotes decrease.

In addition to the estimates of the total population of the United States including members of the armed forces overseas, estimates were made for the civilian population and for the population including military personnel in the continental United States. The estimate of the civilian population for July 1, 1948, was 145,806,000, and the estimate for the population, excluding only those armed forces who were overseas, was 146,114,000. The latter estimate is distributed by States in Table 5, which shows also the percentage of increase over 1940.

The figures in Table 5 indicate that, in general, the population changes resulting from the concentration of war-production effort in certain areas have been maintained up to 1948, that is, most of the States which showed marked increase between 1940 and 1948 were States to which there was a considerable amount of migration for participation

in the war-production effort. Seventeen States and the District of Columbia increased at a higher rate than the country as a whole, while the population of seven States actually decreased. Nearly one-third of the entire numerical increase took place in the three Pacific Coast States, each of which showed a population increase well above 40 percent, while the maximum percentage for any State outside the far west was 24.2 in Florida.

There has been much interest, especially in recent years, in forecasts of the population for future dates, but the unexpectedly large numbers of births which have occurred since 1940, and especially in the fiscal years 1946-47 and 1947-48, have made increasingly difficult the problem of making such forecasts. Revised forecasts of the population of the United States (two alternative series based on different assumptions) were published by the Bureau of the Census early in 1949. The higher of these two series of official estimates gives 149,886,000 for 1950 and 155,745,000 for 1955. Even these estimates seem to be rather conservative, however, in view of the actual increases during 1947 and 1948, and the situation in January, 1949, seemed to justify somewhat larger estimates, perhaps as high as 151 million for 1950, and 159 million for 1955.

Urban and Rural Areas. The urban population of the United States comprises in general all persons living in incorporated places (cities, towns, villages, or boroughs) having a population of 2,500 or more, while the remainder of the population is classified as rural. One of the most significant of the changes in the characteristics of the population of the United States has been the rapid urbanization of the population. In 1790, 94.9 percent of the population was rural and only 5.1 percent urban. By 1850 the percentage urban had increased to 15.3; in 1900 it was 39.7; in 1920, 51.2; in 1940, 56.5; and in 1947, 59.0. There has been consistent and rapid increase in this figure from one census to another since 1830, except that during the depression decade between 1930 and 1940 the urban population increased only a little faster than the rural. The conditions prevailing during this period discouraged the usual movement of the population from rural to urban areas and also reduced somewhat the rate of natural increase so that the urban areas gained far less than in previous decades from the inflow of rural migrants, and somewhat less from the excess of births over deaths. The decennial figures on urban and rural population are summarized for the entire period from 1790 to 1940 in Table 6, together with estimates based on a sample survey of the civilian population made in 1947, which indicate a resumption of the tendency toward urban residence.

Sex and Color. Since 1910, at which time there was an excess of 2,692,288 males in the population of the United States (partly resulting from heavy immigration during the years just preceding), there has been a fairly rapid decline in the sex ratio, that is, the number of males per 100 females. This figure, which stood at 106.0 in 1910, had been reduced to 100.7 in 1940, and further reduced in 1948 to 99.1. Between 1940 and 1948, an excess of 453,909 of males in the population had disappeared and been replaced by an excess of 642,421 females. This situation represents more nearly what might be termed a normal relationship between the numbers of the two sexes, since under present conditions women live somewhat longer, on the average, than men. It is expected that this excess of females will increase somewhat as the years go by, but that it will never reach alarming propor-

TABLE 6—URBAN AND RURAL POPULATION OF THE UNITED STATES: 1790 TO 1947

^a Estimate for July 1. ^b Excess of females.

The percentage of nonwhite persons in the population of the United States has changed very little in recent times. The census figures show a slight decrease from 12.1 percent in 1900 to 10.2 percent in 1930 and again in 1940, at which time the total nonwhite population amounted to 13,454,405. Since 1940, however, the nonwhite population has increased somewhat faster than the white, amounting in 1947, according to a sample survey of the civilian population, to 15,017,000, or 10.6 percent of the total. During this same period there was a very considerable migration of nonwhite persons from the rural south to urban centers in the north and west. Thus while the nonwhite population of the country as a whole increased 11.6 percent, the nonwhite population actually decreased 4.8 percent in the south, and increased by more than 50 percent in the rest of the country. These figures are summarized, by regions, in Table 8.

TABLE 8—POPULATION OF THE UNITED STATES, BY COLOR, BY REGIONS: 1940 AND 1947

^a Estimates based on a small sample. ^b A minus sign (-) denotes decrease.

Age Distribution. The population of the United States, like that of most industrialized countries,

has been rather rapidly growing older for a long time, partly because the declining birth rate has resulted in the addition of relatively smaller numbers of children in successive generations, and partly because improvements in health conditions have increased the span of life. The median age of the population in 1820 was 16.7; in 1870, 20.2; in 1910, 24.1; and in 1940, 29.0. The same tendency is indicated by the increase in the percentage of the population 65 years old and over, which increased from 3.4 in 1880 to 7.5 in 1948.

While the increase in the percentage of the population in the older age groups has continued since 1940, the large numbers of births, already referred to above, have changed the pattern of the age distribution with respect to the younger age groups. These changes are clearly shown by the figures in Table 9, which gives the age data for 1940 and 1948.

TABLE 9—POPULATION, INCLUDING MILITARY OVERSEAS, BY AGE: 1948 AND 1940

Age (years)	Population July 1, 1948		Population April 1, 1940	
	Number	Percent	Number	Percent

75 and over.....	3,456,939	2.4	2,643,125	2.0
Median age.....	29.8	..	29.0	..

The population under 5 years of age, which decreased sharply between 1930 and 1940 and was actually smaller in 1940 than in 1910, increased far more rapidly between 1940 and 1948 than any other age group, gaining 43.3 percent as compared with a gain of only 11.3 percent in the population as a whole, and representing 10.3 percent of the total population in 1948, as compared with 8.0 percent in 1940. The population 5 to 9 years old likewise increased its proportion of the total from 8.1 percent to 8.8 percent. On the other hand, the number of persons from 10 to 19 years of age, comprising mainly persons born during the low-birth-rate years of the 1930's, was smaller by more than 2 million in 1948 than in 1940. The population at the upper end of the age scale continued to increase, however, at a rate materially above that

TABLE 10—POPULATION BY EMPLOYMENT STATUS, DECEMBER, 1940 TO 1948
(Institutional population excluded. Employment figures are based on a small sample. Numbers in thousands)

Employment status	Dec., 1948	Dec., 1947	Dec., 1946	Dec., 1944	Dec., 1943	Dec., 1940
Total population 14 years old and over.....	109,036	107,918	106,940	104,900	103,010	100,780
Total labor force including armed forces.....	62,828	60,870	60,320	65,030	61,970	55,150
Armed forces.....	1,453	1,280	1,890	11,820	6,290	690
Civilian population.....	107,583	106,638	105,050	93,080	96,720	100,090
Civilian labor force.....	61,375	59,590	58,430	53,210	55,680	54,460
Employed.....	59,434	57,947	56,310	52,710	54,160	47,550
Unemployed.....	1,941	1,643	2,120	500	1,520	6,910
Persons not in labor force.....	46,208	47,047	46,620	39,870	41,040	45,630
Employed persons by sex:						
Male.....	42,162	41,653	40,300	34,180	37,500	35,880
Female.....	17,272	16,284	16,010	18,530	16,660	11,670

of the total population. Persons 55 to 64 years of age formed 8.9 percent of the total in 1948, as compared with 8.0 percent in 1940, and the percentage of the population 65 years old and over increased from 6.9 in 1940 to 7.5 in 1948.

Very significant increases in the numbers of children of school age can be definitely forecast on the basis of current data on children of pre-school age—or of the numbers of births which have occurred in specific recent years. The 6-year-olds entering school in the fall of 1948, for example, were mainly the survivors of the 2,808,000 births of the fiscal year 1941–42. Those who will enter school in 1953 will be mainly the survivors of the 3,997,000 births of 1946–47 and may safely be counted on to represent a similar increase (42.3 percent) over the new enrollment of 1948, which, in turn, was 20 percent larger than that of years around 1939 or 1940.

Employment Status. Data on the employment status of the population of the United States have been published each month since 1940 on the basis of a monthly survey of a widely distributed sample of about 25,000 households. Data representing the number of persons in the labor force, the number of employed and the number of unemployed are summarized for various dates from 1940 to 1948 in Table 10.

The decline in the civilian population 14 years old and over from 100,090,000 in December, 1940, to 93,080,000 in December, 1944, reflects the mobilization of the armed forces for World War II, while the rapid increase in the civilian population to 105,050,000 in 1946 reflects the approximate completion of demobilization. The recruitment of additional workers for war production is indicated by the fact that while the civilian population declined by 7 million between 1940 and 1944, the civilian labor force declined by only a little more than 1 million.

The maximum wartime employment (56,290,000 in July, 1943) was equalled in December, 1946, and exceeded by 3 million in December, 1948. Unemployment, which dropped to a very low figure during the war (from nearly 7 million in 1940) was maintained at a level between 1,500,000 and 2,500,000 for most of the postwar period. These figures represent little more than what is sometimes termed "frictional unemployment," that is, the number of persons who will at any one time be in process of transfer from one job to another. The estimate of unemployment for January, 1949, indicated a considerable increase over December, 1948, though still within the range indicated above.

—LEON E. TRUESDELL

PORTS AND HARBORS. The year 1948 has seen some expansion and improvement of ports and harbors, but the principal work has been in rehabilitation due to war damage and neglect. Increased labor and operating costs have dictated the speedier

turn-around of shipping in port and the increased over-all dimensions of ships has necessitated extensive modification of existing facilities.

In the Far East, with the exception of Hong Kong and some of the Japanese ports now used by the American forces, little has been done since the war and conditions generally are unsatisfactory. The Philippine Government has just let a contract to clear Manila harbor of wreckage.

In Europe, Africa, and the Near East the reconstruction of war damage is well under way. Rotterdam, Leningrad, and the Latvian ports of Riga and Libau all report reconstruction virtually complete and an increase of cargo-handling equipment. Poland is spending \$22 million on ports. Gdynia is functioning satisfactorily and Szczecin (Stettin) is being made into the principal bulk-cargo port. Small fishing ports will also be equipped to handle coal.

In France temporary equipment erected for the Allied armies is proving satisfactory and will last for several more years. Therefore reconstruction is of a permanent nature, often along prewar expansion programs, as at Marseilles. Cherbourg is concentrating on passenger facilities now, but hopes to maintain much of her wartime importance as a freight port.

Reconstruction in England is slower, due partly to its extent and partly to strict government control of all construction. However, the larger British ports are operating at about 70 percent of prewar capacity. Many enclosed ports must enlarge their locks to accommodate the larger postwar vessels. New handling equipment is being provided and transit sheds are being built. The Manchester Canal Company plans a large oil dock to be erected outside the city.

The ERP has provisionally agreed to construct an oil harbor and refinery at Antwerp with a capacity of a million tons a year. The contract has been let for a pier and causeway to extend seven miles into the Persian Gulf and carry pipelines and standard gage railroad track for the Arabian American Oil Co.

In the United States, the chief handicap is in labor-management relations and the high cost of pier construction. Substructure costs have doubled and superstructure costs have increased two and a half times in nine years. Considerable work has been done in deepening channels, and more is under way. The main channel in New York from Ambrose Light to 59th Street is now 45 ft. At Philadelphia and Norfolk the channel has been increased to 40 ft. as far as the Navy Yards, and at Baltimore to 39 ft. An improvement in suction dredging permits pumping at practically bottom consistency, speeding work.

In June San Francisco joined New York and New Orleans as a free port with a foreign trade zone where goods may be stored, sorted, processed, and trans-shipped without payment of duty. In No-

vember New Orleans opened its International Trade Mart, "a global showcase for bringing together buyers and sellers from all parts of the world."

Port Newark was transferred to the Port of New York Authority, March 31. Basin dredging is complete, piling is in order, and fenders and trackage are being improved. Five millions will be spent there during 1949 in a 7-year expansion program. Three plans were submitted for the modernization of the Port of New York, but no agreement has been reached.

The Hoosic Terminal under construction in Boston is now 40 percent completed. The B&M Railroad and the city have agreed on Mystic Pier No. 1, but work will not start until the completion of the Hoosic Terminal. The C&O Railroad's new coal-handling pier under construction at Norfolk will increase their capacity by a third. It will be able to handle 6,000 tons an hour by means of conveyor belts and four movable towers making ship movement unnecessary during loading. At Toledo the New York Central and B&O Railroads' rail and water terminal, put into service in 1948, can load a lake vessel holding 16,000 tons of coal in six hours. This terminal, built at a cost of \$18.5 million has three movable ore unloaders and three coal dumpers.

Canada plans to spend \$5,966,000 to expand her harbor facilities in addition to \$2,307,000 earmarked for maintenance in 1949. Work is well along on two large 35-ft draft wharves and fire-proof transit sheds, one at Halifax, and the other at St. John, N.B.

The year's most interesting development in harbor control is the search radar installation at Liverpool, England which lies 14 miles up the Mersey River. Movement is virtually impossible during the frequent fogs. This equipment enables port authorities to observe shipping and obstructions constantly and inform individual pilots of conditions in their areas.

The 15-ft. scanner, built to revolve at 12 r.p.m. in a 100 m.p.h. gale, is installed on a 60-ft. tower with an unobstructed view of the estuary. The new type precision viewers are installed in six units, replaceable for maintenance. The first gives the entire 13-mile range, one mile to the inch and adjustable to a 20-mile range. The center four give larger sectional views and the sixth gives any area within a 20 mile radius. —J. W. HAZEN

PORTUGAL. A republic of southwestern Europe, occupying the western part of the Iberian Peninsula. The climate is temperate.

Area and Population. The area of continental Portugal is 34,254 square miles, and that of the Azores and Madeira Islands 1,236, a total of 35,490. Population: 8,402,000 (1948 est.). Principal cities: Lisbon (capital), Oporto, Funchal, Setúbal, Braga, Evora, Ponta Delgada, Faro, and Coimbra.

Education and Religion. Freedom of worship exists, but the Roman Catholic faith prevails and plays an important part in the life of the nation. The country has a Concordat and a Missionary Agreement with the Vatican. Unofficial estimates show that about half of the population over seven years of age is literate, and that 10,100 primary schools with over half a million pupils function in the country. In 1945, there were 43 secondary schools with 17,281 pupils; 65 technical schools with 41,343 students, and other professional and technical institutions for secondary education. For higher education, there are four universities (Coimbra, two at Lisbon, and Oporto).

Production. Agriculture is the leading occupation, followed by mining, fishing, and manufacturing. Principal agricultural crops are wheat, maize, rye, potatoes, and oats. Other important products are wine, olive oil, and wool. Cork is exported in considerable amounts. Portugal has valuable mineral deposits, but for lack of power, many mines remain unexploited. Production of coal in 1947 was 37,000 metric tons and that of lignite 1,408,000 metric tons. Other products of that year (in metric tons) included cotton fabrics, 1,880; cotton yarn, 4,920; and meat, 4,100.

Foreign Trade. Total exports in 1948 (8 months actual, 4 months estimated) were valued at 4,185 million escudos; imports at 9,504 million escudos. For 1947: exports, 4,243 million escudos; imports, 9,462 million escudos. The bulk of Portugal's exports go to Great Britain, the United States, Mozambique, Angola, and France; imports come mainly from the United States, Great Britain, Angola, Mozambique, and Spain.

Transportation. Portugal has 824 miles of national railways and 1,177 miles of privately owned lines. There are 16,015 miles of roads of all kinds. The merchant marine in 1943 had 315,534 tons registered. Lisbon is one of the most important air centers of Europe, and is well served by the international airlines.

Finance. In the budget for 1948, revenue was estimated at 5,550,600,000 escudos; expenditure at 5,549,500,000 escudos (\$U.S. = 25.06 escudos). Currency in circulation in October, 1948, was 8,150 million escudos; bank deposits 17,930 million escudos.

Government. Portugal is a corporative state under a constitution adopted in 1933, which provides for a President elected for a 7-year term, a Premier, a Corporative Chamber, and a National Assembly. The President appoints the Premier, who in turn elects the Cabinet. The only legal party is the *União Nacional* (Party of the National Union). In the elections of 1942, the only candidate was Gen. Antonio Oscar Fragoso de Carmona, who has held office since 1928, and he was reelected for seven years more. The Government is a dictatorship. The President is a figurehead, political power being in the hands of Premier Antonio de Oliveira Salazar.

Events, 1948. On the domestic front, Portugal had another year under Dr. Oliveira Salazar, with no important political changes.

Anniversary of the "Revolution." The 20th anniversary of the Fragoso-Salazar regime was commemorated with nearly as much pomp as last year's celebration of the 80th anniversary of Lisbon's liberation from the Moors (see YEAR BOOK, *Events* of 1947). Numerous official speeches lauded the achievements of the "Revolution," and the occasion was used to announce a two-year plan for public works. The plan, which provides for 3,872 projects in different parts of the country, was given extraordinary publicity in the press.

In June, an American naval squadron visited the Tagus River. The officers were lavishly entertained by government officials, indicating the interest of the administration in currying favor with the United States.

End of War Boom. The end of Portugal's bonanza was seen early in September, when other European countries appeared to be on their way to economic recovery. During the war, Portugal benefited greatly from exports of important raw materials. A peasant, digging a few pounds of wolfram soil, could collect as much in one day as he could earn in two years' normal work, and the country thus accumulated unprecedented gold reserves and large cred-

its against the United Kingdom. However, they then engaged in large-scale buying of luxuries and necessities, and the effects of a depression soon made themselves felt. Portugal was then faced with serious problems, such as a shortage of foreign exchange, diminishing exports, and dependence upon heavy imports of basic consumer goods. In addition, local industries, artificially developed during the war to meet domestic and even foreign demands, found they could no longer compete with foreign suppliers.

International Front. Portugal's policy during the year consisted, as in 1947, mainly in efforts to gain admission to the United Nations, and especially to draw grants from the Marshall Plan and participate in the distribution of ECA supplies. Her fate in this respect was similar to that of Spain. See SPAIN.
—MIGUEL JORRIN

PORTUGUESE GUINEA. A Portuguese colony in West Africa. Area: 13,948 square miles. Population (1940): 351,089, of whom 347,547 are Negroes. Agricultural products include palm oil and kernels, rice, and groundnuts. Other products are timber, wax and hides. Foreign trade (1946): imports 95,632,000 escudos; exports 93,065,000 escudos. Budget estimate (1946): revenue 40,629,000 escudos; expenditure 37,956,000 escudos. The seat of government is at Bissau, the chief port. Governor of the colony: Commander Rodrigues Sarmento.

PORTUGUESE INDIA. A Portuguese colony in India, comprising Goa (containing the capital Nova Goa, or Pangim), Damão, and Diu. Total area: 1,537 square miles. Population (1940): 624,177. The main crops are coconuts, cashew nuts, salt, and spices. Foreign trade (1945): imports 224,052,000 escudos; exports 67,874,000 escudos. Budget estimates (1946) were balanced at 48,005,000 escudos. A governor general heads the administration.

POST OFFICE, U.S. The United States Post Office Department is the world's largest business operation, public or private. With nearly 42,000 post offices in every community in the nation, it numbers on its rolls some 475,000 employees, making it the largest peacetime agency of the Federal government. The United States Postal Service, the major communication instrumentality of the nation, provides a common bond among the more than 140 million Americans in the cities and villages, on the farm and in the rural areas.

During the fiscal year 1948, the Post Office Department handled the largest volume of mail and special transactions in its history. This was accomplished despite difficult postwar problems, including inadequate motor-vehicle equipment, lack of space and delay in obtaining essential items of supply and equipment.

The Postal revenues for the year reached an all-time high as did the expenditures. The cost of transporting the mails, costs of supplies and equipment and contractual service have greatly increased since the end of the war. These added costs increased the expenses of the Postal Service during the year to \$1,719,943,288, resulting in a gross operating deficit of \$308,972,005. The revenues amounted to \$1,410,971,284.

Over 40,280 million pieces of mail were handled, including 21,948 million letters and cards containing business and social correspondence; over 6,344 million newspapers and magazines; more than 8,188 million circulars and advertising pieces; over 1,142 million parcels including those containing books and catalogs, and 1,419 million pieces

of mail on the business of the government for which no postage was charged. During the fiscal year 1948 there were nearly 184 million pieces of mail insured, and approximately 70 million pieces on which collect on delivery charges were made, as well as some 91,266,000 registered pieces of mail. There were approximately 117 million pieces of special delivery and special handling mail.

The Post Office Department also serves in a banking and insurance capacity. The United States Postal Note, established in 1945, continued to prove popular with the mailing public, and during the year 73,049,000 postal notes were issued. Over 291 million money orders were issued during the year. The Postal Savings System issued 16,630,521 certificates and paid 18,787,757. Great advances were made in the use of Air Mail. On Mar. 15, 1948, the Post Office Department inaugurated foreign air parcel post service, and on September 1 of the same year domestic air parcel post service was instituted.

At the end of the fiscal year 1948 there were 130,093 miles of domestic air mail routes, an increase of 27,637 over June 30, 1947. During the year the domestic air mail service performed a total of 68,000 million lb. miles of service. The rural delivery routes in operation at the end of the 1948 fiscal year required a daily travel of 1,465,198 miles by rural carriers in providing service to over 30 million patrons. During the fiscal year 1948 it was impossible to deliver 100,457 letters, a decrease of 0.46 percent from the previous year. A total of 4,466,166 letters were returned to the senders from the Dead Letter Offices. Some 736,158 unclaimed parcels were found in the mails, and the sale of these parcels at public auctions realized \$174,335.

Several new highway post office routes were put into operation, bringing the total of such routes now in operation to 20. During the year the Department began the installation in post offices throughout the country of stamp vending machines. These machines vend five one-cent stamps for a nickel; five three-cent stamps for a dime and a nickel, and two five-cent air mail stamps for a dime.

POTATOES. The 1948 production of potatoes in the United States, according to the December, 1948, report of the U.S. Dept. of Agriculture, was estimated at 445,850,000 bushels, compared with the 1947 production of 389,048,000 bu. harvested in 1947 and the 10-year average (1937-46) of 392,143,000 bu.

In 1948 the yields of the chief producing States (in bushels) were: Maine 73,340,000, California 46,800,000, Idaho 42,630,000, New York 38,005,000, Colorado 20,670,000, North Dakota 20,295,000, Pennsylvania 19,425,000, Minnesota 16,740,000, Michigan 16,350,000, New Jersey 13,629,000, Washington 11,600,000, Virginia 11,529,000, Oregon 11,480,000, Nebraska 11,395,000, Wisconsin 10,875,000, North Carolina 10,508,000, Ohio 6,765,000, Texas 4,356,000, Indiana 4,140,000.

World Production. In 1948 for the first time since the war, world potato production was estimated to exceed prewar levels. In the 80 countries for which potato data are available the 1948-49 crop was expected to aggregate about 8,900 million bushels. This compares with 7,500 million bushels in 1947 and the 8,400 million bushel average in the prewar years (1935-39). Estimated production in the Northern Hemisphere, 8,700 million bushels; Southern Hemisphere, 188 million bushels.

Sweetpotatoes. United States production of sweetpotatoes in 1948 totaled 49,806,000 bu. (harvested

from 513,800 acres), compared with 55,746,000 bu. in 1947 and the 10-year average (1937-46) of 64,866,000 bu. Yields of the chief producing States in 1948 (in bushels) were: Louisiana 7,315,000, North Carolina 5,635,000, Georgia 4,930,000, Alabama 4,505,000, Mississippi 4,300,000, Virginia 3,510,000, Texas 3,250,000, New Jersey 2,550,000, Tennessee 2,000,000.

POWER, Division of. A division in the office of the Secretary of the U.S. Department of the Interior which coordinates the power activities of the various agencies of the Department of the Interior. Director: Walton Seymour.

PRESBYTERIAN CHURCH, The. A religious system occupying an intermediate position between Congregationalism and Episcopacy, and adhering to a system of church government by presbyters, or elders. The earliest Presbyterian immigration to the U.S. was that of French Huguenots in South Carolina and Florida, between 1562-64. Francis Makemie, an Irish Presbyterian, is considered the father of American Presbyterianism, having organized several churches in Maryland as early as 1683.

Cumberland Presbyterian Church. One of the Presbyterian bodies whose chief strength is in 16 southern States. The denomination was organized in 1810 because of its attitude towards revivalism. In 1906 the major part of the denomination merged with the Presbyterian Church, U.S.A., the minority of the denomination retaining its identity. The total membership of 78,009 is served by 761 ministers, and 1,031 churches. Church buildings and mansees are valued at \$5,996,615. Moderator, Rev. Paul F. Brown, 104 East Grand Ave., Marshall, Tex. Stated Clerk, Rev. Wayne Wiman, 117 Eighth Ave., South, Nashville, Tenn.

Presbyterian Church in the United States. The division of the Presbyterian denomination which covers the territory commonly known as the Southern States. It was composed in 1948 of 17 synods and 87 presbyteries with 3,560 organized churches, 2,663 ministers, and 638,652 members, exclusive of ministers. During the year 26,140 members were received on profession of faith, and 43,597 on certificate. There were 31,151 infant and adult baptisms. Total contributions during 1948 amounted to \$30,489,730. Value of church property: approximately \$100 million.

At the 88th General Assembly in May, 1948, plans for a reunion with the Presbyterian Church in the United States of America was directed to be held in abeyance for a period of 5 years. During this time steps looking toward eventual reunion should be confined to exploring avenues of acquaintance and cooperation only, except that the plan should be completed by Mar. 1, 1949. The General Assembly reendorsed its own Program of Progress: a 5-year program of evangelism, church building, and development at home and abroad.

A total of 12,483 students were enrolled in 37 educational institutions; 1,712 children were cared for in homes. Moderator: Rev. C. Derby Fulton, Nashville, Tenn. Stated Clerk, Rev. E. C. Scott. Office of the General Assembly: 1120 Liberty Bank Building, Dallas 1, Tex.

Presbyterian Church in the United States of America. This body, distinguished by its representative form of government and its Calvinistic theology, was established about 1640. It has in the United States 8,500 churches, 9,500 ministers, and a total membership of 2,300,000. Membership in Sunday Church schools totals 1,325,000. The Church property had an estimated value of \$500 million in

1948. Contributions totaled \$64,972,639. Moderator, Rev. Jesse H. Baird, San Anselmo, Calif. Office of the General Assembly: 514 Witherspoon Building, Philadelphia 7, Pa.

United Presbyterian Church of North America. A union of the Associate Presbyterian Church and the Associate Reformed Presbyterian Church in 1858. Membership in the United States: 205,677. Moderator, Rev. A. H. Baldinger, D.D., Pittsburgh, Pa. Principal Clerk, Rev. O. H. Milligan, D.D., Aliquippa, Pa.

PRICES AND LIVING COSTS. Purchasing power derived from very high levels of incomes and investment generated heavy demands for goods and services of almost all kinds during 1948. The downward trend in the prices of agricultural and many non-durable commodities, which appeared in 1948, particularly in the second half of the year, reflected not so much diminished demand as greatly increased supplies, with some consumer resistance to high prices for individual commodities. The demand for durable goods, particularly metals and metal products, was kept high by heavy commitments for new industrial plant and equipment, record-breaking construction activity and government requirements for defense and foreign aid. Since the supply of these types of commodities can not be rapidly expanded, the pressure of demand pushed prices steadily upward.

Among the more important developments of far-reaching effects were:

- a) In April, the Supreme Court upheld the Federal Trade Commission complaint against basing-point price practices of the Cement Institute. This was widely interpreted to mean that an industry-wide basing-point system of prices was in restraint of trade and, therefore, illegal. As a result of the decision, the cement industry shifted to f.o.b. mill pricing, followed by many other industries, notably steel, various food processors, and some textile manufacturers. The immediate effect of this shift on prices was not clear, although the costs of some industrial consumers were raised; but the long run effect had many implications with respect to the price structure of various industries and products, and with respect to plant and industry locations as well.
- b) The inauguration of the European Recovery Program and the step-up of military purchases also had profound effects on certain markets. The ERP immediately bolstered a declining export market for some agricultural and textile products, but its main effect was to add another element to an excessive demand for machinery, metal products, and capital equipment. In conjunction with the military program (including stockpiling), the demand for metals, both steel and nonferrous, resulted in steadily rising prices and some stimulus to mining lower-grade marginal resources.
- c) A declining trend in agricultural prices was touched off in the first week in February by a sharp collapse of prices quoted on commodity exchanges. The immediate impetus to this decline was a more realistic appraisal of improved crop prospects here and abroad, particularly in comparison to the relatively poor crops of 1947. Although the break itself did not last long, extremely large domestic crops of most agricultural commodities, particularly cotton, corn, and wheat, acted as depressing factors on farm prices all year. This general trend was obscured during the first half-year by rising livestock prices, but from summer on the decline was very

clear. Abundant crops, both actual and prospective, had an immediate effect on prices, and motivated the extension by the Congress of the agricultural price-support program. The new price-support program is designed to insure maintenance of the purchasing power of the farmer relative to other consumers, and will prevent a collapse of farm prices comparable to the debacle of 1920-1921 and the agricultural depression which followed. The change in 1950 from the 90-percent-of-parity formula characteristic of the 1948 and earlier programs to a modified parity formula would permit some further decrease in farm prices, but these decreases would still be limited by the floor of price supports.

- d) Higher costs were built into the price structure for manufactured goods in several ways during the year. The so-called "third round" of postwar wage increases became comparatively universal; there were several important increases in general freight rates; and the cost of raw materials, primarily metals and fuels, advanced considerably. In most cases these increased costs were immediately passed on in the form of higher prices, and have become fairly well solidified in the cost structure of many industries. Their effects, therefore, are not only immediate, but, potentially also of a long-range nature.

The effects of these individual developments and the divergent price trends discussed above can be seen in the differences in the movement of the three official price indexes maintained by the Bureau of Labor Statistics of the U.S. Department of Labor.

- (1) The sensitive daily index of spot prices on organized exchanges and commodity markets started the year very close to its peak and then declined approximately 12 percent as large decreases in agricultural prices offset increases in nonferrous metals.
- (2) The comprehensive wholesale price index includes a large proportion of fabricated commodities and, therefore, reflects to a greater extent continuing increases in labor and distribution costs. This index reached an all-time peak in August, but at the end of the year it had dropped to about where it was at the beginning. A decline in farm prices was offset by the sizable advances for metals, fuels, and building materials.
- (3) The consumers' price index of the Bureau of Labor Statistics advanced to an all-time peak in August and September, 1948, and then turned lower, in line with sharp reductions in retail food prices; the end-of-the-year decline, however, was not large enough to offset the earlier long advance, and the index ended about 2 percent higher than it had been in December 1947. Retail food prices fluctuated comparatively violently as they dipped sharply in February and March in sympathy with the break in the commodity markets, recovered to reach a record high in July, and then declined more than 5 percent by the year end. By December average retail food prices were slightly below the level of the end of 1947. Rents, under control, advanced slowly all year; fuel and miscellaneous goods and services also moved steadily higher. Both retail apparel prices and housefurnishings halted their advance in November and December with very small declines; however, late December, 1948, saw the start of price reductions in apparel and housefurnishings (principally textiles) on a nationwide scale and the possibility of appreciable declines in these groups in early 1949 became more of a reality.

During the second half of 1948 employment consistently ran above 60 million people and, except for temporary dislocations among individual plants and areas, just about everyone who wanted to work, and possessed any degree of skill, could obtain a satisfactory job. Average weekly earnings of factory workers rose to \$54.18 a week in September, an increase of 7.3 percent over the same period in 1947. During this same 12 month period, consumers prices advanced 6.5 percent, so that "real" earnings advanced only fractionally. Since V-J day, weekly earnings have risen 30 percent, but "real" earnings have decreased about 5 percent as prices rose 35 percent.

National income (which measures earnings accruing to the residents of the nation from current production) rose to a record annual rate of \$227,000 million in the third quarter of 1948, an increase of \$5,600 million above the second quarter; the estimate for the full year is \$224,000 million. Gross national product, the market value of the country's goods and services, is about \$253,000 million. A large portion of this record, however, is due to the increase in prices.

Full employment, high wages, a reduction in taxes, and booming business added up to an all-time record of dollar spending by American consumers. Disposable personal income—income of all kinds after taxes—is estimated by the U.S. Department of Commerce at an annual rate of \$194,000 million in the third quarter of 1948 compared with \$174,000 million in 1947 and \$70,000 million in 1939. The 1948 Survey of Consumer Finances by the Federal Reserve Board showed that consumers have added to their stock of liquid assets, although at a slower rate than in previous postwar years. Relatively, liquid assets in the hands of wage-earners were down while those held by persons in business and other self-employed groups were higher.

One of the major steps ever taken in establishing and measuring "American living standards" was the work of the Bureau of Labor Statistics (B.L.S.) in its study of the City Workers' Family Budget. In the spring of 1945 the Labor and Federal Security Subcommittee of the Committee on Appropriations of the House of Representatives directed the Bureau "to find out what it costs a workers' family to live in the large cities of the United States." The subcommittee indicated that it wanted to know the relative differences in living costs between cities and, in addition, the total number of "dollars required for the average worker in overalls to live in these cities."

To carry out this request most effectively, the B.L.S., with the approval of the subcommittee, appointed a Technical Advisory Committee to assist in developing basic standards and methods to be used in the project. The technical committee consisted of specialists and technicians who because of their training and experience are considered responsible authorities in studies of living costs. Guided by the standards established by the Technical Advisory Committee and following the methods which it outlined, the B.L.S. first developed the list of items and quantities making up a budget for a city worker's family, and then obtained prices for this list of goods and services and worked out dollar totals for 34 large cities in the United States.

In determining this budget, a family of four was used as the basis for the calculation. The family of four includes an employed father, a housewife not gainfully employed, and two children under 15. The budget was designed to represent the estimated dollar cost required to maintain this fam-

ily at a level of adequate living—to satisfy prevailing standards of what is necessary for health, efficiency, the nurture of children, and for participation in community activities. This is not a "subsistence" budget, nor is it a "luxury" budget; it is an attempt to describe and measure a modest but adequate standard of living.

In general, whenever appropriate scientific standards are available they have been used as a starting point. These technical standards were then translated into a list of foods and into a description of housing by reference to the actual buying and renting practices of families with moderate incomes.

For clothing and other goods and services, allowances were established to meet prevailing standards of what is necessary for health, efficiency, and participation in social and community activities, with adjustments to take account of geographical differences. Here also, actual lists were made on the basis of records of family purchases obtained in surveys made by the Bureau of Labor Statistics over a period of years by interviews with housewives.

The budget is unique in that it represents, not an "ideal" budget, or a "judgment" budget devised by a few people, but rather the actual choices of American families. It was determined objectively. In considering this budget, emphasis should be placed upon the quantities and kinds of goods of which it is composed. Judgment on its adequacy should be based upon the level of living that it represents in a period of more nearly normal prices rather than upon its dollar cost at today's high prices.

The cost of goods and services included in the city workers' family budget for four persons in

occupational expenses, which add from 8 to 12 percent to the cost of goods and services—amounted to \$3,004 and \$3,458, respectively, in June, 1947. These totals do not take account of the rise in retail prices of living essentials—especially food—which took place after June, 1947.

In March, 1946, when the budget was first priced, and prior to the rapid rise in prices of living essentials which accompanied the discontinuation of price controls in the summer of 1946, the total cost of goods and services ranged from \$2,345 in Houston to \$2,718 in Washington, D.C. Addition of taxes, insurance, and occupational expenses brought the totals at that time to \$2,532 in Houston and \$2,985 in Washington.

The cost of the city worker's family budget for each of the 34 cities surveyed for the Bureau's consumers' price index is shown in the accompanying table in which the cities are arranged in descending order of the total cost of goods and services (only) in June, 1947.

—FRANCIS S. STEIN

PRINCE EDWARD ISLAND. An eastern maritime province of Canada. This, the smallest province, is about 120 miles in length, with an average width of 20 miles, and has an area of 2,184 square miles. Population (1941 census), 95,047; estimated (1948) at 93,000. Principal religious membership (1941 census): Roman Catholic, 42,743; United Church, 24,005; Presbyterian, 14,724; Anglican, 5,739; and Baptist, 5,443. In 1946 there were 2,793 live births, 874 deaths, and 837 marriages. Education (1945-46): 20,632 students enrolled in schools and colleges. Chief towns: Charlottetown (capital), 14,821 inhabitants in 1941; Summerside, 5,034.

Production. The gross value of agricultural output in 1947 was \$21,547,000. Value of all major field crops produced on 485,000 acres in 1947 amounted to \$21,242,000. Chief field crops (1947): oats, 4,270,000 bu. (\$3,459,000); mixed grains, 2,459,000 bu. (\$2,090,000); potatoes, 5,873,000 cwt. (\$9,456,000); field roots, 3,300,000 cwt. (\$2,475,000). Livestock (June 1, 1947) included 95,300 cattle (\$6,825,000), 23,800 horses (\$2,592,000), 63,700 swine (\$1,891,000), 48,600 sheep (\$551,000) and 1,369,000 poultry (\$1,600,000). Fox breeding is carried on extensively. There were 503 fur farms in 1946 with 502 farms reporting fox. Value of fur pelt production in the season 1946-47 was \$658,962. The value of fish marketed in 1946 was \$4,470,877. Lobster fishery is the greatest factor in the fisheries of the Island, followed by cod, hake, mackerel, and herring. In 1947 the estimated production of creamery butter was 3,660,000 lb., valued at \$2,050,000. Cheese production amounted to 658,000 lb., with a value of \$207,000. The estimated total farm value of farm poultry meat and eggs was \$3,141,000.

Manufacturing: In 1946 there were 246 manufacturing establishments employing 1,755 persons; salaries and wages paid totaled \$1,651,469; cost of materials amounted to \$7,582,046; gross value of manufactured products during 1946 was \$11,200,310. The two most important industries are fish curing and packing, and butter and cheese, accounting for 58 percent of the entire gross production. There were 86 sawmills in operation in 1946, reporting a gross value of production of \$562,631.

Government. Finance (year ended Mar. 31, 1948): net combined revenue \$5,515,416 (1949 est. \$5,220,680); net combined expenditure \$7,228,693 (1949 est. \$6,791,412).

Executive authority is vested in a lieutenant governor who is advised by a ministry of the legislature. In the Legislative Assembly there are 30

June, 1947, ranged from \$2,734 in New Orleans to \$3,111 in Washington, D.C., the lowest and the highest cost cities among the 34 surveyed by the B.L.S. The estimated total cost of the budget for these two cities—including taxes, insurance, and

members elected for a five-year term. Four members in the Senate and four elected members in the House of Commons represent the province in the Dominion Parliament at Ottawa. Lieutenant Governor, J. A. Bernard (app. May 18, 1945); Premier, J. Walter Jones (Liberal). At the provincial general election of Dec. 11, 1947, there were elected 24 Liberals and 6 Progressive Conservatives. See CANADA.

PRISONS, PAROLE, AND CRIME CONTROL. Some years ago, Professor Roscoe Pound of the Harvard Law School said, in one of his public lectures, that we have more crime in this country for the same reason that we have more automobiles, more radios, more newspapers and magazines, more railroads, and more large cities. Implicit in this statement is a deep-seated sociological truth, that a highly developed technological society, such as ours, with its high rates of mobility and change creates constant pressure upon the individual for adjustment and readjustment. Certainly, the search for the cause or the causes of crime has been futile and the administration of a criminal law based on an equation of offense to punishment is an 18th century philosophy practiced in a 20th century society.

While the core of the older system of criminal justice still remains and is strongly entrenched in tradition, it has not entirely withstood the attempts to change and adapt the system to modern knowledge and social needs. Thus, probation, the juvenile court, recent legislation on the treatment of the alcoholic and sex offender, and the establishment of Youth and Adult Correction authorities, have added increasing discretionary powers in the administration of justice which minimizes the importance of the offense as contrasted to the need for understanding and treating the individual in terms of his maladjustment and readjustment to society.

Similar changes are taking place in the administration of "correctional programs" as contrasted to the administration of "penal institutions." This field of work is attracting an increasing number of better qualified and professionally trained persons than was true even ten years ago. Several universities have established special curricula in correctional administration to prepare young men for a career in this area of service; notably New York University, University of Wisconsin, Notre Dame University, Ohio State University, and University of Maryland.

As a result the agencies of treatment within the institutional setting, classification, education, medical and psychiatric facilities, will become of increasing concern to institutional administrators and will reflect the new critical spirit among the younger and better-trained prison worker.

Is Crime Increasing. Aside from these theoretical considerations which are slowly being translated into practical terms, the extent of crime throughout the country as reflected in the reported crime rates has this year in some areas taken a downward trend. According to the Uniform Crime Reports published by the Federal Bureau of Investigation, the first six months of the year show a total decline in offenses reported of 1.8 percent as compared to the first six months of 1947. These figures are based on reports of the police in 2,094 cities representing 88 percent of the nation's urban population. With the exception of such offenses as aggravated assault which increased 4.0 percent and larceny which increased 0.6 percent, all other offenses showed a decrease. Auto theft decreased 12.7 percent, robbery 5.6 percent, murder 2.3 per-

cent, burglary 1.9 percent, and rape 0.4 percent.

On the other hand, crime in the rural areas has shown a total increase of 3.8 percent for the first six months of this year over the same period last year. In these areas, rape, robbery, and auto theft have decreased 9 to 7 percent, respectively, while murder, burglary, and larceny have increased one to almost 9 percent, respectively. From these figures, it is not possible to conclude definitely that crime is either decreasing or increasing. These figures must be interpreted in relation to increases in population as well as in shifts of population from urban to rural areas.

Prison Population. In contrast to the figures on crime rates, the statistics on court commitments and prison population reveal a somewhat different situation. Data available from the Census Bureau is to the effect that the adult prison population was higher at the end of 1947 than in any other year since 1941. On Dec. 31, 1947, there were 153,199 persons in the State and Federal adult institutions. This is an increase of more than 8 percent over the year-end population of 1946 or an increase of 11,795 persons confined in penal institutions. These figures do not include commitments or population statistics for juvenile institutions, military and naval correctional institutions, and local jails and workhouses. Unfortunately, the information for 1948 is not yet available.

While the population in State institutions has increased, in Federal institutions, the situation is the reverse. The following table shows the number of Federal prisoners committed over the 4-year period of 1945-48.

FEDERAL PRISONERS RECEIVED
(Fiscal Year Ended June 30)

	1945	1946	1947	1948

* Selective Service, other war offenses, and military prisoners.

One of the probable reasons for this decline in Federal prison population may be due to the decrease in automobile thefts which comes under the Federal Dyer Act and to a general decrease in juvenile delinquency.

Army and Navy Correctional Programs. Both branches of the military service have continued the development of their correctional programs consistent with the best thinking and progressive treatment programs. As of June, 1948, there were 8,980 general prisoners in confinement. This compares with a peak load of 34,766 confined in November, 1945. Of the total of 8,980 prisoners confined, 5,004 were in U.S. Disciplinary Barracks, 3,150 in Federal prisons, 376 in Guard houses in the U.S., and 450 overseas.

Of the approximately 94,000 general prisoners in confinement from January, 1940, through June, 1948, about 43,000 have been restored to duty. Of these, approximately 4,200 have been reconfined, or a rate of less than 10 percent.

Because of the rapidly declining population, the Rehabilitation Centers were discontinued and at present the Army is operating only 5 Disciplinary Barracks. It is the policy of the Army to encourage as many qualified general prisoners as possible to earn restoration to duty with a view to eventual

honorable discharge. If this does not appear possible, every effort is made toward a constructive return to civil life.

The Navy is operating 4 installations, 2 Disciplinary Barracks, located at Terminal Island, Calif., and Portsmouth, N.H.; and 2 Retraining Commands at Mare Island, Calif., and Norfolk, Va. A Corrective Services Division had been established in the Bureau of Naval Personnel charged with the responsibility of developing a modern penal and correctional program. The top confinement population in all Navy installations reached a total of over 16,000 men in 1945.

As of June 30, 1948, there were 2,346 general court-martial prisoners confined in the 4 naval installations. This figure does not include 301 prisoners in Federal institutions. During the first three months of this fiscal year 983 general court-martial prisoners were released. Of this group about 24 percent were restored to duty.

Juvenile Delinquency. The rates of juvenile delinquency throughout the country have shown a general decline, especially since 1945, the last year of the war. The two sources of statistics on juvenile delinquency are the reports on arrests published by the Federal Bureau of Investigation and the reports on juvenile court cases by the U.S. Children's Bureau. These reports show that in 1943, the second full year of our participation in the war, the juvenile delinquency problem became quite spectacular.

In that year, there was reported about 47,800 arrests of juveniles, an increase of 26 percent over the previous year, and about 82,800 juvenile court cases, or an increase of 34 percent over the previous year. The peak was reached in 1945 with about 49,500 arrests and 84,600 court cases. In 1947, however, they had dropped to a little more than 37,800 arrests and about 73,400 court cases. Both figures are lower than in any year since 1938.

The conclusions which may be drawn from these data are that such social forces as the disruption of family life, the entrance of mothers into the labor market, increased mobility of families and young people, and the migration from rural to urban industrial centers could well be the determining factors in the rate of juvenile delinquency. Another important factor, undoubtedly, has been the impetus given by the continuing efforts of the Attorney General's Conference on Prevention and Control of Juvenile Delinquency and the resulting concern on the part of communities regarding local responsibilities for the prevention of juvenile delinquency. Eighteen reports of the National Conference on Juvenile Delinquency are now available in printed form from the U.S. Government Printing Office.

The Problems of the Sex Offender. The inadequacies of dealing with the sex and constitutional psychopath in accordance with the traditional legal and corrective methods is another problem being given serious consideration in many States. The law in most States relating to sex offenses do no more than specify the punishment for certain types of sex offenses. The application of the well worn tests of insanity and mental deficiency have not worked out and modern psychiatry has shown that the sex offender is neither insane nor feeble minded but may actually be an abnormal individual in need of restraint and treatment for the protection of the community.

So far California, Illinois, Michigan, Minnesota, and the District of Columbia have enacted legislation which recognizes this fact. The Massachusetts State Legislature has some legislation under

consideration. During the past year, the New York State Legislature has appropriated \$35,000 to the State Department of Mental Hygiene for a study of the medical, psychiatric, and psychological aspects of sex crimes. The study will be conducted at Sing Sing Prison, to which all sentenced sex psychopaths will be sent.

The answer to the problem of the abnormal sex offender would seem to be in the establishment of competent boards who would determine whether the offender is suffering from a morbid personality or some other abnormality, and legal provisions for indefinite commitment to an institution for psychiatric care and treatment.

Probation and Parole. While probation and parole are accepted as essential parts of a modern correctional program, there are still a number of States in which both exist in name only. However, each year marks some advance and progress, as reflected in State legislation during the year.

In New Jersey, a parole law, enacted in accordance with the recently adopted constitution, establishes in the Department of Institutions and Agencies an autonomous parole board of 3 members appointed by the governor for staggered terms of 6 years. Michigan has enlarged its parole board from 3 to 4 members. In Louisiana, a part-time parole board has been reestablished with the members' terms concurrent with that of the governor. A parole officer and other employees serving at the pleasure of the governor are provided for to do the work now being done by the Department of Welfare.

Enabling legislation in Kentucky, Mississippi, and South Carolina passed this year authorizes the governors of these States to execute the interstate compact for probation and parole supervision. This reduces to 4 the number of States which have not acted on the compact: Georgia, Nevada, North Carolina, and Texas.

In Kentucky, prisoners serving first sentences of 15 years or less may now apply for parole after serving one third of the sentence, or at least 6 months, which is a reduction in the minimum time required for parole eligibility. And in Massachusetts, the salaries of the parole board have been increased from a range of \$2,250 to \$5,500 to a range of \$4,000 to \$9,000.

Other State Action and Legislation. One of the very important pieces of State legislation was passed in Massachusetts which now becomes the fourth State to set up a Youth Correction Authority with the establishment of a Youth Service Board. The other States now having similar legislation are California, Minnesota, and Wisconsin. The Massachusetts board consists of 3 full-time members (serving staggered terms of 5 years) appointed by the governor. All juvenile offenders will be committed to the Youth Service Board by the courts rather than to specific institutions and all training schools have been placed under the authority of the board.

Practically all of the other progressive legislation in other States is concerned with improvements in the treatment of the juvenile delinquent. New legislation in New York provides that children under 15 years of age charged with capital crimes shall be considered juvenile offenders and placed under the jurisdiction of the juvenile authorities. Children between 15 and 16 years of age accused of such offenses may be transferred from the criminal court to juvenile jurisdiction at the discretion of the judge. Formerly these offenses were excluded from juvenile court jurisdiction.

This is in line with recent similar and perhaps more progressive legislation in California, Con-

necticut, Indiana, Michigan, and Minnesota which placed all offenders under the age of 18, regardless of charge, under the jurisdiction of the juvenile courts.

The Juvenile Code Commission of Kansas which was granted an appropriation by the 1947 State Legislature to study needed changes in State laws pertaining to children, is prepared to submit its recommendations to the 1949 session. The recommendations will include sweeping revisions of statutes relating to juvenile courts, adoptions, child labor, and licensing of boarding homes.

In Missouri, measures substantially increasing appropriations and providing for more flexible programs at the 3 State training schools, Booneville, Chillicothe, and Tipton were passed and submitted to the governor. The new appropriation will make possible an increase in personnel, new cottages, an education building, and a new power plant at Booneville. A second measure establishes a minimum age of 12 for all commitments to these institutions and a maximum age of 17 for boys and 21 for girls, and authorizes the commitment of children under the minimum age to the guardianship of the division of welfare.

A State reorganization act in Virginia consolidated the Welfare and Corrections Department, the parole board, and the program of hospital care and treatment for indigents formerly in the Health Department, to form the Department of Welfare and Institutions.

The Virginia Advisory Legislative Council was directed to study the advisability of establishing a statewide system of district juvenile and domestic relations courts, to be governed by a Court Commission. The results of this study is to be reported to the General Assembly by Sept. 1, 1949.

A number of States have instituted programs looking toward the construction of new facilities and institutions. In Florida plans have been completed for a new institution for women to be called the Female Correctional Institution, located at Ocala, Fla., at an estimated total cost of about \$5 million. Construction has been started on a correctional institution for the younger male offender to be located at Apalachee. In South Carolina the construction of a new State penitentiary located at Columbia has been approved. In California, progress is reported in the construction of the new medium-security prison at Soledad and a reception unit at Chino. Plans for future construction to round out the State prison system include a State vocational institution at Tracy and a State medical center.

Federal Prison Industries, Inc. Federal Prison Industries, Inc., is a Government Corporation authorized by Congress in June 1934, and established in December 1934 by an Executive Order of the President. The Board of Directors, appointed by the President, serve without compensation and consist of 5 persons, one each representing industry, labor, agriculture, retailers and consumers, and one representing the Attorney General. The Corporation is required to make an annual report to the Congress on the business of the Corporation and on the condition of its funds.

The Corporation operated 39 different industries in 17 of the Federal penal and correctional institutions providing employment for about 3,100 prisoners. Products are sold only to other Federal Government departments and agencies at current market prices. During the war, Federal Prison Industries produced approximately \$80 million worth of vitally needed war goods. In addition, the Corporation is financing an extensive vocational and

trade training program in all Federal institutions.

The industries operated by the Corporation include the manufacture of brooms and brushes; shoes; textile and canvas goods; clothing; mattresses; office furniture, both wood and steel; and the canning of fruits and vegetables. The total sales of goods during the past fiscal year exceeded \$14,785,000 of which the net earnings during the same period amounted to slightly less than \$3 million which represented an increase of about \$1 million over the last fiscal year. Wages to each inmate employed averaged from \$15 to \$20 per month and these earnings are kept either as a savings account for the inmate or sent out to the inmates' dependents.

All funds of the Corporation are held in the Treasury of the United States and during the year the Corporation paid to the U.S. Treasury a dividend of \$2 million, making a total dividend paid to the U.S. Treasury up to June 1948 of \$11,688,000.

Prison Industries in State Institutions. This situation however is not generally true in State prison systems. For about 20 years, prison industries and the full utilization of prison labor has provided the most disheartening picture of the whole prison system. Even the best State prisons have had their programs undermined by the presence of hundreds of men deteriorating in idleness. Federal and State legislation, beginning in 1929 and culminating in 1940, prohibited the interstate shipment of prison-made goods and practically paralyzed industry in most State prisons.

With the exception of the war years, when State prisons were permitted to manufacture goods for the Federal Government, only about 20 percent of the inmates in State institutions have at any time been employed in productive industries. With the increase in population in State penal institutions, the problem of idleness is once again harassing the prison administrator and except for a few States very little is being done to solve the problem of idleness. The State use system which is the only practical substitute for the contract and the open market system has so far not been adequately developed or exploited. The need for a concerted attack on a cooperative national level supported by adequate legislation is becoming more and more obvious.

—JAMES V. BENNETT

PRODUCTION AND MARKETING ADMINISTRATION. An agency of the U.S. Department of Agriculture, created Aug. 20, 1945, which consolidated several existing agencies. It consists of 9 commodity branches and 11 functional branches. Under authorization by Congress and the bylaws of the Commodity Credit Corporation, it has been delegated authority to carry out programs of the Corporation. One commodity branch exists for each of the following: cotton, dairy products, fats and oils, fruits and vegetables, grain, livestock, poultry, sugar, and tobacco. Each branch is responsible for the commodities over which it has jurisdiction, for production, adjustment, price support, marketing research and services, and distribution. The agency may establish programs to effect economies in processing and marketing food, and may cooperate with industry and other agencies of the Department in developing new or substitute products. It supervises market news services and sets and maintains standards and performs inspection and grading. Administrator: Ralph S. Trigg.

PROTESTANT EPISCOPAL CHURCH. This body entered the colonies in 1607, as the Church of England. It

became autonomous and adopted its present name in 1789. On Jan. 14, 1947, Henry Knox Sherrill was formally installed as the 20th Presiding Bishop of the Episcopal Church. Bishops consecrated during 1948 included George T. Gunn, Coadjutor, Southern Virginia; Charles F. Hall, New Hampshire; Louis C. Melcher, Coadjutor, Southern Brazil; J. Wilson Hunter, Coadjutor, Wyoming; F. Eric Bloy, Los Angeles; Lauriston L. Scaife, Western New York; William J. Gordon, Alaska; Russell S. Hubbard, Suffragan, Michigan; Charles A. Clough, Springfield; Theo. N. Barth, Coadjutor, Tennessee; M. George Henry, Western North Carolina; Hamilton West, Coadjutor, Florida; Walter M. Higley, Suffragan, Central New York.

On Apr. 7, 1948, in Manila, three Bishops consecrated three Filipinos as Bishops for the Philippine Independent Church. The Philippine Church, with some 2 million baptized members and 35 Bishops, comprises about 10 percent of the Christians in the island.

During the year the Church gave more than a million dollars toward European and Asiatic relief. This money together with thousands of pounds of clothing, food, etc., is administered through Church World Service, the cooperative relief agency of the Churches of America. A similar sum will be raised in 1949.

In July and August 66 Bishops journeyed to London to attend the Lambeth Conference, meeting at Lambeth Palace under the presidency of the Archbishop of Canterbury. A total of 329 Bishops attended, representing all parts of the Anglican Communion.

Communicants in 7,864 parishes totaled 1,650,538 in 1948. The baptized persons numbered 2,436,589; baptisms during the year totaled 110,618, and confirmations, 73,251. A total of 149 priests were ordained, bringing the total number of clergy to 6,506. Enrollment in Church schools totaled 462,179. The General Convention approved a 1949 budget of \$3,910,000.

Outstanding events in 1949 will be the 400th Anniversary of the Book of Common Prayer, and the triennial General Convention, meeting in San Francisco, in September-October.

Headquarters of the National Council, which is also the board of directors of the Domestic and Foreign Missionary Society, are in the Church Missions House, 281 Fourth Ave., New York 10, N.Y. The official periodical is *Forth*, of which William E. Leidt is the editor. President of the National Council, Rt. Rev. Henry Knox Sherrill.

PSYCHIATRY. The most discussed event of the year in psychiatry was the International Congress on Mental Health, held in London, August 11-21, under the presidency of Dr. J. R. Rees, and reported in the *British Medical Journal*, Aug. 21 and Aug. 28, 1948. Some 2,000 delegates from more than 50 countries were in attendance.

Administratively the significant issue of the Congress was the setting up of a permanent international organization, the World Federation for Mental Health, whose purposes are implied in its title. The World Federation is to be made up of the professional societies in the several countries representing various aspects of mental health in its broadest terms—anthropologists, sociologists, educationists, psychologists, and psychiatrists. By this composition a fact, long recognized by many, was given world-wide currency, namely, that the health of the mind is much more than merely a medical question in the traditional sense and involves disciplines dealing with all human relationships.

An executive committee of 12 members was provided, representing different countries and it is proposed to hold annual assemblies in various parts of the world. A Russian delegation, although invited, was not present at the Congress.

Space permits mention of but few features of this 10-day meeting. Up to World War II psychiatry had made little headway in China, as Dr. Ch'eng pointed out. He indicated that social stability had been favored by the characteristic closely-knit family relationships in that country, and that contact with western civilization had not strengthened these standards. Because of these age-old family ties and a strong sense of filial obligation involutional psychoses are comparatively rare. From other sources, too, we have had evidence that depressions in later life are infrequent in China because of the customary respect for and care of the aging person.

The very important subject of pathogenic publicity media was touched on by Professor Gokay of Turkey who reported studies of the effects of gangster films in developing adolescent criminals. A wholesome step has been taken in that country in prohibiting accounts of suicide in the press.

The psychiatric problems of childhood were discussed at considerable length during the Congress, with attention focussed largely on the concepts of "aggression," "frustration," "guilt," etc., that have been elaborated so extensively and variously in recent years. Modern psychiatry in its intensive search for causes of mental illness turned naturally and fruitfully to the childhood years, and child psychiatry has emerged as a most important division of the larger field. Here, from the very nature of the situation, the responsibility of the investigator is very great; and while extremists are perhaps more prone to appear in psychiatry than in any other branch of medicine, one may venture to express regret that they should be found dealing with childhood. One reason why today so many children are in the hands of psychiatrists may well be that they have not so good homes to live in as they had in other years. Without doubt there would be general agreement that studies of the early years of life are fundamental to an understanding of mental health and unhealth at all ages, and that prevention of mental troubles in adult life involves not only the question of heredity and constitution but also the discipline, habit formation, and human environment of childhood; it must also be said that there is sharp difference of opinion as to the validity and even the legitimacy of certain practices of so-called child analysis.

A development from which much may be hoped was the organization of the International Association of Child Psychiatry with Dr. Frederick Allen of Philadelphia as first president. The next international conference will be held in the latter city.

One session of the Congress had to do with psychiatry in the field of relations between nations, as an instrumentality to promote peace and abolish war. Here psychiatry and all the social sciences need to proceed warily. It is all too evident that an excess of zeal—even if in the right direction—on the part of the more assured and optimistic members of the profession does not inspire confidence on the part of government agencies. Psychiatry has been, especially since World War II, a victim of too much publicity and the suspicion of pretensions beyond capacity of performance, and is itself in part responsible for this state of affairs.

There have been two previous international congresses of psychiatrists and mental hygienists

(Washington, 1930; Paris, 1937), but the recent one was of broader scope, and the permanent body, open to all nations, which is set up with machinery for continuous exchange and collaboration encourages hope that social sanity among the peoples may not be an utter and ultimate impossibility; and if not, that the social sciences may contribute their humble part to such a consummation. Possibly the wisest pronouncement during the London Congress was the quotation by Professor MacCalman of Aberdeen of a Chinese proverb: "If there is righteousness in the heart there will be beauty in the character; if beauty in the character, harmony in the home; if harmony in the home, order in the nation; if order in the nation, peace in the world."

Trends in Psychiatry. The earliest observations naturally dealt with conspicuous symptoms—excitement (mania), depression (melancholia), mental enfeeblement (dementia). Through the centuries new diagnostic terms were added, many became obsolete or were replaced by others. Gradually the list of types of mental disorder expanded, syndromes replaced symptoms, and with more intensive study of the behavior of patients, objective differential criteria were refined, sometimes to a point that made agreement between different clinicians difficult. Kraepelin eventually described 9 subtypes of dementia praecox, although specifically stating that the delimitation of the several clinical groups was artificial and that many transitional forms occurred.

With the rise of histologic techniques and especially differential staining methods during the latter half of the 19th century and the demonstration of characteristic changes in the central nervous systems associated with certain mental diseases; notably paresis, arteriosclerosis, toxic, defective, and senile states; the organic aspect of psychiatry came into prominence; and around the turn of the century hope was growing that eventually a pathological basis would be established for most forms of psychical disorder. Particularly fruitful were the histo-pathological studies of Nissl, Alzheimer, and others during a period of great research activity in many quarters, strengthening the bonds between psychiatry and the other medical sciences.

At this time, too, another tendency was developing—emphasis on the psychology and the psychological factors of mental illness. Kraepelin, a pupil of Wundt, had established at Heidelberg the first experimental laboratory for the study of psychotic and neurotic patients. The work of Charcot, Janet, Bernheim, Freud, Prince, and others called attention to the possibility of purely psychogenic origin of certain abnormal mental states. And if such states could be caused by psychological factors, they should be curable by the same means, as Babinsky set forth, i.e., by psychotherapy. There was much controversy between those who, taking their cue from traditional medicine, insisted upon an organic basis for psychiatric disorders—that mental disease meant brain disease—and those who laid stress on psychogenesis, pointing out that in the majority of mental cases related brain pathology could not be demonstrated. Was the patient suffering from a "brain spot" or a "mind twist," as Southard vividly put it?

The proponents of psychogenesis and psychotherapy fell into several groups. There were those who might be called the eclectic or conservative group but who adhered to no "school," using suggestive therapy in accordance with commonly accepted psychological principles as part of a multi-dimensional treatment program. Myerson

used the expression "total-push" to describe such a holistic method.

Followers of the doctrines of Freud constituted a second group of a strictly "school" or sectarian type; and that this school has attracted more attention than all the others put together requires no mention here. Its popularity has within recent years been particularly manifest in the United States; much less so in Austria, the country of its origin, or in France. Spokesmen of this group have sometimes taken the unfortunate stand that psychoanalysis is essential in good psychiatric practice and that the student's training in psychiatry is incomplete without a personal analysis.

Regrettably the zeal of the Freudians and their derivatives has tended to produce schism in the ranks of the profession and thus impair confidence in the minds of a public that has no criteria for distinguishing psychiatry as such from its sectarian offshoot. Critics both within and without the profession have not been lacking. The most recent, Dr. Hiram K. Johnson (*Psychiatric Quarterly*, April, 1948) has anatomized the Freudian gnosis in very thorough and scholarly fashion. He likens psychoanalysis "to the vogue of phrenology and animal magnetism in the preceding century." An editorial in the *Journal of the American Medical Association* (Oct. 16, 1948) takes approving notice of Johnson's criticisms.

Another imposing group of psychotherapists is that of the clinical psychologists. Devising intelligence tests, personality inventories, scales for measuring aptitudes and morbid tendencies, the psychologists have made most valuable contributions to psychiatric procedure. But the borders of psychology have widened *pari passu* with those of psychiatry and as both focus on the person they inevitably overlap. Each discipline is concerned with both normal states and deviations therefrom; and the deviations are discussed respectively under the captions "abnormal psychology" and "psychopathology"—terms which mean essentially the same thing.

Naturally enough the clinical psychologists, as their field expanded, took on treatment as well as diagnostic functions, and this border area between psychology and psychiatry has been a particularly controversial one. The situation is unsatisfactory. Psychologists are accepting and treating patients with psychiatric disorders who, the doctor holds, should be under medical care. This accords with the position of contemporary medicine that generally speaking a person is not sick exclusively in mind or exclusively in body but rather as a biological (psychobiological) unit and as such becomes a medical problem. The recent vogue of so-called psychosomatic medicine is in line with this view. The American Psychiatric Association and the American Psychological Association are endeavoring to arrive at a common understanding in these matters.

One of the unsavory by-products of clinical psychology is the fact that it encourages quackery. Totally unqualified persons posing as psychologists open offices and carry on consulting practices. The variety and scope of this abuse were admirably exemplified in Steiner's book, *Where Do People Take Their Troubles* (Houghton-Mifflin, 1945). Dael Wolfe, Executive Secretary of the American Psychological Association (*Transactions, N.Y. Academy of Sciences*, March, 1948) outlines steps to be taken "to protect society against the psychological racketeer," chief of which is the establishment of licensing laws such as regulate the practice of medicine and ensure the prosecution of quacks.

The extraordinary range of the more legitimate forms of psychotherapy, from both the psychological and psychiatric standpoints, is set forth in considerable detail by Snyder (*Psychological Bulletin*, July, 1947).

In psychiatry probably more than in other medical disciplines when the pendulum swings, it swings too far. There have been those who have felt that the whole concept of psychogenesis and psychotherapy, important as it is, has been overworked, at times to the neglect of other factors and indications. Sargant and Slater's book, *Physical Methods of Treatment in Psychiatry* (2nd ed., 1948, Williams and Wilkins, Baltimore) marks a timely reaction and bids psychiatrists remember that after all mental patients have bodies as well as minds and that there are physical and physiological routes to the psyche as well as psychological ones.

Studies in connection with the somewhat heroic treatment measures of recent years—insulin coma, electroshock, psychosurgery, and accelerated interest in the biochemistry and electrophysiology of mental deviations, as well as the increasing attention to psychosomatic relationships on the part of all branches of medicine, all of which have been referred to in previous editions of the YEAR BOOK, seem to indicate a return swing of the pendulum whereby American psychiatry, capitalizing on its splendid accomplishments and correcting its errors, may become even more closely integrated into the corpus of medicine.

Nosophobia (fear of disease). It is not irrelevant to note that the law of supply and demand operates in medicine as well as in economics. Published description of a "new" disease tends to arouse fear in nervous persons that they may have this disease. It is not an altogether unreasonable question whether the excessive publicity of psychiatric issues, in association with and following World War II, has not favored an increase of neuroticism in and out of the armed services.

Nosophobia was the subject of the twenty-first Maudsley lecture by Professor Ryle of Oxford (*Journal of Mental Science*, January, 1948). He stressed the ubiquity of this disease and many of its avoidable causes. In determining the order of frequency of the common diseases seen by him in a general consulting practice, Ryle found that *Anxiety* (without evidence of serious organic trouble) came second on the list of the 12 more frequent diagnoses.

Sometimes these fears have their origin in the doctor's office. "Specialists in the physical branches of medicine too often err through concentration on a part of the body to the neglect of the whole person." And again, "the mechanistic, objective character of modern investigations also tends to distract the doctor's from the patient's thought and to direct attention away from private sensibilities and present needs." There will be general agreement with Professor Ryle that "fears of disease are widely engendered through the advertisements of proprietary medicines; by the outpouring of ill-judged medical articles in the lay press, of a type even more familiar, perhaps, to American than British readers; and by unorthodox practitioners."

Publicity campaigns in support of research in heart disease and cancer have also their seamy side in causing unnecessary anxiety in the victims of these diseases and phobias in others who have them not. As Ryle points out cancer phobia without cancer is much commoner than cancer phobia with cancer. In this field of anxiety and fears concerning disease, real or imagined, there is need of an

everyday kind of psychiatry that every doctor should conscientiously practice.

Hospital Services. After long and careful preparation the Rating and Inspection Service, sponsored by the Psychiatric Foundation (see 1948 YEAR BOOK) has begun operation under the directorship of Dr. Ralph W. Chambers, a psychiatrist of wide experience in all aspects of hospital procedure and administration. This is undoubtedly the most important step within the present century in practical service in a field that represents in magnitude the greatest public health problem. According to the inspection and rating plan, mental hospitals, public and private, may make application for inspection by trained inspectors who will appraise every aspect of hospital activity against a set of minimum standards.

To meet these standards specific recommendations will be made, with a reasonable time for putting them into effect. Failure to achieve results within the specified time will automatically classify the institution as substandard, thus affording a basis for legislative and community leaders to demand ways and means for the necessary corrective measures. While the initiative is thus left with individual hospitals, it is believed that few will wish to remain unrated as such failure would *ipso facto* reflect unfavorably upon the institution.

Three major requisites to raise mental hospital standards to suitable level are: (1) increased accommodation to relieve serious overcrowding that exists virtually everywhere, and to provide for rising admission rates as the population increases; (2) increase in the number of trained physicians and of all other ranks of hospital personnel; (3) decrease in mental hospital loads by extension of psychiatric services in general hospitals and of out-patient clinics and other extramural services.

Federal grants to assist in building operations to increase bed accommodation were referred to in the 1948 YEAR BOOK. For training personnel, and also for research and development of mental health facilities, under the National Mental Health Act, Congress authorized an appropriation of \$9,028,000 for the fiscal year 1949. This is to supplement parallel work being carried on by the Public Health Service and the Veterans Administration. The latter organization, by improved techniques, has been able for the first time to raise its discharge rate of neuropsychiatric patients above its admission rate. The recent trend is shown in the following figures:

Period	Admissions	Discharges
July-December, 1946.....	26,528	25,296
January-June, 1947.....	29,841	29,128
July-December, 1947.....	31,508	31,773
January-June, 1948.....	29,268	30,892

In Canada the Federal Government appropriated \$4 million for provincial mental health programs in the past fiscal year, with subsequent annual increases to \$7 million a year. The Federal Department of Health set up an advisory committee on mental health consisting of provincial mental health authorities and representatives of university departments of psychiatry. Immediate objectives: training of personnel and research.

Extramural Psychiatry. Widely extended organization of various types of out-patient clinics is the third means of raising hospital standards and at the same time meeting the service needs of the country at large. 1948 recorded a noteworthy advance in this direction. Aided by grants by the U.S. Public Health Service, 36 states have established full or part-time out-patient clinics and may

have been able to expand their clinic activities. Altogether, 46 states now provide community psychiatric services under the National Mental Health Act. The Veterans Administration increased its mental hygiene clinics from 34 to 51 during the year.

Pollock (*Amer. J. Psychiat.* January, 1949) reports that family care of mental patients is employed in 10 states and 3 Canadian provinces. Expansion of this very desirable supervised care facility has been retarded since 1941 because of war and postwar conditions. Nevertheless there has been progress in family care in California, Illinois, Ohio, and New York. It is gratifying to note that this type of community service for which Gheel, Belgium, has long been famous, has now been restored at Gheel which suffered so grievously during the war.

Industrial Relations. Psychiatry entered industry in 1915 when Dr. C. C. Burlingame joined the staff of the Cheney Silk Company in Connecticut. (*Digest of Neurology and Psychiatry*, August, 1948) The National Industrial Conference Board had recently been organized for a systematic study of labor relations and problems; and it was this Board that brought medicine, and with it psychiatry, into the field as an integral part of the industrial program. Burlingame traces this development, indicates accomplishments so far, and the vastly greater tasks that lie ahead.

A major contribution was the psychologically based recommendation that an injured employee be kept on the job whenever possible, and on full pay, even if his production were temporarily decreased. May not the early ambulation, advocated by surgeons today, hark back in part at least to that psychiatric principle enunciated more than thirty years ago?

Sir George Schuster of the British Government's Committee on Industrial Productivity (*Brit. Med. Jour.* Sept. 11, 1948), discusses human relations in industry as Plato might have done in *The Republic*, and indicates how indispensable to the medical officer is that "specialized understanding" that good psychiatry, firmly rooted in common sense, represents. Sir George states the ends of industrial activity: (1) excellence (areté) of production—producing the right things with minimal expenditure of human effort and material resources; (2) satisfactory work conditions as the basis of a good life; (3) the industrial life fitted satisfactorily into the over-all social pattern of the nation.

Genetics. Controversy continues between exponents of heredo-constitutional factors and proponents of environmental or cultural factors in determining personality and behavior. Both sets of factors are of course involved and the problem is to establish their relative values. The geneticists appear to be consolidating a solidly scientific position. Kluckhohn and Murray (*Personality in Nature, Society and Culture*, Knopf, 1948) deprecate "the tendency of certain psychiatrists, sociologists, and anthropologists to neglect constitutional factors in theories of personality formation almost completely," and Gregg (*American Psychologist* 3:397) comments that medicine and psychology, having neglected human genetics, are responsible for the old misconception "that heredity is a study of one's uncontrollable ancestors whereas it is one of the few fields that offer any dependable control over one's descendants."

Kallmann (*Psychiat. Quarterly*, October, 1947) reviews the present state of our information as to the psychiatric aspects of heredity and constitution. Heredity is "the transmission of potential

physical and mental properties from parents to children through genes." Not the disease but the predisposition is inherited. "Each predispositional faculty of response is related to the action of a certain gene or a combination of genes." The sources of all psychic and somatic functioning (total behavior) in "vital organic phenomena, determined by heredity" must be evaluated as preliminary to any psychological or social interpretation.

For example, while an individual is not predestined from birth to become a manic-depressive or a schizophrenic, the tendency to develop either of these disorders "cannot be explained without the assumption of a specific predisposition. . . . There is no known constellation of purely environmental circumstances that would produce a true schizophrenia or manic-depressive psychosis . . . in persons who do not have specific predisposition." Kallmann offers statistical estimates of average expectancy of schizophrenia as follows:

	Percent
In the general population.	0.85
In children of one schizophrenic parent.	16.4
In grandchildren of one schizophrenic parent.	4.3
In nephews and nieces of one schizophrenic parent.	3.9
In children of two schizophrenics parent.	ca. 80.
In identical twin partners of schizophrenics.	85.8

"The chance of developing a schizophrenic psychosis increases in direct proportion to the degree of blood relationship to a schizophrenic index case—a conclusive proof of the operation of heredity."

—CLARENCE B. FARRAR

PUBLIC BUILDINGS ADMINISTRATION. A unit of the Federal Works Agency, authorized to design and construct any type of Federal building, either by direct appropriation or by reimbursement from appropriations made to other agencies. It operates, maintains, and protects buildings under its jurisdiction, and disposes of certain types of real property declared surplus to the needs of the Government. It maintains a backlog of industrial plants, equipment, and machine tools that constitutes an emergency reserve of productive capacity. The components of PBA are the Offices of Design and Construction, Real Estate Management, Buildings Management, Administration, Solicitor, and Division of Industrial Properties. Commissioner: W. E. Reynolds.

PUBLIC FINANCE. During 1948, the Federal Government's receipts exceeded expenditures by a record amount, and for the second year since the ending of the war the U.S. Treasury was able to effect a large reduction in the public debt. Because of the reduced taxes and increased armament expenditures, however, the surplus was largely eliminated in the second half of the year. As a result, the importance of the surplus as an anti-inflationary factor, through its use in retiring debt held by the banking system, was greatly reduced.

The 1948 Budget. Budget receipts in the fiscal year ending June 30, 1948, totaling \$42,211 million, were \$2,168 million above those of the 1947 fiscal year and, coupled with a large decline in expenditures, resulted in a budget surplus of \$8,419 million for the year. Expenditures for the year totaled \$33,791 million, a decline of \$5,498 million from 1947. The excess of receipts over expenditures of \$8,419 million compared with a corresponding figure of \$754 million in the preceding fiscal year and was the largest budget surplus in United States history. During the period almost \$6,000

million of Government securities were redeemed, leaving the outstanding public debt \$252,300 million on June 30.

Direct taxes on individuals brought in almost \$1,500 million more than in the 1947 fiscal year, while corporation taxes yielded an additional \$498 million. These totals did not yet reflect the reduction in taxes provided by the Revenue Act of 1948, which became law in April. The increase in income tax receipts was partially offset by a decline in proceeds of sales of surplus property.

On the expenditure side, the largest decline, amounting to more than \$3,500 million, was accounted for by national defense. Almost half of this reduction was due to a decrease of \$1,700 million in leave payments made to the armed forces. Budget expenditures for naval defense were nearly \$1,400 million less than in 1947.

Expenditures for international affairs and finance in the fiscal year 1948 were almost \$1,800 million less than in the previous year. The principal reason for the reduction was the fact that the United States subscriptions to the International Bank and the International Monetary Fund, totaling \$1,400 million, were made in the 1947 fiscal year. In addition, drawings on the \$3,750 million loan to Great Britain were \$400 million less than in 1947, the loan being completely used up by Mar. 1, 1948.

The Economic Cooperation Act of 1948 provided that the sum of \$3,000 million be transferred to the Foreign Economic Cooperation Trust Fund and "considered as expended during the fiscal year 1948, for the purpose of reporting governmental expenditures." The effect of this bookkeeping transaction was to charge the budget in the fiscal year 1948 for expenditures to be made in the fiscal year ending June 30, 1949.

Thus, nominally the budget surplus for 1948 was reduced from \$8,419 million to \$5,419 million, while the estimated expenditures for 1949 were correspondingly decreased. While this transfer made no difference whatsoever, so far as actual expenditures and receipts of the Government were concerned, it provided a means of offsetting part of the loss in tax receipts for the fiscal year 1949 brought about by the reduction in tax rates enacted by the Revenue Act of 1948.

On a cash basis, the Treasury surplus for the 1948 fiscal year amounted to \$9,000 million as compared with \$7,600 million in 1947. The difference between the cash surplus and the budget surplus is primarily a matter of accounting. The former, indicating the actual flow of cash receipts from and payments to the public, include the operations of the various government trust funds, such

as the Federal Old-Age and Survivors Insurance Trust Fund, as well as cash outlays for the redemption of securities previously issued to cover government expenditures. On the other hand, the budget figures include certain intra-governmental transactions and non-cash payments to the public in the form of securities, such as the Armed Forces Leave Bonds. The cash surplus was used primarily to effect a reduction of \$6,000 million in the public debt and to increase the General Fund of the Treasury by \$1,600 million during the fiscal year.

The 1949 Budget Estimates. Based on estimates made available by the President in his budget message of Jan. 10, 1949, budget expenditures for the fiscal year ending June 30, 1949, were scheduled to total \$40,180 million while receipts were to total \$39,580 million, leaving a budget deficit of \$600 million. The estimated outlays were \$6,389 million above the actual expenditures for 1948. On the other hand, estimated receipts were \$2,631 million less, thus wiping out the huge surplus of the previous year.

The principal rise in estimated expenditures for 1949 was in the allotment for international affairs and finance, which showed an increase of \$2,437 million over actual 1948 outlays. The major part of this item was accounted for by the European Recovery Program, which was started in April, 1948, and entailed expenditures of \$4,600 million for the 1949 fiscal year. Included in the total were also large expenditures for providing military supplies to various countries abroad. Foreign relief operations, scheduled at \$1,817 million, were about 9 percent below those of 1948. The principal activities in this group were the Army's program of administration and relief in occupied areas, mainly Germany and Japan.

By far the largest outlays in the 1949 budget were those for national defense, which totaled \$11,745 million as against \$10,924 million the year before. This reflected a substantial increase in procurement of aircraft and in purchase of equipment and strategic and critical materials as well as the cost of the draft. Under the increased budget, the military strength of the Armed Forces was raised from 1,394,000 regulars and reserves on full-time duty on Apr. 1, 1948, to 1,604,000 on Dec. 1, 1948. In addition, on the latter date there were 655,000 reserves in regular training status and 1,950,000 other reserves.

Veterans' services and benefits, estimated at \$6,799 million, were slightly above the figure for the

fiscal year 1948. Of the total, expenditures for education and training took \$2,481 million, the program involving about 2 million veterans. Pensions paid to more than 2,900,000 individuals and families absorbed an estimated \$2,140 million, and hospitals, other services and administration costs, \$1,130 million. Unemployment and self-employment allowances to the amount of \$424 million went to about 400,000 veterans.

Interest on the national debt, estimated at \$5,325 million, increased by 2.6 percent over 1948, tax reductions provided in the 1948 Revenue Act making it impossible to effect any sizable reduction in the public debt. The combined expenditures for national defense, international affairs and finance, veterans' services and benefits, and interest on the public debt amounted to \$31,088 million, or 77 percent of the total budget. Thus, more than three-fourths of the outlays in the 1949 fiscal year represented the cost of past wars and of the existing military establishment. This total does not include expenditures for atomic energy development and a number of other activities related to national defense.

Other items showing substantial increases in the 1949 budget as compared with outlays in 1948 included housing and community facilities, agricultural aid, development of natural resources, and promotion of transportation and communications facilities. Housing and community expenditures of \$349 million included \$222 million for public housing programs. Expenditures for flood control, reclamation and similar projects totaled an estimated \$804 million, a rise of \$319 million, and development and control of atomic energy \$634 million, an increase of \$159 million.

Assistance to agriculture amounted to \$1,805 million, the major part of the increase of \$1,230 million being represented by outlays of \$866 million by the Commodity Credit Corporation for support of farm prices. Development of transport and communication facilities were slated to total \$1,757 million in 1949, a gain of \$490 million. The principal items included in this category were the postal service, highways, navigation aids and facilities, and promotion of aviation and the merchant marine.

Social welfare activities, budgeted at \$1,963 million, were estimated at \$110 million more than in 1948. The major functions in this group were old age and other relief payments, \$1,075 million; outlays of the Railroad Retirement Board, \$569 million; and promotion of public health, \$198 million. General government expenditures, totaling \$1,187 million, showed a decline of \$317 million from 1948. Almost two-thirds of this decrease was due to the tapering off of the surplus property disposal programs, mainly under the War Assets Administration. Outlays for the Bureau of Internal Revenue and other Treasury bureaus made up 30 percent of total general government expenditures.

The reduced income tax rates in the Revenue Act of 1948, passed over the President's veto, resulted in a decline in estimated receipts from direct taxes on individuals of \$2,569 million. Because of high business activity and increased profits, revenue from taxes on corporations, however, showed a gain of \$1,535 million. Direct taxes on individuals and corporations constituted 78 percent of all budget receipts while excise taxes, totaling \$7,715 million, accounted for 19 percent of the estimated total.

Actual receipts and expenditures in the fiscal years 1947 and 1948 and the estimated totals for 1949 are shown in Table 1,

TABLE 1—BUDGET RECEIPTS AND EXPENDITURES
[In millions of dollars. Years are fiscal years]

	1947	1948	1949 Estimate
Receipts			
Direct taxes on individuals . . .	\$20,408	\$21,896	\$19,327
Direct taxes on corporations . . .	9,676	10,174	11,709
Excise taxes	7,270	7,402	7,715
Employment taxes	2,039	2,396	2,610
Customs	494	422	407
Miscellaneous receipts	4,621	3,809	2,276
Deduct:			
Appropriation to Federal old-age and survivors' insurance trust fund	1,459	1,616	1,754
Refunds of receipts (excluding interest)	3,006	2,272	2,709
Total Budget receipts . . .	40,043	42,211	39,580
Expenditures by major functions			
International affairs and finance	\$ 6,542	\$ 4,782	\$ 7,219
National defense	14,281	10,924	11,745
Veterans' services and benefits	7,370	6,567	6,799

General government	1,364	1,504	1,187
Interest on public debt	4,958	5,188	5,325
Reserve for contingencies	45
Adjustment to daily Treasury statement basis	305	-388	...
Total expenditures	39,289	33,791	40,180
Excess of expenditures	600
Excess of receipts	754	8,419	...

The Public Debt. At the end of the 1947-48 fiscal year the gross public debt amounted to \$252,300 million, a decline of \$5,990 million during the year. Interest-bearing marketable public debt issues were reduced by \$8,356 million during the fiscal

year, mainly by the use of the Treasury surplus. This reduction was offset to some extent, however, by increases in special bond issues sold to government trust funds and investment accounts to a total of \$2,845 million, by a net increase of \$1,926 million in savings bonds outstanding, and net sales of 2½ percent investment Treasury bonds totaling \$959 million. Redemption of Treasury notes in excess of sales were \$1,159 million, due primarily to the use of the notes for payment of taxes. Net

retirement of armed forces leave bonds totaled \$1,229 million and repayment of the special non-interest-bearing notes held by the International Bank and the International Monetary Fund accounted for \$913 million.

The composition of the outstanding public debt at the end of the 1947 and the 1948 fiscal years is shown in Table 2.

TABLE 2—PUBLIC DEBT OUTSTANDING

(In millions of dollars)

Issues	June 30, 1947	June 30, 1948
Public issues (interest-bearing):		
Marketable obligations:		
Treasury bills.....	\$ 15,775	\$ 13,757
Certificates of indebtedness.....	25,296	22,588
Treasury notes.....	8,142	11,375
Treasury bonds.....	119,323	112,462
Postal savings and other bonds....	166	164
Total marketable obligations....	168,702	160,346
Nonmarketable obligations:		
Armed forces leave bonds.....	1,793	563
Treasury savings notes.....	5,560	4,394
United States savings bonds.....	51,367	53,274
Treasury bonds, investment series.....		959
Depository bonds.....	325	316
Total nonmarketable obligations.....	59,045	59,506
Total public issues.....	227,747	219,852
Special issues to Government trust funds and agencies.....	27,366	30,211
Matured debt on which interest has ceased.....	231	280
Debt bearing no interest:		
International Bank and Monetary Fund.....	2,140	1,227
Other.....	803	722
Total gross public debt.....	258,286	252,292
Guaranteed debt:		
Not owned by the Treasury.....	90	73
Total public and guaranteed debt.....	258,376	252,366
General fund balance.....	3,308	4,932
Total debt less general fund balance.....	255,068	247,434

As a result of reduced receipts and increased expenditures, during the second half of the calendar year 1948 the budget surplus was cut to \$125 million as against a surplus of \$1,659 million in the corresponding period of the previous year. Sales of special issues to government trust funds exceeded the reduction in the public issues outstanding. As a result, the gross public debt was increased by \$507 million and on Dec. 31, 1948 totaled \$252,780 million.

The average rate paid on the interest-bearing public debt outstanding June 30, 1948, was 2.182 percent as against 2.107 percent the year before. The rise was due mainly to the increase in the short-term rates on bills and certificates and the continued issue of non-marketable and special issues at higher than average rates.

As of the end of September 1948, individuals held about 27 percent of the public debt, commercial banks 25 percent, U.S. Government agencies and trust funds almost 15 percent, the Federal Reserve Banks 9 percent, insurance companies a little under 9 percent, and other corporations and associations 8 percent. The remainder was owned by mutual savings banks and State and local governments. The reduction in the debt from a year before was accounted for mainly by retirement of obligations held by banks.

Changes in ownership of the U.S. direct and guaranteed debt are shown in Table 3.

TABLE 3—ESTIMATED OWNERSHIP OF INTEREST-BEARING SECURITIES ISSUED OR GUARANTEED BY THE U.S. GOVERNMENT
(In millions of dollars)

Owned by	Aug. 31, 1947	Sept. 30, 1948
Commercial banks.....	\$ 69,700	\$ 62,500
Federal Reserve Banks.....	22,200	23,400
Individuals.....	66,300	67,500
Insurance companies.....	24,900	22,300
Mutual savings banks.....	12,200	11,700
Other corporations and associations.....	21,800	21,100
State and local governments.....	6,400	7,800
U.S. Government agencies and trust funds.....	33,700	36,800
Total.....	\$257,200	\$252,700

In 1948, sales of Series E savings bonds, issued in denominations of up to \$1,000, totaled \$4,224 million, a gain of 3 percent over 1947 and the record amount ever sold in any peacetime year. Sales exceeded redemptions by \$494 million as against \$155 million in 1947. The improvement was due mainly to the larger volume of individual savings in 1948 and the drive launched May 15 to sell more savings bonds as an anti-inflationary measure. A feature of this campaign was the effort to promote more sales through payroll deductions. The amount of E bonds in the hands of the public at the end of the year reached the new high level of \$32,188 million.

The policy of supporting prices of Federal obligations in order to maintain the stability of the government bond market was continued in 1948 through the cooperation of the Treasury and the Federal Reserve System. The objective of this policy, which kept the price of long-term government bonds at a level yielding a return of $2\frac{1}{2}$ percent, was to keep prices from fluctuating too rapidly either up or down. It was felt that a decline in prices might shake the confidence of many investors and perhaps lead to wholesale liquidations, particularly by holders of the \$55,000 million of savings bonds outstanding. Moreover, the higher interest rate would increase the cost to the government of servicing the public debt. Finally, the possible drastic deflationary effects of such a policy were feared. In carrying out the price-support program the Federal Reserve Banks bought large amounts of long-term government bonds from investors at a pegged price. Because of simultaneous redemption of short-term obligations, however, there was only a relatively small increase in the holdings of government obligations of the Federal Reserve System.

—SAMUEL S. SHIPMAN

PUBLIC HEALTH SERVICE, U.S. The Public Health Service celebrated its 150th anniversary in 1948, commemorating the establishment in 1798 of the United States Marine Hospital Service. Originally created to provide medical and hospital care for American Merchant Seamen, the Public Health Service now conducts many broad programs for the protection and improvement of national health. These include: research in medical and related sciences; foreign and interstate quarantine; control of biologic products sold in interstate commerce; financial and technical assistance to the States for the expansion of public health programs and the control of widespread diseases.

In 1948, activities of the Public Health Service were expanded by Congress, through laws establishing new programs and through increased appropriations. Programs for the control of cancer and cardiovascular diseases were added and two new research institutes, on heart diseases and dental research, were created. A program for the control

of water pollution also was established. Appropriations to the Public Health Service for the fiscal year 1948 totaled \$126,691,697; in addition, Congress authorized contractual obligations for subsequent years, which totaled about \$74 million. Appropriations for 1947 totaled \$104 million. Grants-in-aid to State agencies for public health activities and to scientific institutions and individual scientists for research absorbed the major part of the increases in appropriations and contract authorizations.

The health status of the nation, as measured by death rates and the incidence of communicable diseases in 1947, remained at about the same level as in former years. The general death rate for 1947 was 10.1 per 1,000 population, excluding the armed forces overseas. Poliomyelitis and measles were epidemic during 1947-48, but cases of other communicable diseases were at or below expected numbers.

National Institutes of Health. The National Institutes of Health comprise the National Cancer Institute, Experimental Biology and Medicine Institute, National Heart Institute, National Institute of Dental Research, and Microbiological Institute. The last three of these were established in 1948. Appropriations to the National Institutes of Health for the fiscal year 1948 amounted to \$24 million, compared with less than \$8 million in 1947. Of this sum, \$14 million was appropriated for the combined program of cancer research, professional training, and control. The Public Health Service was also authorized to make grants to scientific and educational institutions for "drawing plans, erection of buildings and acquisition of land therefor for cancer research and training projects."

Congress also authorized the construction of a 600-bed clinical and laboratory research center in connection with the Institutes. The center will be completed in 1950 and will provide laboratory and clinical facilities for an integrated program of basic and applied research on physical and mental diseases.

During the past year, a number of notable achievements were credited to scientists of the National Institutes of Health. One causative agent of the common cold was isolated. In a cooperative study with university and public health authorities, Q fever was found to be endemic in Southern California. Organisms identified as *Coxiella burnetii*, the cause of Q fever, were recovered from raw milk. A vaccine for the prevention of mumps was developed and tested clinically; it provides temporary protection for male adults exposed to mumps.

New drugs and antibiotics were developed and tested for their value in the treatment of tuberculosis. In nutrition studies, addition of niacin to the diet of experimental animals resulted in the correction of abnormal conditions of the blood and resumption of growth; these results may have a bearing on the treatment of clinical anemia.

A 6-year study at a training school for boys was completed, showing that ultraviolet radiation in dormitories failed to affect the incidence of airborne diseases.

Radioactive penicillin was produced by the use of radioactive sulfur in the media on which the *Penicillium notatum* fungus grew. By means of radioactive penicillin, it should be possible to obtain more information on how penicillin destroys bacteria.

New knowledge of the internal structure of the molecule was gained from electron microscope pictures, obtained by technics developed at the National Institutes of Health.

Fifty new chemotherapeutic agents that produce

destructive effects on tumors in mice were discovered in the systematic testing of many newly synthesized chemical compounds. Improvements in technic were made, which afforded larger cultures of cancer cells than ever grown before in test tubes. Recent studies also demonstrated that sex hormones do not influence tissue growth when certain vitamins are lacking and that anti-vitamin compounds are potential neutralizers of the harmful effects of hormones in cancer of the breast and prostate.

The National Advisory Health Council, the National Advisory Cancer Council, and the National Advisory Mental Health Council, whose members are leading authorities in these fields, recommended 986 research grants amounting to \$12 million for non-Federal institutions and scientists. Research fellowships were awarded to 133 men and women.

Hospital Construction. At the close of the second year of the Hospital Survey and Construction Act (1946), all States and Territories (except Nevada) had submitted and received approval of long-range State plans. More than 350 individual projects had been approved. Congress authorized the Public Health Service to assume obligations up to \$75 million in 1948. This 5-year program is aimed at building more than 1,250 million dollars' worth of health facilities by 1952.

Industrial Hygiene. The Public Health Service continued its cooperative programs with the 58 state and local industrial hygiene units through various types of assistance. An investigation of sodium fluoride as a health hazard in the manufacture of rimmed steel was made at the request of the United Steelworkers of America, CIO, and the Republic Steel Corporation. Sodium fluoride was exonerated but other irritating factors were discovered in the course of the survey and recommendations made for their control. A major study of health hazards in 24 foundries was completed.

The Public Health Service continued its systematic collection and classification of information on poisons and their control, and consultation on chemical problems increased. Laboratory facilities were planned for the analysis of radioactive materials. A mobile dental unit was used in extensive studies of the relation of industrial hazards to oral diseases. Industry-wide conferences were held on the incidence of cancer in the chromate industry and on health hazards associated with the use of beryllium.

Tuberculosis Control. The death rate from tuberculosis reached an all-time low in 1947: 83 per 100,000 population as compared with 36.4 in 1946, and 46 in 1940. The nationwide program launched in 1944 has contributed to this encouraging trend. The Public Health Service continued its cooperative activities in this field with State and local health authorities and voluntary agencies. Five major objectives are sought: (1) prevention, (2) case finding, (3) isolation and medical care, (4) rehabilitation and after-care, and (5) economic and social protection for families of the tuberculous. The Service concentrated its activities upon aid to States, research, and training of professional and technical personnel. During the year, over one million X-rays were taken by Public Health Service X-ray equipment, of which 662,764 were taken by Service staff in community-wide X-ray surveys in Minneapolis and St. Paul, Oak Ridge, Tenn., and Washington, D.C.

Studies of the effectiveness of BCG vaccine in preventing tuberculosis now include approximately 9,000 persons. A long-range investigation of early tuberculous lesions among student nurses con-

tinued; more than 24,000 nurses are participating. The search went on for an effective and universally applicable antibiotic agent. A coordinated, cooperative program was undertaken to evaluate the effectiveness of streptomycin in tuberculosis therapy. Two new cooperative laboratories were established to explore the chemotherapy of tuberculosis and to expand medical mycological research. Extensive studies were undertaken in epidemiology, clinical problems, and the post-sanatorium follow-up of tuberculous patients. In radiology, research projects conducted by Public Health Service scientists resulted in the development of new X-ray materials and equipment which will improve radiological technics materially.

Venereal Disease Control. Major activities in venereal disease control included the rapid treatment center program, community-wide public education and case finding projects, research, and evaluation studies. During the fiscal year 1948, 3,000 clinics made over 2 million diagnostic examinations, finding about 431,000 cases of venereal disease. These cases included about 44,000 cases of primary and secondary syphilis, 53,000 cases of early latent syphilis, and about 273,000 cases of gonorrhea. About 65 percent of the syphilis cases were referred to rapid treatment centers for in-patient penicillin treatment, while 97 percent of the gonorrhea cases were treated with penicillin in the clinics. Rapid treatment centers were maintained in 41 States, the District of Columbia, Alaska, and the Virgin Islands.

State and local health departments continued to emphasize case-finding and contact investigation as fundamental parts of their control program. Health departments reported that about 640,000 epidemiologic investigations were made during the year, from which more than 150,000 previously untreated cases of venereal disease were brought to treatment.

Communicable Disease Control. The CDC at Atlanta, Ga., conducted a program of malaria control in 13 States, Puerto Rico, and the Virgin Islands. Typhus control work continued in endemic areas of southern and southwestern parts of the country.

The Center trained more than 300 laboratory directors and technicians in various diagnostic technics, such as the recovery of viruses of neutrotropic disease, seriological diagnosis of virus and rickettsial diseases, detection of amebic dysentery, and sputum-culture diagnosis of tuberculosis. The Center also provided extensive services to State and local health agencies in the investigation and control of diarrheal diseases, poliomyelitis, plague, dengue fever, encephalitis, rabies, and other communicable diseases. Nine field training stations are operated to give instruction and field practice to State and local health personnel in the use of new control methods.

Demonstrations. Demonstrations conducted during the year served the multiple purposes of investigation, application of new concepts in public health practice, exploration and perfection of specific control methods, demonstration of new technics to State and local health workers, and training of personnel in newly developed fields. Demonstrations continued in nutritional services, heart disease and diabetes control, and dental health.

Congress appropriated \$1 million for a demonstration in each State of the topical application of sodium fluoride to children's teeth, as a means of preventing dental caries. Demonstration teams include one dentist, two dental hygienists and a records clerk. They travel in trailers, using portable equipment to demonstrate the technic to dentists

and dental hygienists. A 10-year study of the effects of adding fluorine to community water supplies was continued. Communities and health departments were shown the technics of nutrition surveys, and health department personnel were given in-service training in nutrition. Four demonstration field units were assigned to State health departments in various parts of the country. In addition, the Public Health Service participated in a cooperative nutrition project with the California State Health Department, the U.S. Department of Agriculture, and the College of Agriculture of the University of California.

Demonstrations in heart disease and diabetes control concentrated on the development of effective methods of detecting these conditions in large groups of supposedly healthy people. The electrokymograph, adapted to the detection of heart disease several years ago by Doctor Bert Boone of the Public Health Service, is now in use in a number of institutions. Field studies to evaluate its effectiveness continued. New technics were developed for mass use, whereby blood samples can be tested for sugar content, as a means of detecting diabetes.

Cancer control activities, begun during the fiscal year 1948, included: public health nursing and cancer education for nurses; cancer teaching in medical and dental schools; surveys to evaluate cancer control methods; and general cancer education. The Public Health Service allotted funds to State agencies and to professional schools for these purposes.

Mental Health. In the fiscal year 1948, Federal funds were available for the first time for a nationwide attack upon the growing problems of mental illness. With an appropriation of about \$4.5 million, the Public Health Service was able to carry the program authorized by the National Mental Health Act of 1946 from the planning stage into the realm of positive action.

The program concentrated on meeting three major areas of need: research in mental and nervous diseases; training of psychiatrists, psychologists, psychiatric social workers, and nurses; and strengthening of State and community mental health services. To stimulate additional research, grants totaling \$373,665 were made to 38 non-Federal institutions and individual investigators. Twenty fellowships totaling \$64,122 were awarded to scientists. Applications for the support of professional education were received from 173 training centers and totaled \$5 million. On the basis of funds authorized, it was possible to pay a total of \$1.2 million for 62 training grants and stipends. Grants-in-aid totaling about \$2 million were made to 46 States and Territories, 24 of which had no preventive mental health program prior to July, 1947.

Foreign Quarantine. Despite the rising incidence of smallpox, cholera, and other communicable diseases abroad, no cases of the "quarantinable diseases" (smallpox, cholera, typhus, plague, yellow fever, anthrax, psittacosis) were introduced into this country during the fiscal year 1948.

The Public Health Service established a stricter requirement of smallpox immunization for persons arriving from abroad. Persons entering the United States must give definite proof of having been vaccinated during the preceding 12 months, or submit to vaccination on entering. The procedure for radio pratique, or advance quarantine clearance, was extended to qualifying fishing vessels arriving at Los Angeles. Sodium Fluoracetate ("1080") and DDT continued to compare favorably with hydrocyanic acid gas fumigation of ships as means of rodent

control. Approximately 30,000 arriving aircraft were inspected to prevent introduction of disease-transmitting insects.

Marine Hospitals. The Public Health Service operates 24 hospitals (called Marine Hospitals because they were established originally to care for seamen only) and 120 out-patient clinics and offices for the care of its beneficiaries. Beneficiaries include American merchant seamen, Coast Guard personnel, civil service employees injured on the job, Coast and Geodetic Survey officers and crew members, and other groups for whom the Federal Government is responsible.

The Marine Hospitals include 21 general hospitals, 2 tuberculosis sanatoria, and a hospital at Carville, Louisiana, for the treatment of persons with leprosy. The hospitals are located, for the most part, at major American seaports, on the shores of the Great Lakes, and along the principal rivers.

Clinical research projects conducted in the hospitals during 1948 included: electrokymography in the diagnosis of heart disease, the use of streptomycin in the treatment of tuberculosis, and the role of sulfone drugs in the treatment of leprosy. Most of these projects are conducted in cooperation with other research units of the Public Health Service. The Council on Medical Education and Hospitals of the American Medical Association has approved 11 of the Marine Hospitals for internships, and 10 for training of residents. Several are affiliated with medical schools. Intern training programs are also available for dietitians and hospital administrative personnel.

During the fiscal year 1948, the Marine Hospitals reported nearly 80,000 admissions. The average daily in-patient census was 5,700, and bed occupancy 85 percent of standard capacity.

Environmental Health and Water Pollution Control. The Water Pollution Control Act, approved June 30, 1948, provided for joint action by the Federal Security Agency and the Federal Works Agency to conserve the water resources of the nation by controlling pollution of watercourses. Specifically, the Act directed the Public Health Service to administer a program of grants-in-aid to the States for research and surveys on the control of industrial wastes. These provisions greatly expand the work of the Public Health Service in this field. The law authorized the appropriation of \$22.5 million annually for each of the next five fiscal years, to be used as loans to States, municipalities, and interstate agencies for the construction of sewage treatment works. Loans are dependent upon approval by the Public Health Service of the proposed construction. A new laboratory at Cincinnati, Ohio, was authorized. The Public Health Service completed its plans for 14 river basin stations throughout the United States to be the focal points for all interstate activities in connection with water pollution control.

Important new public health engineering activities were begun. They include intensive study of the disposal of radioactive and industrial wastes and study of housing standards in relation to health and safety. An agreement was reached between the Public Health Service and the Canadian Department of National Health and Welfare which facilitates the exchange of information on shellfish sanitation between Canada and the United States. One result of this agreement is the inclusion of the names of Canadian shippers on routine releases and the joint endorsement of control measures by the two participating health agencies.

Action was initiated to revise the Interstate Quar-

antine Regulations as they relate to the interstate shipment of lather brushes for the control of anthrax. Supervision of the policies and technical phases of the milk and food sanitation program was continued. Sources of water used on trains and airplanes were inspected to determine compliance with the Drinking Water Standards prescribed in the regulations.

The Environmental Health Center at Cincinnati, Ohio, conducted numerous cooperative investigations. Pollution of international boundary waters between the United States and Canada was under study throughout the year. A study of septic tank systems for home sewage disposal was launched. In addition, the Center cooperated in a stream pollution survey of the Kansas River Basin and a study of bathing beaches in the Chicago area. A mobile laboratory and personnel were sent to Florida on an investigation of the public health aspects of water hyacinth control with 2,4-D. Consultative services were provided to the Atomic Energy Commission by staff members in connection with liquid waste disposal problems.

World Health Relations. Among the international meetings in which the Public Health Service participated were the First World Health Assembly, the Directing Council and Executive Board of the Pan-American Sanitary Organization, and the Finance and Transfer Commission of the Office International d'Hygiene Publique. In addition, the Service arranged for appropriate representation at international congresses on cystology, microbiology, ophthalmology, leprosy, venereal diseases, tropical medicine and malaria, and BCG vaccine.

The Public Health Service administered training programs for public health students from Latin America, the Philippines, and Greece, and assisted in placing fellows of the World Health Organization and of private organizations and foreign countries in schools, hospitals, institutions, and laboratories throughout the United States. The Public Health Mission to Liberia, the American Mission for Aid to Greece, and the health program of the Philippine Republic were serviced by officers of the Public Health Service, assigned to these organizations.

The Nation's Health. A few local outbreaks of influenza were reported in 1948, but the incidence was below that for the two preceding seasons, and the small excess of deaths in the major cities of the United States indicated the clinical mildness of the disease. The outbreaks were generally characterized by gastro-intestinal symptoms. Where identified, it was due to type "A" influenza virus. The periodic epidemic cycle for measles occurred during 1947-48, and a total of 586,282 cases was reported during the measles season as compared with 208,389 in 1947 and 577,159 in 1946 for the corresponding periods.

Poliomyelitis was epidemic in 1948 for the sixth consecutive year, with 21,515 cases through the week ended Oct. 16, 1948, as compared with 20,686 for the same period in 1946. Although the death rate from poliomyelitis has increased since 1942, the increase has not been so great as the increase in incidence. This disparity indicates that a large proportion of mild, non-paralytic cases are being reported.

Other reportable diseases are approximately at or below the median expectancies. Only 53 cases of smallpox were reported up to the week ended Oct. 16, 1948, as compared with 151 for the same period last year, the previous low for the period.

Since June, 1946, the Public Health Service has been the chief Federal agency responsible for the

collection and publication of national vital statistics, including data on births, stillbirths, deaths and causes of death, marriages, and divorces.

In 1947 the birth rate was 25.8 per 1,000 population including the armed forces overseas, the highest reported since the birth registration area was established in 1915. The crude death rate from all causes for 1947 was 10.1 per 1,000 population, excluding armed forces overseas. This was the second lowest rate ever reported for the United States; the lowest was 10.0 in 1946.

The 1947 marriage rate was 12.9 per 1,000 population excluding armed forces, and the divorce rate was 3.3 per 1,000 population including armed forces overseas. During the 80 years (1867-1947) for which estimates are available, this marriage rate has been exceeded only once, in 1946. The divorce rate was exceeded only twice previously, in 1945 and 1946.

PUBLIC ROADS ADMINISTRATION (PRA). The highway program in the United States gained momentum in 1948, despite continued shortages of materials, labor and engineering personnel. Contract awards by State highway departments for all classes of road work, including Federal-aid and non-Federal projects, passed the \$1,000 million mark for the first time in history.

The total construction cost of all highway jobs placed under contract during the year by State agencies was approximately \$1,150 million. Of this amount, an estimated \$746 million was for improvements on routes in the Federal-aid systems. Approximately \$15 million of Federal work in parks and forests is also included. These figures do not include cost of right-of-way, engineering costs, and contingencies. The improvements involved work on about 40,000 miles of road.

An important event of the year was passage by Congress of the Federal-aid Highway Act of 1948, authorizing an appropriation of \$450 million for each of the fiscal years 1950 and 1951, to assist the States in developing Federal-aid primary and secondary roads.

Passage of the 1948 act makes it possible for the States to continue the postwar Federal-aid highway program authorized by the Federal-aid Highway Act of 1944, which authorized an appropriation of \$500 million for each of the first three postwar fiscal years for Federal-aid projects. At the end of 1948 nearly all funds available under provisions of the act had been assigned to specific projects.

In 1948 considerable progress was made in the improvement of National Interstate highways and Federal-aid secondary roads. Development of urban expressways to relieve traffic congestion in large cities also was well advanced at the end of the year. Commissioner in 1948: Thomas H. MacDonald.

PUERTO RICO. A West Indian island, forming a Territory of the United States; acquired from Spain through the Treaty of Paris, 1898. The adjacent islands of Vieques, Mona, and Culebra are included in its jurisdiction. The area of Puerto Rico is approximately 3,423 square miles.

Population. As of July 1, 1948, the population was estimated at 2,146,686, or over 640 persons per square mile, making the territory one of the most densely populated agricultural countries in the world. Chief cities: San Juan (capital), 230,235 inhabitants; Ponce, 119,097; Mayaguez, 90,000. Seventy-six percent of the people are native-born whites and the remaining 24 percent are for

the most part Negroes and Mulattoes. The birth rate increased in 1947 to 43.5 live births per 1,000 population as compared with 42.7 in the previous year. The death rate fell from 14.1 per 1,000 population in 1945 to 12.0 in 1947.

Education. School enrollment in 1947 was 460,000—an increase of 110,085 over the previous year. The University of Puerto Rico, located at Río Piedras, 10 miles from San Juan, had in the academic year of 1947-48 a daytime registration totaling 8,000 students. Enrollment in all the colleges, including evening extension, totaled 10,651. Illiteracy has been reduced in Puerto Rico to 29 percent.

Production. The island is predominantly agricultural, with about 825,000 acres under cultivation out of a total area of some 2 million acres. In 1945-46, agriculture produced 26 percent of the island's net income, the most important crops being sugar, tobacco, coffee, and starchy vegetables. In 1948, a total of 1,108,260 tons of sugar was produced. The Sugar Act of 1948 sets the quota for shipment of sugar to the continental United States at 910,000 tons.

Manufacturing has increased in importance. In 1939-40, manufacturing net income was only 37 percent as large as that of agriculture as compared with 50 percent for 1945-46. Sugar and tobacco processing, rum, and needlework are among the established industries. The local Government, mainly through the Puerto Rico Industrial Development Company and the Puerto Rico Development Bank, is making an effort to industrialize the island. The Development Company is already operating subsidiary corporations for the production of cement, glass containers, paper, clay products, and shoes. Total sales of the Company and its subsidiaries during 1946-47 were \$4,296,426 as compared to \$3,680,011 for the previous year. New industries are tax-exempted by law.

Trade. Exports during 1947 totaled \$191.3 million or in value 129 percent higher than in 1940. Imports were calculated for the same period at \$308.6 million or 197 percent above the 1940 value. Exports from sugar alone added up to \$124.4 million. Textiles followed with \$25.7 million.

Finance. Revenues from the general fund and other funds of the Insular Government totaled \$132,494,893 for 1946-47 as compared with \$125,113,230 for 1945-46. While revenues from the shipment of rum to the mainland declined, inflation of income has brought about a substantial increase from Insular income taxes.

Government. Under the Organic Act that was passed by the U.S. Congress in 1917 and later amended, Puerto Rico has the status of an organized territory of the United States. Its citizens are U.S. citizens. A new law, providing for an elective governor in 1948, was signed by President Truman on Aug. 5, 1947. Luis Muñoz Marín, president of the Popular Democratic Party, was elected governor of Puerto Rico on November 2.

The legislative power is vested in a Legislature of two houses which is elected by popular vote for a 4-year term. In addition there is a Resident Commissioner to the United States who is elected by the popular vote for a 4-year term. Dr. Antonio Fernós Isern is the present Resident Commissioner.

Events, 1948. The year was marked by intense political activity as a preliminary to the election of the first native governor. Relations were friendly between the local and the federal administrations. The industrialization program went rapidly ahead, and there was an upward swing in the economy, although inflation continued. On February 21,

President Truman visited the island and was enthusiastically received. In an address, he praised the government's program of industrial and agricultural development and added: "Too often we have had our attention directed to Puerto Rico's problems. We have heard too little of your achievements. In less than half a century you have raised your wages and standard of living, have developed universal free schooling, highways, hospitals, utilities, and all the other institutions of modern society. I have said to the Congress several times and I repeat it here—that the Puerto Rican people should have the right to determine for themselves Puerto Rico's political relationship to the Continental United States."

On April 20, Representative Fred L. Crawford of Michigan urged the House to lift quantitative restrictions on trade between the island and the United States. Crawford argued against the statutes which prevent Puerto Rico from refining more than about 15 percent of its own sugar and urged that the island's sugar cane industry get the same treatment as the beet sugar industry in the Western states. A bill to do away with present restrictions was introduced by the Puerto Rican Resident Commissioner.

A strike at the University of Puerto Rico on April 14, headed by a small group of students, received widespread publicity in the United States. Classes were suspended on April 15 and reopened on May 3. The rebellious students tried on several occasions to interrupt activities within the campus and in the graded and secondary schools. The University authorities suspended classes indefinitely, but examinations were held with an attendance of more than 90 percent. The strikers tried again to interrupt classes in September, but failed to have the support of the student body.

The local elections were contested by 3 political groups. The Popular Democratic Party favored increased industrialization, a better distribution of the insular wealth, and a territorial constitution until the island's economy would permit choosing between statehood and independence. The Puerto Rican Independentist Party advocated complete independence after a transition period. A coalition of Republicans, Socialists and Reformists favored statehood and a revision of the social legislation and other measures of the party in power. Luis Muñoz Marín, leader of the Popular Democratic Party, was elected governor by a landslide in a peaceful and orderly election. Resident Commissioner Fernós was returned to Washington.

—ARTURO MORALES-CARRIÓN

PULITZER PRIZES. The annual awards in journalism and in letters, established under the terms of the will of the late Joseph Pulitzer, publisher of the *New York World*, are awarded by the trustees of Columbia University on recommendation of the Advisory Board of the School of Journalism (Graduate) at Columbia University. Awards made on May 3, 1948, which are for work done in the preceding year, 1947, are listed below.

Journalism. Public Service—\$500 gold medal: *The St. Louis Post-Dispatch*, for its coverage of the Centralia, Ill., mine disaster on Mar. 25, 1947, and the succeeding stories which "resulted in impressive reforms in mine-safety laws and regulations."

Reporting—\$500: (*Local*)—George E. Goodwin of *The Atlanta Journal*, for his history of the Telfair County, Ga., vote fraud during the election of Nov. 5, 1946. (*National*)—Two awards: Bert Andrews, of the *New York Herald Tribune's* Washington Bureau, for his story of the summary dismissal of one

State Department employee on the basis of a disloyalty accusation; and Nat S. Finney, of *The Minneapolis Tribune's* Washington Bureau, for his articles concerning government proposals to form a type of censorship on government acts and utterances in peacetime. (*International*)—Paul W. Ward of *The Baltimore Sun*, for his series of articles on "Life in the Soviet Union."

Editorial Writing—\$500: Virginus Dabney, editor of *The Richmond Times-Dispatch*.

Cartoon—\$500: Reuben L. (Rube) Goldberg of *The New York Sun*, for his cartoon entitled "Peace Today."

Newspaper Photography—\$500: Frank Cushing of *The Boston Traveler*, for his picture of a boy gunman using another small boy as a shield.

Letters. Novel—\$500: James A. Michener, for *Tales of the South Pacific* (in the form of a collection of short stories).

Drama—\$500: Tennessee Williams, for *A Streetcar Named Desire*.

History—\$500: Bernard De Voto, for *Across the Wide Missouri*.

Biography—\$500: Margaret Clapp, for her *Forgotten First Citizen: John Bigelow*.

Poetry—\$500: W. H. Auden, for his long poem *The Age of Anxiety*.

Music—\$500: Walter Piston, for his *Symphony No. 3*.

Special Award—\$1,500 scholarship: Philip Anthony Moose of New York City.

QATAR. An Arabian sheikdom occupying a peninsula in the Persian Gulf. Area, 8,500 square miles. Population: estimated at 25,000. Capital, El Beda. Relations with Great Britain are regulated by the Treaty of Nov. 3, 1916. Sheik, Abdullah ibn Jasim al Thani. In 1947 Petroleum Development Ltd., a subsidiary of the Iraq Petroleum Company, engaged in searches for oil deposits on the Qatar Peninsula.

QUEBEC. A province in eastern Canada. Area 594,860 square miles (523,860 sq. mi. land area and 71,000 sq. mi. water). Population (census, 1941) 3,331,882; 3,792,000 (1948 est.). According to principal religious denominations in 1941, 2,894,621 were Roman Catholics; 162,056 Anglicans; 100,196 United Church; 56,086 Presbyterian; 65,683 Jewish. In 1946 there were 111,285 live births; 33,690 deaths; 36,650 marriages. Education (1945-46): 712,249 students enrolled in schools and colleges. Chief cities: Quebec (capital) 150,757 inhabitants in 1941; Montreal 903,007; Verdun 67,349; Three Rivers 42,007; Sherbrooke 35,965; Hull 32,947; Outremont 30,751; Westmount 26,047; Shawinigan Falls 20,325; Lachine 20,051.

Production. The gross value of agricultural production in 1947 was \$344,377,000. In 1947 there were 6,390,000 acres in field crops valued at \$162,410,000. Chief field crops (1947): oats 26,639,000 bu. (\$22,643,000), mixed grains 5,568,000 bu. (\$5,457,000), barley 2,885,000 bu. (\$3,231,000), buckwheat 1,523,000 bu. (\$1,919,000), potatoes 10,558,000 cwt. (\$26,078,000), field roots 3,453,000 cwt. (\$3,798,000), hay and clover 5,935,000 tons (\$92,171,000), fodder corn 713,000 tons (\$5,276,000). Livestock (June 1, 1947): 2,033,500 cattle including 1,120,800 milk cows (\$166,078,000), 316,600 horses (\$41,442,000), 1,061,200 swine (\$27,428,000), 571,700 sheep (\$6,634,000), 14,004,300 poultry (\$19,482,000).

The number of fur farms in 1946 was 1,768 with fur animals valued at \$2,595,564. Value of

fur pelt production in 1946-47 was \$3,913,915. Total marketed value of fish in 1946 was \$7,927,022. Cod was the main fishery followed by lobsters, herring, mackerel, and salmon. A total of 97,527,000 lb. of creamery butter was produced in 1947 valued at \$52,665,000; factory cheese was 24,812,000 lb. valued at \$7,851,000; estimated total farm value of poultry meat and eggs was \$37,783,000.

Maple syrup produced in 1947 was 2,831,000 gal. valued at \$9,852,000; honey, 5,399,000 lb., valued at \$1,458,000; fruit amounted to \$3,548,000. The 1948 tobacco crop was estimated at 11,148,000 lb. There were 1,989 sawmills in operation in 1946 and the value of lumber sawn was \$55,249,378; gross value of products in the pulp and paper industry (1947) was \$346,119,699; newsprint production (1947) was 2,596,604 tons.

Quebec is the second largest manufacturing province in Canada. Manufacturing establishments numbered 10,818 in 1946. They furnished employment to 357,276 persons who received \$565,986,105 in salaries and wages. The gross value of products was \$2,497,971,521 from materials costing \$1,297,009,099. The production of pulp and paper occupied first position. Other leading industries, in the order named, were: clothing, non-ferrous metal smelting and refining, railway rolling stock, cotton yarn and cloth, slaughtering and meatpacking, tobacco, cigars and cigarettes.

Government. Finance (year ended Mar. 31, 1947): revenue \$147,434,000; ordinary expenditure \$82,057,350; total direct and indirect liabilities (less sinking funds) \$412,811,099. The executive authority is vested in a lieutenant governor who is advised by a ministry of the legislature. There are 24 members (appointed for life) in the Legislative Council, and 92 members (elected by male and female suffrage) in the Legislative Assembly (82 Union Nationale, 8 Liberals, and 2 Independent were elected at the provincial general election of July 28, 1948). Twenty-four members (appointed for life) in the Senate and 65 elected members in the House of Commons represent Quebec province in the Dominion Parliament at Ottawa. Lieutenant Governor, Maj. Gen. Sir Eugène Fiset (app. Dec. 30, 1939). Premier, Maurice L. Duplessis (Union Nationale), elected Aug. 8, 1944, (reelected July 28, 1948). See CANADA.

RADIO BROADCASTING. See the article on U.S. RADIO BROADCASTING.

RAILROAD RETIREMENT BOARD. An independent executive agency of the U.S. Government which administers the Railroad Retirement and Railroad Unemployment Insurance Acts, laws which provide retirement, survivor, and unemployment benefits for railroad employees. Chairman: William J. Kennedy.

During the fiscal year which ended June 30, 1948, \$283,900,000 was paid to over 700,000 railroad employees and their families, of which \$187,800,000 went to 237,000 retired employees; \$37,100,000 to 139,000 survivors of railroad employees; \$32,400,000 to 210,000 railroad workers who were unemployed because of lack of work; and \$26,600,000 to 150,000 railroad workers who were unemployed because of sickness or injury.

Major legislation enacted by Congress on June 23, 1948, increased retirement benefits by 20 percent, and guaranteed each railroad worker that if the total of all benefits paid to him and his survivors would be less than the amount he had paid in retirement taxes, plus an allowance for interest,

the difference would be paid to some one designated by the worker, or to one or more of his survivors, or to his estate, as provided in the Act.

RAILWAYS. The immediate necessity of taking up deferred maintenance was the dominant factor in operation of the railways of the United States in 1948. Increased cost of materials and increased wage payments made it difficult to operate at a profit. Truck and inland waterway competition made it difficult to increase or even retain the level of gross revenues.

That cars, locomotives, and track were brought up to a fairly good condition is attested to by the fact that there was not an unusual number of accidents due to defective equipment or track. There were, however, accidents due to human failures.

It is doubtful whether any large part of deferred repairs to cars, locomotives, and track has been made good. Neither the materials nor the labor has been available at any price. American ingenuity in "make do" is the more likely explanation of the railway accident record in 1948.

Changes in types of locomotives and cars that took place during the 10 years 1938-1948 were of great importance both to the financial results in 1948 and to the problems presented to railway managements in that year. A shop and its personnel fitted to repair 8-wheel steam locomotives may have to be somewhat enlarged to repair a mountain-type locomotive with 73-inch driving wheels but it does not have to be fundamentally changed. A shop fitted to repair 30-ton wooden boxcars can readily be adapted to repair 50-ton wooden boxcars. But a shop fitted to repair steam locomotives cannot be used to service Diesel locomotives, and neither can a shop suitable for repairs of wooden cars be adapted to repair steel cars.

Freight Rates. In an effort to secure more revenue to meet increased expenses, the railways applied to the Interstate Commerce Commission for permission to raise freight rates generally by 13 percent. In connection with this application the Pennsylvania Railroad submitted proof that it was costing 85.19 percent more to operate their property in 1948 than it cost in 1940, while revenues were only 47.20 percent greater in 1948 than they were in 1940. Revenues increased 47.19 percent, so that gross revenues amounted to \$176,628,000 in 1948. Expenses increased 85.19 percent, so they totaled \$185,190,000 in 1948. Thus there would have been an operating profit of \$20 million in 1940 and an operating loss of \$11,310,000 in 1948.

It is significant that in opposing the first request for an increase in rates it was claimed that it would bring the railways less revenue because higher railway rates would divert business from the railways to trucks and inland waterways. Heretofore shippers had based their opposition to higher rates on the contention that the railways did not need larger revenues. When it was suggested that regional hearings be held on the application the railways asked for an emergency increase of 8 percent. This plea was met by shippers attempting to show that an emergency increase was not needed. The hearings were still going on in December.

Labor. An attempt was made to force further wage increases for both skilled and unskilled railway workers through strike threats. Uninterrupted railway operation was absolutely dependent on trainmen doing their work. President Truman let it be known that he would take over the railways, under the authority granted the Commander in Chief during the war, rather than permit an interruption of railway transportation.

Car Building. With a severe car shortage threatening at the beginning of 1948 railway managements called on car builders to increase their output. A goal of 10,000 cars a month was set. This goal was attained in only two or three months of 1948, but for the entire year the output of new cars by commercial concerns was slightly over 110,000 cars. With 85,000 cars so badly in need of repair as to be unserviceable the net gain in usable cars was 25,000.

Reorganizations. In 1946 the Seaboard Air Line Railway property was turned over to a new company, The Seaboard Air Line Railroad Company. The owners of the property, holders of the Railway Company common and preferred stock, had been entirely wiped out and its creditors, the bond holders, alone had participated in the distribution of the Railroad Company stock. From the start of operations of the new company interest on its bonds had been paid and, in December, 1948, a dividend of \$1 a share on the new (Railroad) stock was declared. The property consists of a single-track line from Richmond, Va., to Jacksonville, Fla., from where it continues south to Tampa on the west coast of Florida.

A line from Norfolk, Va., that connects with the Richmond-Jacksonville line gives the Seaboard Air Line two northern termini, one a source of fuel coal (Norfolk) and the other a destination for Florida products. There is also an east and west line to Birmingham, Ala.

Dividends. The Pennsylvania Railroad resumed the payment of dividends which had been passed in 1947. The company has only one class of stock—common. It has a par value of \$50 a share and is very widely held by small investors. Up to 1947 it had been paying \$1 a share all through the depression and for 100 years before that. Resumption was at the rate of \$1 per share, 2 percent on par value.

Taken as a whole the dividend changes in 1948 give a significant picture of the financial condition and prospects of the railways of the United States. The Seaboard, connecting population centers with Florida and carrying fruit, vegetable, and luxury passenger traffic, was able after drastic reorganization to inaugurate dividends. The Pennsylvania Railroad, carrying coal and steel, was able to resume dividends; as also was the New York Central, carrying miscellaneous freight over its water-level route. In other words, railways peculiarly well adapted to their situation were making a satisfactory profit.

Motive Power. Officers in the mechanical departments of American railways have come to a general agreement that Diesel engines are more satisfactory as motive power than steam engines. The recent widespread building of railway shops especially designed to repair and service Diesels marked the acceptance of Diesels as standard motive power. There is still a difference of opinion as to the most economical weight. The two figures most often mentioned are 60,000 and 100,000 lb.

At the end of 1946 the railways owned 37,255 steam locomotives and 4,222 Diesel and electric locomotives. On Dec. 1, 1948, they had 32,854 steam locomotives and 6,201 Diesel and electric locomotives.

Earnings. In 1948 the railways earned the largest gross income for any year in their history. It amounted to \$9,626 million and compared with the \$9,437 million earned in 1944, the largest heretofore. The volume of business done in 1948 was smaller, but the rates were higher and so were the expenses. The accompanying table gives a con-

RAILWAY REVENUE AND EXPENDITURE, 1947-1948
[000 omitted]

	1948	1947
Total operating revenue.....	\$9,626,000	\$8,685,000
Total operating expense.....	7,498,000	6,797,000
Taxes.....	987,000	936,000
Operating income.....	970,000	781,000
Net after bond interest.....	653,000	479,000
<i>Operating revenue</i>		
Freight revenue.....	7,952,000	7,041,000
Passenger revenue.....	954,000	963,000
Mail revenue.....	191,000	170,000
Express revenue.....	121,000	116,000
Other revenue.....	408,000	395,000
Total.....	9,626,000	8,685,000
<i>Operating expense</i>		
Maintenance of way, structure.....	1,365,000	1,212,000
Maintenance of equipment.....	1,702,000	1,476,000
Traffic.....	195,000	176,000
Transportation.....	3,831,000	2,538,000
General.....	405,000	375,000
Total.....	\$7,498,000	\$6,797,000

densed income account for class I (companies earning a million dollars or more annually) railways of the United States.

The average revenue per ton per mile in 1948, based on the first nine months, was 1.238 cents compared with 1.076 cents in 1947. The average revenue per passenger per mile in 1948 was 2.294 cents compared with 2.097 cents in 1947.

Record Operation. The number of net tons per freight-train hour was 18,768 in 1948 compared with 18,126 in 1947.

Transportation Produced. The railways of the United States carried 640,000 million tons of freight one mile in 1948. In 1947 they carried 654,728 tons one mile and in 1944, the peak year, they carried 737,246. It is inaccurate to say that higher freight rates alone accounted for the higher revenue in 1948. The nature of the commodity carried has quite a lot to do with the revenue earned.

Carloads of coal carried in 1948 amounted to 8,730,000, which was less by 358,000 cars than the amount of coal carried in 1947. On the other hand carloads of ore carried in 1948 totaled 2,781,000, which was 129,000 cars more than was carried in 1947. There were 4,000 more cars of coke carried in 1948 than in 1947. Carloads carried of all other commodities showed a decrease in 1948 as compared with 1947. The average revenue per ton per mile in 1948 was 1.238 cents compared with 1.076 cents in the previous year.

Employment. The average number of men employed by the railways of the United States in 1948 was 1,327,000 and the total payroll was \$4,743 million in that year. In the previous year the total number of men was 1,351,961 and the total payroll was \$4,350 million. The compensation per employee per year was \$3,575 in 1948 and \$3,218 in 1947.

Railroad Retirement Board. The number of beneficiaries on the retirement rolls on Oct. 31, 1948, was 332,471 compared with 267,556 on that date in 1947. Total retirement benefit disbursements during the month of October, 1948, amounted to \$23,243,506 compared with \$18,885,910 in October, 1947. This is at the rate (in 1948) of about \$70 a month for each beneficiary. In the first 10 months of 1948 a total of \$24,271,441 was paid for unemployment compensation compared with \$34,355,342 paid in the first 10 months of 1947.

Railroad Credit Corporation. This corporation, which made its final distribution in 1948, was set up in 1932 and during its existence made loans totaling \$73,691,000. It had only minor losses, paid

all its operating expenses, and returned to the contributing railways slightly more than 100 percent of the original fund. —WILLIAM E. HOOPER

RAPID TRANSIT. In spite of high operational and labor costs during 1948, the rapid transit field was characterized by a gradual replacement of badly-worn equipment and improvement in service. In the first half of 1948 traffic showed gains, with city travel up 6.7 percent and suburban up 1.2 percent.

Most rapid transit systems which had not previously raised fares (and some which had) were granted increases, but often the rise was barely sufficient to meet increased labor and operating costs leaving nothing for improvement. New York raised subway fares from the traditional nickel to 10 cents and bus fares have been raised first to 6, later to 7 cents, but many companies claim that 10 cents is the operational minimum.

Although new trolley cars are being built and, in many large cities, have proved efficient where rush-hour peaks exceed 2,500 persons an hour, the number in use in this country and elsewhere is declining annually. In Kingston, Jamaica, people are proud of their shiny new American buses, but miss the convenience of boarding the open trams on the run at any point which suited their fancy. However, in San Francisco, while they love their ancient cable cars, they agree the trolley coaches which are replacing them are more convenient.

New York has removed the trolley cars from the Williamsburg Bridge and the Norton Avenue line to Coney Island. Forty of these cars were to be sent to Vienna under the ERP. All trolley lines in the Bronx have been supplanted by buses. New Orleans has converted 2 car lines to trolley coaches this year and plans 2 more in 1949. Halifax, N.S., has converted from small one-man cars to trolley coaches and increased its mileage. The city and the transit company have developed an interesting profit-sharing agreement.

In Cleveland existing bus lines have been cut in half. The congested central part of the line is served by local buses while extra-fare expresses stop only at transfer points until they reach outlying districts. A new development in trolley coaches permits express coaches to pass locals on the same line.

More than 20 cities have installed revenue-producing radios in buses. Installed in the rear they draw passengers to the back of the bus. During 1949, Chicago will spend \$11 million for 400 new buses and 130 new elevated cars, the first new cars to be purchased in 24 years.

The London Underground's Central Line was extended on both ends for a total of 10 miles. It now runs from West Ruislip to Greenford. Work on this extension commenced before the war and was completed in November at a cost of \$8 million. To increase passenger comfort, doors are opened individually by push buttons, thus eliminating draft when no one wishes to enter or leave the car.

The IND division of the New York subway system opened a 4-station extension in Brooklyn on the Fulton Street Line to Euclid Avenue, during November. This was constructed at a cost of \$47 million. At the same time a \$2 million push-button signal and control system was inaugurated. One man sitting at a horseshoe panel can route all trains on the new line. Automatic safety devices make mistakes virtually impossible even with trains running on 90 second headways.

With the fare increase on the subways, New

York further consolidated its 3 subways allowing passage from one division to another without payment of additional fare. Many platforms were extended to accommodate longer trains.

Stockholm, Sweden, is building a subway to be completed about 1950. One is under study for Sao Paulo, Brazil, and another from Catia to Petare, Venezuela. Cincinnati plans to discontinue its subway system and convert all transportation to buses, using the tubes for other purposes. The Dearborn Street Subway in Chicago is due to be completed early in 1949.

In Moscow, work has been going on for a belt line connecting the 7 major railway stations which are located on the edge of the city. It was hoped that this would be completed by the end of 1948. In Calcutta, work is scheduled to start on a \$150 million electric railway to circle the city on a high level viaduct. —J. W. HAZEN

RECLAMATION, Bureau of. A Bureau of the U.S. Department of the Interior which constructs and operates multipurpose reclamation projects in the 17 Western States. During 1948 the Bureau supplied irrigation water to 4,500,000 acres of the approximately 5 million irrigable acres in project areas, while electric power production totaled nearly 17,000 million kilowatt-hours. Other benefits include river regulation and flood control, preservation of fish and wildlife, recreation, and water for municipal and industrial use. Crops valued at more than \$555 million were produced in 1947.

Projects upon which there was a substantial amount of construction during 1948 include Central Valley in California, Columbia Basin in Washington, Davis Dam in Arizona and Nevada, Colorado-Big Thompson in Colorado, and units of the Missouri River Basin Project in Montana, North and South Dakota, Wyoming and Nebraska. Commissioner, 1948: Michael W. Straus.

RECONSTRUCTION FINANCE CORPORATION. Pursuant to the provisions of Public Law 548, 80th Congress, 2nd Session, approved May 25, 1948, the Reconstruction Finance Corporation was given succession through June 30, 1956. The Corporation was originally established by the Congress Jan. 22, 1932, and began operations February 2 of that year. The capital stock of the RFC, originally fixed at \$500 million, all of which was subscribed by the United States, has been reduced to an outstanding amount of \$100 million through retirement at par of \$175 million in 1941 and \$225 million in 1948.

Management of the Corporation is vested in a bipartisan Board of five Directors, appointed by the President by and with the advice and consent of the Senate. It functions through a principal office at Washington, D.C., thirty-one Regional Offices located throughout the continental United States, and Special Representatives at San Juan, Puerto Rico, and Honolulu, T.H.

Under existing law RFC is authorized: (1) To make loans to business enterprises. Loans to railroads engaged in interstate commerce or air carriers engaged in air transportation require the approval of the Interstate Commerce Commission or the Civil Aeronautics Board, respectively. (2) (a) To make loans to financial institutions; (b) to subscribe to or make loans upon non-assessable preferred stock in insurance companies if the Secretary of the Treasury certifies that funds for capital purposes are needed. (3) To make loans to or purchase the obligations of States, municipalities, political sub-divisions of States, or other public

agencies and bodies to aid in financing projects authorized under Federal, State or municipal law. (4) To make loans determined to be necessary or appropriate because of floods or other catastrophes. (5) To make loans to business enterprises to provide financial assistance for the production of prefabricated houses or prefabricated housing components, or for large scale modernized site construction. For all purposes enumerated above, the total amount of investments, loans, purchases and commitments made subsequent to June 30, 1947 shall not exceed \$2,050 million outstanding at any one time.

The Corporation may make loans to business enterprises either directly or in participation with banks, provided the credit sought is not otherwise available on reasonable terms and that such loans are of such sound value or so secured as reasonably to assure repayment. During the fiscal year 1948 more than fifty percent of the number of all business loans authorized by the Corporation were made in participation with banks and approximately ninety percent were in amounts of \$100,000 or less. From June 30, 1947, to July 1, 1948, RFC authorized 4,725 business loans aggregating approximately \$277 million and in 2,622 of those loans banks participated in an aggregate amount of approximately \$53 million. The outstanding amount of business loans as of June 30, 1948, was \$303,417,000. In addition to business loans, other loans and investments authorized by the Corporation over the same period included those to public agencies amounting to approximately \$24,342,000, catastrophe loans aggregating \$1,814,000, and purchase of home loans made pursuant to the National Housing Act, as amended, in the amount of \$286,000,000. Total loans and investments outstanding as of June 30, 1948, amounted to \$1,178,000,000.

Federal National Mortgage Association, an RFC subsidiary, is authorized to purchase mortgages insured subsequent to April 30, 1948, under certain sections of the National Housing Act, as amended, and to purchase real estate mortgages on homes and farms guaranteed after April 30, 1948, under the provisions of the Servicemen's Readjustment Act of 1944, as amended. (Public Law 864, 80th Congress, 2nd Session, July 1, 1948; Public Law 901, 80th Congress, 2nd Session, Aug. 10, 1948.) The objective of the program is to establish and maintain a secondary market for such mortgages with a view to encouraging the extension of credit to assist in financing the purchase of homes and the construction of rental housing. Such mortgages must meet certain requirements prescribed in the legislation in order to be eligible for purchase by the Association.

The only tin smelter of consequence in the Western Hemisphere was constructed at Texas City, Texas, by RFC at a cost of approximately \$8,650,000 to insure a domestic supply of tin in the United States. Since completion in 1942, the smelter has been operated for the account of RFC, and during the 1948 fiscal year the Corporation's sales of tin amounted to \$118,591,000. The Corporation is authorized to operate this smelter by lease or otherwise; to buy, sell and transport tin, tin ores and concentrates; and to finance research in tin smelting and processing until June 30, 1951, or until such earlier time as the Congress shall otherwise provide. (Public Law 824, 80th Congress, 2nd Session, approved June 29, 1948.)

RFC's investment in synthetic rubber manufacturing plants and related facilities which were built during the national defense and war periods

amounted to approximately \$672 million at the close of the war. A few of these plants have been sold; some have been placed in stand-by condition; and others have been continued in operation for the account of RFC. During the period July 1, 1947, to June 30, 1948, the Corporation's sales of synthetic rubber of all types totalled \$197,720,000. Under the provisions of Public Law 469, 80th Congress, 2nd Session, approved March 31, 1948 and Executive Order 9942, Apr. 1, 1948, RFC is authorized to continue the production and sale of synthetic rubber and the component materials thereof until June 30, 1950. The Act requires that a study be made with the objective of determining and formulating a program for disposal to private industry by sale or lease of the government-owned rubber producing facilities, and a report made to the President and to the Congress not later than Apr. 1, 1949.

The vast stockpiles of more than two hundred strategic minerals and metals and other critical and strategic supplies acquired by RFC for national defense and war purposes have been in process of liquidation since the cessation of hostilities, and during the 1948 fiscal year such materials and supplies amounting to approximately \$470 million were sold or transferred to the national stockpile. As of June 30, 1948, inventories of such materials and supplies were carried at a book value of \$35,295,000.

The gross wartime investment of RFC in industrial plants, equipment, flying schools and other facilities including related expense applicable to land, plants, machinery and equipment amounted to approximately \$7,800 million. As of June 30, 1947, the remaining plants and facilities were carried at a book value of \$1,245 million exclusive of the synthetic rubber plants, the Texas tin smelter, and the fiber plantations in Central America, Panama, and Haiti. Liquidation of these facilities through sales and declarations as surplus to War Assets Administration has reduced the Corporation's investment in such facilities to \$141,500,000 as of June 30, 1948. The gross original investment in the synthetic rubber, tin, and fiber facilities amounted to approximately \$694 million.

Plants and equipment formerly owned by Smaller War Plants Corporation were transferred to RFC for liquidation purposes pursuant to Executive Order issued in December, 1945. On June 30, 1947, the remaining plants and equipment were carried at a book value of \$4,349,000 and this book value was reduced to \$1,407,000 as of the close of the 1948 fiscal year, through sales, surplus declarations, and disposals otherwise.

Late in December, 1947, the two remaining programs of U.S. Commercial Company, an RFC subsidiary, namely the "Pacific Ocean Operations" and "Trade with Occupied and Liberated Countries," were taken over by the Department of the Navy and the Department of the Army, respectively. Upon consummation of a few miscellaneous transactions, the Company will be dissolved.

The net profits from operations of the war damage insurance program amounting to \$209,827,810 were paid into the Treasury of the United States in August, 1947, and with the exception of some pending claims and unfinished audits, liquidation of the affairs of RFC's subsidiary, War Damage Corporation, has been substantially completed.

RED CROSS. The International Red Cross is comprised of the International Committee of the Red Cross, an independent, neutral body entrusted

in Germany, Austria, and Italy challenged the resources of governments and international agencies. They were the residue of the slave-laborers, prisoners of war, and other persons deported by the Germans, as well as those who at or after the end of the war had fled from Eastern Europe to escape Communist rule or incidents of anti-Semitism.

During 1945, 1946, and the first half of 1947 approximately 7 million had been repatriated by the Western military authorities and UNRRA, and additional numbers by the Soviet authorities. The overwhelming majority of those who remained (mostly Poles, Balts, Ukrainians, Yugoslavs, and Jews) were non-repatriable refugees, unwilling to accept repatriation because of political, social or economic changes which had taken place in their home countries. Permanent settlement in Germany, Austria, and Italy also proved impractical for economic and psychological reasons. Resettlement in other countries mainly overseas remained as the only possible hope of reducing the displaced persons problem.

In order to provide for the repatriation or resettlement of refugees and for their interim care and maintenance pending ultimate disposition, the International Refugee Organization was created by a decision of the General Assembly of the United Nations in December, 1946. The Constitution of the IRO provided that the organization would come into formal existence when 15 governments, whose allocated contributions to the operational budget constituted 75 percent of the total, had become parties to the Constitution. Before these requirements were fulfilled the Preparatory Commission for IRO, originally set up as a planning body, assumed and performed the function of an operating agency from July 1, 1947, up to Aug. 20, 1948, when the IRO was finally constituted.

As long as the Preparatory Commission functioned as an interim organization, its funds proved inadequate as the Commission was dependent on advance voluntary contributions from governments. Such funds as were available had to be spent primarily for the care and maintenance of refugees and displaced persons, and the Commission was not in a position during the period to exploit fully all opportunities for the resettlement of refugees. When the IRO came into existence the contributions of governments were placed on a contractual basis and thus income more adequate to the task was assured.

The changed financial position of IRO was however not reflected in IRO operations until the fall of 1948. Up to July, 1948, the main reception country was the United Kingdom which during the operational year July 1, 1947, to June 30, 1948, had received 69,788 displaced persons under the movement known as Westward Ho; in the second half of 1948 resettlement to England declined sharply. Likewise Belgium, after having recruited over 20,000 displaced persons in order to cover her urgent need of miners, received smaller numbers in the last half of the year. On the other hand, resettlement in Canada, which in the operational year 1947-48 had received 25,244 displaced persons, was steadily increasing. There was also an increase in the movement to Venezuela and Australia. The prospects of larger resettlement in the United States and Palestine also developed.

The U.S. Displaced Persons Act of 1948, which came into force on June 25, 1948, permits entrance into the United States of 200,000 displaced persons who had reached the Allied occupation areas before Dec. 27, 1945, and 2,000 Czechoslovaks from among refugees who escaped in 1948 from their

Communist dominated countries. These displaced persons and refugees will be admitted without regard to immigration quotas, but their numbers will be charged annually against future quotas of the respective countries, up to 50 percent of the pertinent quota. In addition, 3,000 displaced orphans will be admitted as non-quota immigrants.

The Act also provides for regularization of the status of 15,000 displaced persons who had been admitted to the United States on a temporary basis before Apr. 1, 1948. Finally, the Act reserves 50 percent of the German and Austrian quotas in the fiscal years 1948-49 and 1949-50 to Germans from Poland, Czechoslovakia, Hungary, Rumania, and Yugoslavia who had been expelled from their countries and who were in Germany and Austria on the effective date of the Act.

The Act establishes preferences according to the country of origin of the displaced persons and to their occupational equipment. With regard to the country of origin, 40 percent of the visas are reserved for displaced persons from territories annexed by a foreign power (the Baltic States and Eastern Poland). As to occupational equipment, 30 percent of the visas are reserved for agricultural workers, a further priority being granted to certain categories of skilled workers, construction and clothing workers, professionals, and others. An assurance is required that the prospective immigrant will be employed and housed in the United States without displacing other persons from employment or housing.

Admissions to the United States of 2,499 refugees under the Act in the course of the year 1948 were disappointing. This resulted from delays in establishing the procedures of admission and from inadequate funds for implementation of the provisions of the Act.

The number of displaced persons resettled in Palestine greatly increased after the establishment of the state of Israel. By December, 1948, over 40,000 Jewish refugees had entered the country. It has been estimated that during the next two years the state of Israel will provide homes for all the Jewish displaced persons desiring to settle there.

From July 1, 1947, when the Preparatory Commission for the IRO started functioning, up to the end of September, 1948, a total of 255,779 were resettled. During the same period 57,117 displaced persons were repatriated to their homelands. Of this total 7,772 were overseas Chinese who had fled during the war to China from Burma, Malaya, the Netherlands East Indies, and the Philippines and were helped to return to their former countries of residence. Repatriated European displaced persons numbered 49,345 of whom 32,433 returned to Poland.

A survey made by the IRO has shown that the displaced persons are mostly people in the best productive years with many much needed skills. As of Mar. 31, 1948, there were nearly 600,000 persons receiving IRO care and maintenance in Germany, Austria and Italy. The survey covered 340,000 persons in the working ages of 16 to 65 (excepting mothers with children under 12 years). Over 98,000 were skilled and 24,000 semi-skilled workers, particularly in the clothing and textile trades and the construction industry. Furthermore, the survey listed 76,000 agricultural, 80,000 professional and 14,000 domestic workers. Only 11 percent of displaced persons covered by the survey had no previous work experience.

Apart from displaced nationals of United Nations countries, there are in Germany and Austria

numbers of displaced Germans constituting a problem of a different character. In Germany their number amounts to 9,500,000 including Reich Germans from the part of Germany under Polish administration, Sudeten Germans and ethnic Germans from Poland and Hungary who fled or were transferred to Germany under the Potsdam Agreement of 1945. Their resettlement in Germany is considered the only apparent solution. However, their integration into the German economy has proceeded slowly.

There are also in Austria 250,000 ethnic German refugees from Czechoslovakia, Hungary, and the Balkan countries. The problem of the eligibility of these Volksdeutsche in Austria for IRO assistance has been discussed at length in its legal and ethnological aspects. However, only single groups of Volksdeutsche appear to fall within the scope of the IRO. Pending further examination of the general problem, the eligibility of Volksdeutsche in 1948 was determined on an individual basis.

After the end of the war Czechoslovakia faced, apart from the problem of the Sudeten Germans, the serious problem of another minority—the Hungarian. This problem embittered Hungarian-Czechoslovak relations. A part of the Hungarians who lived in Slovakia were exchanged for Slovaks formerly resident in Hungary, others were moved from the solidly Hungarian southern strip of Slovakia to various parts of Bohemia. On Dec. 4, 1948, Czechoslovakia announced that Hungarians who had been moved to Bohemia could return to Slovakia, not necessarily to the same land from which they had been earlier expelled, but to equivalent holdings. The Hungarians were urged, however, not to return to southern Slovakia but to apply for farms in the western frontier area where land was available resulting from the expulsion of the Sudeten Germans.

A new displacement of population took place in Palestine as a consequent of the Arab-Jewish conflict. The number of refugees from Jewish-held Palestine exceeded 500,000. Within the state of Israel there were 7,000 Jewish refugees from Arab-held Palestine.

The partition of the Indian Empire into two dominions produced a mass movement of refugees in 1947 which continued into the first half of 1948. More than 11 million people were involved—Hindu refugees from Pakistan to the Indian Union and Moslem refugees in the opposite direction. The movement constituted in effect an exchange of population. By the end of 1948, however, some 4 million of the refugees remained unsettled.

—GEORGE L. WARREN

RELIGIOUS ORGANIZATIONS. Church membership in the United States in 1947 numbered 77,386,188 persons, the largest total in the nation's history. Four major groups account for the majority of religious membership: Protestant bodies, 46,149,676 members; Roman Catholic, 26,075,697 members; Orthodox, 575,000 members; Jewish, 4,641,000 members. For further information on the larger denominations, see separate articles.

RELIGIOUS SOCIETY OF FRIENDS (QUAKERS), The. A religious society developed from the conviction of George Fox (1624–91) that there is something of God in every man to which God speaks. If men will keep silent they will hear God's message in their hearts. There are about 170,000 Friends in the world today, of whom about 114,000 are in the United States and Canada. There are 28 Yearly Meetings in America. The most recent, which was set up in 1947, is called Pacific Yearly Meeting and includes nearly 20 small meetings scattered from

Mexico to British Columbia. The largest groups of Friends are in the vicinity of Philadelphia, Pa., Richmond, Ind., and Whittier, Calif. Eleven of the Yearly Meetings in the United States and Canada are affiliated with the Five Years Meeting of Friends with headquarters in Richmond, Ind. Six Yearly Meetings are affiliated with the Friends General Conference with headquarters in Philadelphia. The other 11 Yearly Meetings are independent bodies, but are in fellowship with the other groups.

There are 12 Friends Colleges located in Pennsylvania, Indiana, Kansas, North Carolina, Nebraska, Oregon, California, Iowa, Ohio, and Ontario, Canada. Friends secondary schools are maintained in 12 different States. There are 3 main Quaker journals published in the United States—*The American Friend*, published in Richmond, Ind., *The Friends Intelligencer* and *The Friend*, published in Philadelphia.

The London Yearly Meeting is the largest and in some ways the leader among the yearly meetings. Since World War I small groups of Friends have formed Yearly Meetings in France, Germany, Denmark, and Austria.

At home the Service Committee seeks to promote understanding by holding Institutes of international relations, Seminars on industrial relations, and to promote friendly race relations between all peoples. Young people of high school and college age participate in Work Camps, gaining new insights into social and industrial problems by working with their hands while discussing questions with leaders of labor and capital.

The Friends, a small denomination, are able to do all this by the generosity of the public in giving funds and supplies. In particular, men and women have contributed used clothing for European relief so that in the fiscal year ending Sept. 30th, 1948, the American Friends Service Committee shipped 1,133 tons of clothing, shoes, household linen, bedding, soap, and textiles to Europe and Asia. Much more could have been used.

The Friends World Committee for Consultation, with headquarters in London, keeps in touch with Friends groups throughout the world by inter-visitation and conferences. The next conference of the American Section will be in Jamaica, British West Indies, in April, 1949. There are 54 organized groups of Friends throughout the world. Through the Friends World Committee they are organized into 3 sections, namely, the American Sections, the European Section, and the Pacific Area. The last Friends World Conference was held in Swarthmore, Pa. in 1937. The next Friends World Conference is expected to be held in England in 1952.

The American Friends Board of Missions has missions in Palestine, Cuba, Jamaica, and British East Africa. The last named set up in 1947 as a Yearly Meeting, the second largest in the world, with about 20,000 members. There are also Friends missions, under other Boards, in Japan, China, India, and Bolivia.

REPUBLICAN PARTY. The Republican National Committee was authorized at the Republican National Convention in Philadelphia in June, 1856. The chief purpose of the Committee today is to conduct the National Convention every four years, and to assist in the election of the Republican Presidential candidate nominated at that Convention, as well as in the election of other Republican candidates for national office. This includes the raising of funds for the Presidential election campaign. The Committee cooperates with and pro-

vides services for Republican members of Congress, state and local Republican organizations, the Young Republicans, and women's Republican groups. It publishes *The Republican News* and works to promote the Republican cause through press and radio releases. Membership: 106. Chairman, Hugh D. Scott, Jr.; Secretary, Mrs. Charles P. Howard; Treasurer, James S. Kemper; General Counsel, Barak T. Mattingly. Headquarters: 1337 Connecticut Ave., NW, Washington 6, D.C.

RÉUNION. An overseas department of France, 420 miles east of Madagascar. Area: 970 square miles. Population (1946): 242,343. Chief towns: St. Denis (capital), 35,982 inhabitants; St. Paul, 25,959; St. Louis, 24,004; St. Pierre, 22,289. The main port is Pointe-des-galets. Education (1946): 242 schools and 33,576 pupils. Products include sugar, rum, manioc, coffee, vanilla, and spices. Foreign trade (1946): 712,700,000 francs; exports 1,326,400,000 francs. On Mar. 19, 1946, Réunion was made a department of France, effective from Jan. 1, 1947, and was represented in the National Assembly (3 deputies), in the Council of the Republic (2 councillors), and in the Assembly of the French Union (1 delegate).

REYNOLDS FOUNDATION, The Z. Smith. Established in 1936 by Richard J. Reynolds, Mrs. Mary Reynolds Babcock, and Mrs. Nancy Reynolds Bagley, for charitable, civic, and eleemosynary purposes within the State of North Carolina, by a grant of all the property received by them from the estate of their late brother, Zachary Smith Reynolds of Winston-Salem, N.C. Since its organization the Foundation has made annual grants to the North Carolina State Health Department for the inauguration and maintenance of a campaign for the control of venereal disease in the State, totaling \$1,541,000. Contributions for other charitable purposes since organization have amounted to \$773,000, and administrative expenses to \$16,454.

Since July 1, 1947, the Foundation has pledged its income to Wake Forest College for the latter's program of expansion and relocation near Winston-Salem. With an original endowment of \$7 million, the present assets of the Foundation, as of Dec. 31, 1947, were \$10,457,020, and total amount expended to date, \$2,330,454.

The Trustees of the Foundation are: Richard J. Reynolds, Mrs. Mary Reynolds Babcock, Mrs. Nancy Reynolds Bagley, W. N. Reynolds, Thomas B. Butler, Charles H. Babcock, Henry Walker Bagley, and L. D. Long. Secretary, Stratton Coyner. Offices: 1206 Reynolds Building, Winston-Salem 3, N.C.

RHODE ISLAND. A New England State. Area: 1,300 sq. mi. Population: (July 1, 1948) 748,000, compared with (1940 census) 713,346. Chief city: Providence (capital), 253,504 inhabitants in 1940. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$45,683,000; total expenditure, \$58,895,000.

Legislation. The General Assembly met in annual session January 6 and adjourned April 29. Increased costs and expanded services resulted in record level appropriations. A sum of \$3 million in annual State aid to cities, begun in 1947, was continued, and authorization was given for a State airport at Hillsgrove. The State retirement system was broadened to cover teachers, and the

minimum annual pension was boosted. The Governor's salary was increased and a constitutional amendment initiated to raise salaries of legislators, now among the lowest in the United States, to \$1,500 per year.

Other enactments included laws of an "open competition" nature regulating fire and casualty insurance; an arrest law requiring immediate notice to families of persons arrested for misdemeanors; expansion of Department of Public Works functions to include airport control; and consolidation of the Port Authority and the Industrial Commission into a new Port and Industrial Commission which also supersedes the State Planning Board. Primary and election laws were revised and a constitutional amendment initiated to provide permanent registration.

Elections. The 4 electoral votes went to Truman who received 188,619 votes to Dewey's 134,892 and Wallace's 2,587. Truman's plurality was slightly larger than Roosevelt's in 1944. Democratic Senator Theodore Francis Green was reelected. Democrats retained the 2 House seats. Governor John O. Pastore, Democrat, was reelected. Other State officers elected were: Lieutenant Governor—John S. McKiernan; Secretary of State—Armand H. Coté; Attorney General—William E. Powers; Treasurer—Raymond H. Hawksley.

Officers, 1948. Governor, John O. Pastore; Lieut. Governor, John S. McKiernan; Secretary of State, Armand H. Coté; Attorney General, John H. Nolan; State Treasurer, Russell H. Handy; Director of Finance (Acting), Howard A. Kenyon; Controller, M. Joseph Cummings.

RHODESIA, Northern. A British protectorate in the interior of southern Africa. Estimated total area: 287,640 square miles. Population (1946 census): 1,565,547, of whom 21,809 were Europeans and 1,115 Asiatics. Capital: Lusaka. Education (1946): 2,119 schools and 156,347 pupils.

Production, etc. Agricultural products include maize, tobacco, wheat, and livestock. The most important timber product is the Rhodesian "redwood." Mineral production in 1947 included (in metric tons): copper 192,000, lead 15,840, and zinc 21,480. Other minerals are cobalt alloy, iron ore, selenium, vanadium, and silver. Total value of mineral output (1946): £14,503,196. Foreign trade (1946): imports £7,400,000; exports £12,600,000.

Government. Budget estimates (1947): revenue £4,295,543; expenditure £4,352,611. Public debt (Jan. 1, 1947): £2,347,007. The protectorate is administered by a governor with the aid of an Executive Council and a Legislative Council. Governor: Sir Gilbert McCall Rennie.

RHODESIA, Southern. A British self-governing colony in the interior of southern Africa, grouped with British Central Africa territories. Area, 150,333 square miles. Population (1946), 1,777,000. Chief towns: Salisbury, (capital) 69,098 inhabitants, Bulawayo 52,723, Umtali, Gwelo, Gatooma and Que Que. Education (1946): 2,000 schools and 195,255 pupils.

Production and Trade. The chief agricultural products include maize, tobacco, citrus fruits, tea, dairy products, groundnuts, and livestock. Mineral products include gold, chrome ore, asbestos, tungsten, coal, and tin. The value of base metals output in 1946 was £2,912,634; gold £4,697,526. Foreign trade (1947): imports £33,360,000; exports £19,080,000. Chief exports: tobacco, gold, and asbestos.

Government. Budget estimates (1947-48): revenue £11,148,000; expenditure £21,603,387. Public debt (Mar. 31, 1946): £24,684,264. The colony has a responsible government, headed by a governor who is assisted by an Executive Council and a Legislative Assembly of 30 members. The latter is elected for a five-year term by British subjects over 21 years of age, subject to certain qualifications. The constitution limits the powers of the Legislative Council with respect to appropriation and taxation bills. Governor: Sir John Noble Kennedy. Prime Minister: Sir Godfrey M. Huggins.

RICE. The 1948 output of rice in the United States, according to the December report of the Bureau of Agricultural Economics, U.S. Dept. of Agriculture, was estimated at 81,170,000 bushels, compared with 78,259,000 bu. in 1947 and the 10-year average (1937-46) of 60,460,000 bu. Yields of the chief producing States for 1948 were (in bushels): Louisiana 23,522,000, Texas 23,040,000, Arkansas 19,740,000, California 14,868,000.

World Rice. According to the Nov. 8, 1948, issue of *Foreign Crops and Markets* (U.S. Dept. of Agriculture), the 1948-49 forecast (preliminary) of world rice production was 7,318 million bu., compared with 7,102 million bu. in 1947. Yields of the principal producing countries for 1948-49 were (in million bushels): China 2,275, Indian Union 1,550, Japan 576, Pakistan 550, Netherlands East Indies (Indonesia) 275 (in 1947-48), Burma 260, French Indochina 250, Siam 240, Korea 150, Philippine Republic 119. The world area sown to rice in 1948-49 was estimated at 213,300,000 acres, compared with 210,800,000 acres in 1947-48.

ROADS AND STREETS. The mileage for Federal-aid road construction completed during the fiscal year July 1, 1947, to June 30, 1948, is not available as of this writing; however, the dollar volume of the Federal-aid highway work under construction, as of July 31, 1948, of approximately \$906 million is far in excess of that of any previous dollar volume in history. The Federal-aid Highway Act of 1948

(Public Law No. 834) authorizes the appropriation of \$450 million for the fiscal year ending June 30, 1950, and a like sum for the fiscal year ending June 30, 1951. Forty-five percent of the total is to be allocated to projects on the Federal-aid Highway System, 30 percent for projects on the second-

ary system, and 25 percent on the Federal-aid Highway Systems in urban areas. Matching of funds is on a 50-50 basis.

Public Roads Administration has developed an approximate apportionment of the \$450 million by States, including Hawaii, Washington, D.C., and Puerto Rico. Those States with the greatest highway mileage will receive the largest apportionment, as indicated in the accompanying table. On this basis, New York will receive more than \$30 million as the largest percentage apportionment while Delaware will receive the lowest percentage.

During the year 1948 problems of design, construction, and maintenance received more attention probably than at any time in history. Highway problems were magnified by traffic accidents, shortage of engineering personnel, and increased use of the highways by heavy trucks. In regard to the shortage of highway engineering personnel, the American Association of State Highway Officials conducted a survey among the nation's engineering schools to determine interests of the undergraduate engineering student body. Of the 21,000 engineering students who expected to graduate in 1948, only one seventh were in civil engineering, and of this number, only 600 indicated any interest in highway engineering.

This is creating a serious problem both because of the unprecedented highway construction programs throughout the country and the fact that young engineering personnel has not been recruited for a number of years because of the war. In 1949 it is likely that highway departments will initiate better salary scales and will adopt changes in personnel policies. A committee on highway engineering personnel has been formulated by the American Road Builders Association and the universities are initiating research programs, which in the end, should interest more engineers in highway engineering.

A gratifying accomplishment during the year 1948 was the striking reduction in the traffic death rate. In May of 1946 this rate was approximately 12 for each 100 million miles traveled. This death rate has steadily decreased and in 1948 the figure may drop as low as 7.0 per 100 million miles of travel. Although there have been many factors operating in lowering the death rate, it is apparent that the action program that has grown out of the President's First Highway Safety Conference has been of primary importance.

Travel on the nation's highways was extremely heavy during the year 1948, particularly in connection with commercial transportation. Public Roads Administration reports truck registrations of 6.5 million in 1947 as compared with something under 4.5 million in 1941, while automobile registrations increased from approximately 29.5 million in 1941 to approximately 30.5 million in 1947. Coupled with the increased number of trucks was the fact that the average load was much heavier. Increased frequencies of 18, 20, and 22,000 lb. axle loads were indicated throughout the country and axle loads above 25,000 lb. and ranging up to 41,600 lb. occurred in "almost every State."

Highway engineers became greatly interested in pavement design as a result of the indicated correlation between the increase in number and magnitude of truck loads and pavement pumping. Increased use of base courses was indicated in many States where pavement pumping had become a problem and two large experimental projects were built—one in Illinois and one in New Jersey—in which continuous reinforcement was employed. The 1938 Indiana experimental project with con-

tinuous reinforcement was receiving more than average attention.

Maintenance practice operations were used in correcting pavement pumping by undersealing with bituminous materials, the use of cement-slurry mixtures, and in various types of resurfacing procedures. Snow removal was an expensive project in most of the northern States and in many of the large cities such as New York, Buffalo, Chicago, Detroit, St. Paul, and Minneapolis. Increased use of magnetic sweepers that travel over the road in

sylvania Turnpike from its present eastern terminus at Carlyle, Pa. to Philadelphia. Paving was completed on the Maine Turnpike—the longest and most costly road project in the United States since the last world war. Programs were developing in connection with express-ways for Detroit, Chicago, and several other large cities.

Research made important contributions to the highway profession in 1948. Many highway departments have established research organizations at universities and State colleges. During the past

a number of States picking up nails and other objects dangerous to tires, reached a new peak in 1948. The use of two-way radio hook-ups, particularly in connection with maintenance operations, was indicated in many States throughout the country.

The damage to roads during the spring breakup received more than average attention during the past year. The Highway Research Board established a committee to study the change in strength characteristics of pavements and subgrades as influenced by seasonal and climatical variations.

It is of interest to know that the Canadian Government will erect the world's first all-aluminum bridge across the Saguney River in Canada, and that air-entrained concrete to eliminate surface scale as a result of ice control became standard practice, particularly in the northern tier of States. Plans were being made in 1948 to extend the Penn-

sylvania Turnpike from its present eastern terminus at Carlyle, Pa. to Philadelphia. Paving was completed on the Maine Turnpike—the longest and most costly road project in the United States since the last world war. Programs were developing in connection with express-ways for Detroit, Chicago, and several other large cities.

Research made important contributions to the highway profession in 1948. Many highway departments have established research organizations at universities and State colleges. During the past year additional research units were established in several sections of the country. These activities, coupled with those of the Public Roads Administration and other governmental units, the research endeavors by industrial concerns, and materials producers, added emphasis to research development. Consideration is being given to the use of plastics for traffic signs. Purdue University has experimented with the use of plastics as center-line markers.

Drainage maps and soil maps are being constructed by the use of contact aerial photographs and large-scale experiments with lime as an admixture were initiated, both in the field in Texas and in several research laboratories. The use of rubber as an additive to bituminous-aggregate mixes was tried experimentally in Akron, Ohio, on a city street and the Michigan State Highway Department installed electric heating elements on two

sections of one of the Michigan State highways in an experiment to determine the feasibility of keeping heavily traveled highways free of ice and snow.

—KENNETH B. WOODS

ROCKEFELLER FOUNDATION, The. Chartered in 1913 for the permanent purpose of "promoting the well-being of mankind throughout the world," the Foundation is at the present time concerned with the extension and application of knowledge in certain definite fields of the medical, natural, and social sciences, the humanities, and public health. Except to a limited extent in public health the Foundation is not in general an operating organization. Its activities are confined to support of the work of other agencies—universities, laboratories, and research institutes—and to the operation of a fellowship program which aims, through postdoctoral grants to especially qualified men and women, to increase the supply of competent personnel in the various fields of knowledge.

In the field of medical science the Foundation's interest centers mainly on research in the sphere of nervous and mental diseases and on the improvement of medical education. Illustrative of the assistance given during 1948 for work along these lines are grants to Johns Hopkins University (\$100,000) for its department of psychiatry; Harvard University (\$74,880) for teaching and research in psychiatry, and (\$54,000) for investigation of dynamics of personality development; University of Oxford (\$83,025) for neurological research; Western Reserve University School of Medicine (\$70,000) for research in biochemistry related to mental diseases; University of Pennsylvania (\$100,000) and Harvard University (\$100,000) for the development of departments of dermatology in their Schools of Medicine; Meharry Medical College (\$185,000) for general support; National Health Council, Inc., (\$225,000) for expenses of a program in coordination of voluntary health agencies; Child Research Council of Denver (\$125,000) for study in child growth and development.

In the natural sciences the emphasis is chiefly on experimental biology. Among the institutions receiving grants were the California Institute of Technology (\$700,000) toward support of combined research programs in biology and chemistry; University of Wisconsin (\$100,000) for scientific equipment for a broad program of research in enzyme chemistry; Columbia University (\$82,500) for research in genetics and experimental zoology; Harvard University (\$60,000) for basic studies in chemotherapy; and for completion of the 200-inch telescope at Mt. Palomar, \$300,000 to California Institute of Technology.

Another important feature of the program in the natural sciences was assistance to certain Latin American countries in the development of agricultural research. The agricultural program of the Foundation in Mexico, which is operated in collaboration with the Mexican Government, and which is aimed at improving the volume and quality of the basic food crops of Mexico and the training of Mexican personnel, was continued through the year.

In the social sciences the special fields of interest during the year were projects contributing to the understanding of important social problems and to the development of personnel and method. Grants were made to Cornell University (\$110,000) for study of the relation of civil rights to the control of subversive activities in the United States; Columbia University (\$100,000) for support of a

program of the Institute for Urban Land Use and Housing Studies; University of Chicago, Cowles Commission (\$100,000) for research in economics; Cornell University (\$94,270) for research in field of group hostility and prejudice, using one community as a laboratory; Yale University (\$68,400) for studies of communication and the related attitude changes of persons exposed to specific communications; University of Chicago (\$45,000) for a program of research in agricultural economics; Stanford University (\$25,000) for a study of Soviet Russian Economics; University of Chicago (\$15,000) for research on the determinants of constructive union-management relations.

In the humanities the emphasis is chiefly on programs which tend to raise the general cultural level and to promote cultural interchange between countries. Among the grants made during the year were: Colegio de Mexico (\$53,000) toward support of a center for research and teaching in all aspects of Spanish and Spanish American culture, and \$10,000 for preparation of a history of modern Mexico; Korean Language Society (\$45,000) for cost of publishing five unpublished volumes of its new dictionary of the Korean language; University of Stockholm (\$50,000) for Far Eastern studies; Columbia University (\$36,246) for use by the American Press Institute in training program for German press personnel; University of Minnesota (\$25,000) for studies of Northwestern history; Cornell University (\$25,000) for support of the Division of Modern Languages; University of Wisconsin (\$15,000) for development of a state program in drama and allied arts.

The Foundation appropriated \$2,200,000 for the work in public health in 1948. From this fund sums were allocated for malaria and anopheline studies in Mexico, Colombia, Peru, Tobago, Venezuela, Corsica, and China; for yellow fever investigations in Colombia, Brazil, and Africa; for studies of rodent ecology and control at the Johns Hopkins University and for a typhus epidemiological study in Florida; for the development of divisions of state health services in Mexico and Bolivia, and of local health services in Egypt and Chile; for support of public health education at Johns Hopkins University School of Hygiene and Public Health, the University of Toronto, the University of California, the Institute of Preventive Medicine, Leiden, Netherlands, and the National School of Hygiene, Bogota, Colombia; for nursing education at Le Bon Secours School of Nursing, Geneva, Switzerland, the Helsinki College of Nursing, Finland, the University School of Nursing, Montevideo, Uruguay, and the National School of Nursing, Ceylon.

A total of \$220,000 was appropriated toward the general objective of European reconstruction. As an example of such aid is a grant of \$120,000 which is being used by the University of Chicago to send from its own staff to the University of Frankfurt six to ten professors who will serve for a semester or two and then be replaced by others.

Officers of the Foundation in 1948 were: Raymond B. Fosdick, President until June 30 (retired); Chester I. Barnard, President from July 1; Thomas B. Appleget, Vice-President; Flora M. Rhind, Secretary; Edward Robinson, Treasurer; George J. Beal, Comptroller. Headquarters: 49 West 49th St., New York 20, N.Y.

ROMAN CATHOLIC CHURCH. As Church Unity Octave was observed throughout the Catholic world, Pope Pius XII expressed hope that the United States Friendship Train, touring Italy with relief supplies

would bring a new birth of generosity that would lead all men to lasting peace. However, a few months later as a political coup tumbled Czechoslovakia into Communism's basket, tension mounted in Italy over Communist prospects in the April 18th elections, when Rome received news that Albania's Communists had executed Bishops Francis Gjini of Alessio and George Volaj of Sappa. At the same time, the Pope in his Ash Wednesday address by radio opened the Lenten campaign of 3 million United States Catholic school students in the \$5 million 1948 Bishop's Fund for Victims of War.

In France, as the Lourdes Shrine marked the 90th anniversary of the appearance of Our Lady to Bernadette, and in Ireland the new Irish Parliament with Premier John Costello, opened with a Votive Mass, the '48 Annuaire disclosed a great growth of the Church during the present Pontificate. A Negro, Indian Mission Report also showed 343,830 Catholics among 15 million colored population. A North China Survey, however, showed many Catholic schools had been closed, and many churches turned into Red Training Centers.

During March as Pope Pius XII marked his ninth coronation jubilee and 72nd birthday, religious education in the United States was hard hit when the Supreme Court, in the McCollum Case, ruled released-time classes conducted in public schools unconstitutional. During this month, Douglas Hyde, editor of the London (England) *Daily Worker* forsook Communism and with his wife and two daughters joined the Catholic Church.

In April, world attention focused on Italy and the ballot-box struggle between Christian Democrats and Communists during the general elections. The Communists were defeated. Other April events included the beatification of Christian Brother Benildus, the Centenary of the Marianite Nuns and the Daughters of Charity in China.

In May, Pope Pius issued an Encyclical urging a month's prayer to Mary for speedy, just settlement of world unrest; and Jacques Maritain, 1948 Sheil School Award recipient, resigned as French Ambassador to the Vatican, and accepted a philosophy professorship at Princeton University.

In June, Most Reverend Francis D. Gleeson, S.J., installed in Juneau as Alaska's third Bishop, took over his 590,000 square mile vicariate, and Pope Pius, in his name-day address proclaimed that in 1950 the 25th Holy Year in the Church's history will be observed. Other events during June included the acceptance of the Catholic religion by the 7 children of Borman—Hitler's missing aide and foe of the Church; the 19th missionary was slain in Indochina; the Vatican lauded Catholics in Hungary as the Church-state struggle neared a climax; a school nationalization bill was passed in Hungary—those in favor incurred excommunication.

In July, unrest was intensified in Yugoslavia, Hungary and in Italy. Despite a sharp break in relations between Moscow and Marshal Tito, Church persecution continued unabated and before the month's end Bishop Peter Cule of Mostar was sentenced to 11 years, and three priests and five nuns given terms from six months to eight years in Yugoslav prisons. Joseph Cardinal Mindszenty, Primate of Hungary, writing to a London Catholic Paper, asserted the Church was far from free in his nation. The Holy See announced diplomatic relations were established with the new state of India and appointment of Archbishop Leo P. Kierkels, C.P., as the first Papal Internuncio, with his legation at Delhi.

In August, 7 Cardinals, 40 Archbishops and Bishops, and thousands of the faithful celebrated

the 700th anniversary of the dedication of the Cologne Cathedral in Germany. The Catholic Near East Welfare Association, in this month, asked a United Nations probe of reports that Catholics were maltreated, Christian shrines desecrated in Palestine, and the third Inter-American Catholic Social Action Congress was held in Rio de Janeiro.

Tension in Communist dominated Czechoslovakia reached new heights in September following the disclosure that confidential documents came to light indicating Communist plans to besmirch and attempt to split the Church in the nation, and the publication of a pastoral by the Czech Bishops asserting opposition to the Church in their nation was being carried out according to a well organized pattern. It was also revealed that Rev. Antonin Zemek, prior of a Dominican monastery, was sentenced to 18 years in prison; others drew terms ranging from 2 to 15 years on charges that they had aided political refugees to flee from Czechoslovakia.

During this month the Vatican payed tribute to Queen Wilhelmina as she relinquished her throne. Austria's Chancellor, Dr. Leopold Figl, asserted that the Faith is the source of Austria's strength.

During October the first shipload of Europe's Displaced Persons arrived in New York under the new United States DP law. Of the 813 aboard, 523 were Catholics. The Holy See created the Karachi diocese, first in Pakistan, and Msgr. Alcuin Van Miltenburg was consecrated as its first Bishop. Pope Pius issued an Encyclical on an internationalized Jerusalem and free access to Holy Land shrines. Other events during October: Archbishop and religious remained at their posts as Tsinan, China, fell to the Communists. Pius XII Institute opened in Florence, as a gift of Myron Taylor to the Pope. Some 60,000 of 205,553 apostates in Austria returned to the Church. The Holy Father received U.S. Secretary of State Marshall and Mrs. Marshall.

In November, Bishops Stephen A. Appelhans and Leo Arkfeld of the Society of the Divine Word, were consecrated Vicars Apostolic of Eastern and Central New Guinea, respectively. War Relief Services, National Catholic Welfare Council, reported it had shipped \$15,793,000 worth of relief supplies during 1947-48. In Hungary, arrests of priests continued in the regime's war on the Church.

During December Bishop Ignatius Krause, C.M., of Shunteh, China, once imprisoned by China's Communists, visited the United States and said if the Communists succeeded to power in China, it would not mean the end of the Catholic faith in that country. Bishop Aloisius J. Muench of Fargo, Apostolic Visitor in Germany, returned to the United States and gave a generally hopeful picture of the Church's situation in Germany. Refugees reaching Vatican City reported that a new persecution of the Church had broken out in Rumania. In Japan, it was reported that Catechumens totaled 1,000 in Japan's universities. See CATHOLIC CHURCH IN THE UNITED STATES; VATICAN CITY.

—BROTHER ALEXANDER JOSEPH

ROWING. Freshman, junior varsity, and varsity eights from the University of Washington made the first sweep of the Poughkeepsie Regatta since 1937, but it remained for California, second to the Huskies in the Hudson varsity grind, to capture the year's most coveted honors—a victory in the Olympics. Surviving a series of record-breaking trials on Lake Carnegie at Princeton, California's John Stack, Justus Smith, David Brown, Lloyd Butler,

George Ahlgren, James Hardy, David Turner, Ian Turner, and Coxswain Ralph Purchase earned the right to represent the United States in England.

Harvard retained its championship of the Eastern Association of Rowing Colleges and captured its annual race with Yale on the Thames at New London, Conn., in the record time of 19 minutes 21 and four-tenths seconds. The Crimson also took the Adams Cup in a meeting with Navy and Penn on the Schuylkill at Philadelphia and the Compton Cup in a race with Princeton on Lake Carnegie.

Princeton kept the Childs Cup—oldest of rowing trophies—by leading home Penn and Columbia on Lake Carnegie and Yale annexed the Blackwell Cup in a race with Penn and Columbia on the Harlem in New York. Cambridge set a new mark of 17 minutes 50 seconds in defeating Oxford in their ninety-fourth meeting on the Thames.

Princeton's 150-pound crew visited England and brought back the Thames Challenge Cup after defeating the Royal Air Force eight in the final of the Royal Henley Regatta. The Diamond Sculls trophy, chief prize in the singles, was won by M. Wood, young Australian. Jack Kelly, Jr., who passed the defense of his title on the Thames to take part in the Olympic trials, captured the Faragut Cup in the American Henley on the Schuylkill, honors for eight-oared crews going to Yale. Kelly went on to finish first in the Olympic trials, but failed in his bid for the big singles award in the Olympic Games. See OLYMPIC GAMES.

The Buffalo West Side Rowing Club swept to its second straight club championship in the Canadian Henley at Port Dalhousie, Ontario, and Ken Nunn of the Toronto Argonauts won the singles crown.
—THOMAS V. HANEY

RUBBER. For the third consecutive year, the rubber manufacturing industry in the United States consumed more than one million tons of rubber in 1948. This was double the annual average consumption for the prewar decade and accurately reflects the tremendous growth of manufacturing operations in the postwar period.

Consumption, estimated at 1,075,000 tons of natural and synthetic rubber, was second highest in the industry's history. This figure compares with the record 1,122,000 tons used in 1947. Forecasts at the year's end within the industry were that consumption during 1949 would be approximately as large as it was in the preceding year. The high rate of rubber consumption throughout the industry was also reflected in the production of some 50,000 different end products carrying an estimated value of 3,500 million dollars.

Output of passenger tires totaled 67 million units. This was down 10 million units from 1947 but substantially ahead of 1946 production and is ahead of the 50.9 million casings produced in 1940. The latter had long stood as the greatest of the so-called normal peacetime years. Production of truck and bus tires totaled 14,700,000 units as compared with 17,754,000 units in 1947 and 15,832,000 units in 1946. The combined production of truck, bus, and passenger car tubes totaled 72 million units in 1948.

The year saw a continuation of a long-term trend toward the increased consumption of rubber in both existing products and new products. In the field of mechanical rubber goods this was particularly true. The same applies in the rapidly growing field of latex-foam products. It also prevailed to a greater or lesser extent in such other lines as rubber footwear, rubber drug sundries, hard rubber goods, rubber flooring, rubber-coated materials,

and others. Nor was there any apparent interruption in the long-term trend toward the replacement by rubber of certain competing materials such as, for example, leather, steel, and textiles in applications to footwear, containers, conveying mechanisms, and to garments and proofed fabric coverings.

The industry singled out as the most significant development of the year in the transportation field its introduction of the extra low-pressure tire, now in large-scale production. This tire is claimed by the industry's engineers to afford a greater measure of comfort and a higher degree of road safety through greater road contact than any other development in a generation.

Raw Materials. Substantial progress was made during 1948 in the rapidly growing field of man-made rubbers. A number of new polymers of the so-called GR-S type were introduced. Those placed in production proved themselves adapted to do specific jobs better than any raw materials heretofore available.

One new polymer in particular was brought into production in 1948 and by the year's end it was "the talk of the industry." This was known as the low-temperature synthetic rubber, or "cold" rubber, so-called because it is made at 41° F. as compared with preceding types of GR-S which were polymerized at much higher temperatures. Production of cold rubber at the year's end was at an annual rate of 21,000 tons. During 1949 production is being increased to a rated capacity of 183,000 tons by the extensive conversion of a number of polymerization plants. That figure would be equivalent to 47 percent of the total GR-S production in 1948. This work was authorized and is being done under the direction of the Reconstruction Finance Corporation.

Cold rubber was giving evidence in widespread tests by early 1949 of being able to outwear previous tire-tread stock rubber by as much as 30 percent. In some quarters it was hailed by the industry as the best tire-tread stock ever developed. Many of the industry's scientists promise it a brilliant future because of its high resistance to abrasion. They expect it to find wide application in certain areas of the rubber mechanical goods field, particularly in belting. At the year's end the industry's demand for cold rubber far outstripped available supply.

Consumption-wise, the year of 1948 saw natural rubber consumed in favor of synthetic rubber at the ratio of approximately 3 to 2. The industry consumed 625,000 tons of natural rubber, 450,000 tons of synthetic rubber. This was approximately 60,000 tons more of natural rubber and 110,000 tons less synthetic rubber than was consumed a year ago.

There was a hidden significance in these figures, however. It lies in the fact that in 1948 synthetic rubber consumption represented a relatively high proportion of voluntary use except for the tire, tube, and camelback makers. All segments of the rubber manufacturing industry in this country were legally freed from mandatory use of synthetic rubber by amendment to the controlling Government regulation dated Sept. 9, 1947, and officially made a part of the Government's continuing policy upon the adoption of the Rubber Act of 1948 on March 31 of that year.

Legislation. The Rubber Act of 1948 requires the rubber industry, in the interests of national security, to consume a minimum of 225,000 tons of general purpose and special purpose synthetic rubber a year. Consumption of synthetic rubber in 1948 actually doubled required or mandatory usage,

thanks in a large measure to voluntary demand for the American-made synthetic rubbers.

Far East Supply. The past year saw substantial improvement in natural rubber supply by reason of the progressive restoration of plantations and native producing areas in the Far East and particularly in the Netherlands East Indies. The natural rubber producing areas have a potential variously estimated at from 1.8 million tons to 2.1 million tons. With American-made rubber in the picture, new rubber supplies have been thus more than ample to meet the requirements of the manufacturing industry in this country and to meet, simultaneously, the schedules set up for achieving the United States Government's security stockpile objectives. As against this supply picture, world consumption of rubber was 1,735,000 tons in 1947. It has been estimated at perhaps as much as 1,900,000 tons in 1948.

Security Planning. In conformity with its longstanding policy to maintain a close working co-operation with the administrative agencies of Government, the rubber manufacturing industry, through its designated advisory committees, devoted much of its time throughout the year to the Munitions Board, Reconstruction Finance Corporation, and the National Security Resources Board in implementing the security stockpile program, in developing plans for the disposal of Government-owned synthetic rubber plants, and in drafting a blueprint for the quick and effective industrial mobilization of plant capacity in the event of a national emergency.

—RUBBER MANUFACTURERS ASSOCIATION, INC.

ROMANIA. A republic (proclaimed Dec. 30, 1947) in the Balkans. King Michael I, who ascended the throne upon the abdication of his father, Carol II, on Sept. 6, 1940, abdicated on Dec. 30, 1947.

Area and Population. The area (1946) was 92,000 sq. miles (assumed to be the 1941 area which excluded Bessarabia, Northern Bucovina and Southern Dobrođa; plus Northern Transylvania as included in the 1941 census of Hungary), and the population was 15,872 (census of Jan. 25, 1948). Chief cities (1948): București (capital), 1,041,807; Cluj, 117,915; Timișoara, 11,987; Ploiești, 95,632; Brăila, 95,514; Iași, 94,075.

Vital statistics: males, 7,671,569 (48.3 percent); females, 8,201,855 (51.7 percent). Nationality: Rumanian, 13,597,613 (85.7 percent); Magyar, 1,499,851 (9.4 percent); German, 343,913 (2.2 percent). Illiterates (over the age of 7): 3,197,278 (23.1 percent). Urban population, 3,713,139 (23.4 percent); rural, 12,159,773 (76.7 percent); density, 66.8 inhabitants per sq. kilometer.

Education and Religion. Free and universal education is given "where there are schools." There were (1942-1943) 11,041 elementary schools, 716 secondary schools (1937-1938). For higher education there are universities at Bucharest, Iași, Cluj, and Timișoara. About 73 percent of the population belongs to the Greek Orthodox Church.

Production. The economic wealth rests chiefly on agriculture; 76.7 percent of the population is classified as "rural." In addition to vast forests, Rumania has large quantities of excellent oil (320,000 metric tons of crude petroleum produced in March, 1947), inexhaustible salt deposits, much coal, some iron, even gold and silver, and extensive fisheries. By far the most important source of mineral wealth lies in the oil deposits. All branches of industrial production are represented, the foremost being foodstuffs. In 1946, on 2,739 thousand hectares, 1,609,000 metric tons of wheat were produced.

Foreign Trade. In 1947, Rumania's total imports and exports amounted to \$96 million. Trade with the U.S.S.R. was \$47 million; Czechoslovakia, \$12 million; Hungary, \$6,600,000; Bulgaria, \$6,600,000; Switzerland, \$3 million; Yugoslavia, \$1,400,000; Poland, \$1,300,000; Turkey, \$1,300,000. A U.S. Commerce Department's report on general trade in 1947 showed that Rumania's exports to the United States were \$15,079,000, and imports \$435,000.

Finance. The national budget planned for the period Aug. 15, 1947, through Mar. 31, 1948, as amended on Mar. 22, 1948, was in balance, with revenue and expenditure amounting to 55,100 million lei (\$367,500,000). The official rate of exchange from August to October, 1948, was \$U.S. = 150 lei.

Transportation. In 1945 there was a total of 43,163 highway miles, including 7,499 miles of national roads, 15,940 miles of departmental roads, and 19,724 million passenger-kilometers for December, 1946, and during the same month 311 million ton-kilometers of freight traffic were handled.

Government. On King Michael's abdication on Dec. 30, 1947, his functions were taken over by a Presidium of the following five personalities: Professor Constantin Parhon, Chairman (on the ground of his seniority of years), a medical authority of world-wide repute; Mihai Sadoveanu, Chairman of the Chamber of Deputies, a brilliant novelist of peasant origin; Ștefan Voitec, Social Democratic Minister of Education; Ion Niculi, Deputy Chairman of the Chamber of Deputies; and George Stere, Councillor of the Court of Appeals, acting as Secretary. The Presidium, legally and collectively, discharged the functions of "Head of the State." The legislative power is vested in a Chamber of Deputies (the Senate having been abolished). On Jan. 21, 1948, the National Assembly modified the electoral law which prevailed under the old Constitution. In future all citizens over 20 years of age will have the vote; parliamentary candidates must be 23 years old. "The reactionaries will forfeit their rights as electors." Any deputy expelled from his political party will simultaneously lose his mandate. "Disorderly elements, as well as the politically rotten, will thus be discarded in a determined fashion." On April 13, the National Assembly passed the new Constitution. C. Parhon was reelected President of the Presidium of the Rumanian Peoples' Republic; the Presidium has 14 members (among whom 4 are women).

Events, 1948. The announcement by Premier Groza of his intention to dissolve all that remained of his much purged Parliament in February and to hold new elections in March, marked another milestone on the road towards full Communist dictatorship. The elections, of course, came out "right," and the Communist-dominated Popular Democratic Front (which replaced the old National Democratic Front), received 90.8 percent of the votes cast on March 28, with 405 seats in the new National Assembly. The opposition won 9 seats (the dissident Liberal Party, led by George Tatarescu, 7, and the Democratic Peasant Party, led by Dr. Lupu, 2).

On January 9, the government turned over nearly all the powers of the Rumanian throne to a "High Presidium." The decree also gave Rumania a new coat of arms and a flag; the coat of arms is a tractor and three furnaces on a rising sun field; surrounded by a bundle of wheat spears tied with a ribbon and inscribed "Rumanian Popular Republic"; the flag is of blue, yellow and red vertical stripes, with the new coat of arms in the center.

That there was, however, a considerable opposition to Groza's régime was evident from the continuous purges, in spite of the formal protests of the U.S. Department of State that Rumania was failing in every respect to live up to her pledges of a democratic government stipulated in the Peace Treaty. Nevertheless, Groza was eliminating all opposition; on February 21, Social Democrats disappeared in Communist "Workers" groups and the "Popular Democratic Front" was formed by the Workers' Party, the Plowmen's Front of Groza, the National Liberal Party and the Hungarian Popular Union. On April 13, the National Assembly adopted the new Constitution which provided for the nationalization of mines, oil, and mineral rights, transport, telegraph, telephone, and radio services. On April 22, a government decree provided that prosecutor for the so-called Popular Courts take over the system of justice corresponding to that in the U.S.S.R.; under it, the General Prosecutor will supervise the "prosecution and punishment of those who commit crimes against the democratic order and liberties, against the economic interests, the national independence and sovereignty of the Rumanian state." On April 16, the Ministry of Mines and Petrol clamped down on the Romãno Americano, Rumanian subsidiary of the Standard Oil Company of New Jersey, and appointed a supervising administrator; similar action was taken against the Shell Oil and Phoenix Transport (two British subsidiaries) in December, 1947. Currency reform stripped property owners, merchants, peasants, and factory workers alike of their savings. Before the reevaluation of currency one American dollar was worth 3 million Rumanian Lei; the new rate was pegged at one for 140. Citizens were ordered to exchange all their old money—but in the banks all persons got back only 3 million Lei, the actual equivalent of one dollar. The rest was held by the government "for safekeeping." This maneuver was timed just after most farmers had sold their autumn crops. On May 14, the government decided upon a state monopoly of foreign trade. Thereafter, the government intensified the nationalization of all industrial, mining, banking, insurance, and transport companies, and started taking steps for the collectivization of agriculture.

In foreign affairs, Rumania was integrated in the Soviet net of alliances. On January 16 the Rumanian-Bulgarian Treaty of Friendship, Collaboration and Mutual Aid, and a special protocol for economic collaboration were signed by Premiers Dimitrov and Groza. On January 24, Rumania and Hungary signed a twenty-year Friendship and Military Treaty; on February 5, a Friendship and Mutual Aid Treaty was signed with the U.S.S.R.; a similar treaty was signed with Czechoslovakia on July 21. On July 17, the government denounced the Concordat with the Vatican (concluded on June 12, 1929). On March 6, the Rumanian National Committee for Aid to the Greek People decided to bring 3,000 Greek children to Rumania from areas "liberated by the Democratic forces." After Tito's break with the Cominform, Bucharest became the headquarters of that organization, and Groza's government, like the other satellite states, carried on political and economic warfare against the Marshal. On May 30, Radio Romãnia said that the rehabilitation of Rumania had only been possible thanks to Soviet generosity since 95 percent of the cotton and wool used in the textile industry had come from the U.S.S.R. In June, at the request of Groza's government, Stalin reduced Rumania's reparations by 50 percent (as of July 1). On August 25, the Ministry of National Education

made the study of the Russian language compulsory in all schools. On September 10, a new Rumanian-Polish convention for economic cooperation and a trade agreement were signed. On December 11, the State Department disclosed that Col. John R. Lovell, Military Attaché, and Henry P. Leverich, Counselor of the American Legation in Rumania, had been ousted from that country for alleged plotting against the Rumanian government. Simultaneously, the State Department revealed that it had asked the Rumanian government to recall "as soon as possible" Grigore Preoteasa, Minister Counselor, and Alexandru Lazareanu, Counselor, of the Rumanian Legation in the United States. At the same time, Bucharest carried on an anti-Catholic campaign. On September 18, a governmental decree fixed the number of bishoprics: Rumanian Orthodox Church 17, Greek Catholic Church 2, Rumanian Catholic 2, Protestant Church 1, and the Old Christian Church 1. At the end of September, a meeting of 38 delegates representing 450 Transylvanian Greek Catholic priests decided to return to Orthodox Church; on Oct. 21 "the reintegration" ceremony of the Greek Catholics in the Rumanian Orthodox Church took place in spite of the protests of the Vatican.

—JOSEPH S. ROUCEK

RURAL ELECTRIFICATION ADMINISTRATION (REA). Administrator: Claude R. Wickard. Address: Washington 25, D.C. REA, an agency of the Department of Agriculture since July 1, 1939, was created by executive order of the President (May 11, 1935) under the Emergency Relief Appropriation Act of 1935. The Rural Electrification Act of 1936 provided a legislative basis.

REA lends funds for providing central station electric service to unserved farmsteads and other rural establishments. It gives preference to applications from cooperatives and other non-profit groups. Loans are authorized for construction and operation of distribution systems, generating plants, transmission lines, and for the financing and installation by consumers of plumbing, wiring, and electrical equipment and appliances. All REA loans bear two percent interest, and are amortized over a maximum period of 35 years.

More than 95 percent of REA loans have been made to cooperatives owned and operated by the people they serve. Their elected officials are chosen by and from the membership. They are non-profit organizations. Since its inception, REA has received authorization to lend a total of \$1,875,428,288, including \$400 million for the fiscal year 1949.

As of Oct. 1, 1948, REA had approved loans of \$1,468,802,761 to 1,040 borrowers. These included 954 cooperatives, 42 public power districts, 22 other public bodies, and 22 commercial power companies. Of the total loans approved, \$1,024,233,450 had been advanced to borrowers, as they needed funds to meet costs of finished construction. Some 938 borrowers had facilities in operation. These included 692,195 miles of line serving 2,354,381 farms and other rural consumers in more than 2,500 of the Nation's 2,900 counties, in 46 States, Alaska, and the Virgin Islands. In the summer and autumn of 1948, consumer-connections on REA-financed lines were progressing at the average rate of 40,000 a month, the largest in REA history.

REA approved loans totaling \$313,023,099 during the fiscal year 1948, the greatest volume in any fiscal year since REA was established. These funds will enable borrowers to build more than 120,000 miles of new lines and other facilities to serve

about 364,000 new consumers. REA had on hand a backlog of more than \$363 million in loan applications when the fiscal year 1948 ended, the largest in REA history.

Since establishment of REA, farm electrification in the Nation increased from 743,954, or 10.9 percent, to 4,019,476, or 68.6 percent, by the end of the fiscal year 1948. Of the 3,275,522 farms receiving electric service since 1935, more than 53 percent are served by REA-financed systems. REA estimated at the end of the fiscal year 1948 that about 1,840,000 farms, plus many non-farm units, remain to be electrified.

RUSSIAN LITERATURE. Stalin Prizes. In 1948, as in the preceding two years, the announcement of Stalin Prizes for the best works in prose, poetry, and drama represented the major event of Soviet literary life. The first prize of 100,000 rubles was awarded to three novels: *White Birch*, a large war epic by the young Michael Bubennov who tried to show how the reverses of 1941 had tempered and strengthened men and officers of a Red infantry regiment; *Happiness*, a talented, in parts brilliant picture of the postwar reconstruction in the Crimea with some interesting details on the Yalta Conference by Petr Pavlenko, a prominent Soviet writer whose novel about the imminent war with Japan (*Red Planes Fly East*) was translated into English in 1938; and *The Storm* by the well known Ilya Ehrenburg, a full length novel built on two planes: its descriptions of the fall of France and of the German occupation of Paris alternate with panoramic scenes of the Russian struggle against the Nazi invaders. Written in a snappy, biting style *The Storm* compares the corruption and weakness of the "declining West" to the self-sacrificing and vigorous attitude of Soviet citizens. *Happiness* and *The Storm* were both widely read and discussed, they were the best-sellers of last year.

The six second prizes (of 50,000 rubles each) went to the Ukrainian Alexander Gontchar for his *Standard-Bearers* (Red troops in Europe); to Emmanuel Kazakevich for his pathetic novelette *The Star* (tragic adventures of an intelligence platoon); to Valentin Kostylev for his impressive historical trilogy *Ivan the Terrible*; to Berdy Kerbabaev, native of Turkmenistan whose large novel *The Decisive Step* describes the civil war at the beginning of the revolution in Central Asia; to Fedor Panferov, author of a novel on war and reconstruction entitled *The Fight For Peace*; to Vera Panova, for her novel *Kruzhilikha*—a description of a steel factory during the war. V. Panova, a young and promising writer, won a wide popularity after the publication of her first novel, *The Companions* in 1946; *Kruzhilikha*, despite its flaws, is written with deep psychological insight and a sensitive, humanitarian approach to life.

Other Fiction. The Soviet prose of 1948 could be roughly divided into two main sections: war novels and novels of reconstruction. Descriptions of the "struggle for the fatherland" are published in large numbers. Most of them, composed and written according to an already established pattern, hardly present any literary interest though sometimes they have some value as historical documents.

Only a few rise above the average: Victor Avdeiev's *Herds on the Road* (evacuation of the cattle on the steppes of southern Russia), Pavel Shebunin's *Mamaev Hill* (a dramatic panorama of the battle for Stalingrad), Alexander Perventsev's *Stick to your Honor when Young* (a description of the warfare in the Cossack regions of the Caucasus and in the Crimea).

Two novels by women writers deal with the sufferings and the heroic resistance of Leningrad's population: *The Siege* by Vera Ketlinskaya (Third Stalin prize) and *The Stojarov Family* by Elena Katerli. A new novel by Fedor Panferov *The Land of the Vanquished* is a badly written thriller about beautiful Russian spies and shrewd intelligence men working for the Soviets in the German rear.

Novels on postwar reconstruction are mostly devoted to the farmers. Life in kolkhozes (collective farms) and various agricultural or political problems facing the returning veterans are dealt with in the widely discussed novel by Semen Babaevski *The Knight of the Golden Star* (the farmers of Kuban). This theme recurs in novels of lesser stature such as *Stone Wood* by Gennadi Fish and *Our Land* by Sergei Voronin (both books describe the farmers of Karelia) or in the long story of northern peasants *From All Our Heart* by Elizaveta Malzev.

The industrial reconstruction and the new Five-year plan also find their reflection in literature: Vassili Ajaev in his highly praised novel *Far Away From Moscow* describes with many details the building of a pipe line in the extreme north of Siberia. Michael Chakovski draws portraits of veterans who attempt to readjust themselves to factory work (*Days of Peace*).

A special place is occupied by a group of books devoted to the Russian North—a beloved subject-matter of Soviet fiction. Representative of this trend in 1948 are the Tchuktchi novel by Tikhon Semushkin *Alitet Retires to the Mountains* and Ivan Kratt's *Tales of the Arctic*. Other novels worth mentioning are: *The University* (student life in a provincial university town) by Grigori Kononov; *Three in Greatcoats* (veterans in college) by Victor Dobrovolski; and *Prospectors* by Vassili Gannebesov (an exotic picture of Siberian gold mines).

Historical Novels. Historical novels continued to form a large segment of Soviet fiction. Konstantin Fedin, one of the most distinguished writers of the U.S.S.R., completed (in 1948) his highly literary and whimsical novel *The Unusual Summer* (life in a Volga town before, and in the first years of the revolution). Novels on tsarist military leaders had considerable success: *General Suworov* by Leonti Rakovski, *Prince Potemkin* by Marianna Yakhontova, *The Storming of Izmail* by Boris Paparigopol (blamed by Soviet critics for his "superficiality").

Special mention should be given to the *History of a Stolen Idea* by Yuri Veber who tells the life of A. S. Popov and his discovery of wireless telegraphy, later exploited by Marconi. In general, the desire to prove the independence of Russian science and literature originated a series of novels and tales portraying obscure inventors and forgotten scientists.

Poetry. Although the number of poems published in book form or in various monthlies was as large in 1948 as in previous years, no outstanding work of poetry can be mentioned. Only two Stalin prizes for poetry were awarded to Russian language poets: Alexei Nedogonov, who wrote a long-winded narrative epic *The Flag Over the Village Soviet* and died soon after its completion; and Nikolai Gribachev, author of war poems and patriotic stanzas.

The other four prize winners were the Ukrainian Vladimir Sossura, the Byelorussian Maxim Tank, the Latvian Jan Sudrabkalk, and the native of Tadzhikistan (Central Asia) Mirzo Tursun Zade, whose poems on India are widely read by Moslems. One of the most popular poets of the U.S.S.R., Konstantin Simonov, published a book of political poems *Friends and Foes* inspired by his travels in Can-

ada, the United States, Great Britain, and Japan. The sharp satirical tendency of these poems discloses the desire of their author to revive the tradition of the great Soviet poet Mayakovsky.

Drama. Next to numerous revivals of plays by 19th century writers such as Ostrovski, Turgenev, and Chekhov, a large number of comedies and dramas by contemporary playwrights have been produced in 1948, in Moscow as well as in the capitals of the 16 Soviet Republics. Leading place in new productions was occupied by adaptations of novels, mostly of the latest best-sellers such as *The Young Guard* by Alexander Fadeyev (also made into a film), *Companions* by Vera Panova, *Men with Clean Conscience* (the guerilla warfare) by Petr Vershigora, and others.

Among original plays the most successful were: *The Great Strength* by Boris Romashov, an exposure of Soviet scientists guilty of "kow-towing to the decadent West"; *Our Daily Bread* by Nicolas Wirta, a description of a collective farm administered by women; *A Certain Town* by Anatoli Sofronov who ridicules the excesses of Soviet bureaucracy; *The Last Borders* by Yuri Chepurin, describing the Red Army in Europe and sharply criticizing the Americans; *On Our Soil* by Olga Bergholz and Grigori Makogonenko, giving a picture of life in a steel plant; *Makar Dubrava* by the popular playwright Alexander Korneichuk who glorifies an old miner, a faithful militant of his class. A score of dramas were devoted to war topics.

Memoirs and Essays. Most memoirs dealt with the events of World War II. Both Ivan Kozlov's *In The Crimean Underground*—describing the fight against the Germans in occupied Crimea—and the much-discussed *Transport Ship 'Kachetia'* by Olga Djigurda—an Army surgeon who made a colorful report on her war adventures—were well received by critics and readers. So were Yuri Jukov's *The West After The War* and *The Second Front* by Dimitri Kraminov who had been attached to Allied Headquarters in 1943-45.

The centenary of the death of Vissarion Belinski, the great Russian critic, was marked by a series of books, essays, and articles; much attention was also devoted by the Soviet press to the 500th anniversary of the Uzbek poet Alisher Navoi, whose works are among the classics of the Near East. In general, the development of national cultures in the Republics of the Union is highly promoted by the government and various literary organizations. As in previous years great activity prevailed in the major Russian publishing houses. Among the numerous works of Soviet scholars the remarkable critical editions of collected works of Chekhov and Lermontov should be mentioned.

—MARC SLONIM

RYE. The 1948 rye crop of the United States was estimated at 26,388,000 bushels compared with the 1947 crop of 25,975,000 bu. and the 10-year average (1937-46) of 37,398,000 bu. Yields of the principal producing States were (in bushels): South Dakota 4,704,000, North Dakota 4,656,000, Minnesota 3,466,000, Nebraska 2,250,000, Michigan 1,280,000, Wisconsin 1,104,000, Illinois 946,000, Indiana 928,000.

World production of rye for 1948 was estimated at 1,625 million bu., compared with the 1947 output of 1,490 million bu. and the 5-year average (1935-39) of 1,730 million bu. Yields of the chief producing countries for 1948 were (in bushels): U.S.S.R. (Europe and Asia) 920,000,000 (in 1947), United States 26,388,000, Canada 25,348,000,

France 24,200,000, Spain 20,000,000, Argentina 16,000,000, Denmark 15,500,000, Turkey 15,500,000, Netherlands 14,860,000, Austria 14,000,000, Sweden 12,500,000, Belgium 9,500,000.

RYUKYU (Loochoo) ISLANDS. A chain of islands reaching from the Japanese main island of Kyushu to near northern Formosa. The islands were completely occupied by the armed forces of the United States following the surrender of Japan in September, 1945. Area: 921 square miles. Population: 600,000 (estimated). Capital: Naha, on Okinawa—the largest island in the group.

ST. HELENA. A colony belonging to Great Britain, in the South Atlantic about 1,200 miles west of the African coast. It comprises the island of St. Helena (47 sq. mi.) and its dependencies—the islands of Ascension (34 sq. mi.), 700 miles northwest of St. Helena, and the smaller Tristan da Cunha group, about half-way between the tip of Africa and South America. Population of St. Helena (1946 census): 4,748. Capital: Jamestown. The area under cultivation on St. Helena amounts to some 8,000 acres. Agricultural products include flax and potatoes. Foreign trade (1946): imports £94,375; exports £31,790. Finance (1946): revenue £98,591; expenditure £88,822. The colony is administered by an executive council comprising the governor and 5 official members. An advisory council of 6 unofficial members assists the governor. Tristan da Cunha has an important meteorological and radio station. Governor: G. A. Joy.

ST. LUCIA. An island colony in the British Windward Islands group of the West Indies. Area: 233 square miles. Population (1946 est.): 69,091. Chief town: Castries (capital), 12,000 inhabitants. Primary education is free and compulsory. The principal products comprise sugar, cocoa, lime juice and oil, bay rum and oil, honey, rum, hides, coconuts, copra, and fruits. Foreign trade (1946): imports were valued at £503,765; exports £172,452. Finance (1946): revenue £394,884; expenditure £311,831; public debt £51,510. An administrator governs the colony. He is assisted by a nominated executive council and by a legislative council made up of elected and nominated members. Administrator: John M. Stow.

ST. PIERRE AND MIQUELON. An overseas territory of France, comprising two small groups of islands near the south shore of Newfoundland, as follows: St. Pierre group (area: 10 sq. mi.; pop. 3,804 in 1946), and Miquelon group (area: 83 sq. mi.; pop. 550). Total area: 93 square miles. Total population: 4,186. Capital: St. Pierre. The chief industry is fishing. Foreign trade (1946): imports 89,100,000 francs; exports 59,600,000 francs. In the general government of the territory the administrator is assisted by an elected general council and an executive council. The islands are represented in the French National Assembly, the Council of the Republic, and the French Union by one deputy in each.

SAKHALIN. An island northeast of Japan, in the Sea of Okhotsk. Area, 28,597 square miles. The southern part (south of 50° N.) was under Japanese control from 1905 when it was ceded by Russia in the Treaty of Portsmouth until the surrender of Japan in 1945 when it was returned to the U.S.S.R.

SALVATION ARMY, The. A religious and welfare organization with a military government established

in England in 1865 by William Booth, a Methodist evangelist. Introduced into America in 1880, it now operates in 97 countries throughout the world. Primarily an evangelical movement, its objects are: the spiritual, moral, and physical reformation of all those who need it; the reclamation of the vicious, criminal, dissolute, and degraded; visitation of the poor and sick; the preaching of the Gospel and dissemination of Christian truth.

Its social service program in the United States includes children's homes and hospitals, men's industrial homes, maternity homes and hospitals, family welfare, a vast prison program, youth centers, summer camps, etc. Relief teams are working in European reconstruction, emphasis being put on work among women and children.

Total affiliated world membership is over 4 million; that of the United States, 205,881. Five thousand officers and 96,483 bandmen and lay members carry on its work in 2,544 centers of operation in all parts of the country. International Commander, General Albert Orsborn, London. National Commander in the United States, Commissioner Ernest I. Pugmire, National Headquarters: 120-130 West 14th St., New York 11, N.Y.

SAMOA, American. American Samoa includes the island of Tutuila on which the U.S. Naval Station is located; the Manua group, consisting of the islands of Tau, Olosega, Aunuu, and Ofu; Rose Island; and Swains Island. These islands, with the exception of Swains Island, were acquired by the United States on Dec. 2, 1899, through a tripartite agreement with Great Britain and Germany. By joint resolution of Congress, approved Mar. 4, 1925, Swains Island was annexed to American Samoa. All but Rose Island, which is an uninhabited coral atoll, are of volcanic formation. The total area is 76 square miles and the population, as of July 1, 1948, was 18,080, mainly Polynesian. The seat of government is at the village of Pago Pago, Tutuila, which has one of the finest harbors in the South Seas.

Education. During the year ending June 30, 1946, instruction was offered by 45 public and 8 private schools having a total enrollment of 4,548 and employing 123 Samoan teachers, 24 non-Samoan teachers, and 2 Samoan principals. Attendance is compulsory for children between the ages of 7 and 15. English is used in public schools. Illiteracy in 1940 was lower than any other U.S. possession—6.3 percent.

Production. Copra, the most important crop for commercial sale, produced a gross income of \$280,600 for the fiscal year 1948. The Department of Samoan Industry, established in April, 1946, to encourage the production of Samoan handicraft, reported sales amounting to \$58,196.37 for the 1947 fiscal year. An experimental and dairy farm is maintained for the improvement of Samoan agriculture and animal husbandry. For the year ending June 30, 1948, the Bank of Samoa reported resources of \$1,786,964.

Government. American Samoa, classified as a United States possession, is under the control of the Navy Department and is administered by a Naval Governor. Samoans are not citizens of the United States but owe allegiance to the American flag as nationals of the United States. While the Constitution of the United States does not extend to American Samoa, the Regulations and Orders for the Government of American Samoa, printed in both English and Samoan languages, contain most of the guarantees of the Bill of Rights of the United States Constitution. Local administrative matters are con-

ducted by village, county and district councils composed of hereditary chiefs and their advisors. The Chief Samoan legislative council, or Fono, meets annually and serves in an advisory capacity to the Governor in matters relating to the welfare of American Samoa (See *Events* below). For purposes of local administration American Samoa is divided into three districts each having a Samoan governor. The judicial power is vested in Village Courts each presided over by a village magistrate; six District Courts each presided over by a Samoan District Judge and a United States civilian judge; and a High Court presided over by a United States civilian Chief Justice and two Samoan Associate Justices selected from the District Judges. Captain Vernon Huber, U.S.N., the present Governor of American Samoa and Commandant of the Naval Station, Tutuila, assumed office Apr. 21, 1947.

Events in 1948. In 1948 the Annual Fono of American Samoa, heretofore a unicameral, advisory legislative council, was succeeded by a bicameral body with limited legislative powers designated "the Fono" (council). The new Fono which was organized in accordance with the wishes of the Samoan people consists of the House of Alii with a membership of 12 chiefs holding hereditary titles and the House of Representatives with a membership of 54 representing all elements of the Samoan people.

The first regular meeting of the reorganized Fono was convened on Jan. 11, 1949. In 1948 the consolidated High School of American Samoa and the Vocational School of American Samoa were approved by the Veterans Administration for attendance by veterans receiving Federal educational benefits. A schedule of weekly round-trip plane flights between American Samoa and Honolulu was instituted in 1948 for the transportation of passengers and freight.

During 1948 five bills to provide an organic act for American Samoa and United States citizenship for the inhabitants thereof were pending before the Congress of the United States but no action was taken thereon. Plans were realized in 1948 to establish in American Samoa a plant to process fish and other products of the waters surrounding the islands.

SAMOA, Western. A United Nations Trust Territory, comprising a group of islands in the Pacific (West of 171° W.), administered by New Zealand. The two largest islands are Savaii (700 sq. mi.) and Upolu (430 sq. mi.). Total area: 1,133 square miles. Population (June 30, 1947): 71,905, of whom 393 were Europeans, 5,043 part Europeans, and 66,101 native Polynesians. Capital: Apia (on Upolu). The chief export products are copra (18,181 tons in 1947), cacao (2,378 tons), and bananas (101,754 cases).

Trade and Finance. Imports were valued at £923,773 in 1947; exports at £1,351,770. The copra export amounted to £722,272; cacao, £448,794; bananas, £70,317. The 1947-48 estimated budget placed revenue at £548,682 and expenditure at £359,285. A total of 127 vessels (89,051 tons) entered the port of Apia in 1946.

Government. An administrator heads the government and is assisted by an elected native council to advise him on native affairs. There is also a legislative council consisting of 6 official members, 2 elected European unofficial members, and 4 nominated native members. Administrator: Lt. Col. F. W. Voelcker (appointed Feb. 27, 1946).

Events, 1948. In December, 1948, the United Nations Trusteeship Council gave unanimous support to proposals introduced by New Zealand for in-

creased self-government in Western Samoa. The program called for a high commissioner to replace the present office of administrator; the establishment of a council of state; and establishment of a legislative assembly to replace the legislative Council. New Zealand proposed to continue control over defense, foreign affairs, and crown lands.

SANITATION. An important step in the progress of sanitation in the United States was taken this year when the new Water Pollution Control Act (Public Law 845) was passed. It empowers the Federal Government "to enforce abatement of any pollution that creates a health or welfare hazard beyond the borders of the State where it originates." Thus both municipalities or sanitary districts and industries are under the jurisdiction of the enforcing agents of the Federal Government if they discharge wastes into waters, that cross State boundaries, to such an extent as to endanger the health or welfare of the neighboring State.

The Surgeon General of U.S. Public Health Service, the Federal Security Administrator (Head of the executive branch which includes the Public Health Service), and finally the Attorney General are assigned specific tasks of enforcement under the law—the latter to bring suit if necessary.

Another important feature of the law is to offer to the States technical and financial assistance to encourage pollution abatement and the Congress was expected to appropriate \$25 million for the first year of an authorized 5-year program.

It was stated that in the administration of the law "All water uses of each stream will be considered and the treatment recommended will be based upon these uses. Due regard will be taken of the health, welfare, and economic considerations of the particular situation upon national welfare."

Another significant step in the progress of stream pollution control was taken when the Ohio River Sanitation Pact was signed. This is a venture in interstate cooperation rather than in Federal control. Executives from the States of Indiana, West Virginia, Ohio, New York, Kentucky, Pennsylvania, and Virginia participated in a ceremony of signing the compact. A commission is set up consisting of three representatives for each State and three Federal representatives. This commission is authorized to aid State or local bodies on specific problems of waste disposal and are to order municipalities, corporations, or individuals to cease or correct such pollution of streams as they may be causing. Despite the undoubted progress that is being made in the general area of sanitation, it is well to note that the need for this improvement is very great.

Professor Abel Wolman of Johns Hopkins University, a prominent sanitary engineer, has just warned that sanitary conditions in this country are in many respects worse than they were 100 years ago; 6,000 communities still have no water systems, 70 million persons in 8,300 communities require modern refuse disposal, and he doubts that there is a single stream in the United States which has not deteriorated since 1849 and air pollution is immeasurably worse than it was in years gone by. Of course population density has greatly increased in 100 years but Dr. Wolman contends that sanitation has not kept pace with that expansion.

The value of sewerage and sewage treatment construction in 1948 is estimated by the *Engineering-News-Record* to be \$226 million, an increase in dollar value over that of 1947 of 29 percent, but because of the decrease in the value of the dollar, this results in an increase in actual volume of

construction of only about half of this percentage.

Among the new methods of sewage treatment which have continued to be tested this year is step aeration, a modification of the activated sludge process in which the effluent from the primary tank is introduced in regulated amounts at various points along the course of flow of the activated sludge. Improvements over the conventional design are claimed on the basis of tests performed at the Bowers Bay plant in New York City. The new procedure will be incorporated in the design of the new Tallman's Island plant at New York City.

Synthetic detergents now coming into use in increasing amounts have been found to affect sewage-treatment processes but are not toxic to biological activities. Replacing soap, they reduce B.O.D. (bio-chemical oxygen demand) of raw sewage, decrease removals in settling tanks and improve settling qualities of certain sludges, and increase foaming of activated sludge tanks. (A 5-ft. blanket of foam on the activated sludge tanks of Mt. Penn, Pa., formed as a result of the distribution of trial samples of a liquid synthetic detergent.)

Of first-rate importance in the days just ahead, is the disposal of radio-active waste products, both gaseous and solid. Sanitary engineers have been employed by the Atomic Energy Commission to study the many problems and a small group of sanitary engineers in various Federal agencies are being trained in nuclear physics at Oak Ridge and Los Alamos to be able to advise on this new disposal problem.

Among the new sewage plans appearing in the news of 1948 are an \$11 million project for enlargement of the sewage system, construction of intercepting sewers, and treatment plant for Tampa, Fla. Bids will be opened in January, 1949.

In New York City, construction was resumed on the 60 million gals. per day Twenty-Sixth Ward Plant in Brooklyn. Plans were completed early in the year for \$80 million worth of work on the 160 million gals. per day Owl's Head plant, also in Brooklyn. While there is much still to be done in New York City to alleviate pollution conditions, it is believed by those in charge of the sewage treatment program that the city is progressively becoming conscious of the need for so doing.

In Philadelphia, primary treatment is given to about 60 million gals. per day which is only 19 percent of the dry weather sewage flow. Contracts for additions to the plant had been let at the beginning of the year to the amount of \$67 million. Sites for the two additional plants had been acquired. Construction on these plants is planned to start in 1949.

Plans have been made to reduce pollution of the Merrimac River in Massachusetts by the construction of intercepting sewers and several regional sewage treatment plants: an activated sludge plant for the Lowell metropolitan region and one for the Lawrence metropolitan region; and sewage treatment plants for the Haverhill metropolitan region, one at Amesbury, at Newburyport, and one at Salisbury. The total estimated costs of plants is \$27.6 million.

In the field of garbage disposal, it is interesting to note that the City of Winnipeg has completed a new refuse incinerator to handle 300 tons per day of garbage and refuse mixture. It cost \$652,000 and has been tested and found to meet its guarantee of performance. There are three furnaces of 100-tons per day capacity and a chimney capable of accommodating a fourth furnace as well.

The Chicago Sanitary District approved in 1947 a \$22 million interceptor now under construction.

Los Angeles is building the Hyperion 225-million gals. per day activated sludge project with a 5,000-ft. long, 72-inch reinforced concrete ocean outfall. San Francisco is building a very large sludge sedimentation and sewage disposal plant and has approved a \$15 million bond issue for the purpose. Indianapolis has approved a \$3.8 million bond issue for sewer relief. Houston, Tex., has approved a \$2.8 million bond issue for storm sewers.

Studies for the disposal of activated sludge at Houston indicate the superior economy of dewatering, drying, and manufacture into fertilizer. In Allegheny County, Pa., a most unusual proposal has been made for the construction of 4 huge interceptors in the river beds to lessen the cost of sewer construction by avoiding expensive excavation through city streets. Orlando, Fla., has begun construction on a \$3.5 million sewage treatment plant. East St. Louis is planning to spend \$6 million on improvements of her sewer system.

A de-silting project for the Schuylkill River in Pennsylvania is under consideration and will cost \$35 million. The Indiana Stream Pollution Control Board has estimated that \$47 million for new sewage plants in Indiana are now in the planning stage. The States of Washington and Idaho have 36 sewage disposal projects "ready to go."

Air pollution has received public attention by the smog catastrophe at Donora, Pa., in which 20 lives were lost. Smoke control studies at Los Angeles have been under way for more than a year. Smoke control regulations are being discussed in the press for Indianapolis. A model smoke-abatement ordinance has been passed in Kansas City, Mo. Similar developments are under way at many other places.

Industrial wastes and their treatment are receiving increasing attention as evidenced by the many papers published on this subject. The Fourth Annual Industrial Waste Conference held at Purdue University this year attracted 320 registrants from the entire United States. Of especial interest were the reports on new developments in anaerobic digestion as a means of disposal of milk wastes, distillery wastes, and canning wastes; a new process for coagulation of oil wastes was also announced.

Significant progress was made in the control of the insect-borne diseases of malaria and typhus. Death rates from malaria are now one-fifteenth of what they were in 1920. The engineers of TVA (Tennessee Valley Authority) have announced methods, which have proved entirely successful, for control of mosquitoes by management of fluctuating water levels in their reservoirs. This new procedure has helped to reduce malaria in that region almost to the vanishing point.

The use of DDT in rat burrows and other places frequented by these rodents—to control their fleas in addition to the conventional methods for control of the rodents themselves—has helped to control typhus, particularly in the State of Georgia where the incidence of this disease has been reduced by 61 percent in 1947 over that of 1945. An effective rat poison "Castrix" has been announced. DDT has also proved effective in the control of the mosquito and consequently of malaria in many places.

—W. E. HOWLAND

SAN MARINO. An independent republic in Italy, near the town of Rimini. Area: 38 square miles. Population (1947 census): 12,100. Capital: San Marino. Chief exports: cattle, wine, building stone. Financial estimates (1947) were balanced at approximately 330 million lire. The legislative power

is in the hands of the grand council of 60 members elected by popular vote. Two are appointed from this council every six months to act as regents. Executive power is in the hands of the regents, assisted by various nominated congresses.

SÃO THOMÉ and PRÍNCIPE. A Portuguese province comprising two volcanic islands in the Gulf of Guinea, 125 miles from the coast of Africa. They have an area of 372 square miles and a population (1940) of 60,490 (of which 56,666 were Negroes). São Thomé is by far the larger and more important of the two, and also accounts for about nine-tenths of the total population. Despite their small size the islands produce large amounts of cacao, as well as some coffee, copra, and palm oil. Trade (1946): imports 52,998,737 escudos; exports 122,139,883 escudos. Finance (1946): revenue 25,682,000 escudos; expenditure 24,561,000 escudos. Public debt (1946): 2,102,000 escudos. The administration is headed by a governor.

SARAWAK. A British crown colony on the northwest coast of the island of Borneo. Area: about 50,000 square miles. Population (1947 est.): 500,000, including Malays, Dyaks, Milanaus, Kayans, Kenyahs, Muruts, and other indigenous peoples, together with Chinese and other settlers. Schools are conducted by the Church of England, Roman Catholic, American Methodist and various other missions in the country. Capital: Kuching (pop. 38,247). The principal agricultural products are sago, rice, pepper, and rubber. Mineral products include coal, petroleum, rubber, diamonds, and gold. Foreign trade (1947): imports \$72,254,705; exports \$3103,138,575. Most of the trade is with Singapore. The estimated revenue for April to December, 1947, was £757,268; estimated expenditure £1,294,692.

Sarawak became a British crown colony on July 15, 1946, through an agreement between the then ruling Rajah, Sir Charles Vyner Brooke, and the British government. The Council Negri had previously authorized the Act of Cession by 19 to 16 votes. Governor: Sir Charles N. A. Clarke.

SASKATCHEWAN. A prairie province of western Canada, lying between Manitoba on the east and Alberta on the west. Area: 251,700 square miles, including 13,725 square miles of fresh water areas. Population: 895,992 (1941 census), compared with 854,000 (1948 estimate). Leading religious denominations (1941 census) were: Roman Catholic 243,734, United Church 230,495, Anglican 117,674, Lutheran 104,717, and Presbyterian 54,856. In 1946 there were 21,433 live births, 6,422 deaths, and 8,279 marriages. Education (1945-46): 207,696 students enrolled in schools and colleges. Chief cities: Regina (capital): 60,246 (1946 census), Saskatoon 46,028, Moose Jaw 23,069, Prince Albert 14,532.

Production. The gross value of agricultural production for 1947 was \$440,610,000. The value of field crops (1947) was \$342,753,000 from 22,892,000 acres. Chief field crops (1947): wheat 173 million bu. (\$229,500,000), oats 80 million bu. (\$58,400,000), barley 45 million bu. (\$46,800,000), rye 6,780,000 bu. (\$21,967,000), flaxseed 4,200,000 bu. (\$21,924,000). Livestock (June 1, 1947): 1,511,300 cattle (\$113,658,000), 504,900 horses (\$22,860,000), 558,300 swine (\$11,941,000), 285,300 sheep (\$2,810,000), 13,534,100 poultry (\$12,547,000). Fur production (1946-47): \$2,303,554. There was a total of 467 fur farms in 1946, with animals in captivity valued at \$1,357,-

211. The marketed value of fisheries (1946) was \$1,148,886. Dairy products (1947) included about 36,330,000 lb. of creamery butter valued at \$18,892,000; poultry meat and eggs, \$21,961,000; honey (6,232,000 lb.), \$1,558,000.

There were 955 industrial plants in 1946 reporting a combined output of \$168,356,619; 11,957 employees who received salaries and wages totaling \$17,956,317; cost of materials used amounted to \$126,595,761. Slaughtering and meatpacking was the leading industry, followed by flour and feed mills, butter and cheese, and petroleum products.

Government. Finance (year ended Apr. 30, 1947): net combined revenue \$39,406,666; net combined expenditure \$39,527,696; total direct and indirect liabilities (less sinking funds) \$187,672,970 on Jan. 31, 1947. The executive authority is vested in a lieutenant governor who is advised by a ministry of the legislature. In the Legislative Assembly there are 52 members elected for a 5-year term by adult voters. Six senators (appointed for life) and 21 elected members in the House of Commons represent Saskatchewan in the Dominion Parliament at Ottawa. Lieutenant Governor, J. M. Uhrich (appointed Mar. 24, 1948); Premier, T. C. Douglas (C.C.F.; reelected June 24, 1948). See CANADA.

SAUDI ARABIA. Saudi Arabia occupies the central portion of the Arabian Peninsula bounded by the Red Sea and the Persian Gulf. On the north Saudi Arabia is bounded by Transjordan, Iraq, and Kuwait, and on the south by Yemen, and a series of Arab sultanates and sheikhdoms having special political ties with the United Kingdom. The country has an area estimated to be about 927,000 square miles although much of it is still to be explored and surveyed, and a population estimated at about 5,500,000.

The Saudi Arabian state is an absolute monarchy whose king, Abdul Aziz ibn Saud, carved out by the sword during his own lifetime the country which bears his name. He is both the temporal and religious leader of his people, functions which are by no means clearly defined in a land in which Shariah or Koranic law is supreme. Ibn Saud and his people are followers of the puritanical Wahabi sect, which is characterized by a strict interpretation of the Koran.

Although Riyadh (pop. est. 80,000) in the central province of Nejd is the political capital and residence of the king, Mecca (pop. est. 90,000), the center of the annual pilgrimage, is the religious capital, while Jidda (pop. 60,000) is the diplomatic capital and locus of the principal offices of several important Saudi Arabian governmental departments. The remaining provinces are the Hejaz on the west bordering the Red Sea, where the holy cities of Mecca and Medina are located; Asir, which lies south of Hejaz along the Red Sea coast; and Hasa on the Persian Gulf side.

Economically, Saudi Arabia is quite primitive. The vast bulk of the country is a desert incapable of cultivation and, except for oil and small deposits of gold, almost devoid of natural resources. Except in Asir province, cultivation is limited to the oases and other areas where irrigation is possible. A large part of the population is nomadic, and the chief occupation is tending herds of camels, sheep, and goats. Industry in the cities is limited to handicraft production of textiles and leathers and crude metalworking. The country is not self-sufficient either in agricultural or in industrial products, depending upon its revenues from the annual pil-

grimage and more recently upon oil royalties to bridge the large gap between merchandise imports and exports.

World interest was centered on Saudi Arabia with the great oil discoveries on the Persian Gulf Coast in 1938 by the Arabian American Oil Company, a subsidiary of the Standard Oil Company of California and the Texas Oil Company. The concession which was obtained in 1933 runs to 1999 and covers approximately 440,000 square miles. There are four large fields, all on the east coast, with estimated proved reserves of 7,000 million barrels, and with a production at the end of 1948 of about 500,000 barrels per day. During World War II a refinery was built at Ras Tanura, near the oil fields, which now has a capacity of over 100,000 barrels per day.

Events, 1948. As a member of the Arab League, Saudi Arabia played a minor role in the armed conflict with the new Israeli Government, a contingent of the Saudi Arabian army having fought with the Egyptian army in the Negeb during 1948. However, despite the resentment against the United States Government for its role in the Palestine controversy, relations between Americans and Saudi Arabs in Saudi Arabia have been generally cordial. An agreement on royalty payments was reached between the Arabian-American Oil Company (Aramco) and the Saudi Arabian Government, thus clearing up a controversy which had been outstanding for several years.

The original concession agreement provided that Aramco should pay a royalty of 4 gold shillings per ton of oil, the payments to be made either in gold £ (British gold sovereigns) or its equivalent in £ sterling or dollars. However, a difference of opinion arose between the Saudi Arabian government and Aramco over how the equivalent value of the British sovereign should be determined. Under the terms of the new accord Aramco agrees that if it chooses not to pay its royalty in gold sovereigns, and instead elects to pay in dollars, it would do so by computing its royalty rate at \$12 per gold sovereign rather than at the official value of \$8.25 per sovereign.

The war over Palestine indirectly affected Saudi Arabian oil by slowing down operations on the Trans-Arabian Pipe line (TAPLine) scheduled to be laid from the Arabian oil fields on the Persian Gulf to Sidon, Lebanon, on the Mediterranean. During 1948 the Syrian Parliament steadfastly refused to ratify an agreement giving the TAPLine transit rights across Syria. As a result the work on the western end of the 1,100-mile line was suspended entirely, while work on the Persian Gulf end had to be slowed down because the U.S. Department of Commerce restricted the licensing of steel shipments for the TAPLine in response to the growing political uncertainties in the area. Scheduled to be completed by mid-1950 the 30-31 inch line will have a capacity of 300,000-500,000 barrels per day, depending upon the number of pumping stations employed.

The last remaining barrier to the completion of the deal whereby the Standard Oil Co. (N.J.) and Socony-Vacuum acquired 30 percent and 10 percent respectively of the shares of Aramco was removed in 1948 when settlement was reached with the Gulbenkian interests, a similar settlement having been made last year with French oil interests. The difficulty arose over the fact that both Jersey and Socony, as part owners of the Iraq Petroleum Company, were parties to the famous Red-Line Agreement whereby members were pledged not to acquire interests in oil concerns in other Middle

Eastern territories without the consent of the other members.

On July 15 the Saudi Arabian Government allowed a \$15 million Export-Import Bank credit to expire. In addition to enjoying large oil royalties in 1948 the Government received substantial Pilgrimage revenues, thanks to the arrival of an estimated 100,000 Pilgrims from outside the country.

—RAYMOND F. MIKESELL

SAVINGS BONDS DIVISION, U.S. A Division of the U.S. Treasury Department, organized Jan. 1, 1946, from its predecessor organization, the War Finance Division. Its chief purpose is to promote the continued peacetime purchase of U.S. Savings Bonds and Stamps through the payroll savings plan and through schools, as well as the protracted holding of bonds by the American people.

The Division and the Field offices operate through four main branches: Banking and Investment, Labor and Industry, Community, and Promotion and Publicity, all under the direction of the National Director, who is an Assistant to the Secretary. The sales organization (field) consists of offices in all States and the District of Columbia, actively operating in the recruiting of volunteer committees, sales, and promotional personnel. The Washington organization plans campaigns and advises and services the field workers. The Division enjoys the cooperation of all advertising media, including newspapers, radio, magazines and business

publications, motion pictures, labor, business, schools, etc. National Director: Vernon L. Clark.

SCHOOLS, U.S. In the year 1945-46 the enrollment in the public schools of the United States totaled 23,299,941, and the average daily attendance was 19,848,907. This compares with the year 1944-45, as follows: enrollment 23,225,784, average daily attendance 19,671,398 (U.S. Office of Education). In 1945-46 the number of high-school graduates increased 29,871, or 3.2 percent, and there were 34,052 more boys and 4,181 fewer girls graduated than in the year 1944-45. The number of graduates in 1945-46 was 186,792, or 16 percent, fewer than for 1941-42, the first year of the war.

Enrollments and the number of teachers in private and parochial elementary and secondary schools were increasing more rapidly than in public schools. Between 1939-40 and 1945-46 private school enrollments increased 8.2 percent, while during the same period public school enrollments decreased 8.4 percent. In Table 1 are shown the public enrollments by States for 1945-46, with totals for the continental United States for 1945-46, and 1944-45, and the total high-school graduates for 1945-46.

In Table 2 are shown the totals in the instructional staff and the enrollments in the private and parochial schools for 1945-46, with totals for the continental United States for the years 1945-46 and 1944-45.

TABLE 1—U.S. SCHOOL ENROLLMENT BY STATES, 1945-46

United States	Total enrollment	Enrollment		Enrollment		High-school graduates
		Elementary schools Boys	Girls	Secondary schools Boys	Girls	
1945-1946	23,299,941	9,098,013	8,579,731	2,633,117	2,989,080	974,407
1944-1945	23,225,784	9,053,952	8,611,642	2,565,699	2,994,491	944,536
<i>State</i>						
Alabama	638,375	270,938	260,734	44,135	62,568	14,764
Arizona	108,123	43,960	41,607	10,881	11,675	3,394
Arkansas	393,070	165,153	160,696	30,270	36,951	11,237
California	1,434,185	551,108	520,255	174,794	188,028	63,237
Colorado	205,907	82,129	75,113	22,029	26,636	9,242
Connecticut	250,730	93,770	87,689	32,767	36,504	13,044

SECRET SERVICE, U.S. A division of the U.S. Treasury Department, charged with the protection of the President, the suppression of counterfeiting, the suppression of the forgery of Government checks and bonds, safeguarding the money and securities of the United States, and investigations relating to the Treasury Department as directed by the Secretary of the Treasury. Chief: U. E. Baughman.

Domestic counterfeiting increased, but not to any alarming extent. Of a total of \$747,434 in counterfeit bills and coins captured in the United States during the fiscal year 1948, \$644,785 was seized before it could be passed. Bills and coins passed on storekeepers and others totaled \$145,214, including \$42,566 of foreign origin. Of 51 new counterfeit note issues which appeared during the fiscal year, 35 were of foreign origin. There were 158 arrests and 90 convictions.

There were 32,283 forged checks and 11,019 forged bonds received for investigation during the fiscal year. Agents completed investigations of 28,004 checks, totaling \$1,953,186, and 12,174 bonds with a value of \$579,909. Of the 1,732 persons arrested for check forgery, 1,590 were convicted. There were 232 arrests for bond forgery and 245 convictions (which included dispositions on cases pending from prior years). Fines in criminal cases totaled \$70,331 and jail sentences totaled about 2,091 years, with additional sentences of 2,585 years suspended or probated.

The Secret Service closed 43,540 criminal cases and 2,081 noncriminal cases, for a total of 45,621 investigations completed during the fiscal year.

SECURITIES AND EXCHANGE COMMISSION (SEC). An independent agency of the U.S. Government which has the following functions: Registration of security issues to provide factual disclosures, and suppression of fraudulent practices in the sale of securities under the Securities Act of 1933; supervision and regulation of transactions and trading in outstanding securities, both on the stock exchanges and in the over-the-counter markets, and registration of brokers and dealers, as provided in the Securities Exchange Act of 1934; regulation of financial and related practices of electric and gas public utility holding companies and their subsidiaries under the Public Utility Holding Company Act of 1935, as well as readjustment of their system and corporate structures and reduction of their utility holdings to "integrated systems"; qualification of trust indentures pursuant to which new debt securities are offered, as provided under the Trust Indenture Act of 1939; registration and regulation of investment companies and investment advisers under the Investment Company Act and the Investment Advisers Act of 1940; and the preparation of advisory reports on plans, and participation as a party, in corporate reorganizations under Chapter X of the National Bankruptcy Act. Chairman: Edmond M. Hanrahan. See *FINANCIAL REVIEW* under *The Nation's Savings*.

SEISMOLOGY. *Scope of Modern Seismology.* While seismology primarily refers to the scientific study of earthquakes, seismological techniques have been projected into so many other fields in recent years that it can no longer be considered solely a branch of geology. The old practice of associating it mainly with volcanoes is inappropriate because volcanic earthquakes due to intense explosions are in a minor category compared with the thousands of stronger shocks due to ruptures in the deep rock structure of the Earth's crust. Today greater resources are expended on seismological activities in the search for oil than is represented in all other types of seismological activity combined.

The exploration geophysicist simulates earthquake effects by firing small charges of explosives in the ground and by study of the resulting ground vibrations detects what is likely to be an oil-bearing structure. In areas where destructive earthquakes are frequent the structural engineer is interested in the nature and magnitude of the destructive ground vibrations and has thereby created a new and important field of investigation; namely, engineering-seismology. The last decade also has given marked emphasis to the value of seismographic data in meteorological studies.

For several years the United States Navy has been tracking hurricanes and typhoons by measuring the directions of the minute ground waves known as microseisms, which are generated by low-pressure areas over the oceans. The variations in character and amplitude of microseisms of all types are still the subject of much speculation as to their cause but there is little doubt that they are all primarily of meteorological origin. These activities obviously give the word seismology a new and broader significance than heretofore.

Seismographs. The tool of modern seismological investigation is the seismograph. This in broad principle is a special type of damped pendulum which, when set into motion by a ground wave, records in highly magnified form the differential

motion between the oscillating pendulum and the moving ground. By a proper choice of pendulum period a seismograph can be made to record either the acceleration, velocity, or displacement of the oscillatory ground motion but there are practical limitations in certain categories.

The average seismograph is generally a compromise type designed to register clearly all of the important wave groups emanating from a distant earthquake regardless of the type of motion registered. Amplification of the pendulum motion generally varies from 500 to 50,000 but instruments for special purposes extend this range from 1 to 1,000,000. The amplitude of ground motion measured by this broad array varies from a few tenths of a micron found in the normal background activity of very stable geological formations to many feet or yards found in the central area of a great earthquake.

Usefulness of Seismographic Data. In earthquake investigations seismographic data serve a two-fold purpose: (1) to locate earthquakes, and (2) to delineate the structure traversed by the seismic waves which radiate in all directions from an earthquake focus. When an earthquake occurs, which is usually near the surface of the Earth, it radiates three principal wave groups. The first two, so-called primary and secondary waves, expand into the Earth's interior at different speeds so that a seismograph will register the surface trace of the higher-speed wave first and some seconds or minutes later register the slower-speed waves.

By measuring the time interval between the arrival of the two groups the seismologist is able to determine the distance to the earthquake by referring to an empirical seismological table which tells him the exact distance to which a particular time interval corresponds. Close to an earthquake the interval is only a matter of seconds but it increases to nearly ten minutes at distances about one-quarter the circumference of the Earth. When such epicentral distances are known from a large number of stations they are used as radii to swing arcs on the globe, to intersect at the location of the earthquake.

The greater part of the energy radiated by an earthquake is represented in waves which traverse only the crustal layers of the Earth. There are two types, the slower of which makes a completed circuit of the globe in about three hours. The other is only slightly faster. Seismographic data have made it possible to plot accurately the seismic belts of the Earth whether on land or beneath the seas. Although the rim of the Pacific and the southern portion of the Eurasian continent constitute the two major belts there are many minor belts.

No portion of the Earth's surface can be said to be entirely free of some form of seismic activity, which, for the Earth as a whole, sums up to about a million shocks per year including all types from those perceptible only to instruments to the destructive ones. Such activity can often be related to such geological features as mountain building. To the engineer such epicenter maps indicate where buildings, bridges, and dams must be reinforced to withstand earthquake forces.

To the student of Earth physics seismology yields more data on the structure of the Earth's interior than any other science. It furnishes a sort of X-ray of the interior in that it is possible to determine the velocities of all wave types at all depths and from these velocities to speculate on the character of the material traversed and the levels at which abrupt changes occur. From it we know that over continental areas there is generally

a granitic layer varying from 10 to 20 km. in thickness overlying a layer of basaltic rock of about equal thickness. Over portions of the large oceanic basins these layers decrease markedly in thickness and may even disappear. More significant than this is the evidence from seismological data that the core of the Earth, having a radius greater than half that of the Earth itself, transmits seismic waves at greatly reduced speeds.

In the last two decades it has been definitely shown that while most strong earthquakes originate at depths averaging around 12 miles others occur as far as 450 miles down. Some question is therefore raised as to the adequacy of any theory which calls for stress equilibrium at depths much shallower than this. Within the same epoch studies of earthquake energy have indicated that while tens of thousands of earthquakes may occur annually one great shock may represent as much as 90 percent of the earthquake energy expended during the year.

Seismological Organizations. Seismological observations and research are carried on at approximately 250 stations throughout the world about 75 of which are located in the United States. The principal organizations carrying on research in the United States are the Pasadena Seismological Laboratory at the California Institute of Technology, the University of California at Berkeley, the Institute of Technology at Saint Louis University, and the United States Coast and Geodetic Survey which, though centered in Washington, maintains a field office in San Francisco and a network of teleseismic and strong-motion stations in United States, Alaska, and Island possessions.

The Pasadena Seismological Laboratory under Drs. Gutenberg and Richter has been largely responsible for development of an instrumental magnitude scale and its application to earthquake statistics, for studies of the geography of earthquakes and their distribution in depth, and for studies of seismic wave transmission. One of the most important results of the research at the University of California under Dr. Byerly has been the establishment of the existence of a root or projection of lighter crustal material into the deeper layers under the Sierra Nevada Mountains.

At Saint Louis University, work done by Rev. J. E. Ramirez, S.J., under the direction of the Rev. James B. Macelwane, S.J., revealed the possibility of determining for every large microseismic storm the direction from which the microseisms came, thus leading to the United States Navy's successful program of tracking hurricanes in the West Indies and typhoons in the western Pacific.

The U.S. Coast and Geodetic Survey has carried on the seismological service of the Government since 1925. It is currently interpreting and publishing the instrumental results of 27 Survey, cooperating, and independent stations. It promptly reports the location of large earthquakes. This is accomplished by the cooperation of seismological stations all over the world which telegraph their seismographic data to Washington. The Survey also maintains a network of approximately 50 accelerograph stations in western United States and Central and South America to obtain destructive ground-motion data needed by the structural engineer in designing structures in earthquake areas.

Following the destructive seismic sea wave of Apr. 1, 1946, in the Pacific the Survey made arrangements to provide for prompt warning of the possibility of such waves in the future. Visible-recording seismographs installed at Tuscon, Ariz.; College, Alaska; and Honolulu, T.H., and a 24-

hour alarm service will be maintained to permit the rapid determination of the location of submarine earthquakes potentially capable of causing seismic sea waves.

The American Geophysical Union, with its Section of Seismology, and the Seismological Society of America are societies composed of those interested in or engaged in seismology as a profession. Both organizations publish technical journals. The Society of Exploration Geophysicists is composed largely of those engaged in geophysical, including seismic, prospecting. The journal of the Society, *Geophysics*, publishes highly technical papers on various phases of geophysics. The International Union of Geodesy and Geophysics includes the International Seismological Association. Among its functions is the sponsorship of the *International Seismological Summary*, a compilation of worldwide instrumental data.

Earthquake Activity in 1948. During 1948 there were many strong and destructive earthquakes. The greatest shocks of the year in absolute magnitude were those of January 24 in the southern Philippines and September 8 in the Tonga Islands. A great disaster resulted from the earthquake of June 28 in Japan which caused the deaths of about 4,000 persons, injured 10,000 others, and destroyed or damaged approximately 55,000 buildings in and near Fukui. Another destructive shock occurred on October 5 near the border between Iran and the Turkmen Republic causing many deaths and injuries and considerable property damage in both countries. The village of Lihau in Sikang Province, China, was destroyed by an earthquake on May 25. Other destructive shocks occurred in Greece, Italy, Algeria, South Africa, the Dominican Republic, Peru, Chile, Argentina, Bolivia, and Hawaii.

Most of the activity in the United States occurred during December. A strong shock on December 4 caused some damage around Palm Springs, Calif., and a series of quakes shook Reno, Nev., and adjacent sections of California during the last few days of the month. An earthquake on November 2 momentarily interrupted power at Hoover Dam and caused rock slides in nearby mountains. Numerous smaller shocks were reported from all sections of the United States.

—FRANK NEUMANN

SELECTIVE SERVICE. In approving the Selective Service Act of 1948, the United States Congress declared that "in a free society the obligations and privileges of serving in the armed forces and the reserve components thereof should be shared generally, in accordance with a system of selection which is fair and just, and which is consistent with the maintenance of an effective national economy."

The task of applying this deeply-rooted American principle in conformance with the spirit and the letter of the law was assigned to the Selective Service System, created under authority of the Act.

The law recognizes that to be "fair and just" responsibility for selection of individuals for the armed forces must rest on the shoulders of men who know the individuals, their personal problems, and their relation to the welfare of their communities, as well as the Nation at large.

That is why the Act places so much emphasis on the Local Board and—in the final analysis—makes the Local Board the very foundation upon which Selective Service is built.

There are approximately 3,700 Local Boards in the System. Each is composed of three or more male citizens, 30 years of age or older, appointed

by the President upon recommendation of the respective governors. They receive no pay.

There is one Local Board for each county, generally speaking, and in densely populated areas one for each 100,000 population approximately. In areas of sparse population one board may serve as many as five counties when authorized by the Director.

The principal function of the Local Boards is to classify registrants under their jurisdiction—that is, to determine—on the basis of information obtained from its registrants' questionnaire and other pertinent sources—whether the registrant should be placed in a deferred classification, or in I-A—available for service. Obviously, the Local Board must follow the law and the regulations, and the registrant and certain other interested persons have the right of appeal, but that does not detract from the importance of the Local Board in the Selective Service scheme of things. Each State has one or more appeal boards. Under certain conditions appeals may be taken to the President.

Attached to each Local Board is a medical examiner, a registrant's advisor, and a Government appeal agent, who may appeal a case in behalf of the registrant or the Government if he thinks a classification unfair. (All of the foregoing members of the Selective Service System are uncompensated.) Appeals likewise may be taken by the Director or the State Director.

Under the organizational setup the Local Boards are directly responsible to the State Headquarters, State Headquarters to National Headquarters.

Major General Lewis B. Hershey was appointed Director of the Selective Service System by President Truman after enactment of the new law. General Hershey had been associated with Selective Service since 1936, when he was appointed Secretary and Executive Officer of the Joint Army and Navy Committee, which, through its studying and planning, laid the groundwork for the structure and the administration of the Selective Service Act of 1940. Under authority of this Act, 10,123,599 men were inducted into the armed forces—representing more than 66 percent of the armed forces total strength.

The World War II organization which General Hershey headed was, at its peak strength, composed of unpaid personnel totaling 185,000; paid personnel 25,000, compared to a contemplated 50,000 unpaid personnel and 5,500 paid personnel (approximately) under the present (1948) Act.

The Selective Service Act of 1940 expired Mar. 31, 1947. Congressional legislation enacted shortly before that date provided for the establishment of the Office of Selective Service Records, charged with the responsibility of liquidating the Selective Service System, preservation and maintenance of the Selective Service records containing data concerning approximately 44 million men, also preservation of the methods and knowledge of Selective Service. President Harry S. Truman appointed General Hershey as Director of this agency on Apr. 1, 1947, and it, in turn, was absorbed by the new Selective Service System upon enactment of the Selective Service law of 1948, which was June 24, 1948.

It was the planning and training accomplished by the Office of Selective Service Records during the interim between the expiration of 1940 Act and enactment of the 1948 Law which was largely responsible for the speed and efficiency with which the new organization was set up.

Approximately 8½ million men were registered by the Local Boards during the initial registration

period, set by Presidential Proclamation August 30 to September 18. Men 18 through 26 were registered. Those becoming 18 after September 18 are required to register within 5 days of the date of their birthday anniversary. The 18-year-old men are not liable for service until they reach the age of 19.

Actual inductions began in November to meet a call from the Army for 10,000 men. The December call was for 15,000; January, 10,000 (revised); February, 5,000 (canceled). Neither Navy nor Air Force requested any inductees during these months, nor were there indications that they would in the immediate future.

It had been expected that the Army calls would be higher, and in announcing the curtailed calls the National Military Establishment stated on Nov. 30, 1948: "The reductions were necessitated by the limitation of the military budget for Fiscal 1950 to \$15,000 million, of which \$600 millions are for stockpiling of strategic raw materials."

Previously (on June 28, 1948) Secretary of the Army Royall had placed the strength of the Army at 542,000 and pointed out that under authority of the Congress it might be increased to 837,000 with enlistees and inductees. He added, however, that the 1949 appropriations would limit the total number to 790,000 between then and July 1, 1949. The November 30 statement did not include figures on the revised scheduled army strength made necessary by the reduced budget.

As a generality, the number of men inducted depends upon the number needed to make up the difference between those who enlist and the scheduled strength. The more recruits obtained, the fewer who have to be drafted, and conversely, the fewer the recruits, the greater the number of draftees. That the very existence of a Selective Service law would greatly spur the enlistment rate had never been disputed, but to just what extent over a period of time can only be estimated as this is written.

It is well to bear in mind that Selective Service is a procurement agency designed to produce the number of men—and the type of men—required by the armed forces when called upon to do so by the armed forces. A frequently overlooked fact, and a very important one, is that the armed forces prescribe the number of men to be inducted and also the physical requirements each inductee must meet.

Approval of the Selective Service Act of 1948 was the culmination of a series of events put into motion by President Truman in a special message to Congress on Mar. 17, 1948. Pointing out that "our badly depleted military strength is one of the Nation's greatest dangers," the President requested reenactment of a Selective Service law and also a law providing for universal military training.

The President declared: "I believe that we have learned the importance of maintaining military strength as a means of preventing war. We have found that a sound military system is necessary in time of peace if we are to remain at peace. Aggressors in the past, relying on our apparent lack of military force, have unwisely precipitated war. Although they have been led to destruction by their misconception of our strength, we have paid a terrific price for our unpreparedness."

Measures embodying President Truman's recommendations were introduced in the Senate by Chan Gurney, Chairman of the Senate Armed Services Committee, on May 12, and in the House of Representatives by Walter G. Andrews, Chairman of the House Armed Services Committee, on

April 30, after prolonged hearings during which Major General Lewis B. Hershey, the Director of the Office of Selective Service Records, and Colonel Louis H. Renfrow, the Chief Legislative and Liaison Officer, were frequently called to testify and to submit pertinent facts and figures.

The Selective Service Act of 1948 was passed by the Senate and House in final form, without universal military training provisions, on June 12, 1948. On June 24, 1948, the measure was approved by President Truman and thus enacted into law (Public Law 759, 80th Congress). Follows a brief summary of the Act as it was approved June 24, 1948: The period of service is fixed by the Act at 21 months, with a maximum 5-year Reserve obligation subsequent to discharge. Men 18 years old are permitted to enlist for one year, within a 161,000 limit set by the Act. They also have Reserve obligations.

The Act authorizes the President to issue regulations under which persons whose employment in industry, agriculture, or other occupations or employment are found necessary to the maintenance of the national health, safety, or interest may be deferred by their local boards. The President is given authority to issue regulations providing for deferment by local boards of persons whose continued activity in study, research, or medical, scientific, or other endeavors is found to be necessary to national health, safety, or interest. (Pertinent regulations were issued August 23.)

The individual's status with respect to his activity or employment, as determined by his local board, is the governing consideration. Provisions authorize the President to issue regulations authorizing deferment by local boards of men who are married or with other dependents. (Such regulations were issued August 23.)

All males between 18 and 26 residing in the United States are required to register on dates proclaimed by the President, with very few exceptions. The few exceptions include men on *active duty* in the armed forces and foreign diplomats, and a few aliens under conditions rigidly specified.

Exemptions and deferments continue only so long as the cause for them continues. Exemptions are provided for most veterans under minutely specified conditions. Exempt also are ministers, ministerial students, and conscientious objectors, but the Act is specific in defining those who can qualify for exemption under those provisions. The Act provides that a sole surviving son of a family who lost one or more sons or daughters in the war—either in action or of wounds, injury or service-connected disease—cannot be inducted.

Deferments are provided for men who were members of organized units of Reserve components at the time of the law's enactment, and also for certain ROTC members and other ROTC members designated by the Secretary of Defense. Certain public officials are also deferred by the law while holding office.

High school students, under the law, may be permitted by their local boards to continue their courses, if their scholastic work is satisfactory, until graduation, or until they reach the age of 20, whichever is first. College and university students satisfactorily pursuing a full-time course at a college, university, or similar institution of learning may have their induction postponed by their Local Boards until the end of the academic year. Duration of the Act is two years.

No one may be inducted after reaching his 26th birthday anniversary. Reemployment rights are established substantially the same as under the old

Selective Service Act, with administration under the Department of Labor. The Act (as passed June 24, 1948) made no provision for the exemption of former members of the merchant marine. Nor does it provide for their deferment by regulation.

In July it was announced that men would be inducted in sequence of birth dates, beginning with men in the 25-year-old bracket and working down into the lower age brackets. It was pointed out, however, that there were relatively few men ages 25 through 22 who would be inducted because of exemption and deferment provisions in the law affecting veterans and men with wives or other dependents, and because of physical standards.

Regulations issued under authority of the Act established 5 classes and sub-classes, as follows:

CLASS I

- Class I-A: Available for Military Service.
- Class I-A-O: Conscientious Objector Available for Noncombatant Service Only.
- Class I-C: Member of the Armed Forces of the United States, the Coast Guard, the Coast and Geodetic Survey, or the Public Health Service.
- Class I-D: Member of Reserve Component or Student Taking Military Training.

CLASS II

- Class II-A: Deferred Because of Civilian Employment (Except Agriculture).
- Class II-C: Deferred Because of Employment in Agriculture.

CLASS III

- Class III-A: Deferred Because of Dependents.

CLASS IV

- Class IV-A: Registrant Who Has Completed Service; Sole Surviving Son.
- Class IV-B: Official Deferred by Law.
- Class IV-D: Minister of Religion or Divinity Student.
- Class IV-E: Conscientious Objector Opposed to Both Combatant and Noncombatant Military Service.
- Class IV-F: Physically, Mentally, or Morally Unfit.

CLASS V

- Class V-A: Registrant Over the Age of Liability for Military Service.

Follows a summary of registration reports, after the initial registration, which was from Aug. 30 to Sept. 18, 1948:

	United States	Territories	Grand Total
Number Registered.....	8,398,713	186,250	8,584,963
Single, Non-Veteran, Non-Father Born 1922-1929	2,048,626	99,187	2,147,813
Breakdown of Single, Non-Veteran, Non-Fathers *			
Born 1922.....	30,455	2,546	33,001
1923.....	103,727	8,007	111,734
1924.....	124,653	9,522	134,175
1925.....	147,087	10,277	157,364
1926.....	171,346	13,355	184,701
1927.....	261,162	14,811	275,973
1928.....	553,726	21,057	574,783
1929.....	656,470	19,612	676,082

* Non-veterans are those who do not qualify for deferment as veterans as defined by the Act. Husbands and fathers are deferred by regulations authorized by the Act. It should be borne in mind, however, that the total does not represent the available manpower pool, as a very large proportion will be found deferrable because of physical condition, occupational status, and other reasons. Those born in 1929 cannot be inducted until after they reach 19. Approximately 1,200,000 pass from one age group to another each year.

—LEWIS B. HERSHEY

SENATE, U.S. See CONGRESS, U.S.

SEYCHELLES. A British colony in the Indian Ocean, 600 miles northeast of Madagascar. Including its dependencies, the colony comprises 92 islands. Mahe (55 sq. mi.), Praslin (15 sq. mi.), Silhouette, La Digue, Curieuse, and Félicité are the chief islands of the colony. The dependent islands include Amirantes, Alphonse, Bijoutier, St. François, St. Pierre, the Cosmoledo Group, Astove Island, Assumption, the Aldabra Islands, Providence, Coetivy, Flat, and Farquhar Islands. Total area: 156 square miles. Total population (Jan. 1, 1944): 33,621. Capital: Victoria (pop. 4,947).

The principal products include coconuts, cinnamon, patchouli oil, maize, sugar cane, mangrove bark, phosphate, and vanilla. In 1947 imports were worth Rs5,087,106; exports Rs4,163,626. Government revenue in 1946 totaled Rs3,376,382; expenditure Rs1,863,549. The colony is administered by a governor, assisted by an executive council and a legislative council. Governor: Dr. P. S. Selwyn-Clarke.

SHIPBUILDING, Merchant. Shipbuilding in the United States in 1948 saw the last merchant vessel initially conceived and contracted for under the wartime shipbuilding program completed and delivered in April, thus bringing to a close the greatest shipbuilding program in world history.

The United States had produced, insofar as number of vessels and total tonnage is concerned, the largest merchant marine ever known. Despite this fact, however, it did not have the balanced type of merchant marine required either for foreign trade or national security. The present merchant marine is neither adequate nor well rounded, because of a critical lack of passenger vessels, combination passenger-cargo ships and vessels for special trades and purposes.

The loss of such types of vessels was heavy during the war and, whereas at the time of the attack on Pearl Harbor, 25 United States lines were operating 133 vessels accommodating over 38,000 passengers, in October 1948, 17 American steamship companies were operating 52 passenger and combination passenger-cargo ships with a capacity of barely 13,000 persons. The age pattern of the United States merchant fleet is abnormal, in that the majority of those vessels suitable for a permanent merchant marine are of substantially the same age and will become obsolete or worn out, as a group, at the same time.

Country	No. of Vessels	Gross Tonnage
United States.....	3,644	26,689,500
British Empire.....	3,103	18,373,800
Norway.....	766	3,856,500
Sweden.....	512	1,719,200
Netherlands.....	448	2,513,600
Panama.....	436	2,721,700
France.....	426	2,356,300
U.S.S.R.....	418	1,299,300
Italy.....	317	1,995,200
Greece.....	218	1,244,000
Other Countries.....	2,182	7,815,400
Totals.....	12,470	70,584,500

As of June 30, 1948, the world tonnage of merchant ships, of 1,000 gross tons or over, amounting to 70,584,500 gross tons, included 12,470 vessels. The United States had approximately 29 percent of the vessels and better than 37 percent of the tonnage. The world tonnage of merchant ships of 1,000 gross tons or over, as of June 30, 1948, was distributed among the maritime nations according to the accompanying table.

The total of 70,584,500 gross tons of vessels in the world fleet is an increase of only 164,000 gross tons since June 30, 1947.

Postwar Construction. The first step in the U.S. Maritime Commission's contemplated postwar passenger liner program, which had been suspended in the summer of 1946 by Administration action, was taken in August 1948, when the Commission awarded contracts for 2 fast passenger liners and 3 combination passenger-cargo vessels. These were the first such contracts awarded on behalf of private shipping operators since 1940, exclusive of a few vessels completed shortly after the war as a part of the wartime shipbuilding program.

In December, bids were opened by the Maritime Commission for a superliner which will, if constructed, not only be the largest vessel under the United States flag but also will be suitable for conversion to a fast troop transport in a national emergency. Legislation intended to amend the Merchant Marine Act of 1936 by making it possible for shipping operators to procure new ships on more liberal terms than heretofore, and thus help initiate the long-range ship construction program essential to the continuance of the shipbuilding industry as a vital factor in the national security, was introduced in both the House and Senate in the second session of the 80th Congress, but failed of enactment in the closing days of the session.

On Jan. 1, 1948, the private shipyards of the United States had under construction or on order 30 seagoing merchant vessels, of 1,000 gross tons or more, totaling 185,818 gross tons and two dredges aggregating 22,672 displacement tons. The seagoing vessels included 12 cargo ships, 4 fruit ships, 3 ore ships, 3 trawlers, 6 oil tankers, 1 ferry, and 1 passenger ship. During 1948, the private shipyards of the nation delivered 28 merchant vessels, each of 1,000 gross tons or over, aggregating 165,300 gross tons as compared with 50 seagoing vessels totaling 286,473 gross tons in 1947.

On Jan. 1, 1949, the private shipyards had on order or under construction 76 vessels amounting to 1,190,430 gross tons and 2 dredges totaling 24,672 displacement tons. Of the 76 vessels 65 were oil tankers aggregating 1,089,000 gross tons. Scheduled for delivery in 1949 are 39 vessels (568,490 gross tons) and 2 dredges while 36 ships (603,940 gross tons) are to be delivered in 1950 leaving 1 oil tanker of 18,000 gross tons for 1951 delivery.

On Nov. 1, 1948, 1,161 vessels, of 1,000 gross tons or over, totaling 8,199,570 gross tons, were on order or under construction throughout the world. The United States shipyards had 14.9 percent of this construction and ranked third both in the number of vessels and in tonnage. World construction was distributed according to the accompanying table.

Country	Number of Vessels	Gross Tonnage
Great Britain.....	532	3,838,572
Sweden.....	198	1,352,555
United States.....	79	1,221,054
Holland.....	72	417,817
France.....	69	378,818
Norway.....	59	213,766
Denmark.....	56	274,918
Italy.....	31	158,554
Canada.....	29	129,881
Belgium.....	18	132,065
Spain.....	18	81,569
Total.....	1,161	8,199,570

A majority of the tankers on order in United States shipyards are the so-called supertankers ap-

proximating 26,000 to 32,000 deadweight tons as compared with the typical war-built T-2 tankers of 16,613 deadweight tons, and will carry 228,000 to 240,000 barrels of oil as compared with 141,000 carried by the T-2 type. Supertankers are in excess of 590 feet in length, which is about 100 feet longer than the T-2. High-pressure-gear steam turbines were designed to give these supertankers speeds of 16 knots and upwards as compared with the 14½ knots of the typical T-2.

The construction of still faster tankers is contemplated by at least one oil company which has opened bids for 5 high-speed supertankers, incorporating national defense features, having a length of 623 feet, beam of 83 feet, and draft of 32 feet. Each would be of approximately 24,000 deadweight tons and 20,000 shaft h.p. with a speed of 20 knots.

The 2 passenger liners, scheduled for delivery in the fall of 1950, are for use in the Mediterranean service. Each liner is 20,500 gross tons, 638 feet long and 80 foot beam with a designed speed of 23 knots and a passenger carrying capacity of 972 persons in three classes of accommodations. The 3 passenger-cargo vessels being built for around-the-world service are scheduled for delivery in mid-1950. They are of approximately 11,453 gross tons each, 536 feet long, 73 foot beam with accommodations for 228 passengers in one class. They are designed for a speed of 19 knots.

The superliner for which bids were opened in December, 1948, is of 48,000 gross tons, 980 feet in length, with accommodations for approximately 2,000 passengers and 1,000 crew members. The speed was not announced but the ship is expected to equal if not exceed the speeds of the *Queen Elizabeth* and *Queen Mary*. A vessel of this type would require approximately 1,200 days to build.

As of Jan. 1, 1949, the United States Navy had on order 20 vessels in 5 private shipyards which included a 65,000-ton superaircraft carrier, 10 destroyers, 4 cruisers, 4 submarines, and 1 command ship.

Conversion. The ship-repairing branch of the industry continued fairly active in 1948. As high as 70 percent of the employees in the industry had been engaged at times in repair and conversion work, which is a condition inverse to prewar operation. Repair and conversion of vessels from wartime adaptations to types suitable for normal peacetime operation continued, but in smaller volume. Ship repair activity normally is devoted principally to drydocking, painting, survey requirements, routine voyage repairs, and emergency or damage repairs, the volume of which depends upon the extent of ship operations. While yards were fairly active during the first three quarters of the year, repair work materially tapered off in the fourth quarter.

The initiation of the tanker and passenger ship programs provided a fairly substantial volume of business for marine specialty companies and other allied industries with marine divisions engaged in the design and manufacture of marine machinery and equipment.

Employment. In the 89 private shipyards of the shipbuilding and ship repairing industry of the United States reporting to the Council, employment dropped from 103,445 at the beginning of 1948 to 82,000 at the end of the third quarter ending September 30. Of the total employed at that date only 25,000 were engaged in new ship construction as compared with 28,932 at the first of the year. In repair work, 57,000 were engaged as compared with 74,513 at the beginning of the year.

The President's Advisory Committee on the Merchant Marine in its report of November, 1947, recommended as essential for national security, an absolute minimum employment in new ship construction in the shipbuilding industry of 60,000 persons for both private shipbuilding yards and naval shipyards. Based on the average distribution of employment between private shipyards and naval shipyards over a period of years, this minimum would be equivalent to an employment of 42,000 in the private shipbuilding yards. Hence shipyard employment still remains substantially less than the minimum recommended as essential for national security. —H. GERRISH SMITH

SHIPPING, Merchant. At the close of 1948 world shipping began to assume stability after having gone through the immediate postwar readjustment. The majority of foreign nations were well on their way towards achieving the goal not only of replacement of lost tonnage, but also that of considerable postwar expansion.

Whereas most American-flag steamship companies increased the size of their privately-owned fleets through the acquisition of the most modern types available, at the same time these companies gradually divested themselves of those ships under charter from the U.S. Maritime Commission. The result is that the active, privately-owned fleet now includes vessels that are greater, both in number and in tonnage, than the 1939 counterpart. From the standpoint of speed, age, and efficiency, the present vessels are far superior to the prewar ships which were rapidly approaching obsolescence and lacked the power and handiness required.

The accompanying table illustrates the trend which became apparent by year's end of the dwindling fleet of vessels under bareboat charter to the Maritime Commission, as trade for bulk and other cargoes declined and competition with foreign shipping grew keener.

Trade	Number of vessels	
	Sept. 15, 1948	Feb. 28, 1949
Bulk cargo (For.) Est.	344	280
Berth Service (Frt. For.)	121	80
Berth Service (Pass. For.)	8	8
Coastwise & Interoceanic	51	41
Alaska	18	3
Philippine Rehabilitation	10	9
Total	552	421

The greatest shipbuilding program in American maritime history was brought to a close early in April of 1948 when the final merchant vessel initiated under the war-construction program, the liner *President Wilson*, was completed and delivered. See SHIPBUILDING, MERCHANT.

Foreign shipyards during the year 1948 reported even greater gains in the postwar race for new tonnage, with the United Kingdom still the world's greatest postwar builder. As a result of the oil-tanker construction program, the United States ranked third in the gross tonnage of ships on order or under construction in the private shipyards of the world, according to returns compiled by the Shipbuilders Council of America. Great Britain is building 46.8 percent of the tonnage consisting of 532 vessels aggregating 3,838,572 gross tons. Sweden is second with 16.5 percent or 198 ships totaling 1,352,555 gross tons. The United States follows with 14.9 percent and is building 79 vessels of 1,221,054 gross tons.

The returns compiled by Lloyd's Register of shipping, which take into account only vessels of

100 tons gross and upwards the construction of which has been commenced, show that there was a total of 1,135 vessels aggregating 4,203,873 gross tons under construction in the world in 1948. Of this total there were 439 merchant vessels of 2,208,349 gross tons under construction in Great Britain and Northern Ireland. Of the remainder of new tonnage under construction throughout the world's shipyards, the Netherlands had 111 large vessels under construction and France was building 106. The various British dominions were constructing 68 ships. In Spain there were 76 under way and 69 were reported from Italian shipyards. Scandinavian yards reported a good share of new tonnage with 65 ships in Sweden and 60 in Norway. In tonnage, following Great Britain with her substantial lead, comes France with 399,612; the United States, 289,612; Sweden, 263,625; Italy, 220,352; and the Netherlands with 211,327 tons.

Oil-tanker construction throughout the world assumed even greater proportions as the demand for larger vessels became evident. Giant-sized super tankers were ordered to serve the longer hauls from new sources of supply far removed from refinery and market areas. Now under construction or contract in the United States are 58 new super tankers, ranging from 26,000 to 32,000 deadweight tons. Over one-half of all tonnage under construction at the year's end was tanker tonnage.

Of the 406 tankers under construction at the close of 1948, 192 were building in Great Britain and Northern Ireland; 92 in Sweden; 68 in the United States; 18 in Holland; 9 each in Belgium, Denmark, and France; 4 in Norway; 2 each in Italy and Spain; and 1 in Canada.

At the close of 1948 there were 1,584 merchant vessels representing the total active American Merchant Marine fleet, of which there were 1,216 privately-owned ships, and some 354 American war-built ships under charter by private operators from the Maritime Commission. These ships were primarily engaged in transporting Marshall Plan relief and bulk cargoes. Many also served in the military trade supplying our armies of occupation in Germany and Japan. The European Recovery Act, passed in 1948, provided that at least 50 percent of ERP cargoes be transported in American bottoms. Average participation by U.S. flag shipping fell below this mark somewhat towards the close of the year.

While the American Merchant Marine may have dropped in active tonnage from 26 million to 18 million deadweight tons in the course of a year, considerable progress was made toward achieving stability. This was effected by an increase of more than 2 million deadweight tons in the privately-owned fleet, with the total strength of the permanent fleet given as 1,216 vessels at the year's end. The National Defense Reserve fleet, including its several temporary anchorages, consisted of approximately 1,866 vessels. On Mar. 1, 1948, transfer of ships under the ship sales program was limited to U.S. citizens, with those not sold added to the reserve fleet.

Able Seaman	Dec. 31, 1948	Able Seaman	Dec. 31, 1948
United States	\$226.01 *	Greece	74.00
Canada	170.00	Denmark	71.19
United Kingdom	96.60	Italy	35.90

* Since Jan. 1, 1941, there has been an increase of 174 percent in an Able Seaman's basic monthly wages in the United States.

During 1948 American labor played a big role in the operation of American ships, tying up vessels for 95 days on the West coast and 18 days in Atlantic coast ports, while operating costs

reached even higher peaks. The real and relative increase in seamen's basic monthly wages is illustrated in the accompanying table.

New passenger liners (of 13,000 tons or more) launched or completed in the world during 1948 include the following vessels: *Caronia* (U.K.), 34,000 gross tons; *President Wilson* (U.S.A.), 22,000 gross tons; *Parthia* (U.K.), 13,350 gross tons.

Several new moderate-sized foreign passenger vessels were completed over this period, as were 4 new American passenger liners. The cruise picture, now recovering from the difficult postwar adjustment period, has brightened considerably. Many new special cruises were scheduled by both American and foreign lines at the year's end and prospects for 1949 showed even greater cruise offerings in the making. Famous liners, still undergoing repairs or reconversion throughout the world's shipyards, include the following: *Liberté* (formerly the *Europa*, French), 49,746 gross tons; *Ile de France* (French), 43,000 gross tons.

America's inland waterways continued to expand in activity and during 1948 reported a gain of approximately 30 percent in traffic, as more and more industries turned to the barge carriers for every possible saving in transport costs. A record-breaking season of shipping was reported for Great Lakes movements in 1948 with heavy shipments of iron ore and coal.

—FRANK J. TAYLOR

SHOOTING. John W. Schenk of Sharpsburg, Pa., won the Grand American Handicap—top prize of trapshooting—at the 49th championships at Vandalia, Ohio, in August. Mrs. Julius Petty of Stuttgart, Ark., took the equivalent award for women.

Among the other major victors were E. W. Castenado of Shreveport, La., champion of champions; Mrs. Moselle Cameron of Denver, Col., women's champion of champions; Silas M. Simmons of Natchez, Miss., open; Mercer Tennille of Shreveport, doubles; Mrs. Lela Hall Frank of Sierre Madre, Calif., women's doubles; John A. Broughton of Ferguson, Mo., North American clay target; Mrs. Frank, women's North American clay target; Robert E. Reese of Geneseo, Ill., junior; Forrest McNeir of Houston, Texas, veterans; Paul Kohler, Tekamah, Neb., national Class AA.

The big prize in national skeet-shooting competition at Las Vegas, Nev., in September was annexed by Sgt. Glen Van Buren of Fort Worth, the Texan also winning the national service title. Mrs. R. H. Martin of San Antonio, Tex., led the women. Pete Read of San Angelo, Tex., was crowned champion of champions and George Glass, Jr., of Midland, Tex., was tops among the juniors. Alex Kerr of Beverly Hills, Calif., was high over-all king, with Tom San Filippo of San Francisco, Calif., taking the 20-gage laurels.

Harry Reeves of Detroit, Mich., won the national pistol championship, while the King of the national riflemen was Arthur Cook of Washington, D.C., who also triumphed in his specialty at the Olympic Games. See OLYMPIC GAMES.

—THOMAS V. HANEY

SIAM. A limited monarchy in southeastern Asia, west and southwest of French Indochina and separated therefrom by a border line which in 1948 was an issue of dispute between the two countries. Officially called Thailand from 1939 to 1945, it was renamed Siam after liberation from the Japanese in September, 1945. Ruler: King Phumiphon Adundet (born Dec. 5, 1927), proclaimed King on June 9, 1946, following the death of his brother, Ananda.

Area and Population. Comprising 200,148 square miles, the land supported a population of 17,256,325 (by census of May, 1947), of whom 2,500,000 were Chinese and 650,000 were Malaysians. Population of chief cities in 1947 was: Bangkok (capital), 884,197; Khonkaen, 590,664; Chiangmai, 534,628; Chiang Rai, 481,621.

Education and Religion. Sixty percent of the adult population is illiterate. Primary education is free and compulsory. According to the 1947 census, Buddhism claimed 88.5 percent of the population; the Moslem faith, 4.3 percent; Christianity and others, 7 percent.

Production. Siam is essentially a producer of raw materials. The chief products are: rice, 4,500,000 metric tons in 1947-48; rubber, 53,430 metric tons in 1947 (24,600 in 1946 and 42,480 in 1939); teak, 62,000 tons (1947); tin, 1,410 metric tons in 1947 (24,600 in 1946 and 42,480 in 1939). Other leading products are tobacco, cocoanuts, pepper, cotton, and cement (59,300 metric tons in 1947 as against 116,000 in 1939). Tungsten, gold, silver, coal, iron, lead, antimony, copper, rubies, and sapphires are indigenous. Manufacturing is largely restricted to lumber and rice milling.

Foreign Trade. For the calendar year 1947, imports were valued at 1,390,387,840 baht (as against 548,400,000 in 1946 and 129,600,000 in 1939); exports were valued at 946,100,009, excluding tin (as against 456,000,000 baht in 1946 and 204,800,000 in 1939). Imports for 1947 included about \$34 million in gold leaf and bullion and \$15 million in war surplus charged against United States and Indian credit accounts.

Finance. Budget revenue for 1948 was estimated at 1,390 million baht; expenditure, 1,280 million baht. For 1947, estimated revenue was 685 million baht; expenditure, 962 million baht. In 1948 the baht was officially tied at 10.05 to the U.S. dollar, but fluctuated around 20 baht to the dollar in the open market.

Transportation. Railway trackage in 1948 totaled 2,040 miles; length of motor highways, 2,675 miles. With 14 international airlines using its facilities, Bangkok (in 1948) was a regular stop on weekly round-the-world flights touching, among other places, San Francisco, Tokyo, Shanghai, Hong Kong, Calcutta, and New York.

Communications. Bangkok is the only area served by a telephone exchange, which (in 1947) handled about 5,000 telephones. There were 278 telegraph offices, with 9,622 lines, in 1939.

Government. The constitution of Dec. 10, 1932, transformed Siam from an absolute to a limited monarchy. Nominally the King exercises executive power through a State Council (Cabinet) and legislative power through an Assembly of 182 members, to which the State Council is responsible. Half the members of the Assembly were elected by popular vote and half nominated by the Crown. In 1946, a constitutional revision created an Upper House, in addition to the Assembly. At the same time, the members of the Lower House became entirely elective as the system of nominating one-half the Assembly was abolished.

Events, 1948. Undismayed and largely unaffected by the reign of revolutionary terror that culminated in the overthrow of the government late in 1947, the people of Siam continued to display unusual capacity throughout all of 1948 to recover from the economic stagnation that settled over the country during and after the Japanese occupation. Rice production and exports skyrocketed to all-time highs; Siamese rubber and tin, formerly siphoned through British Malaya for world consumption,

were exported in huge proportions directly from Siamese ports and principally to the United States for stockpiling incident to world uneasiness. Against this co-prosperity established with the western hemisphere, and despite the revolutionary, unstable character of the government, the waves of communism awash in southeast Asia were ineffective. And against this background, threats and acts of military aggression from Indochina were equally ineffective.

Political Upturns. Attempting to legalize the powers it gained by revolution in 1947, the rebel government of Premier Khuang Abhaiwong began the year 1948 by ordering general elections within the framework of the democratic constitution it had flaunted only two months previously (see *YEAR BOOK, Events of 1947*). These elections were held early in January and presented the rebel (called Democratic) party with 54 out of a possible 100 seats in the new Parliament, thus defeating the Tharmatipat party of Field Marshal Luang Pibul Songgram, wartime puppet dictator under the Japanese and co-leader of the coup that placed Abhaiwong originally in power. Discontented with the outcome, Marshal Songgram organized a bloodless counter coup d'état, with military support, that forced Abhaiwong to resign (April 7), and installed Songgram as leader in his place (April 8).

Although as Premier before and during the Japanese occupation, Marshal Songgram had instituted a strong-arm dictatorial rule, almost on the Japanese pattern and designed for Japanese approval, his latest accession to power was accompanied by loud vociferations of democratic faith and principle. He quickly oriented his government toward cordial friendship and cooperation with the United States and Great Britain and against the Soviet-Communist bloc reaching out over Asia.

Preoccupied with the benefits of unusual prosperity, the people of Siam paid sparse attention to the political upturns and somersaults that kept the capital, Bangkok, agog. Among the military officers, aristocrats and upper strata of intelligentsia, however, a feeble ferment of dissatisfaction was visible throughout the year. On more than one occasion the government was alerted to forestall a revolution. During the early evening of October 1 a group of insurrectionaries stormed and occupied the offices of the Ministry of Defense and established a rival government until ejected and captured by Loyalist troops a few hours later on October 2. Forty alleged ringleaders of the plot arrested by the Songgram government included a brother of Nai Pride Phanomyong, erstwhile Premier who fled the country in November, 1947, and who was being tried in absentia in 1948 for the alleged murder of the late King Ananda Mahidol on June 9, 1946.

Economic Gains. Phenomenal gains in agricultural and business production were established in Siam in 1948. The rice crop, basic staple of the land, aggregated an export total of 1,500,000 metric tons, exceeding by 800,000 tons an earlier official estimate for the year. The hunger that stalked the country during 1947 was virtually eliminated. Acquiring big dollar balances by virtue of American purchases of rice for China, Japan, and Korea and of tin and rubber for stockpiling purposes, the country became an important center of postwar United States economic and political interest.

American business flourished and expanded without parallel in that part of the world. Moving in a sphere that for 50 years before the Japanese conflict was virtually a monopolistic preserve of British interests, the dominant American position

was reflected in the number of American business enterprises established in Bangkok, a number that increased from one in 1945 to 30 in 1948. A prime resource in American accumulation of tin and rubber, the country became the chief supplier of tin ore for the war-built tin smelter works at Texas City in 1948.

The tempo of business activity brought renewed pressure on the Siamese government to expand and modernize the transportation facilities of the country, and on October 13 it was announced that orders for £5 million of railway stock were being placed with the British government by emissaries of Siam.

Communist Pressure. Encouraged by the series of revolutionary plots that overthrew elective government and mocked the democratic processes guaranteed by the Constitution, a small but volatile group of Communists sought throughout 1948 to increase the scope of Soviet influence in the land. Bangkok and other strategic centers were heavily garrisoned to thwart what was officially described on July 25 as "threatened Communist violence and sabotage." Almost simultaneously the government announced the presentation to the Parliament of a bill to outlaw the Communist party, and stated that 61 Chinese Communists had been arrested for "participation in illegal secret societies." The total number of Communists in the country was estimated at 50,000, almost exclusively composed of Chinese nationals or expatriates. On July 27, the Kuomintang, governing party of China, was officially banned by Prasit Chumphinit, Assistant Secretary of the Interior Ministry, on the ground that it violated a Siamese law prohibiting alien societies from engaging in political activity.

Strife with French Indochina. The smoldering border dispute with French Indochina, which was only partially settled with the cession of the Loatian territory to Indochina in 1947, continued to flare throughout the past year. Armed troops faced each other across the disputed line and minor incidents, both real and fanciful, provided fuel to keep the tension alive.

Siamese provincial officials reported on October 21 that 100 French soldiers had crossed the Siamese border on October 18 and had killed a police constable and two Siamese civilians. Siamese police were dispatched to the scene and after an hour-long skirmish the French troops withdrew across the Mekong River. The incident occurred just south of the Loatian territory. The possibility of further bloodshed was reflected in a report from Bangkok (October 23) that Great Britain had agreed to re-equip eight Siamese divisions, and in a further report (December 7) that Siamese authorities had called up thousands of reservists for three months' special training in the use of modern weapons and commando tactics.

Opium Curbs. Plans to outlaw the cultivation of opium poppies and to require the registration of all opium addicts were announced by the government on August 29. A bill to this effect was subsequently introduced in the Parliament. It was estimated that the country's opium trade aggregated \$6 million annually and that there were 300 licensed and twice that many unlicensed opium dens throughout the land, with 20,000 addicts in Bangkok alone.

—HAROLD J. COOPER

SIERRA LEONE. A British West African colony (271 square miles) and protectorate (27,669 square miles, including those areas of the colony treated as protectorate). Total area, 27,925 square miles. Population (1940): 2 million (estimated). Cap-

ital: Freetown (86,000), an important naval base.

Production and Trade. The chief agricultural products are palm kernels and oil, kola nuts, piassava, ginger, rice, millet, cassava, and groundnuts. Mineral products include diamonds, gold, iron ore, and chromite. Foreign trade (1946): imports £3,961,384; exports £2,139,624. The chief exports were diamonds, iron ore, palm kernels, and chromite.

Government. In 1946 revenue totaled £2,195,474; expenditure £1,833,483. Net public debt (Jan. 1, 1945): £1,369,684. The colony and protectorate are administered by a governor, assisted by an executive council (nominated) and a legislative council of 23 members, 3 of whom are paramount chiefs of the protectorate. In addition, there is a protectorate assembly, which was convened for the first time on July 23, 1946. This assembly is under the chairmanship of a chief commissioner and is the recognized body empowered to advise the government on matters pertaining to the social, political, and economic development of the inhabitants of the protectorate. It includes elected and nominated members. Governor: G. Beresford Stooke.

SILVER. Production of silver in the Western Hemisphere is estimated at 121 million fine oz. (1947: 121.8 million oz.). Mexico was the principal producer with 46 million oz. (1947: 49.2 million oz.); followed by the United States, 37.7 million oz. (1947: 36.1 million oz.); Canada, 16 million oz. (1947: 13.5 million oz.); and Peru, 8.5 million oz. (1947: 10.2 million oz.). Industrial demand was at a very high level. Consumption by the arts and industries in the United States is estimated at 110 million oz., an increase of 10 percent. Two-thirds of the total was consumed for flatware and hollowware. Use of sterling silver for jewelry increased, as well as silver used for industrial purposes, principally electrical contacts and brazing alloys. Allocations for authorized uses by the United Kingdom were 14 million oz. Canadian industrial uses required 4.5 million oz., while Mexico used only 800,000 oz. for industrial purposes. Purchases of silver in New York by foreign buyers were severely limited by exchange restrictions. Foreign sellers willing to accept sterling were attracted to the London market by somewhat higher silver prices. The Bombay market continued to operate on a completely internal basis. Prices on the New York market ranged from the high of 77.75 cents per troy oz. to the low of 70.00 cents at year-end. Domestic production was purchased by the Treasury at 90.50 cents per fine oz. under the Act of July 31, 1946. Treasury holdings of silver at the year-end are estimated at 2,782,700,000 oz., an increase of 37.2 million oz.

—JOHN ANTHONY

SINGAPORE. A British island colony at the southern tip of the Malay Peninsula. Area (including its dependencies—Cocos, or Keeling, Islands and Christmas Island): 220 square miles. Population (1947 census): 942,756, including 728,523 Chinese, 73,802 Malays, 71,300 East Indians, 8,790 Europeans, and 9,012 Eurasians. The capital city, Singapore, situated at the southern end of the island, is the most important commercial emporium of southeastern Asia. Principal products of the island are coconuts, tapioca, cacao, aloes, nutmegs, gambier, and a great variety of fruits and vegetables. Phosphate of lime is exported from Christmas Island. Singapore is the center of a tremendous transshipment trade—its imports and exports include cotton piece goods, copra, rice, tin, silks, tobacco, spices, pe-

troleum, sugar, coffee, pepper, opium, gambier, coal, fish, rattans, skins, and rubber. The manufactures include white pepper, tapioca, sago, gambier, vehicles, tools, furniture, ships, canned pineapple, and biscuits. Foreign trade (1946, April–December): imports \$571,847,802; exports \$440,970,592.

Government. Finance (1946): revenue \$331,524,000; expenditure \$348,511,000. Formerly one of the Straits Settlements, Singapore was constituted a separate colony on Apr. 1, 1946. During the period of transition the government is administered by a governor, assisted by an advisory council of 7 official and 10 nominated unofficial members. A legislative council was set up following elections on Mar. 20, 1948. The legislature will have 23 members, 10 official and 13 unofficial (9 elected and 4 nominated). Governor and Commander in Chief: Sir F. C. Gimson (appointed Jan. 29, 1946).

SKATING, Ice. Barbara Ann Scott of Ottawa dominated all rivals in figure skating, and then turned professional after the campaign. Canada's pretty ice ballerina started her string of sparkling conquests in the European championships at Prague, then went on to capture the Olympic title, retain her world crown at Davos, Switzerland, and wind up the season with a victory in the Canadian tests. See OLYMPIC GAMES.

Dick Button of Englewood, N.J., shone in the senior men's competition, sweeping European, Olympic, world, and national honors. Micheline Lannoy and Pierre Baugniet of Belgium won the world pairs title at Davos, while Andrea Kekessy and Ede Kiraly of Hungary triumphed in the pairs event at Prague.

Women's honors in our national meet were kept by little Gretchen Merrill of Boston, Mass., the pairs title going to the sister-brother team of Karol and Peter Kennedy of Seattle, Wash. The gold dance championship was won by Lois Waring and Walter Bainbridge of Washington, D.C., while the fours crown went to the St. Paul Figure Skating Club.

Speed skating was featured by close competition. Champions in the world meet were O. Lundberg, Norway, all-around; Konstantin Kurdjavitset, Russia, 500 meters; John Werket, United States, 1,500; Kees Broeckman, the Netherlands, 5,000 and 10,000. North American title winners were George Fischer, Chicago, outdoors; Al Broadhurst, Roslindale, Mass., indoors; Betty Mitchell, Winnipeg, women's outdoors; Loraine Sabbe, Detroit, Mich., women's indoors. Fischer and Miss Sabbe also took top awards in the national championships. Victors in the European title tests were Reidar Liaklev, Norway, all-around; Bob Fitzgerald and Del Lamb, United States, tied at 500 meters; Broeckman, 5,000; and Liaklev, 10,000.

—THOMAS V. HANEY

SKIING. Rugged weather and improvements for Winter sports in many municipal and national parks throughout the United States added greatly to the popularity of skiing for recreation, while interest in Olympic competition gave this ever-growing sport tremendous impetus. See OLYMPIC GAMES.

Swedish stars just about dominated the men's events in most of the major European meets, as well as the Winter Olympic Games, although followers of the sport on this side of the Atlantic showed a definite improvement in competition.

Jack Reddish of the Alta Ski Club of Utah, star of the U.S. Olympic squad, made a practical sweep

of the major honors in North American events. One of the features of a crowded competitive schedule was the North American championship meet held at Aspen, Colorado, in March. Reddish won the downhill, slalom and combined slalom, open and amateur honors in that meet, the Class A jump being won by Hans Karstein of Oslo, Norway. Jack Wahlburg of Berlin, N.H., was the cross-country victor and Reidar Andersen of Oslo took the combined jump and cross-country crown. Maud Banks of Aspen, Colorado, swept the women's North American titles, taking the downhill, slalom and combined, open and amateur events.

Reddish added three titles to his long list of achievements for the campaign in the national championships, taking the downhill, slalom and combined, open and amateur laurels. Other winners were Arne Ulland of Oslo, Class A jumping; Trygve L. Nielson of Madison, Wis., Class A cross-country, and Robert Wright, St. Lawrence University, combined jumping and cross-country.

Feminine winners in the national meet were Janette Burr of Seattle, Wash., downhill, open and amateur; Ann Winn of the University of Utah, slalom, open and amateur, and Suzanne Harris of Sun Valley, Idaho, combined slalom, open and amateur.

Following the Olympic Games, stars from eight nations took part in the first international meet for the Hannes Schneider Trophy at St. Anton Am Arlberg in Austria, and Reddish won added glory there when he set a new record of 2 minutes, 38 seconds for the 2,600-foot Osthang Galzig slope in capturing the downhill race.

Other outstanding events during the busy campaign included major meets at Oslo, where Olle Dalman and Ake Nilsson of Sweden were the shining stars; the Lauberhorn races at Wengen, Switzerland, and the Swiss women's world meet at Grindelwald.

—THOMAS V. HANEY

SLOAN FOUNDATION, INC., Alfred P. Incorporated in 1936, the Foundation aids accredited schools and colleges in developing new "patterns" in economic education. On Dec. 31, 1947, its capital assets were valued at \$9,981,846. Up to the same date, the Foundation had made grants and donations amounting to \$8,321,117. At present the Foundation is enabling colleges and universities to promote popular economic education through radio, recordings, motion pictures, books and pamphlets, fellowships, and class instruction. Among such projects aided by the Foundation are: the University of Chicago Round Table of the Air, a weekly radio discussion of economic phases of national and international questions; and the New Tools for Learning Bureau of the New Jersey State Teachers College at Montclair, New Jersey, which produces dramatic radio programs illustrating economic institutions and principles for broadcasting by transcription.

In addition, the Foundation is presently providing support for seminars on current economic problems and related subjects at American University and at the Universities of Denver, Southern California, and California. Members of these seminars include graduate students and community leaders.

In the field of applied economics, the Foundation has aided the Universities of Kentucky, Florida, and Vermont in carrying on experiments designed to help low-income groups. The experiments aim to discover whether solely through instructing school children in simple, inexpensive ways of improving diet, housing, and clothing, the community level of living can be raised. To enable teacher-

training institutions throughout the country to apply the results of this experimentation, special grants have been made to the American Association of Colleges for Teacher Education.

In recent years the Foundation has made grants totaling \$4,562,500 to Memorial Hospital for the erection and maintenance of the Sloan-Kettering Institute for Cancer Research. Construction of this Institute has been completed and it is now in operation. President: Alfred P. Sloan, Jr. Executive Director: Arnold J. Zurcher. Offices: 80 Rockefeller Plaza, New York 20, N.Y.

SMITHSONIAN INSTITUTION. The affairs of the Institution are administered by a Board of Regents consisting of the Vice President, the Chief Justice of the United States, three members of the Senate, three members of the House of Representatives, and six citizens other than members of Congress. The executive officer of the Institution is the Secretary, at present Dr. Alexander Wetmore. The Institution now has 10 branches, as follows: United States National Museum, National Gallery of Art, National Collection of Fine Arts, Freer Gallery of Art, Bureau of American Ethnology, International Exchange Service, National Zoological Park, Astrophysical Observatory, National Air Museum, and Canal Zone Biological Area.

The Institution was founded in 1846 through the bequest of James Smithson, of England, for the "increase and diffusion of knowledge among men." This purpose is carried out chiefly by means of scientific researches, explorations, and publications.

In 1948 many fundamental investigations were in progress in the fields of anthropology, zoology, botany, geology, and astrophysics. Scientific field work in connection with these researches was carried on in Arnhem Land in Australia, the Antarctic, Bikini, the Persian Gulf, Colombia, and Panama, besides many localities in the United States.

Among the 500,000 new specimens accessioned in 1948 by the U.S. National Museum, the most outstanding was the original Wright Brothers airplane of 1903, presented to the United States of America by the heirs of Orville Wright on Dec. 17, 1948. Visitors to the Smithsonian buildings totaled 2,293,499 for the fiscal year 1948.

The River Basin Surveys, a unit of the Bureau of American Ethnology, investigated 1,576 archeological sites that will be inundated through dam construction in river basins in various parts of the country. Of these, 250 were recommended for prompt excavation in order to save valuable archeological data from oblivion.

SOCIALISM. The Socialist movement throughout the world divided increasingly in the year 1948 into two camps. The Socialist parties in democratic countries became, for the most part, ever more unified in their opposition to totalitarian communism and their refusal to join with Communist parties in united-front activities. The Socialists in the Russian-satellite countries, who had entered into electoral pacts with Communists, were, on the other hand, either merged into a single party dominated by Communists or were permitted to retain their own organizations only at the price of the loss of practically all independence of action.

As in former years, the Socialist movement had its most solid base in the countries of Western and Northern Europe and in Australasia. The British Labour Party remained the most important of the democratic Socialist parties of the world, and continued throughout the year to carry out its five-year program of socialization. In Asia several

Socialist and semi-Socialist governments were functioning or fighting for survival in the Indies.

In Great Britain, the Labour Government on Jan. 1, 1948, took charge of the operation of inland transportation following the passage of "the largest and most extensive socialization measure," according to Minister Barnes, "ever presented to a free, democratic Parliament." On July 5, the Government put into effect its National Insurance Act of 1946 which provided an all-embracing system of insurance for every person in the country over school-leaving age. It likewise began the operation of the National Health Act, which made available to every man, woman, and child in Great Britain free medical attention, hospital and specialist services, surgical appliances, and drugs.

In November, the Government introduced a measure for the nationalization of the iron and steel industry. This act brought into public ownership all firms producing 50,000 or more tons of iron ore a year, or 20,000 or more tons of iron and steel. All the firms taken over retained their names and legal entity. Labor during the year likewise passed a statute which, in the future, would prevent the House of Lords from blocking legislation passed by the House of Commons for more than a 12-month period. In the death of Sidney Webb, it lost one of the most outstanding intellectual leaders.

On the European continent, Socialists continued in control of the three Scandinavian governments. In Sweden, an election for members of Parliament was held on September 19, resulting in the election of 112 Social Democrats. While its popular vote was increased by 265,000 over that of 1944, its parliamentary representation was reduced by 3. The Liberals, the next largest party, secured 57 seats, a gain of 30; the Communist Party, 9, a loss of 6. Following the election, the Social Democratic Party continued as the Government under the leadership of Premier Tage Erlander.

The most extensive experimentation in new public undertakings in Scandinavia during 1948 was in Norway, where the Government since the end of the German occupation has greatly increased its control over electrical, aluminum, and chemical production; has initiated state monopolies in the importation of grains, solid fuels, and medical supplies, and has undertaken the operation of a nation-wide chain of agricultural machinery stations.

In Finland, despite its proximity to Russia, the Social Democrats in the parliamentary elections secured 54 out of 200 seats, a gain of 6. Although the Agrarians won the largest number of seats (56), the Socialists obtained the largest popular vote, and, following the elections, formed a cabinet consisting of 15 Socialists and 1 Independent.

In France, during the year, the Socialists continued with the third largest representation in the House of Deputies, 103 out of 618. The party refused support to the Schuman Cabinet in July over a dispute regarding the wage-price relationship. Five Socialists joined the country's cabinet in early September headed by Premier Henri Queuille, Radical Socialist, and composed of 3 Radical Socialists, 5 Socialists, 5 Popular Republicans, 1 Liberal Republican, and 1 Union of Resistance member. In the elections for the Council of the Republic in early November, Socialists secured 62 seats out of 309 (with 11 not reported); the DeGaullists taking first place—and the Communists dropping down from a representation of 84 to 21. The Socialist Party throughout the year gave its support to the Marshall Plan, while the

Communists, through the party and the Communist-controlled French Confederation of Labor, vigorously opposed it.

In Belgium, Paul-Henri Spaak, head of the Belgian Labor Party, headed a coalition cabinet except for a few weeks during the year. On November 19 he resigned from the premiership during a dispute with Justice Minister Struye over the latter's alleged leniency toward convicted Nazi collaborators, but on November 26 formed a new cabinet of Socialists and Social Christians. One of his first acts was the appointment of a commission with a view toward the settlement of the monarchical question. He declared that the question of the punishment of traitors would be dealt with in agreement with Parliament.

In Italy, the split between the Socialist Party, which had closely cooperated with the Communists, and the Socialist Workers Party under the leadership of Giuseppe Saragat became permanent. The Socialist Party under Pietro Nenni formed a Popular Front with the Communist Party in the April elections and together this Popular Front won 30 percent of the seats in the Lower Chamber, although of 178 seats captured by the two parties, the Socialists secured but 36. The Saragat Socialists received 7 percent of the votes cast and won 33 seats. The Christian Democrats under DeGasperi formed the Cabinet, in which the Saragat Socialists were represented by several members. In July, the Socialist party in its convention criticized Nenni for following too closely the leadership of the Communist Party. It also accepted the Marshall Plan "as a reality it is useless to fight."

In Austria, in Central Europe, Dr. Karl Renner, Socialist, remained President of the Republic, and Socialists and the People's Party still divided political power almost equally. The Socialists remained in control of the strong trade union movement.

In Germany, Socialists in the Russian sector became completely merged with the Communists as an organized force in the Socialist Unity Party. In the western sector, the Social Democrats in the late fall won a majority of seats in the municipal council of the non-communist portion of Berlin; controlled the government in lower Schleswig-Holstein, and, in other parts of the British, French, and American zones, competed with the Christian Democrats for political leadership.

In Switzerland, a Socialist, Ernest Nobs, was elected by Parliament, in December, President of the Swiss Confederation, the first time a member of the Social Democratic Party ever held that office.

Throughout Europe the democratic Socialists held several international conferences to consider their common problems. In December, the Committee on International Socialist Conferences delivered an ultimatum to the Italian Socialist Party to terminate its association with the Communist Party of Italy by the middle of March, 1949. The Committee maintained that it had failed to understand the "fundamental incompatibility of democratic socialism and totalitarian communism." Unless it gave "clear proof" of its willingness to reunite with the Right Wing of the Italian Socialist movement on the basis of a program acceptable to international socialism, the party would be expelled from the international organization.

On the American continent, the Cooperative Commonwealth Federation of Canada, among the Socialist parties, made substantial progress. It increased its parliamentary representation from 28 to 31 in the year's by-elections. The party, under the leadership of Prime Minister T. C. Douglas,

was again returned to power in Saskatchewan as a result of a June election in which the C.C.F. won 31 out of 50 seats in the provincial legislature against the combined opposition in most districts of the Liberal and Progressive-Conservative parties. In Ontario the party increased its representation in the provincial legislature from 8 to 22, and again became the official opposition.

In the United States, Norman Thomas ran for the sixth time as the party's standard bearer for President of the United States, with Tucker Smith as candidate for Vice President. Thomas and Tucker received a vote of 140,260 as compared with a vote of 80,426 in 1944. In Milwaukee, Wis., a Socialist, Frank P. Zeidler, was elected mayor. In Bridgeport, Conn., the party, headed by Mayor Jasper McLevy, voted to reaffiliate with the Socialist Party U.S.A. The Socialist Party U.S.A. throughout the year urged the formation of an independent party of industrial workers, farmers, and others along lines similar to that of the Canadian C.C.F.

In Latin America, Socialist progress was impeded by restrictive legislation in several countries, especially in Venezuela and Peru, where military coups ousted democratic governments, and in Argentina, where the Peron dictatorship strengthened its hold on the country.

In the East, the Labour Government in Australia continued in office with a representation in the lower house of Parliament of 43 out of 75. During the year the Government initiated legislation empowering the Government-owned Commonwealth Bank to acquire the assets and liabilities of all privately-owned banks, some of which were British-owned. In August, several of the provisions of this act were declared invalid, and an appeal was taken to the Privy Council in London. In New Zealand, the Labour Government, backed by a slim majority of 42 out of 80 parliamentary members, continued to carry out its postwar program of social change. During the year, the representatives of both countries played conspicuous parts in the councils of the United Nations.

In Japan, Tetsu Katayama, leader of the Socialist Party, which held the largest representation in the Japanese Lower House (140 out of 466), continued as Premier until March, 1948, when he resigned during a controversy over the raising of postal and railway rates as a means of raising the budget. In the coalition government of Premier Ashida that succeeded, several Socialists served until its dissolution in October. The party refused to join the succeeding Yoshida conservative Cabinet and joined the opposition parties. The controversy within the party as to how actively its leadership should work legislatively for a program of socialization resulted in the secession of several Socialist Diet members.

In India, despite the Socialist persuasion of Prime Minister Pandit Jawaharlal Nehru, leader of the Congress Party, the Socialist Party of India broke more clearly from the Congress Party during the year, and, in its April convention, instructed all of its members to withdraw from the Congress Party and from any government job to which they had been elected on the Congress ticket. The party congress declared that there were anti-democratic forces in the Congress Party, and that the Socialist Party was needed as a bulwark of democracy. Distinguishing itself sharply from the Communist Party, it declared that the Communists were "a grave source of danger, because they pursue their ends with little regard to the stability and integrity of the state." During the year Socialists helped in

the formation of an Indian Labor Congress.

The Indian Government during the year adopted a plan for nationalization, and in April declared its intention to run the railways, generate and distribute electricity, manufacture arms and control atomic energy, and, except in special cases, be exclusively responsible for the establishment of new undertakings in the fields of coal mining, iron, steel, and aircraft manufacture; shipbuilding; and the production of telephone, telegraph, and wireless apparatus. Existing undertakings in numerous of these fields would be reviewed and a decision made as to their future control.

In Burma, Thakia Nu, Socialist, and leader of the Anti-Fascist People's Freedom League, continued as Premier. He helped in the organization of a United Left Party, which aimed "at the creation of a Socialist state by democratic means." The Burma Government during the year was called upon to suppress a Communist insurrection.

In Indonesia, the Socialistic Soekarno-Hatta Republican Government was confronted with a Communist rebellion in September, which it quickly suppressed. In early October, and in December it was overwhelmed by the Dutch troops.

In the Near East, the Palestine Labor Party and the United Labor Party, with socialistic programs, became the dominating force in the newly established Israel Government.

Within the United Nations Socialist and Labor statesmen of the type of Trygve Lie of Norway, Spaak of Belgium, Evatt of Australia, Nash of New Zealand, and the various representatives of the British Labour Government, played a conspicuous part in the formation of UN policy. Socialist parties in general supported the Marshall Plan and plans for regional federations for the promotion of peace. During the year, the British Labour Government acted as host (October 11-22) to the Prime Ministers from the British Commonwealth of Nations, and tackled problems of mutual interests. The Conference, consisting of representatives of countries embracing one-fourth the area of the world, and committed, in major part, to a large degree of publicly owned industry, maintained, among other things, that "freedom must be safeguarded not only by military defensive measures but also by advancing social and economic welfare."

Throughout the world, Socialists gave increasing attention in 1948 to the problem of how to avoid bureaucracy and regimentation under public ownership and to the working out of techniques for democratic control. They insisted that economic security should not be bought at the expense of freedom.

—NORMAN THOMAS and HARRY W. LAIDLER

SOCIAL SECURITY ADMINISTRATION. The Social Security Administration, one of the four operating units of the Federal Security Agency, has Federal responsibility for all programs now operating under the Social Security Act. The responsibility is carried out through four program bureaus. The Bureau of Old-Age and Survivors Insurance administers the old-age and survivors insurance system. This is the only completely Federal program under the act. In the other three programs, the Federal Government cooperates with States in financing various State and community programs operating under State law and State administration.

Federal responsibilities for these three Federal-State programs are carried by the Bureau of Employment Security (for unemployment insurance and employment services), the Bureau of Public Assistance (for old-age assistance, aid to the blind,

and aid to dependent children), and the Children's Bureau (for maternal and child health services, services for crippled children, and child welfare services). A fifth program bureau—the Bureau of Federal Credit Unions—was established in the Social Security Administration on July 29, 1948, when administration of the Federal Credit Union Act was transferred from the Federal Deposit Insurance Corporation to the Federal Security Agency. On July 1 the United States Employment Service was transferred to the Agency from the Department of Labor and placed in the Bureau of Employment Security.

In addition to the programs under the Social Security Act there are various other provisions, operating under Federal or State laws, that ensure basic protection against the major risks to economic security or that furnish health and welfare services to different groups of the population. Among these social insurance and related programs are workmen's compensation for industrial accidents and diseases; various provisions for veterans, including disability and old-age pensions and compensation, comprehensive medical care, and benefits for their survivors; retirement, disability, and survivor protection for railroad workers and civilian employees of the Federal Government; and retirement and, in certain instances, disability protection for employees of State and local governments, certain nonprofit organizations, and other occupational groups. In terms of the number of persons in the population immediately or potentially affected, however, the largest segment of this broad social security program is that under the Federal Social Security Act and related State legislation.

PAY ROLLS IN EMPLOYMENTS COVERED BY FEDERAL OLD-AGE AND SURVIVORS INSURANCE AND BY STATE UNEMPLOYMENT INSURANCE PROGRAMS, CALENDAR YEARS 1946-47

(In millions)

<i>Program and Item</i>	<i>1946</i>	<i>1947</i>
Old-age and survivors insurance:		
Pay rolls covered during year.....	\$79,260	\$92,600
Contributions collected during year.....	\$1,295	\$1,557
Trust fund assets at end of year.....	\$8,150	\$9,360
Workers with wage credits during year..	49.1	49.2
Living workers with insured status at beginning of year.....	40.3	41.6
State unemployment insurance:		
Pay rolls covered during year.....	\$73,403	\$86,434
Contributions collected during year.....	\$912	\$1,096
Trust fund assets at end of year.....	\$6,775	\$8,124
Workers with wage credits during year..	45.5	45.6

All these programs operated during 1948 in a setting of full employment, a record peacetime production of goods and services, and rising prices. Fewer workers were without jobs than in the preceding year. Earnings were higher, and the aggregate volume of savings increased. Prices were also at a record high, increasing more rapidly than did wages or industrial production. Even in a vigorously functioning economy, however, some firms will fail and plants will be shut down for reorganization or retooling or because of shortages of raw materials. As a result, several million wage earners are thrown out of jobs during the course of a year. In 1948, about 2,100,000 were unemployed on the average, or about the same number as in 1947.

No comprehensive changes were made in the Social Security Act during 1948 although numerous bills were introduced in the second regular session of the Eightieth Congress and some amendments were passed. In one of the amendments, Congress recognized the threat of rising prices to family security by increasing the amount the Federal Government will contribute toward public as-

sistance payments. This increase in Federal participation, the second in two years, enabled States and local communities to raise the amount of the individual monthly payments (which come from local, State, and Federal funds) and in some instances to assist needy persons and families that otherwise could not have been aided because of limited State and community funds. The monthly benefit amounts payable under Federal old-age and survivors insurance, on the other hand, remained geared to the levels fixed in 1939, despite the rise of some 70 to 75 percent in living costs since that year.

The Advisory Council on Social Security, created in 1947 by the Senate Committee on Finance to assist and advise the Committee in studying the present programs under the act, issued four reports. In the first, the Council recommended extension of coverage under old-age and survivors insurance to all employments and liberalization of benefit amounts, as well as other changes to strengthen the present program.

The second report recommended the adoption of an insurance program, coordinated with old-age and survivors insurance and covering the risks of wage loss from permanent and total disability. The third report recommended certain changes that should be made in the public assistance programs if the preceding recommendations are accepted and embodied in legislation. In the fourth report, issued at the end of 1948, the Council dealt with unemployment insurance, recommending, among other changes, extension of coverage to small firms and to certain of the occupational groups now excluded and changes in methods of financing the system.

Old-Age and Survivors Insurance. Federal old-age and survivors insurance provides retirement benefits at age 65 to workers in industry and commerce and supplementary benefits to their aged wives and dependent children; it also provides survivor benefits to the widows and children, or dependent parents, of deceased insured workers. The benefits, financed by the contributions of the workers and their employers, are based on the insured status of the worker, which is determined by the wages he has earned in jobs covered by the program and the amount of time he has spent in such jobs. An estimated 49.2 million persons worked at some time during the calendar year 1947 in covered employment. They earned wage credits totaling \$76,700 million or an annual average of \$1,559 per worker. Both in number and amount these totals were larger than in any previous year.

At the beginning of 1948, about 42.5 million persons had sufficient wage credits to be either fully or currently insured, which meant that, if they died, their dependent survivors would be protected under the program. About 11.6 million of the 42.5 million were permanently insured throughout their lifetime, without further covered employment. Of those permanently insured wage earners, approximately 1,800,000 were aged 65 or over and eligible for retirement benefits, and 875,000 of them had withdrawn from covered employment and were receiving monthly benefits. The majority of the persons who had some wage credits but were not insured had worked in covered employment in too few calendar quarters to gain insurance protection. The cumulative amount of taxable wages these uninsured workers had received was comparatively small.

In June, 1948, monthly benefits were being paid at a monthly rate of \$42,400,000 to nearly 2,200,000 persons, representing 1,500,000 different fami-

rest were aged widows (189,000), young widows with children (141,000), and aged dependent parents (11,000) of deceased workers. June expenditures represented an average monthly benefit of \$25.60 for a retired man with no dependents receiving benefits, and \$39.90 for a man and his wife. For survivor families, the average benefit was \$20.50 for aged widows and \$35.90 for a family consisting of a widowed mother and one child, both receiving benefits.

Some \$499,300,000 was paid out under the program during the fiscal year 1947-48 for monthly benefits and \$31,300,000 for lump sums, payable when the deceased insured wage earner leaves no dependents immediately eligible for monthly benefits. Employers and employees contributed \$1,616,000,000 under the Federal Insurance Contributions Act, and at the end of June, 1948, the assets of the old-age and survivors insurance trust fund amounted to \$10,047,000,000. Under legislation enacted in 1947 the contribution rates, now 1 percent each for employers and employees, are scheduled to rise to 1.5 percent each in 1950 and to 2 percent each in 1952 and thereafter.

Benefits to survivors of veterans of World War II who die within 3 years of their discharge from the armed forces first became payable in September, 1946. These benefits are payable only to survivors not receiving or not eligible for payments under other veterans' legislation. For the fiscal year 1947-48, \$2,300,000 was certified for monthly benefits to such survivors, and \$1,200,000 in lump sums.

Under an amendment to the Railroad Retirement Act, survivor benefits based on combined earnings from both railroad employment and employment covered under the Social Security Act became payable Jan. 1, 1947. During the 1948 fiscal year, the survivors of more than 11,500 deceased workers who had such combined earnings were awarded benefits under old-age and survivors insurance. In addition, survivors of approximately

1,700 workers had their benefits recomputed to include railroad earnings of the deceased wage earner.

Unemployment Insurance. State unemployment insurance laws—in operation in the 48 States, the District of Columbia, Alaska, and Hawaii—cover workers in industry and commerce. The benefits are financed through contributions made to the State by employers—and, in two States, by employees also. The Federal Government does not share the cost of the benefits to unemployed workers but does bear the entire cost incurred by the State in administering the program. The benefits are payable to an unemployed worker who qualifies on the basis of his previous employment and for whom suitable job openings cannot be found. The amount of the weekly payment and the length of time the worker can draw benefits are determined by the provisions of the State law.

Although State unemployment insurance systems cover approximately the same types of employment as does old-age and survivors insurance, not all States cover small firms—those with less than eight employees. For this reason an estimated 45,600,000 workers earned some wage credits under the unemployment insurance system in the calendar year 1947 as against the 49,200,000 who earned credits under old-age and survivors insurance. About four-fifths of the former group, or 37 million, earned sufficient wage credits to qualify for unemployment benefits.

In relation to the number of wage earners covered by the State systems the number of unemployed persons who filed claims for unemployment benefits was low throughout 1948. Not all persons who filed claims receive benefits. Of the 4,700,000 workers who filed claims and had sufficient wage credits to qualify for benefits during the 1948 fiscal year, about 3,800,000 or 79 percent drew some benefits. Some of the others who did not receive benefits were declared unavailable for work or were disqualified for various reasons, but by far the greater proportion of them were reemployed during the waiting period before benefit payments began.

The States paid out a total of \$752,500,000 in benefits during the fiscal year. This figure was about 90 percent of the amount disbursed in the 1947 fiscal year. The average weekly benefit for the country as a whole was \$18.19, but the State averages varied widely, ranging from \$11.10 in North Carolina to \$23.26 in Alaska.

Five States—Connecticut, the District of Columbia, Massachusetts, Michigan, and Nevada—supplemented the unemployment benefit by small additional allowances for the dependents of claimants. Claimants whose unemployment was caused by temporary disability received benefits in Rhode Island and California. In June, 1948, New Jersey also enacted a temporary disability insurance law for workers covered by its unemployment insurance law, and payments began Jan. 1, 1949.

Contributions collected under the State laws totaled \$1,007 million in the fiscal year, and the unemployment trust fund earned interest of \$147 million, bringing the State balances in the fund to \$7,400 million at the end of June, 1948. Amounts collected and deposited in the unemployment trust fund can be used only for benefit payments, and administration of the State programs is financed by the Federal Government. During the year the States received \$67,200,000 in Federal grants for administration.

Protection against wage loss from unemployment was also available to railroad employees under the

* Fiscal years ended June 30. ^b Represents payments certified. State distribution estimated; data for beneficiaries residing in foreign countries included in fiscal-year totals, not distributed by State. ^c Fiscal-year totals represent payments under the 1935 act and under the 1939 and 1946 amendments. State distribution excludes payments under 1935 act. ^d Adjusted for refunds of contributions and for voided benefit checks. ^e January-June 1940, since monthly benefits were not payable before 1940. ^f Excludes \$3,276,904 reconversion unemployment benefits paid to seamen. ^g No plan in operation. ^h No plan in operation under the Social Security Act.

Railroad Unemployment Insurance Act, and to unemployed veterans under the Servicemen's Readjustment Act.

Public Assistance. The public assistance programs under the Social Security Act provide monthly payments to three specific groups of needy individuals—the aged, the blind, and children deprived of necessary support or care because of a parent's death or absence from home. These programs are financed and administered by States or States and localities, and the Federal Government participates in the amount of assistance, within certain maximums, and in the administrative

costs of the programs. During 1948, old-age assistance programs operated with Federal financial participation in all 48 States, the District of Columbia, Alaska, and Hawaii; all States but one received Federal funds for aid to dependent children, and all but four States had approved programs for aid to the blind.

The continued upswing in consumer prices has worked hardship for all groups in the population but the effects have been most acute among persons with very small incomes. The increase in the Federal share of assistance payments made it possible for a State to raise payments \$5 per recipient

of old-age assistance and aid to the blind and \$3 per child receiving aid to dependent children provided the State continued to spend as much per recipient from its own funds as before.

In June, 1948, nearly 2,400,000 persons aged 65 or over were receiving old-age assistance, at an average payment of \$38 during the month. Nearly 1,150,000 children in 450,000 families were receiving aid to dependent children, at an average pay-

and to insurance beneficiaries than do the industrial States.

Other needy persons who cannot qualify under one of these special assistance programs are cared for by general assistance, financed by States and localities without Federal participation. In June, 1948, about 366,000 cases were receiving general assistance, at an average payment of \$43 per case. Since a case may represent a single individual or

* Excludes Federal work programs. ^b Beneficiaries represent persons receiving monthly benefits; exclude persons receiving lump-sum payments only. Payments include lump-sum death payments. ^c Data estimated; for 1948, not available. ^d Data for 1948 partly estimated. ^e Average weekly number. ^f Compensation for temporary disability payable in Rhode Island beginning in April 1943, and in California beginning December 1946. ^g Number not available. Payments primarily for calendar year; partly estimated; for 1948, not available. ^h Average number of persons receiving benefits for unemployment in a 14-day registration period. ⁱ Under Servicemen's Readjustment Act of 1944, effective September 1944. Average weekly number for unemployment and number during month for self-employment. ^j Data through 1942 for continental United States only. ^k Partly estimated.

ment of \$26 per child and \$66 per family. Nearly 66,000 blind persons received assistance at an average payment of \$41. It should be remembered that these figures on average payments relate to the country as a whole.

Averages by State show wide differences that reflect both the ability of States and localities to finance assistance and the standards prevailing in the State. Another factor in the variations from State to State is the coverage limitation on old-age and survivors insurance. Since coverage under the insurance program excludes agricultural labor, the predominantly agricultural States have more assistance recipients in relation to total State population

several persons in a family, the total number of individuals receiving general assistance was larger than the number of cases.

Expenditures during the fiscal year 1948 for all four programs, representing both assistance payments and costs of administration, amounted to \$1,700 million. Of this total, \$1,500 million represented expenditures from all sources—Federal, State, and local—for the three programs under the Social Security Act, and \$200 million represented expenditures by States and localities for general assistance.

Maternal and Child Health and Child Welfare Services. Federal grants under the Social Security Act

are made to States to help them extend and improve State and community services for mothers and children, especially in rural areas and areas suffering from severe economic distress. All 48 States and the District of Columbia, Alaska, Hawaii, Puerto Rico, and the Virgin Islands received Federal grants for these programs during 1948. To receive the grants, the State plan must meet certain requirements set forth in the Social Security Act and must match certain portions of the Federal funds.

Federal grants of \$11 million a year are authorized for maternal and child health services. The grants are made to State public health agencies whose responsibility it is to assist local health departments in developing and providing health services to children from birth through school age, and to mothers before and after childbirth. In general, the services are primarily preventive, designed to help well mothers and children keep well and to direct the sick ones to the care they need. Most frequently the services include prenatal clinics, child health conferences, home nursing visits, medical examinations in schools, and nutritional, dental, and mental health programs. Both in quality and quantity, the services vary considerably from State to State and from community to community.

During the calendar year 1947, medical services, financed in part with Federal funds, were given to about 152,000 women at prenatal clinics. About 234,000 mothers received nursing service during pregnancy, and after the baby's birth more than 40,000 received medical examinations and 215,000 received nursing service. Some 561,000 infants and preschool children attended well-child clinics in 1947, and public health nursing services reached more than 1,010,000. Physicians' examinations of school children totaled 1,862,000 and public health nursing visits, 2,200,000. Reports of immunization show an increase of diphtheria and a decrease of smallpox. About 55,000 preschool children and 1,600,000 school children received inspections by dentists or dental hygienists.

For services for crippled children, \$7,500,000 a year is authorized in Federal grants. This money goes to help States extend and improve their services for locating crippled children and for providing medical, surgical, corrective, and other services

EXPENDITURES FOR PUBLIC ASSISTANCE PAYMENTS AND ADMINISTRATION UNDER THE SOCIAL SECURITY ACT, FISCAL YEARS 1945-48*

Program and fiscal year	Amount (In 1,000's)	Percentage Federal funds	distribution State funds	Local funds

1948.....	33,288	49.4	41.2	9.4

* Excludes Federal administrative expenses. Fiscal years ended June 30.

and care, and facilities for diagnosis, hospitalization, and after care, for children who are crippled or suffering from conditions that may lead to crippling.

All States maintained a register of crippled

children in the State. A child is eligible for registration if he has a type of crippling for which, according to the State plan, children may be accepted for care by the official State agency, and has had his crippling condition diagnosed by a licensed physician. The number of children on the different State registers varies widely. Some States do a much more thorough job of registration than others, and some are more careful in clearing their registers of children no longer eligible for care under the program.

At the close of 1947, some 474,000 children or an average of 9.6 per 100,000 population under age 21 were registered under the program. Approximately 168,000 children received one or more types of service during the year from official State agencies. Additional numbers of crippled children were, of course, under care of private physicians and other agencies though to what extent is not known.

Nearly 120,000 children received diagnostic or treatment service at crippled children's clinics in 1947, 29,000 children were hospitalized, 4,800 received convalescent-home care, and more than 850 received foster-home care. More than 71,000 children received public health nursing services, about 19,000 received physical therapy, and 27,000 had care from medical social workers. Various States operated special programs for the care of children with rheumatic fever and rheumatic heart disease, poliomyelitis, and cerebral palsy, and some provision was being made for surgical correction of visual impairments and for the care of children with hearing defects.

In the child welfare program, Federal grants totaling \$3,500,000 a year are authorized for State public welfare agencies to help in establishing, extending, and strengthening services for the protection and care of homeless and neglected children and children in danger of becoming delinquent. These community services include arranging for foster-home or institutional care for children who need care away from their own homes; protecting neglected and mistreated children; obtaining the necessary attention for children who have physical, mental, and emotional handicaps and are not receiving the care they need; safeguarding children of illegitimate birth; cooperating with courts and schools in handling children's cases and with State institutions that care for children; and working with mental hygiene clinics. Child welfare workers also aid in the organization of community services for children, including services to prevent juvenile delinquency.

At the end of 1947, about 230,000 children were receiving child welfare services from State and local public welfare agencies. About 41 percent of the children served were living with parents or other relatives, 40 percent were in foster-family homes, and 19 percent were in children's institutions or elsewhere. Federal aid represented a small part of State and local resources devoted to the care of these children. (See PRISONS, PAROLE, AND CRIME CONTROL.) —ARTHUR J. ALTMAYER

SOCIETIES AND ORGANIZATIONS. The following is an alphabetical list of some of the leading national and international organizations. Certain classifications have been omitted because they are represented elsewhere in this volume. The reader is, therefore, referred to the following articles: for accrediting associations, to the article on UNIVERSITIES AND COLLEGES; for labor organizations, to LABOR CONDITIONS; for religious bodies, to the interdenominational groups below, and to the sepa-

rate articles on churches; for sports organizations, to articles on various sports. For foundations and trusts, government agencies, learned academies, and institutes, see separate articles. For official international organizations, see PAN AMERICAN ACTIVITIES and UNITED NATIONS, as well as various separate articles.

Academy of Medicine, Canadian, founded in 1907 to advance the art and science of medicine; promote and maintain an efficient library and museum; cultivate harmony and good feeling among its fellows; promote the corporate influence of the profession in relation to the community. Membership: 1,570. President, Dr. W. A. Burr; Treasurer, Dr. E. C. Fielden; Secretary, Dr. J. W. Ross. Headquarters: 288 Bloor St., W, Toronto 5, Canada.

Academy of Motion Picture Arts and Sciences, founded in 1927 to advance the arts and sciences of motion pictures and to foster cooperation among the creative leadership of the motion picture industry for cultural, educational, and technological progress. Membership: 1,911. President, Jean Hersholt; Secretary, Robert Montgomery; Treasurer, N. Peter Rathvon; Executive Secretary, Margaret Herrick. Headquarters: 9038 Melrose Ave., Los Angeles 46, Calif. Academy awards for the calendar year 1947 presented Mar. 20, 1948. See MOTION PICTURES.

Academy of Natural Sciences of Philadelphia, The, a research institution founded in 1812 and supported by voluntary gifts and bequests. Besides research laboratories, the Academy houses a free museum of natural history and a library in the natural sciences. The study collections of specimens in natural history exceed 8 millions. President, Charles M. B. Cadwalader; Managing Director, Dr. H. Radcliffe Roberts. Address: Nineteenth and the Parkway, Philadelphia 3, Pa.

Academy of Political Science, founded in 1880 to uphold the ideals of scholarship, scientific procedure, and impartial investigation in the fields of economics, politics, and public law. Membership: approximately 10,800. President, Lewis W. Douglas; Director (as of 1/1/49), Grayson L. Kirk; Treasurer, Sam A. Lewisohn. Headquarters: Fayerweather Hall, Columbia University, New York 27, N.Y. Semi-Annual Meetings in 1948 held April 1 and November 10.

Actors' Fund of America, The, founded in 1882 to aid the aged, sick, and destitute of the theatrical profession. Membership: 3,025. President, Walter Vincent; Secretary, Robert Campbell; Treasurer, Vinton Freedley. Headquarters: 1619 Broadway, New York 19, N.Y. Annual meeting held at Coronet Theatre, New York, N.Y., on May 21, 1948.

Aero Medical Association, founded in 1929 as a non-profit organization (1) to advance the science and art of aviation medicine by stimulating investigation and study; by disseminating knowledge; (2) to establish and maintain cooperation between the medical and other sciences concerned with aeronautical development and progress. Membership: 1,600. President, 1948, Marion M. Kalez, M.D.; President, 1949, Wilbur E. Kellum; Secretary-Treasurer and Business Manager, Thomas A. Sutherland, M.D. Headquarters, Office of the Secretary: 214 South State St., Marion, Ohio. The 1949 Annual Meeting will be held in New York, August 23-26. Theodore C. Lyster Award to Professor W. R. Franks; Raymond F. Longacre Award to Detlev W. Bronk.

Alcoholic Foundation, Inc., The, headquarters for Alcoholics Anonymous, founded in 1934 for the one purpose of helping the sick alcoholic recover if he wishes. Membership: 70,000; no officers. Headquarters: P.O. Box 459, Grand Central Annex, New York 17, N.Y.

Altrusa International, Inc., founded in 1917, is the oldest national organization of executive and professional women. In 1935 it became international. Membership is by invitation and is limited to one outstanding representative of each particular business or profession within the territory of an Altrusa Club. Membership: Approximately 8,000. President, Corinne V. Loomis; Executive Secretary, Hazel P. Williams. Headquarters: 332 South Michigan Ave., Chicago 4, Ill. Each of the 10 districts into which Altrusa is divided holds an annual conference. Next International Convention at Banff, Alberta, June, 1949.

Amateur Astronomers Association, Inc., founded 1927, to promote interest and foster education in the science of astronomy by a program of lectures, classes, outdoor observing, home-study course, telescope construction, inspection trips, and publication (*Astronomical News Service*). Membership: 650. President, Dr. C. S. Brainin; Treasurer, H. T. Kirkeby; Staff Editor, Jane S. Davis; Secretary, G. V. Plachy. Headquarters: Hayden Planetarium, New York 24, N.Y. Eight monthly lecture meetings, open to the public, are held at The American Museum of Natural History, New York, N.Y.

Amateur Athletic Union of U.S., founded in 1888 for the improvement and promotion of athletic sports among all amateurs. The Union consists of 77 allied and active associations covering the U.S. and the Territory of Hawaii. Membership: 80,000 individuals; 2,800 clubs, colleges, schools, and industrial athletic associations. President, James A. Rhodes; Secretary-Treasurer, Daniel J. Ferris.

Headquarters: 233 Broadway, New York 7, N.Y. District associations hold meetings in September and October. The annual convention is held in December.

American Academy in Rome, founded in 1894, incorporated by the U.S. Congress 1905, consolidated with the American School of Classical Studies in Rome 1913. Purpose: To promote the study and practice of the fine arts and the investigation of archaeology through the annual granting of Fellowships in architecture, the arts, history of art, and classical studies. President, James Kellum Smith; Director, Laurance P. Roberts; Executive Secretary, Mary T. Williams. Headquarters: 101 Park Ave., New York 17, N.Y., and Via Angelo Masina 5, Rome, Italy.

American Academy of Arts and Sciences, founded in 1780 "to cultivate every art and science which may tend to advance the interest, honor, dignity and happiness of a free, independent and virtuous people." Membership: 968. President, Howard M. Jones; Secretary, John W. M. Bunker; Treasurer, Horace S. Ford; Librarian, Ernest H. Huntress; Editor, Taylor Starck. Headquarters: 28 Newbury St., Boston 16, Mass. Eight monthly meetings held at headquarters.

American Academy of Dental Medicine, Inc., founded in 1945 to promote the study and dissemination of knowledge of the cause, prevention, and control of diseases of the teeth and related subjects; to promote a closer medico-dental relation to these studies; and to foster better understanding between the fields of dentistry and medicine. Membership: 350. President: J. Lewis Blass; Secretary, William M. Greenhut; Treasurer, Louis R. Burman; Editor, *Journal of Dental Medicine*, Allan N. Arvins. Headquarters: Office of Secretary, 124 East 84th St., New York 28, N.Y. The 3d Annual Meeting will be held in New York, June 4-5, 1949.

American Academy of Political and Social Science, The, founded in 1889 to advance the progress of political and social science especially through publications and the holding of meetings. Membership: Approximately 13,500. President, Ernest M. Patterson; Secretary, J. P. Lichtenberger; Treasurer, Charles J. Rhoads. Headquarters: 3817 Spruce St., Philadelphia 4, Pa. The 52nd Annual Meeting was held in Philadelphia, Pa., Apr. 2-3, 1948.

American Anthropological Association, founded in 1902 to advance the science of anthropology in all its branches and to further the professional interests of American anthropologists. Membership: 450 Fellows; 1,200 Members. President, H. L. Shapiro; Secretary, D. B. Stout; Treasurer, E. G. Aginsky. Headquarters: Office of Secretary, Maxwell Hall, Syracuse University, Syracuse 10, N.Y. Through a special committee the Association selects the annual recipient of the Viking Fund Medal and Prize in Cultural Anthropology. Publications: *American Anthropologist* (quarterly) and *Memoirs*.

American Antiquarian Society, founded in 1812 for furthering the knowledge of American history by research, publication, and the maintenance of a research library. Membership: 200. President, Samuel Eliot Morison; Director, Clarence S. Brigham; Librarian, Clifford K. Shipton. Headquarters: Worcester 5, Mass. Meetings to be held in Boston on Apr. 20, 1949, and in Worcester on Oct. 19, 1949.

American Association for Adult Education, founded in 1926 to further the idea of education as a continuing process throughout life. Membership: 2,600. President, Hans Kohn; Secretary, Mildred V. D. Mathews; Treasurer, James Creese; Director, Morse A. Cartwright. Headquarters: 525 W. 120th St., New York 27, N.Y.

American Association for the Advancement of Science, founded in 1848 to further the work of scientists, to facilitate cooperation among them, to improve the effectiveness of science in the promotion of human welfare, and to increase public understanding and appreciation of the importance and promise of the methods of science in human progress. It is a non-profit scientific and educational organization. It holds meetings and conferences, produces and distributes publications, administers gifts and bequests, provides support for research, arranges awards for the accomplishment of scientific work, and cooperates with other organizations in the advancement of science. Membership: 42,000. President, E. C. Stakman; Administrative Secretary, Howard A. Meyerhoff. Headquarters: 1515 Massachusetts Ave., NW, Washington 5, D.C. The Annual Meeting will be held Dec. 26-31, 1949, in New York.

American Association for the United Nations (formerly League of Nations Association), founded in 1923 to develop an informed public opinion in support of the United Nations. It is the U.S. member of the World Federation of United Nations Associations; its research affiliate is the Commission to Study the Organization of Peace. Membership: 25,000. President, William Emerson; Director, Clark M. Eichelberger; Treasurer, Frederick C. McKee. Headquarters: 45 East 65th St., New York 21, N.Y.

American Association of Economic Entomologists, founded in 1889, to promote the study of and to advance the science of entomology, and to publish *The Journal of Economic Entomology*. Membership: About 2,800. President, S. A. Rohwer, United States Department of Agriculture; Secretary-Treasurer, Ernest N. Cory. Headquarters: College Park, Md. Annual meeting to be held Dec. 13-16, New York, N.Y.

American Association of Junior Colleges, founded in 1920 to stimulate the professional development of its mem-

bers and to promote the growth of the junior college. Membership: 480 institutions, 100 individual and sustaining organizations. President, Leland Medsker; Executive Secretary, Jesse P. Bogue; Director of Research and Editor of *Junior College Journal*, L. V. Koos. Headquarters: 1201 Nineteenth St., Washington 6, D.C.

American Association of Museums, founded in 1906 to help museums solve their problems and increase their usefulness. Membership: 400 museums, 700 individuals. President, David E. Finley; Secretary and Treasurer, Luke Vincent Lockwood; Director, Laurence Vail Coleman; Associate Director, Lauder Greenway. Headquarters: Smithsonian Institution, Washington 25, D.C. The 43rd Annual Meeting was held at Boston, Mass., May 27-29, 1948. Distinguished Service Award to Henry W. Kent.

American Association of Physical Anthropologists, founded in 1923 to promote research in physical anthropology and cooperation with cognate sciences. Membership: Approximately 200. President, W. M. Krogman; Editor of the *American Journal of Physical Anthropology*: W. W. Howells; Secretary-Treasurer, G. W. Lasker (Wayne University College of Medicine, Detroit 26, Mich.). Viking Fund Medal and Prize in Physical Anthropology to E. A. Hooton. Next Annual Meeting will be held at the Wistar Institute, Philadelphia, Pa., Apr. 11-13, 1949.

American Association of Social Workers, founded in 1921 to improve the quality of social services and advance public understanding of the profession of social work. It provides a channel through which social service practitioners formulate policies. Membership: 11,500. President, Donald S. Howard; Secretary, Esther Hilton; Treasurer, Malcolm S. Nichols. Headquarters: 130 E. 22nd St., New York 10, N.Y. Delegate Conference to be held June 10-12, 1949, at Cleveland, Ohio.

American Association of University Professors, founded in 1915 to maintain and advance the ideals and standards of the profession of teaching in colleges and universities. Membership: 30,857. President, Ralph H. Lutz; General Secretary, Ralph E. Himstead. Headquarters, 1101 Connecticut Ave., NW, Washington 6, D.C. Annual meeting to be held at Washington, D.C., Feb. 26-27, 1949.

American Association of University Women, founded in 1881 to unite the alumnae of different institutions for practical educational work. It comprises 1,065 branches in 48 state divisions organized in 9 regions. It is a member of the International Federation of University Women. Membership: 101,056. President, Althea Kratz Hottel; Treasurer, Mrs. Dorothy B. A. Rood; General Director, Kathryn McHale. Headquarters: 1634 Eye St., NW, Washington 6, D.C.

American Astronomical Society, founded in 1897 for the advancement of astronomy and closely related branches of science. Membership: 675. President, Otto Struve; Secretary, C. M. Huffer. Headquarters: Dearborn Observatory, Evanston, Ill. Meeting to be held in Ottawa, Ont., June, 1949.

American Automobile Association, founded in 1902, is a national civic body operating without personal profit and providing representation for motorists of the U.S. as well as automobile club services to members. Membership: Over 2,500,000. President, R. J. Schmunk; Executive Vice-President, Russell E. Singer; Secretary, Ralph Thomas; Treasurer, Corcoran Thom. Headquarters: Penna. Ave. at 17th St., NW, Washington 6, D.C.

American Bar Association, founded in 1878 "to advance the science of jurisprudence, promote the administration of justice and uniformity of legislation and of judicial decision throughout the nation, uphold the honor of the profession of the law, encourage cordial intercourse among members of the American bar, and to correlate the activities of the bar organizations of the respective states on a representative basis in the interest of the legal profession and of the public throughout the United States." Headquarters: 1140 North Dearborn St., Chicago 10, Ill. Annual meeting to be held Sept. 5, 1949. Medal to Arthur T. Vanderbilt, New Jersey.

American Bible Society, founded in 1816 to encourage the wider use of the Holy Scriptures without note or comment and without purpose of profit. Membership: Approximately 150,000. President, Daniel Burke; Recording Secretary, Francis C. Stuffer; Treasurer, Gilbert Darlington. Headquarters: 450 Park Ave., New York 22, N.Y. The 133d Annual Meeting will be held May 12, 1949.

American Booksellers Association, Inc., founded in 1900, protects and promotes the interests of retail booksellers in the United States. Membership: Approximately 1,450. President, Robert B. Campbell; Secretary, Benedict Freud; Treasurer, Frederick Wood; Executive Secretary, Gilbert E. Goodkind. Headquarters: 31 Madison Ave., New York 10, N.Y. National Convention of Booksellers and Publishers and a Book Trade Show to be held at the Shoreham, Washington, D.C., May 15-18, 1949. *ABA Basic Book List*, Spring, 1949; *ABA Book Buyer's Handbook*, 3rd Ed., Fall, 1949.

American Cancer Society, Inc., founded in 1913 to control and cure cancer through a program of education, service and research. Divisions in 48 states. President, C. C. Nessel-

rode, M.D.; Executive Vice President, Douglass Poteat; Secretary, Charles D. Hilles, Jr.; Treasurer, J. Ernest Allen; Medical and Scientific Director, Charles S. Cameron, M.D.; National Commander Field Army, Mrs. H. V. Milligan; Comptroller, E. Tyson Matlack. Headquarters: 47 Beaver St., New York 4, N.Y. Membership obtainable only in State and geographic divisions.

American Chemical Society, founded in 1876 to encourage in the broadest and most liberal manner the advancement of chemistry in all its branches. Membership: 58,776. President, Charles A. Thomas; Executive Secretary, Alden H. Emery; Treasurer, Robert W. Mellefont. Headquarters: 1155 16th St., NW, Washington 6, D.C. Publications: *Industrial and Engineering Chemistry*, *Analytical Chemistry*. ACS Award in Pure Chemistry to Saul Winstein; Borden Award to B. L. Herrington; Eli Lilly & Co., Award to D. W. Woolley; Fisher Award to N. H. Furman; Garvan Medal to Gerty T. Cori; Paul-Lewis Laboratories Award to A. L. Lehninger; Priestley Medal to E. R. Weidlein. In 1948 two national meetings were held.

American College of Physicians, The, founded in 1915 "... to establish an organization composed of qualified physicians of high standing who shall meet from time to time for the purpose of considering and discussing medical and scientific topics, and who through their organization shall attempt to accomplish the further purposes of: (a) maintaining and advancing the highest possible standards in medical education, medical practice and clinical research; (b) perpetuating the history and best traditions of medicine and medical ethics." Membership: 6,200. President, Walter W. Palmer, M.D.; Secretary-General, George Morris Piersol, M.D.; Executive Secretary, Edward R. Loveland. Headquarters: 4200 Pine St., Philadelphia 4, Pa. National annual session to be held in New York, N.Y., Mar. 28-Apr. 1, 1949. Phillips Memorial Medal to Ernest W. Goodpasture, M.D.; Bruce Memorial Medal to James Stevens Simmons, M.D.; Stengel Memorial Award to Charles F. Martin, M.D.

American College of Surgeons, founded in 1913 to establish and maintain an association of surgeons to benefit humanity by advancing the science of surgery and the ethical and competent practice of its art. Membership: 16,000. President, Dr. Dallas B. Phemister. Headquarters: 40 East Erie St., Chicago 11, Ill. The 1949 Annual Clinical Congress will be held in Chicago, Ill., October 17-21.

American Council of Learned Societies, founded in 1919 for the advancement of the humanistic studies, and the maintenance and strengthening of relations among the national societies devoted to such studies. Membership: 23 societies and associations. Executive Director, Charles E. Odegaard; Chairman, William C. DeVane; Secretary, Lewis Hanke; Treasurer, S. Whittemore Boggs. Headquarters, 1219 Sixteenth St., NW, Washington 6, D.C. Next annual meeting, Jan. 27-28, 1949, Claridge Hotel, Atlantic City, N.J.

American Council on Education, founded 1918, to advance American education in any or all of its phases through voluntary cooperative action by educational associations, organizations, and institutions. Membership: 123 educational organizations, 890 institutional members (colleges and universities, city school systems, private school systems, state departments of education, etc.). President and Executive Officer, George F. Zook; Chairman, Herold C. Hunt. Headquarters: 744 Jackson Place, NW, Washington 6, D.C. Annual Meeting May 6-7, 1949, at Hotel Mayflower, Washington, D.C.

American Dental Association, founded in 1859, is a national non-profit association to encourage the improvement of the health of the public and to promote the art and science of dentistry. Membership: 71,826. President, Dr. Clyde E. Minges; Secretary, Dr. Harold Hillenbrand; Treasurer, Dr. H. B. Washburn. Headquarters: 222 East Superior St., Chicago 11, Ill. National and regional meeting to be held Oct. 17-21, 1949, in San Francisco, Calif.

American Dietetic Association, The, founded in 1917 to improve the nutritional status of mankind, bring about closer cooperation among dietitians and nutritionists and workers in allied fields, and raise the standard of dietary work. Membership: Approximately 8,000. President, Helen E. Walsh; Secretary, Margaret A. Ohlson; Treasurer, Fern Gleiser. Headquarters: 620 North Michigan Ave., Chicago 11, Ill. Meeting to be held in Denver, Colo., Oct. 10-14, 1949. Copher Memorial Award to Grace Bulman.

American Documentation Institute, founded in 1937, is a non-profit organization for the promotion and development of documentation in scholarly and scientific fields. Membership: 62, nominated by scholarly and scientific agencies. The Institute is the U.S. organization in the International Federation of Documentation. President, Vernon Tate; Secretary, Watson Davis. Headquarters: 1719 N St., Washington 6, D.C.

American Economic Association, founded in 1885 for the encouragement of economic research, the issue of publications on economic subjects, and the encouragement of perfect freedom of economic discussion. Membership: 5,766; 2,402 subscribers (university libraries, etc.). President, Joseph A. Schumpeter, Harvard University; Secretary-Treasurer, James Washington Bell, Northwestern University, Evanston, Ill. Annual meeting at Hotel Cleveland, Cleveland, O., Dec. 27-30, 1948.

American Ethnological Society, Inc., The, founded in 1842 to stimulate an interest in and knowledge of anthropology through its publications and open meetings. Membership: 240. President, Esther S. Goldfrank; Secretary-Treasurer, Dorothy L. Keur. Headquarters: Hunter College, New York 21, N.Y.

American Eugenics Society, incorporated in 1926 as an educational society to promote a wider and better understanding of eugenics based on human heredity and correlational environment and aiming at human betterment, individual, family, and racial. Membership: 400. Publication: *Eugenics News*. President, Frederick Osborn; Vice President, Joseph K. Folsom; Secretary-Treasurer, Chauncey Belknap. Headquarters: 1790 Broadway, New York 19, N.Y.

American Farm Bureau Federation, founded 1919 to promote, protect, and represent the business, economic, social, and educational interests of farmers. Membership: Approximately 1,300,000 farm families. President, Allan B. Kline; Director of Information, J. J. Lacey. Headquarters: 109 N. Wabash Ave., Chicago 2, Ill.

SHAKESPEARE'S *The Taming of the Shrew* comes in for some modernizing in the Cole Porter-Bella Spewack collaboration *Kiss Me, Kate*. Shown above (left to right) are Patricia Morison, Alfred Drake, Lisa Kirk, and Harold Lang.

► **TALLULAH BANKHEAD** revives Broadway with her lusty and rollicking performance in a return of Noel Coward's *Private Lives* and makes a personal hit in that light comedy.

◀ **CLARENCE DAY'S LIFE** carries on, this time with *Mother*. The new play is by Howard Lindsay and Russel Crouse, and stars Mr. Lindsay and Dorothy Stickney in the usual roles.

LIGHT UP THE SKY is the title of a new Moss Hart comedy, dealing with actors and allied folk at the time of a play's tryout. Above (from left) are Bartlett Robinson, Audrey Christie, Glenn Anders, Phyllis Povah, and Sam Levene.

ANNE OF THE THOUSAND DAYS was Maxwell Anderson's happily received drama of Henry the Eighth and Anne Boleyn. Joyce Redman and Rex Harrison appeared in the play's leading roles.

TENNESSEE WILLIAMS presents an early play, *Summer and Smoke*, with less success than either *The Glass Menagerie* or his *A Streetcar Named Desire*.

JEAN-PAUL SARTRE, French existentialist, made an impressive mark on the theater season in 1948, at one time able to count four of his plays on Broadway stages. The above picture is from the Jean Dailrymple presentation of Sartre's *Red Gloves*, featuring Charles Boyer as a Communist leader, and with Francis Compton and Royal Beal. Also seen on the stage during the year were Jean-Paul Sartre's *The Respectful Prostitute*, *The Victors*, and *No Exit*.

of released prisoners. Membership: Approximately 1,000. President, John C. Burke; General Secretary, E. R. Cass; Treasurer, John L. Schoenfeld. Headquarters: 135 East 15th St., New York 3, N.Y. The 79th annual Congress of Correction will be held in Milwaukee, Wisc., Sept. 25-30, 1949.

American Psychiatric Association, founded in 1844 to foster the study of all subjects pertaining to mental disease and defects. Membership: 4,765. President, William C. Menninger; Secretary, Leo H. Bartemeier; Treasurer, Howard W. Potter. Headquarters: Room 412, 1270 Avenue of the Americas, New York 20, N.Y. A meeting will be held at the Hotel Windsor, Montreal, Canada, May 23-27, 1949.

American Psychological Association, founded in 1892 to advance psychology as a science, as a profession, and as a means of promoting human welfare. Membership: 5,700. President, Ernest R. Hilgard; Recording Secretary, Helen Peak; Treasurer, Carroll L. Shurtle; Executive Secretary, Dael Wolfe. Headquarters: 1515 Massachusetts Ave., NW, Washington 3, D.C. The 1949 annual meeting will be held Sept. 6-10, in Denver, Colo.

American Public Health Association, founded in 1872 to protect and promote public health. Membership: 11,500 including 31 regional affiliated agencies. President, Charles F. Wilinsky, M.D.; Treasurer, Louis I. Dublin; Chairman of the Executive Board, Hugh R. Leavell, M.D.; Executive Secretary, Reginald M. Atwater. Headquarters: 1790 Broadway, New York 19, N.Y. The 77th Annual Meeting will be held in New York the week of October 23, 1949. Lasker Awards (1948) to Drs. Rene J. Dubos, R. E. Dyer, Martha M. Eliot, Vincent du Vigneaud, Selman A. Waksman, and the Department of Medicine and Surgery, U.S. Veterans Administration; Sedgwick Medal to Abel Wolman. Publication: *Journal of Public Health*.

American Public Welfare Association, founded in 1930 to develop and maintain sound principles and effective administration of public welfare services. It acts as a clearing house for the exchange of thought and experience in the public welfare field, coordinates welfare activities, and works to improve the professional standing of personnel in the public field. In all its activities the association cooperates with federal agencies and national organizations. Membership: 4,200. Joseph E. Baldwin, President; Leland Hiatt, Vice President; Howard L. Russell, Secretary; Joseph L. Moss, Treasurer. Headquarters: 1313 East 60th St., Chicago 37, Ill.

American Radio Relay League, Inc., founded in 1915, is a membership (non-profit) association of government licensed amateur radio operators. Membership: 65,000. President, George W. Bailey. Headquarters: 88 Lasalle Rd., West Hartford 7, Conn. A meeting of the Board of Directors will be held at West Hartford, Conn., in May, 1949.

American Russian Institute (ARI), The, is a non-political, non-profit organization founded in 1926 and incorporated in 1936. Its purposes are to promote cultural intercourse between the peoples of the U.S.A. and the U.S.S.R. and to foster understanding by making available accurate information concerning cultural, scientific, and educational activities in both countries. Library: 12,000 books and pamphlets, 512 periodical titles, 350,000 English language clippings, and 6,000 biographical cards on Soviet personalities. The ARI also engages in paid research; provides translations and photostat services; conducts a Russian language school; and publishes the *American Review on the Soviet Union*, *Russian Technical Research News* and miscellaneous pamphlets. Chairman of the Board, Ernest C. Ropes; Executive Director, Henry H. Collins, Jr. Headquarters: 58 Park Ave., New York 16, N.Y.

American Seamen's Friend Society, The, founded in 1828, is a national organization which cooperates with all who aid seamen, particularly merchantmen. It maintains a library and an information service ashore for seamen and supplies books for vessels sailing from the port of New York. Recently opened a convalescent home for seamen in Tottenville, Staten Island, N.Y. Membership: 250. President, Winchester Noyes; Treasurer, Orrin R. Judd; Secretary and Executive Director, R. H. Lee-Martin. Headquarters: 175 Fifth Ave., New York 10, N.Y.

American Society for Metals, founded in 1918, is a technical and educational society (non-profit) to promote the arts and sciences connected with either the manufacture or the treatment of metals, or both. It has 76 chapters throughout the United States and Canada. Membership: 20,000. President, Harold K. Work; Secretary, William H. Eisenman. Headquarters: National Office, 7301 Euclid Ave., Cleveland 3, O. The National Metal Congress and Exposition will be held in Cleveland, Ohio, Oct. 17-21, 1949. A.S.M. Gold Medal to Francis C. Frary; A.S.M. Medal for Advancement of Research to Willard H. Dow; Howe Medal to J. W. Spretnak.

American Society for Psychical Research, Inc., The, founded in 1905 for the scientific investigation of all types of psychic phenomena. Membership: 750. President, George H. Hyslop, M.D.; Secretary-Assistant Treasurer, Mrs. Edward W. Allison; Treasurer, Gerald L. Kaufmann. Headquarters: 880 Fifth Ave., New York 21, N.Y.

American Society of Civil Engineers, founded in 1852 for "the advancement of the sciences of engineering and architecture in their several branches, the professional improve-

ment of its membership, the encouragement of intercourse between men of practical science, and the establishment of a central point of reference and union for its members." Membership: 24,000. President, 1948, R. E. Dougherty; President, 1949, Professor Franklin Thomas; Executive Secretary, Col. William N. Carey. Headquarters: 33 West 39th St., New York 18, N.Y. The 1949 annual meeting is scheduled for January 19-21, in N.Y., the spring meeting for April 20-23 in Oklahoma City, Okla., the summer convention for July 13-15 in Mexico City, Mex., and the fall meeting for October 30-November 4, in Washington, D.C. Norman Medal to Boris A. Bakhmeteff; Croes Medal to Thomas R. Camp; Rowland Prize to R. F. Blanks and H. S. Meissner; James Laurie Prize to Ross M. Riegal; Collingwood Prize to F. L. Ehasz; Hering Medal to A. L. Genter; Stevens Award to Maurice L. Albertson; Hilgard Prize to A. A. Kalinske.

American Society of Mechanical Engineers, The, founded in 1880 to promote the art and science of mechanical engineering; to encourage research; to foster engineering education; to advance the standards of engineering; and to broaden the usefulness of the engineering profession. Membership: 26,000 in 20 professional divisions. There are student branches in 122 engineering schools. President, James M. Todd; Secretary, Clarence E. Davies. Headquarters: 29 West 39th St., New York 18, N.Y. Publications: *Mechanical Engineering*; *Journal of Applied Mechanics*; *Transactions*; *Applied Mechanics Review*; *ASME Mechanical Catalog and Directory*.

American Society of Zoologists, founded in 1902, is an association of workers in the field of zoology for the presentation and discussion of new or important zoological facts and problems, and for the adoption of measures to advance zoological science. Membership: 1,150. President, Carl G. Hartman; Secretary, L. V. Domm. Headquarters: Office of the Secretary, Whitman Laboratory, 5700 Ingleside, Chicago 37, Ill.

American Sociological Society, founded in 1905 to stimulate and improve research, instruction and discussion, and to encourage cooperative relations among persons engaged in the scientific study of society. Membership: 2,400. President, Talcott Parsons; Secretary, Treasurer and Managing Editor of *Review*, Ernest R. Mowrer; Editor, Maurice R. Davie. Headquarters: Northwestern Univ., Evanston, Ill.

American Standards Association, founded in 1918, is a federation of national associations and government departments dealing with standardization. Through it, government, technical societies, industry, labor, and the consumer, work together to develop a mutually satisfactory set of national standards. Membership: 108 trade associations, technical societies, consumer groups, and government departments; over 2,100 company members. President, Thomas D. Jolly; Secretary, G. F. Hussey, Jr.; Technical Director & Assistant Secretary, Cyril Ainsworth; Chairman, Executive Committee, Howard Conoley. Headquarters: 70 East 45th St., New York 17, N.Y.

American Statistical Association, founded in 1839 to promote unity and effectiveness of effort among all concerned with statistical problems, and to increase the contribution of statistics to human welfare. Membership: Over 5,000. President, Simon Kuznets; Secretary-Treasurer, Merrill M. Flood. Headquarters: 1603 K St., NW Washington 6, D.C.

American Veterans Committee, Inc., founded in 1944 to assist veterans in their problems of reintegration into community life; to support legislation which will benefit veterans, first, as citizens, second, as veterans; to achieve a more democratic and prosperous America and a more stable world. Membership: 110,000. National Chairman, Chat Paterson; National Vice Chairman, Joseph A. Clorety, Jr.; National Secretary, Joseph A. Clorety, Jr.; National Treasurer, Ely Wagner. Headquarters: 1200 Eye Street Northwest, Washington 5, D.C. 3rd Annual Convention—November 25-28, 1948.

American Veterinary Medical Association, founded in 1863 to advance the science and art of veterinary medicine, including its relationship to public health. Membership: 9,600. President, Dr. L. M. Hurt; Executive Secretary, Dr. J. G. Hardenbergh. Headquarters: 600 S. Michigan Ave., Chicago 5, Ill. Annual meeting will be held at Detroit, Mich., July 11-14, 1949. Twelfth International Veterinary Congress Prize to Dr. A. E. Cameron; 1948 Borden Award and Medal to Dr. A. F. Schalk; 1948 Humane Act Award to Richard Swank.

American Vocational Association, Inc., founded in 1925, is a national professional organization of teachers, supervisors, administrators, and other persons interested in education for occupational efficiency. The AVA extends its services to individuals and organizations interested in this field of education. Membership: 27,534. President, Julian A. McPhee; Treasurer, Charles W. Sylvester; Executive Secretary, L. H. Dennis. Headquarters: 1010 Vermont Ave., Washington 5, D.C.

American Wildlife Foundation, founded in 1935 to promote the coordination of the wildlife conservation, restoration, and management work of organizations throughout North America. Membership: 25 trustees. President, F. C. Walcott; Treasurer, T. E. Doremus; Secretary, C. R. Guter-muth. Headquarters: 822 Investment Building, Washington 5, D.C. The foundation issues grants-in-aid to cooperating agencies and organizations.

American Woman's Association, The, founded in 1922 to advance the economic, cultural and social interests of business and professional women. President, Mrs. Natalie W. Linderholm; Secretary, Dorothy L. Wood; Treasurer, Maude K. Wetmore. Headquarters: The Barclay, 111 East 48th St., New York 17, N.Y.

American Youth Hostels, Inc., founded in 1934 to help build a more peaceful world through the wide and happy comradeship of youth. The society provides youth hostels (inexpensive overnight accommodations) in America, and sponsors trips in America and abroad. Membership: Over 15,000. President, John D. Rockefeller, 3rd; Executive Vice President, Ben W. Miller; Treasurer, Edwin A. Locke, Jr.; National Director, Monroe W. Smith. Headquarters: Northfield, Mass.

AMVETS (American Veterans of World War II), organized in 1945 under a charter by the U.S. Congress to preserve world peace, to strengthen the American way of life, and to help the veteran to help himself. Membership: 100,000. National Commander, Harold A. Keats; National Executive Director, Elliot Newcombe. Headquarters: 724 Ninth St., NW, Washington 1, D.C. The Annual National Convention will be held at Des Moines, Iowa, Aug. 31-Sept. 4, 1949.

Archaeological Institute of America, founded in 1879 to promote interest in archaeology. Membership: about 1,800. President, Sterling Dow; Secretary, Van L. Johnson; Treasurer, Seth T. Gano; Headquarters: Andover Hall, Harvard University, Cambridge 38, Mass.

Arctic Institute of North America, founded in 1944 to encourage scientific research in the Arctic and Subarctic regions of North America and, in general, to act as coordinating center for Arctic work in North America. Membership: 18 members of Board of Governors, 1,500 Associate members. Chairman, Dr. Henry B. Collins, Jr., Executive Director, A. L. Washburn; Director Montreal Office, P. D. Baird; Director New York Office, W. A. Wood. Headquarters: 3485 University St., Montreal, Canada. New York Office: Broadway at 156th St., New York 32, N.Y. In 1948 the Institute supported 13 field projects; instituted a program of Associate membership; began publication of *Arctic*, a biannual journal, and a newsletter.

Army Relief Society, founded in 1900, provides assistance to dependent widows and orphans of officers and enlisted men of the Regular Army and of temporary personnel. President, Mrs. David Wagstaff; Recording Secretary, Mrs. Clarence P. Townsley; Treasurer, Walter G. Kimball. Monthly meetings are held at Headquarters, 350 Fifth Ave., New York 1, N.Y. The annual meeting will be held in April, 1949.

Association of the Junior Leagues of America, Inc., founded in 1921 to unite in one body all the Junior Leagues of America and to foster their interest in the social, economic, educational, cultural, and civic conditions of their respective communities. The association also works to improve the efficiency of the volunteer service of members. Membership: 50,000. President, Dorothy Rackemann; Secretary, Mrs. J. Archibald Hodgson; Treasurer, Mrs. Robert E. Harwell. Headquarters: Waldorf Astoria, New York 22, N.Y. The annual conference will be held at Boca Raton, Fla., Apr. 19-23, 1949.

Automobile Manufacturers Association, Inc., organized in 1913 as the Automobile Chamber of Commerce and changed to its present name in 1934. The purpose of the association is to assist in the solution of problems affecting the industry; to promote free competition of the industry's products; to collect and disseminate technical information relating to the automotive industry; to facilitate the exchange of information among its members regarding inventions, patents, trade marks, etc.; to acquire and dispose of property. Membership: 35 corporations. President, G. W. Mason; Managing Director, William J. Cronin. Headquarters: 320 New Center Building, Detroit 2, Mich.

Automotive Safety Foundation, founded in 1937 to encourage safe and efficient use of streets and highways through grants of funds and/or staff services to national, state, and local organizations active in the field. Membership: 500 supporting member companies. Chairman of Board, Alexander Fraser; President, Pyke Johnson; Treasurer, A. O. Dietz; Secretary, D. C. Fenner. Headquarters: 700 Hill Building, Washington 6, D.C.

Benevolent and Protective Order of Elks, a fraternal organization founded in 1868 "to inculcate the principles of Charity, Justice, Brotherly Love and Fidelity." Membership: 950,000. Grand Exalted Ruler (Executive Head), George I. Hall; Grand Secretary (Executive Secretary), J. E. Masters. Membership: 700. President, W. W. Chaplin; Secretary, Hester E. Hensell; Treasurer, Ralph Jules Frantz. Headquarters: Times Building, Suite 411, 1475 Broadway, New York 18, N.Y.

Pan-American Foundation, founded in 1938 to promote and maintain, through nongovernmental means and agencies, the principles and policies of Pan Americanism. The foundation cooperates with inter-American organizations, and publishes Pan American booklets, pamphlets, and bibliographies. Director, A. Curtis Wilgus; Secretary, William A. Reid. Headquarters: 1217 13th St., NW, Washington 5, D.C.

P.E.N. Club—American Center, founded in 1923 to promote greater understanding between writers. There are 50 centers throughout the world. The international secretariat is in London. Membership: American Center—about 300. President, Henry Seidel Canby; Secretary, Manual Komroff; Treasurer, Kenneth McCormick. Headquarters: 123 East 94th St., New York 28, N.Y.

Photographic Society of America, Inc., organized in 1934 to succeed the Associated Camera Clubs of America, founded in 1919. It is an association of photographers, amateur and professional, and others interested in photography and photographers, which serves as a clearing house for ideas, methods, and achievements in photography. Membership: 9,500. President, C. B. Phelps, Jr.; Secretary, Mrs. A. P. Dewey; Treasurer, Charles Heller. Headquarters: 1815 Spruce St., Philadelphia 3, Pa.

Planned Parenthood Federation of America, Inc., founded in 1921 as the American Birth Control League to strengthen maternal and infant health through providing methods of and spreading knowledge on conception control. In 1941 name changed to express program expansion in aid to fertility, education for marriage, and research in human reproduction. Membership: 163 member organizations. Chairman, Charles E. Scribner; Secretary, Mrs. Henry C. Taylor; Chairman, Medical Executive Committee, Dr. William T. Kennedy; National Director, D. Kenneth Rose. Headquarters: 501 Madison Ave., New York 22, N.Y. Annual Lasker Foundation Awards to John Rock, M.D. and Richard N. Pierson, M.D. Publications: *Human Fertility*; *News Exchange*. The Annual Meeting will be held in October, 1949, in New York.

Poetry Society of America, The, founded in 1910 to secure fuller recognition for poetry as one of the important forces for a high civilization and especially to foster American poetry and assist poets. Membership: Approximately 500. President 1948, Carl Carmer, President 1949, Robert Hillyer; Secretary, Harold Vinal; Treasurer, Frank E. Gerry. Headquarters: Correspondence should be addressed to Secretary, 687 Lexington Ave., New York, N.Y. Meetings are held at 122 East 58th St., New York 22, N.Y. Monthly awards of \$10 and \$5; yearly awards of \$100 and \$50.

Reserve Officers Association of the United States, founded in 1922 to support and assist in the development of a military policy for the United States that will provide adequate national security. Membership: 100,000. President, Clarence E. Barnes; Vice Presidents, Henry G. Nulton, John P. Bracken, Morris J. Brummer; Treasurer, Carroll Morgan; Executive Director, E. A. Evans. Headquarters: 2517 Connecticut Ave., NW, Washington 8, D.C. The 1949 national convention will be held in Grand Rapids, Mich., in July.

Rockefeller Institute for Medical Research, The, founded in 1901 by John D. Rockefeller to "assist and encourage investigations in the sciences and arts of hygiene, medicine and surgery, and allied subjects. . . ." It is organized with three departments: the Department of the Laboratories, the Hospital, and Animal and Plant Pathology. During 1948, research was conducted by a full-time staff of 88, and by 34 visiting investigators. Publications: *The Journal of Experimental Medicine*; *The Journal of General Physiology*; and the *Studies from the Rockefeller Institute for Medical Research*. President, John D. Rockefeller, Jr.; Director, Herbert S. Gasser; Business Manager, Edric B. Smith. Headquarters: 66th St. and York Ave., New York 21, N.Y.

Rosicrucian Order, AMORC (Ancient, Mystical Order Rosae Crucis), had its traditional founding in Egypt; first came to America in 1894, was reactivated in 1909. The organization is a nonprofit, nonsectarian, Fraternal Order devoted to the investigation and study of the higher principles of life as found expressed in man and nature and works actively for peace, tolerance, and enlightenment as the means to banish superstition and ignorance. Publications: *Rosicrucian Digest*; *The Rosicrucian Forum*; *The Rosicrucian Library*. Imperator and Chief Executive, Ralph M. Lewis; Supreme Secretary, Cecil A. Poole. International headquarters: Rosicrucian Park, San Jose, Calif.

Rotary International is the world-wide organization of Rotary clubs, the first of which was formed in Chicago, Ill., in 1905. Rotary is a world fellowship of business and professional executives who meet together to further the "Ideal of Service," which is thought for and help to others in business and community life. Membership: 6,600 Rotary Clubs in 80 countries and geographical regions, with a membership in excess of 320,000. President, Angus S. Mitchell (Australia); Secretary, Philip Lovejoy (U.S.A.); Treasurer, Richard E. Vernor (U.S.A.). International headquarters: 35 East Wacker Drive, Chicago 1, Ill. Offices for serving Rotary Clubs are also located in London, England and Zurich, Switzerland. Publication: *The Rotarian* (official organ of Rotary International). The 1949 Rotary International Convention will be held in New York, N.Y., June 12-16.

Royal Institution of Great Britain, founded in 1799 for the promotion of science and the diffusion and extension of useful knowledge. Membership: 1,100. President, Lord Brabazon; Secretary, A. O. Rankine; Treasurer, R. E. Slade. Resident Professor and Director of the Davy Faraday Research Laboratory, E. K. Rideal; General Secretary, Thomas Martin. Headquarters: 21 Albemarle St., London, W.1, England.

Royal Society of Arts, founded in 1754 for the encouragement of arts, manufactures, and commerce. Membership: approximately 5,000. President, H.R.H. Princess Elizabeth; Secretary, K. W. Luckhurst. Headquarters: John Adam St., Adelphi, London, W.C.2, England. Albert Gold Medal to Sir William Reid Dick.

Royal Society of Canada, The, founded in 1881 by the then Governor-General (1) to encourage studies and investigations in literature and science; (2) to publish transactions containing records of the work performed, original papers and memoirs of merit; (3) to offer prizes for valuable papers on subjects related to Canada; (4) to aid researches already begun and carried so far as to render their ultimate value probable; and (5) to assist in the collection of specimens with a view to the formation of a Canadian Museum of archives, ethnology, archaeology and natural history. Membership: 398. President, Gustave Lanctot; Honorary Secretaries, F. J. Alcock and Séraphin Marion; Honorary Treasurer, L. E. Howlett; Honorary Editor, G. W. Brown. Headquarters: National Research Building, Ottawa, Ontario. The 1949 annual meeting will be held at Dalhousie University, Halifax, N.S., June 5-8.

Royal Society of Medicine, founded in 1805 (Royal Charter 1834) "for the cultivation and promotion of physic and surgery and of the branches of science connected with them." Membership: 9,000. President, Sir Henry Dale; Secretary, Geoffrey R. Edwards. Headquarters: 1 Wimpole St., London, W.1, England. A total of 200 medical meetings divided amongst the 24 Sections are held during the year.

Royal Society of South Africa, founded in 1877 as The South African Philosophical Society and granted a Royal Charter in 1908. Membership: limited to 100 Fellows, 150 ordinary members; bodies in exchange relations for publications number 240. Publication: *Transactions*. Contributions cover pure and natural sciences, humanistic studies, etc. Monthly meetings held at Cape Town. President 1948, Professor R. S. Adamson; President 1949, Dr. J. Jackson; Secretary, A. J. H. Goodwin. Headquarters: c/o University of Cape Town, Rondebosch, South Africa.

Royal Society, The, founded in 1660 for the advancement of natural knowledge. Membership: 546. President, Sir Robert Robinson; Treasurer and Vice-President, Sir Thomas Merton; Secretary, Sir Alfred Egerton; Secretary and Vice-President, Sir Edward Salisbury; Foreign Secretary, E. D. Adrian. Headquarters: Burlington House, Piccadilly, London, W.1, England.

Save the Children Federation, Inc., founded in 1932 to study the needs of children in the United States and in

other lands and develop and operate programs for their aid. Membership: 105 corporation members. Chairman, John O. Tilson; President and Executive Director, John R. Voris; Secretary, Henry Israel; Treasurer, Joseph A. Bucher. Headquarters: One Madison Ave., New York 10, N.Y.

Science Service, founded in 1921 as a nonprofit institution for popularization of science, with trustees nominated by the National Academy of Sciences, the National Research Council, the A.A.A.S., the E. W. Scripps Estate, and the journalistic profession. Its activities include press service for newspapers and magazines, publication of *Science News Letter* (weekly), *Chemistry* (monthly), *Things of Science* (monthly), conduct of radio programs, sponsorship of 15,000 Science Clubs of America in secondary schools, conduct of the national Science Talent Search, editing of books, preparation of experimental kits, etc. President, Harlow Shapley; Director, Watson Davis. Headquarters: 1719 N St., NW, Washington 6, D.C.

Scientific Research Society of America (RESA), founded in 1948 to encourage original investigation in science, pure and applied, especially in industrial and governmental organizations. Membership: 10 incorporators. Chairman, George A. Stetson; Director, Donald B. Prentice; Treasurer, George A. Batsell. Headquarters: 54 Hillhouse Ave., New Haven, Conn. First annual national meeting was held in Cleveland, Ohio, Nov. 27, 1948.

Seeing Eye, Inc., The, founded in 1929 "to act as a benevolent and charitable association to raise funds for the purpose of supplying blind persons with dogs trained to act as guides for such persons; . . . and to educate and to train such blind persons in the proper use and handling of such trained dogs." Membership: 24,800. President, Henry A. Colgate; Treasurer, James Carey; Executive Vice President, W. H. Ebeling. Headquarters: Morristown, N.J. More than 1,500 dogs have been trained for blind persons who came to the school to learn how to use them.

Social Science Research Council, founded in 1923 (incorporated 1924) to advance knowledge of human relations through scientific research. Membership: 30. Board Chairman, Robert B. Hall; President, Pendleton Herring; Vice President, Paul Webbink. Headquarters: 230 Park Ave., New York 17, N.Y.

Society for American Archaeology, founded in 1935 to promote and stimulate interest and research in the archaeology of the American continents; to serve as a bond among those interested in American archaeology and to aid in directing their efforts into more scientific channels; to publish their results; to aid in the conservation of archaeological data; to foster the formation and welfare of local societies. President, Waldo R. Wedel; Secretary, George I. Quimby; Treasurer, Glenn A. Black; Editor of *American Antiquity* (quarterly), Irving Rouse. Headquarters: c/o Secretary, Chicago Museum of Natural History, Chicago, Ill.

Society of American Bacteriologists, founded in 1899. Membership: 3,740. President, Wm. McD. Hammon; Secretary-Treasurer, John E. Blair. Headquarters: c/o John E. Blair, 1919 Madison Ave., New York, N.Y. Publications: *Journal of Bacteriology*, *Bacteriological Reviews*, and *News-Letter*. The 1949 Annual Meeting will be held May 16-20 at Cincinnati, Ohio. Eli Lilly Award (1948) to Alan Bernheimer.

Society of American Foresters, founded in 1900 to provide a medium for exchange of professional thought, and to promote the science, practice, and standards of forestry in America. Membership: 6,000. Executive Secretary, Henry Clepper. Headquarters: Mills Building, Washington 6, D.C.

Society of Automotive Engineers, Inc., founded in 1905 "to promote the Arts and Sciences and Standards and Engineering Practices connected with the design, construction and utilization of automotive apparatus, all forms of self-propelled or mechanically-propelled mediums for the transportation of passengers or freight and internal-combustion prime-movers. The principal means for this purpose shall be the holding of meetings for the reading and discussion of professional papers and reports, the publication and distribution of the same, and social intercourse." President, R. J. S. Pigott; Treasurer, B. B. Bachman. Headquarters: 29 West 39th St., New York 18, N.Y. The 1949 Annual Meeting is scheduled for January 10-14 at Detroit, Mich. The 1949 Summer Meeting will be held in French Lick, Ind., June 5-10, and the National West Coast Meeting in Portland, Ore. August 15-17.

Society of Naval Architects and Marine Engineers, The, founded in 1893 to advance the art, science, and practice of naval architecture; shipbuilding; marine engineering; commercial and governmental, in all of their branches, and of the allied arts and sciences. Membership: 5,300. Publications: *Principles of Naval Architecture*; *Marine Engineering*; *The Shipbuilding Business in the United States of America*. President, E. L. Cochrane; Secretary, W. N. Landers. Headquarters: 29 West 39th St., New York 18, N.Y.

Special Libraries Association, founded in 1909, incorporated in 1928, by librarians of business, professional, governmental, and industrial organizations to promote the collection, organization, and dissemination of information in specialized fields. Its program includes an annual con-

vention for the discussion of common problems by experts in various fields of activity; consultant services on the organization and administration of special libraries; publication of professional and bibliographical tools and manuals; and a placement service for members and employers. Chapters established on a geographical basis and groups organized in accordance with subject interests of members implement this program. President, Rose L. Vormelker; Treasurer, David Kessler; Executive Secretary, Mrs. Kathleen B. Stebbins. Headquarters: 31 East 10th St., New York 3, N.Y. Two periodicals, *Special Libraries and Technical Book Review Index*, are issued 10 times yearly. A *Directory of Members of Special Libraries Association* was published in 1948. The 1949 annual convention will be held in Los Angeles, Calif., June 12-17.

Temperance League of America, The, successor in January, 1948, to the Anti-Saloon League of America, a national temperance organization formed in 1895 of a federation of State Leagues active in temperance education, statistical research, local option legislation, and in the adoption of the 18th Amendment to the U.S. Constitution. President, Bishop G. D. Batdorf; Vice President, Bishop Ralph S. Cushman; Treasurer, Samuel Reid; General Superintendent, Clayton M. Wallace. National headquarters: 131 B St., SE, Washington, D.C.

National Travelers Aid Association, founded in 1917 to promote throughout the country means of cooperation and to improve the standards of Travelers Aid Service, to study the causes of migration, and to encourage a public understanding of moving people. Travelers Aid Service includes individualized information, travel and short contact service to travelers and other persons in difficulty away from their homes. Membership: operating members—109. Travelers Aid Societies providing services in 613 communities; 935 cooperating organizations and individuals; associate members. President, John G. Thompson; Secretary, Mrs. Robert C. Clothier; General Director, Conrad Van Hynning. Headquarters: 425 Fourth Ave., New York 16, N.Y. Six regional conferences are scheduled for 1949. As a member agency of the USO, it has administration of the USO Travelers Aid Service to the military and general supervisory responsibility for the lounges for troops in transit.

United Seamen's Service, Inc., founded in 1942 to promote and foster the welfare of seamen and other personnel of the U.S. Merchant Marine. The work of the Service includes the provision and maintenance of clubs and other facilities for the use of the merchant marine, and recreational, convalescence, personal, and other services for their benefit, in major foreign ports of the world. President, William S. Newell; Secretary, Dorothy C. Kahn; Executive Director, Orho J. Hicks. Headquarters: 39 Broadway, New York 6, N.Y. The annual meeting of trustees is held each October.

United Service for New Americans, Inc., established in 1946 by consolidation of the National Refugee Service and the National Service to Foreign Born of the National Council of Jewish Women. Its purpose is to assist refugees and displaced persons in their migration, resettlement, social and economic adjustment, and Americanization. Membership: 500 members of the Board of Directors; 1,200 affiliated local groups and agencies in 48 states. President, Edwin Rosenberg; Chairman of the Board, Mrs. Irving M. Engel; Secretary, Mrs. S. E. Sobeloff; Treasurer, Carlos L. Israels; Executive Director, Joseph E. Beck.

United States Committee for the Care of European Children, Inc., The, incorporated in 1940. The Committee brings to the United States from Europe, unaccompanied refugee children up to the age of 21 years, 170 in 1948. Most of the children are placed in foster homes under the supervision of local children's agencies which have been approved by the U.S. Children's Bureau. Honorary President, Mrs. Franklin D. Roosevelt; President, Marshall Field; Secretary-Treasurer, Carl S. Stern; Executive Director, Ingeborg Olsen. Headquarters: 215 Fourth Ave., New York 3, N.Y.

United States Conference of Mayors, The, founded in 1932 to improve municipal administration throughout the United States. To this end the conference works to provide interchange of information and experience between the major municipalities of the country, and to foster relationships on mutual problems between the Government of the United States and the cities. Membership: 250 American cities. President, George W. Welsh; Executive Director, Paul V. Betters. Headquarters: 730 Jackson Place, NW, Washington, D.C.

United States Junior Chamber of Commerce, founded in 1920 to provide a medium of expression for young men through which they may acquire a sense of civic responsibility. Membership: 180,000. President, Paul D. Bagwell; Executive Vice President, Frank Fister. Headquarters: Akdar Building, Tulsa, Okla.

United States National Student Association, founded in 1946 as a nonpolitical, nonsectarian, nonprofit representative intercollegiate organization to promote the interests and welfare, and to serve the needs of students of the United States. Membership: 265 colleges and universities (900,000 students). President, Ted Harris; Secretary-Treasurer, Helen J. Rogers; Public Relations Director, Allan Ostar. Headquarters: 304 North Park St., Madison 5,

Wisc. The Association has a seat on the U.S. Commission for UNESCO, is an associate member of the Department of Higher Education of the National Education Association, and is a sponsoring organization of World Student Service Fund. Publication: *NSA News*.

United World Federalists, Inc., founded in 1947 to bring about an American public opinion favorable to making the major objective of United States foreign policy the creation of a federal world government of limited powers, adequate to insure peace. Membership: 40,000. President, Cord Meyer, Jr.; Secretary, Lawrence Fuchs; Treasurer, Duncan Spencer. Headquarters: 7 East 12th St., New York, N.Y.

Veterans of Foreign Wars of the United States, founded in 1899 "to preserve and strengthen comradeship among its members; to assist worthy comrades; to perpetuate the memory and history of our dead and to assist their widows and orphans; to maintain true allegiance to the government of the United States of America and fidelity to its constitution and laws; to foster true patriotism; to maintain and extend the institution of American freedom; and to preserve and defend the United States from all her enemies, whosoever." Membership is open to American citizens who have been awarded a campaign medal or badge for service in the Armed Forces on foreign soil or in hostile waters. Membership: 1,500,000. Commander-in-Chief, Lyall T. Beggs; Adjutant General, H. N. Hensley; Quartermaster General, R. B. Handy, Jr.; Judge Advocate General, James Hardin; Surgeon General, Dr. Oliver C. Pratz; National Chaplain, Max J. Matz. Headquarters: Broadway at 34th St., Kansas City 2, Mo. The 50th National Convention will be held in Miami, Fla., Aug. 28-Sept. 2, 1949.

Wildlife Management Institute, founded in 1946, is dedicated to the conservation, restoration and management of wildlife resources and the application of sound wildlife practices and techniques on both public and private lands. Membership: 746. President, Ira N. Gabrielson; Vice President, C. R. Guteruth; Treasurer, C. Stewart Comeaux; Secretary, Ethel M. Quee. Headquarters: 822 Investment Building, Washington 5, D.C. The institute issues scholarships, fellowships, and research grants. It furnishes technical counsel to cooperating organizations, disseminates informative literature, and publishes outstanding manuscripts on natural science subjects.

Wistar Institute of Anatomy & Biology, The, founded in 1892 for the preservation and free exhibition of the museum originally known as The Wistar and Horner Museum; publication of original scientific material; research in biological and related fields; etc. President, William H. DuBarry; Secretary, William G. Rhoads; Executive Director, Edmond J. Farris. Scientific staff: Members, Associate Members, and Fellows. Headquarters: 36 St. and Woodland Ave., Philadelphia 4, Pa. Publications: *Journal of Morphology*, *American Journal of Anatomy*, *Anatomical Record*, *Journal of Experimental Zoology*, *American Journal of Physical Anthropology*, *Journal of Cellular and Comparative Physiology*, *Journal of Nutrition*, *Journal of Comparative Neurology*.

Women's American ORT (Organization for Rehabilitation through Training), founded in 1927 for the training and retraining of impoverished people in technical trades and agriculture so that they may become useful wanted citizens. More than 50 trades are taught in ORT schools in 22 countries throughout the world (principally in Europe). Membership: 20,000. President, Mrs. Ludwig Kaphan; Treasurer, Mrs. Alexander Konoff; Corresponding Secretary, Mrs. Seymour Nathan; Executive Secretary, Mrs. Lisbeth H. Goodstein. Headquarters: 212 Fifth Ave., New York 10, N.Y.

Woodrow Wilson Foundation, founded in 1922 in recognition of the national and international services of Woodrow Wilson. The Foundation has developed a program to further the Wilsonian concept of international organization and world cooperation. Publications: *United Nations News*, and reprints. President, Thomas K. Finletter; Secretary, Allen W. Dulles; Executive Director, Julie d'Estournelles; Librarian, Harriet Van Wyck. Headquarters: 45 East 65th St., New York 21, N.Y. The Foundation, in cooperation with the American Political Science Association, makes an annual award for the outstanding publication of the year dealing with government and democracy.

Woods Hole Oceanographic Institution, The, founded in 1930, is a privately endowed nonprofit organization at Woods Hole, Mass., for the study of oceans in all their aspects, including problems in hydrography, biology, chemistry, geology, and meteorology. President, Henry B. Bigelow; Director, Columbus O'D. Iselin. Publications: *Papers in Physical Oceanography and Meteorology*, and *Collected Reprints*.

World Association of Girl Guides and Scouts, founded in 1928 to encourage understanding and friendship among girls of all nations and promote the fundamental aims of Girl Scouting and Girl Guiding, as expressed in the Promise and Laws, throughout the world. Membership: 3 million. Chairman, World Committee, Mrs. E. Swift Newton (U.S.A.). World Bureau: 9 Palace St., London, S.W.1, England. The 12th biennial conference met at Coopers-town, N.Y., August, 1948.

World Council of Churches, founded provisionally 1938,

officially inaugurated 1948 in Amsterdam. Unites churches of the world for cooperative study, research, youth work, evangelism and inter-church aid. Membership: 145 churches in 44 countries. Presidium: Marc Boegner, the Archbishop of Canterbury, T. C. Chao, Archbishop S. Germanos, Bishop G. Bromley Oxnam, the Archbishop of Upsala. General Secretary, W. A. Visser 't Hooft. Offices: 17 Route de Malagnou, Geneva, Switzerland; 7 Kensington Church Court, London, England; 297 Fourth Ave., New York 10, N.Y.

World's Young Women's Christian Association, founded in 1894 to unite and serve national Young Women's Christian Associations. Membership: Approximately 1,500,000 women and girls of every race; 5,000,000 more share in its activities. President, Lilace Reid Barnes (U.S.A.); Treasurer, Catherine Picot (Switzerland). Headquarters: 37 Quai Wilson, Geneva, Switzerland. The association has been accepted in consultative status with the United Nations. The executive committee met in Geneva, Switzerland, in May, 1948.

Young Women's Christian Associations of the United States of America, founded in 1858 to promote the physical, social, intellectual, and spiritual interests of young women. Membership: A constituency of 3,000,000. President, Mrs. Arthur Forrest Anderson; Secretary, Margaret E. Burton; Treasurer, Mrs. Roland P. Beattie; General Secretary, Mrs. Harrison S. Elliott. Headquarters, 600 Lexington Ave., New York 22, N.Y. In 1948 the first YWCA International Study Conference on Women and World Reconstruction was held at Teachers College, Columbia University, New York, N.Y., with 45 women from 27 nations present.

Zonta International, founded in 1919, is a service club of business executive and professional women working for the advancement of understanding, goodwill, and peace. Membership: 7,000; 200 clubs. International President, Elizabeth A. Judge; International Treasurer, Ruth H. Gates; Executive Secretary, Harriet C. Richards. Headquarters: 59 East Van Buren St., Chicago 5, Ill. Theme for 1948-49 "Community Service for World Service." The 1949 international convention will be held at Quebec, Canada, in June.

SOIL CONSERVATION SERVICE. A scientific and technical agency of the U.S. Department of Agriculture, established in 1935. The principal responsibility of the Service is to assist farmers and ranchers in soil conservation districts, through its planning technicians and other soil and water conservation specialists. As of Nov. 1, 1948, there were 2,073 of these farmer organized and farmer managed soil-conservation districts including 1,132,321,880 acres and 4,500,260 farms in all 48 states, Puerto Rico, the Virgin Islands, Alaska, and Hawaii.

Approximately 626,000 complete soil-conservation plans, covering about 222 million acres of farm and ranch land, had been developed by technicians of the Service, working with farmers and ranchers, by July 1, 1948. More than 157 million acres of this land had been treated with soil-saving and water-management practices according to the needs and capabilities of the land. Detailed conservation surveys, which are made by the Service to provide data and information required for farm planning, had been completed on 280 million acres.

Other responsibilities assigned to the Service include special treatment of land for flood control, to supplement major downstream flood-control works such as reservoirs and levees; water conservation and utilization for development of irrigation lands of the West; and management and development of government-owned submarginal lands in 32 states. The Service carries on flood-control operations in 11 major watersheds, and is making investigations and surveys in many other watersheds to collect data for the planning of flood-control projects.

Research studies to perfect soil-conservation practices and to develop measures for applying those needed in different regions, are conducted by the Service at experiment stations in all parts of the country, chiefly in cooperation with the State and territorial Experiment Stations. Chief: Hugh H. Bennett.

SOUTH AFRICA, Union of. A self-governing dominion of the British Commonwealth of Nations, com-

posed of four provinces—Cape of Good Hope, Natal, Orange Free State, and Transvaal. South Africa retains control of South-West Africa, a former German territory mandated to the Union in 1920 by the League of Nations. Seat of the government, Pretoria. Seat of the Legislature, Cape Town.

Area and Population. The area of the Union is 472,494 square miles. That of South-West Africa is 317,725 square miles. Population at the 1946 census was 11,259,000, of whom 2,335,000 were Europeans, 7,736,000 Bantu, 283,000 Asiatic, and 905,000 of other races. Chief cities in 1946 (European population only): Johannesburg, 324,304; Cape Town, 214,201; Durban, 124,792; Pretoria, 124,542.

Education and Religion. State-aided and state-conducted schools for Europeans are adequate in number, but schools for the native population are relatively fewer. The Union has five universities (1945 enrollment, 14,222) and a number of technical, trade, and commercial schools; and schools for the handicapped.

The religious affiliations of the European population at the time of the 1936 census were: Dutch churches, 54 percent; Anglican, 17 percent; Methodist, 7 percent; with the remainder largely Roman Catholic, Jewish, and Presbyterian.

Production. Gold mining, which occupies four-fifths of the country's employed population and furnishes the chief export, is the country's most important business with production in 1948 at £100 million. South Africa stands first in the production of diamonds as well as gold, but in its domestic economy diamonds are outranked by coal in value of output. Lime and limestone, copper, asbestos, and platinum are other minerals produced in quantity.

The raising of sheep and goats occupies a considerable section of the population. In agriculture proper, fruits, both citrus and other, and tobacco are increasingly emphasized. In 1947-48 tobacco production was 163,722,000 lb. and wool 205,170,000 lb. Metals and engineering is the largest industry and food processing the second, but textiles and clothing are also important and a tendency towards diversification is apparent.

Foreign Trade. Exports (excluding gold) in 1947 were S.A. £96 million and imports S.A. £276 million. Exports are dominated by gold but imports are diversified and include apparel and other consumer goods. The adverse balance of trade with the United States in 1947 was S.A. £76 million.

Transportation. The government operated 13,255 miles of railways in 1945 and road motor services over 18,324 route miles. In that year 7,406,564 tons net of shipping entered the four chief ports of Durban, Cape Town, Port Elizabeth, and East London. The South African Railways and Harbors Board operates internal airways connected with all African airlines.

Finance. The budget estimates for 1948-49 provided for revenue of £137,500,000; expenditure of £130,597,000; and a resulting surplus of £6,903,000. Net debt (Mar. 31, 1948): £592,174,000, of which £583,974,000 was internal. The Union's gold reserves declined by Sept. 30, 1948, to £66,100,855 or 30.9 percent (legal minimum: 30 percent) and imports were therefore restricted.

Government. Executive power is vested in the Governor General, appointed by the Crown upon recommendation of the South African Government, and in the Executive Council (Cabinet) which is responsible to Parliament. Parliament consists of a Senate and a House of Assembly. The Senate has

a basic membership of 40, 8 elected for each of the four provinces and 8 appointed by the Governor General. Each Senator must be a British subject of European descent. The House of Assembly has a basic membership of 150, elected from the provinces roughly in proportion to the white population.

The Representation of Natives Act, 1936, provided for direct representation of natives in the Senate by four additional members, for three additional members in the House of Assembly, and for a Natives Representation Council. The Asiatic Land Tenure and Indian Representation Act of 1946 gave the Indians of Natal and Transvaal joint representation by two senators, one elected by the Indians and one appointed by the Government, and entitled them to a representation of three in the House of Assembly.

Governor General, Major Gideon B. van Zyl, Prime Minister and Minister for External Affairs, D. F. Malan (Nationalist), succeeding General Jan Smuts (United Party), as a result of the election of May 26, 1948. Election results: Government parties 79 (70 Nationalist, 9 Afrikaners); Opposition 74 (United Party 65, Labor 6, Native 3).

Events, 1948. The session of Parliament which opened on January 16 was scarcely more than an overture for the general election that was to take place in May. General Smuts, the Prime Minister, made several Cabinet changes just before the session opened. The Speech from the Throne included a reference to the bill for controlling the exploitation of uranium deposits discovered on the Rand and, it was rumored, elsewhere in South Africa. This bill was passed after the election as the Atomic Energy Bill. On March 27 the Governor General approved the bill passed by Parliament enabling the Union Government to apply the General Agreement on Tariffs and Trade concluded at Geneva on Oct. 30, 1947.

Defeat of Smuts. The victory of the Nationalist Party, with the aid of the Afrikaner Party, in the election of May 26, appeared to come as a general surprise. Actually Prime Minister Smuts and his United Party, together with the Labor Party, won a majority of the votes cast (551,590 to 443,719), but rural seats have a preference up to 30 percent in the electoral quota. There appeared to have been a shift to the Nationalists in rural areas.

General Smuts lost his seat in the Transvaal constituency of Standerton, and on May 28 he handed the resignation of his Cabinet to Governor General van Zyl. Van Zyl immediately asked Dr. Daniel François Malan, Nationalist leader, to form a new government. Smuts at first insisted on leaving public life, but on June 1 he accepted a seat offered by C. W. Clark, who won in Pretoria East. The acceptance gave Smuts the position of Leader of the Opposition, a desirability if the United Party was to be kept a close-knit organization after its defeat. Smuts reached his 78th birthday on May 24, 1948.

The Malan Government. Malan announced his Cabinet on June 3. The Prime Minister kept for himself the portfolio for External Affairs. Malan had been Minister of the Interior in the Hertzog administrations. N. C. Havenga was designated Minister of Finance, a post he had held from 1924 to 1938. Havenga, the leader of the Afrikaner Party, was the only member of that party appointed to a Cabinet post. The appointments on the whole were more moderate than the composition of the new House of Assembly suggested.

Several of the Nationalists who gained seats were interned as suspects in World War II or were mem-

bers of totalitarian organizations, but Dr. Malan himself was exonerated in 1946 of significant collaboration with the Nazis (see YEAR BOOK for 1946, p. 613). In the election campaign he acknowledged his membership in the *Broederbond*, a secret society seeking Afrikaner domination over the British. At the same time he maintained a feud with the *Ossewabrandwag*, a Fascist-minded organization imitating the Nazi ceremonial, and during the campaign a mutual boycott was carried on.

The Nationalists fought the election chiefly on the issue of outright separation (*apartheid*) of Europeans and natives; topographically, politically, and economically; as well as socially. Nationalist fear of the end of the white race and of white civilization in South Africa appeared to be extreme. Although they were republican, they gave repeated assurances during the campaign that there would be no immediate attempt to break with the Commonwealth.

Native Rights. In pursuance of the racial policy announced in the election campaign, Malan announced on September 1 his belief that Parliament could amend the Representation of Natives Act by a simple majority. The reference was to the South Africa Act of 1909, which provided that the existing franchise of non-Europeans in Cape Province could not be changed except by a two-thirds majority of both houses of Parliament sitting together. This procedure was followed in the passage of the Representation of Natives Act, 1936, which introduced a system of communal representation for all natives.

In November Prime Minister Malan told the Transvaal National Party Congress that the Cabinet had approved a system of national registration which would assist the country in its policy of *apartheid*, since the identity cards would show the race of the holders. A person would be classed as non-European if at least one grandparent were black. Dissension within the Government was indicated when Havenga, leader of the Afrikaner Party, told the party congress on December 1 that he intended to stand by the South Africa Act and the Constitution. Subsequently the Afrikaner Party withdrew from the provincial elections to be held in March, 1949.

The Nationalist plan of abolishing native representation would serve the double purpose of *apartheid* and increasing the slender Nationalist majority in Parliament. Three members of the House of Assembly, three Senators, and the Natives Representation Council would disappear.

An allied issue was the treatment of Indians in South Africa. In July, 1948, India asked that the matter be taken up by the General Assembly of the United Nations at its next meeting, as had been done in 1946 and 1947, when results were inconclusive. The feud between the two countries was continued in the UN Trusteeship Committee in November, when the Chairman reprimanded South Africa's representative Eric Louw for an over-personalized attack on India's Mrs. Pandit. Mr. Louw had suggested that Mrs. Pandit look to her own country for the kind of inhuman excesses she attributed to South Africa.

South-West Africa. Once again in 1948 South Africa refused to place under UN trusteeship the former mandated territory of South-West Africa. On November 16, speaking in the Trusteeship Committee meeting in Paris, Louw called the question a domestic one and asked whether it was surprising that decent South Africans from all parties were questioning South Africa's membership in an organization [the United Nations] "where the Union

and its Government are annually abused and vilified." The Indian delegation had previously offered a resolution proposing that a UN commission be sent to South-West Africa. On November 26 the General Assembly, by a vote of 43 to 1, criticized South Africa for its refusal to place South-West Africa under Trusteeship.

Dwindling Gold Reserves. South Africa's shortage of foreign exchange, apparent as early as April, was attributed to the unaltered price of gold since September, 1939, by Dr. de Kock, Governor of the South African Reserve Bank, in his annual address on July 28. As the gold supply continued to fall the reserve ratio was reduced from 30 to 25 percent, and on November 4 a plan of reducing imports by rationing dollars was announced.

When the 25 percent ratio was threatened South Africa bought \$10 million of United States currency from the International Monetary Fund. In December the restriction of the very large purchases from the United States had not yet been felt, and de Kock urged the need of American credits.

—ALZADA COMSTOCK

SOUTH AMERICA. A continent comprising 10 republics (Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay, and Venezuela) and three colonies (British Guiana, French Guiana, and Surinam). Total area: 6,937,445 square miles (17,968,000 square kilometers). Estimated population: 88,680,000 (Jan. 1, 1940).

SOUTH CAROLINA. A south Atlantic State. Area: 30,989 sq. mi. Population: (July 1, 1948) 1,991,000, compared with (1940 census) 1,899,804. Chief cities: Columbia (capital), 62,396 inhabitants in 1940; Charleston, 71,275. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$104,481,000; total expenditure, \$106,360,000.

Legislation. The annual session of the General Assembly convened January 13 and adjourned April 15. Appropriations for the ensuing year totaled about \$100 million, a record for one year. Included were increased amounts for teachers' salaries, health and welfare purposes, and highways. Appropriations for farm-to-market roads were unprecedentedly high. Cities in the State were granted about \$2 million as their share of the State excise tax on hard liquors.

Other major developments included the creation of interim committees to study revision of the 1895 Constitution; reorganization of the State departments and agencies; and revision of legislative processes and procedures. The interstate parole and probation compact was adopted. By popular vote, in November, South Carolina joined the other States in legalizing divorce, and provided specific grounds on which divorces may be obtained.

Elections. Thurmond won his home State's 8 electoral votes with a popular majority over Truman, Dewey, and other candidates of more than 50,000. Incumbent Democratic Senator Burnet R. Maybank was reelected. Democrats retained the 6 House seats. There were no Statewide contests for State office.

Officers, 1948. Governor, J. Strom Thurmond; Lieut. Governor, George Bell Timmerman; Secretary of State, W. P. Blackwell; Attorney General, John M. Daniel; State Treasurer, Jeff B. Bates; Comptroller General, E. C. Rhodes; State Auditor, J. M. Smith.

SOUTH DAKOTA. A west north central State. Area: 77,615 sq. mi. Population: (July 1, 1948) 623,000, compared with (1940 census) 642,961. Chief cities: Pierre (capital), 4,322 inhabitants in 1940; Sioux Falls, 40,832. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$36,175,000; total expenditure, \$30,035,000.

Elections. Dewey won the 4 electoral votes with a popular majority over Truman and Wallace not half as large as his 40,000 majority in 1944. Congressman Karl E. Mundt, Republican, was elected Senator. Republicans retained the 2 House seats. Incumbent Republican Governor George T. Mickelson was reelected. Other State officers elected included: Lieutenant Governor—Rex Terry; Secretary of State—Annamae Riiff; Attorney General—Sigurd Anderson; Land Commissioner—Bernard Linn. The voters approved a \$30 million bond issue for veterans' bonuses.

Officers, 1948. Governor, George T. Mickelson; Lieut. Governor, Sioux K. Grigsby; Secretary of State, Annamae Riiff; Attorney General, Sigurd Anderson; State Treasurer, C. E. Buehler; State Auditor, Steve E. Anderson; Commissioner of School and Public Lands, John A. Lunden.

SOUTH PACIFIC COMMISSION. This regional international organization was set up by the South Seas Conference at Canberra, Australia, in January-February, 1947, when an Agreement was signed by the Governments of Australia, France, the Netherlands, New Zealand, the United Kingdom, and the United States of America. It was established as a consultative and advisory body to assist the six signatory governments in promoting the social and economic advancement of the approximately 2 million peoples in the non-self-governing territories within the scope of the Commission. The territorial scope has been defined as comprising "all those non-self-governing territories in the Pacific Ocean which are administered by the participating governments and which lie wholly or in part south of the Equator and east from and including Netherlands New Guinea."

For the accomplishment of the purposes of the organization, the Agreement provides for two bodies auxiliary to the Commission: (1) The South Pacific Research Council, a standing advisory body to be composed of persons distinguished in the fields of research within the competence of the Commission; and (2) the South Pacific Conference, a periodic conference of representatives of the local inhabitants in the region.

An interim organization was established at Sydney in April, 1947, and functioned in the intervening period. On Nov. 26-28, 1947, a Preparatory Conference attended by representatives of the participating governments met in Australia for the purpose of considering matters affecting the preliminary organization of the Commission.

United States participation in the South Pacific Commission was authorized by Public Law (80th Congress, 2nd Session), approved by the President on Jan. 28, 1948. The President on that day also signed the instrument of acceptance of the Agreement Establishing the South Pacific Commission. The Agreement, duly ratified by the signatory governments, came into force on July 29, 1948.

The Commission, which held its First Session at Sydney, Australia, on May 11-21, 1948, is composed of two Commissioners and their alternates appointed by each of the six governments. Among

the more important items on the agenda were the permanent seat of the Commission; the appointment of the Secretary General, the Deputy Secretary General, and the Deputy Chairman of the South Pacific Research Council, the organization of the Research Council, the South Pacific Conference, and the establishment of the Working Committee, which meets frequently between sessions and makes policy decisions for the Commission and the Secretariat. The six nations also agreed that the following projects should be given immediate and active attention: (1) Production of food to be increased in order to raise nutrition standards and to augment food exports; (2) mechanization of the copra industry and the study of by-products and essential uses of copra residue; (3) intensification of fisheries research to improve present inadequate supplies; (4) construction of more ships to encourage production and to relieve shortages of goods; (5) improvement of infant and maternal welfare; (6) collection and dissemination of information on training of islanders in technical skills; (7) stimulation of education by radio and film strips; and (8) dissemination of information on modern agricultural practice.

The selection of Nouméa, New Caledonia, as the site for the permanent headquarters of the Commission, together with appointments to the senior positions on the staff of the Commission and of the Research Council, were among the major decisions enacted by the Commission at its Second Session, which was held at Sydney from October 25 to November 2, 1948.

The Senior Commissioners for the Commission in 1948 were: Australia, Mr. J. R. Halligan; France, Mr. R. F. Lassalle-Séré; the Netherlands, Mr. A. J. Beversluis; New Zealand, Mr. C. G. R. McKay; the United Kingdom, Sir Brian Freeston; and the United States, Dr. Felix M. Keesing.

—EDNA H. BARR

SOYBEANS. The 1948 soybean crop of the United States was estimated at 220,201,000 bushels—the largest on record. This compares with the 1947 crop of 183,558,000 bu. and the 10-year average (1937-46) of 134,642,000 bu. The yields of the principal producing States were (in bushels): Illinois 78,504,000, Iowa 35,443,000, Indiana 31,196,000, Ohio 18,614,000, Missouri 15,900,000, Minnesota 15,614,000. For the United States the yield per acre was 21.4 bu.

SPAIN. A state of southwestern Europe, occupying the greater part of the Iberian peninsula.

Area and Population. Area, 196,607 square miles, including the Balearic and Canary Islands. Population, 27,761,000 (1948 est.). Principal cities, Madrid (capital), Barcelona, Valencia, Sevilla, Zaragoza, Málaga, Murcia, and Bilbao.

Education and Religion. Roman Catholicism is the official religion of the state. After the Civil War, the Church was restored to its preeminent position, its confiscated property returned, religious education introduced in the public schools, and divorce suppressed. According to the latest census, the country has 45,000 non-coeducational elementary schools, with an enrollment of 4,480,619 pupils, and an additional attendance of 483,243 adults. There are 120 intermediate schools or institutos, with an attendance of 185,644 students, and twelve universities throughout Spain, that in 1945 had a total enrollment of 39,400 students. There are also 31 seminaries or ecclesiastical schools with 6,555 students enrolled. The government claims that the rate of illiteracy is only 5 percent of the youth

population, and about 20 percent of the adults.

Production. Spain's economy is based on agriculture and mining. Chief items of mineral production in 1947 (in metric tons) were estimated as follows: coal, 10,476,000; iron ore, 396,600; pig iron, 502,800; steel ingots, 541,200; and lead, 28,320. Principal agricultural exports consist of citrus fruits, olive and vegetable oils, fresh fruits, onions, raisins, almonds, bananas, tomatoes, potatoes, olives, and cork products. Important industries are textiles, metallurgical and chemical products, glass, leather, fish, and vegetable canneries.

Foreign Trade. For 1948 (9 months actual, 3 months estimated): total exports were valued at \$339,960,000; total imports at \$469,200,000. Total exports in 1947, valued at \$306 million; total imports, valued at \$396 million. (Official rate of exchange, November, 1948: \$U.S. = 11.22 pesetas.)

Spain has important trade agreements signed with the United Kingdom, France, and other European and Latin American countries. On Apr. 3, 1948, she signed an agreement with Argentina, and on May 10, another one with the United States and Great Britain, settling the liquidation of the German assets, gold, and property in Spain. Although there is no trade agreement with the United States, the average monthly trade exchange amounts to nearly \$6 million.

Transportation. The country has 7,932 miles of broad-gauge track and 2,955 miles of narrow-gauge lines. The national highway system consists of about 79,672 miles of highway and 6,100 miles of provincial roads. The merchant marine had a registered tonnage of over one million tons in 1946. The Iberia National Airlines serves the country and provides transportation to the Balearic Islands, as well as transoceanic service to the Canary Islands and Argentina. Spain is also served by American, British, Dutch, Swiss, Portuguese, Cuban, and Mexican international airlines.

Finance. In the 1947 budget, revenue was estimated at 12,963,523,857 pesetas and expenditure at 11,358,827,402 pesetas, of which 4,800,848,758 were allocated to the armed forces, or more than one-third of the whole. Currency in circulation in September, 1948, was 25,300 million pesetas. Gold reserves on the same date were \$111 million. Cost of living in September, 1948, was 450 (July, 1936 = 100).

Government. As a result of the Civil War that ended in 1939, the Spanish Republic established in 1931 was replaced by the dictatorship of Generalissimo Francisco Franco, who was recognized as head of the Rebel Nationalist Government in Burgos during the early stages of the Civil War, on Oct. 1, 1936. A law promulgated by Franco on Mar. 31, 1947, and ratified by the Cortes on June 7 of the same year, granted him life tenure as Chief of the State and set up a Regency Council, which is to enthrone a king as his successor, if he dies or has to be replaced. The Cortes Parliament has as its principal function the planning and formulation of laws, but its members cannot introduce legislation. Cabinet Ministers, Civil Governors, university heads and presidents of learned bodies are ex-officio members of the Cortes.

Events, 1948. Spain had another year under Franco's dictatorship, with no indications of an immediate return to a democratic form of government.

Domestic Front. Political news from inside Spain has consisted mostly of speculations with regard to Franco's successor. The only tolerated opposition, composed of the different monarchist factions, were working to have their candidates approved

by the Caudillo (Franco) and the European powers. Early in the year, Franco filled all vacancies of the Council of the Realm, the important political organ which is to select the king in case of resignation or death of the Caudillo. New appointees were army officers, important businessmen, members of the nobility and the higher clergy. An effort to win the support of the Latin American republics was the resurrection of the old Instituto de la Hispanidad (a cultural organization created by the Falange to strengthen cultural ties with Spanish-speaking countries). In Barcelona, the Instituto held a formal Congress in May, where all propaganda aimed at the similarity between the objectives of Perón in Argentina and Franco in Spain. In June, Laureano Gomez, leader of the Conservative Party of Colombia, who fled his country after the Bogotá riots in April (see COLOMBIA), made his residence in Madrid, where the Instituto formally entertained him.

The Search for Dollars. The economic condition of the country was difficult. Reports from tourists who returned from Spain indicated that in the rural areas the situation was better than in the cities, where poverty was evident. The contrast between the wealthy classes of Spaniards and the middle and lower classes was sharper than ever. In Madrid, for example, there were more beggars, fewer taxis, and such a scarcity of electricity that elevators functioned only at certain hours of the day. The government tried to ease the shortage of exchange by securing economic help from the United States. Franco's ambassador in Paris, José Félix Lequerica, came to the U.S. to try to obtain a loan.

In November, Franco stated to the *New York Times* correspondent in Madrid that he was seeking a \$200 million loan from the U.S. This help, according to him, did not have to be included in the ECA because "the other nations that participate in it do not appear to want Spain." This, of course, meant that Franco wanted the \$200 million, but no interference with his form of government. He pointed out that Spain was the bulwark against Communism in Europe and added that he could wait no longer for economic help. The Madrid press was disturbed over the Truman victory, as they had expected an easier time if John Foster Dulles had become Governor Dewey's Secretary of State.

Monarchist Activities. The different monarchist pretenders continued to pull their respective wires during the year. The Carlistas were active in January and February, but as they were divided into two factions, they accomplished little. Nevertheless, pretender Carlos Pío, who calls himself Carlos VIII, said in June that he stood the best chance of becoming Franco's successor, as Alfonso XIII's son, Juan de Borbón, had lost Franco's favor. Carlos announced as his program that he would keep law and order; would cooperate especially with the United States, and would "defend the sanctity of private property."

Monarchist activities within Spain were highlighted by trouble caused to Franco by various Borbón followers, some of whom Franco did not hesitate to imprison. Two of these were General Kindelán and the colorful Duchess of Valencia, who was sentenced in December to one year's incarceration. From without, pretender Juan de Borbón attempted to draw closer to Franco. In August, he and the Caudillo met on board a yacht, and it was rumored that conversation centered around the education of Juan's son, prince Juan Carlos. The Madrid press reported that the young prince

would come to Spain to continue his high-school studies in a Spanish school, in order to prepare him for his future duties as King of Spain. This rapprochement between Juan and Franco was credited to Foreign Minister Alberto Martín Artaño, former head of Catholic Action, and was meant to counterbalance the efforts made by the Socialists to form a coalition with other monarchist factions, with the purpose of ousting Franco from power.

Municipal Elections. On November 21, an election for members of town councils was held. The event attracted little attention from the people, as the electoral law grants the vote only to "heads of families with full civil capacity," a method of eliminating government opponents. Voting took place in 9,332 cities, but as restrictions eliminated more than half of the voting population, it was estimated that not more than 20 percent went to the polls. One result of the election indicated internal division among the groups supporting Franco. All the candidates were picked by top men in the Franco clique. Some were monarchists, some Falangists, others belonged to Church groups, industry or big business. Each of these groups struggled to control the municipal positions, and Franco appeared to be favoring the Church and the monarchists, rather than the Falangists.

International Front. On February 10, the borders with France that had been closed since 1946 were officially opened. The Franco press thought this was a feather in their cap, but the English and French governments announced that the opening of the border had not changed their foreign policy. During the year, important visitors from the United States gave occasional spurts to Franco's optimism. Among them were James A. Farley and Senator Chan Gurney, Chairman of the Senate Armed Services Committee. Both visitors publicly expressed their friendship toward Franco's regime; however, the State Department stated that their opinions did not reflect the stand of the U.S. government, but were purely personal ones.

The most important international event of the year was Franco's effort, backed by a small group of Latin American countries under the leadership of Argentina, to gain admission for Spain to the United Nations, and participation in the ECA. The traditional propaganda line was used at the Paris meeting of the U.N., to the effect that Spain was needed for the defense of the western hemisphere. However, this boomeranged, because the Benelux countries and France and England feared that in case of war the United States would center all strength south of the Pyrenees and abandon northern Europe. The pro-Franco proposal thus met with a cold reception from a majority of the United Nations countries.

Another important development on the international front was the signature of a pact between the Spanish Socialist Trade Union movement, headed by Indalecio Prieto, and the supporters of Spanish pretender Juan de Borbón. This pact was presented on October 6 to the British, American, and other Western governments. The British Foreign Office made a favorable comment, and naturally the Franco government protested. The main features of the pact were that both parties pledged themselves to the reestablishment of a democratic government in Spain, eliminating all totalitarian tendencies; the holding of free elections to determine the form of government preferred by the Spanish people; and the incorporation of Spain in ERP and the Brussels Alliance. See PORTUGAL.

—MIGUEL JORRÍN

SPANISH GUINEA. A West African colony of Spain, comprising the mainland area known as Continental Guinea (10,040 square miles; pop. 138,797), and the islands (pop. 28,708) in the Gulf of Guinea: Fernando Pó (800 sq. mi.), Annobon (7 sq. mi.), Corisco (5.5 sq. mi.), Little Elobey (22 acres), and Great Elobey (0.75 sq. mi.). Chief towns: Santa Isabel (capital), and Bata. The principal products are cacao, coffee, vegetables, fruits, and timber. Spanish Guinea is divided into two districts: Continental Guinea and Fernando Pó. Included in the district of Continental Guinea are the islands of Great Elobey, Little Elobey, Corisco, and Annobon. The whole territory is under a governor general, assisted by a sub-governor, and a secretary general.

SPANISH LITERATURE. No change of any significance can be recorded in Spanish letters during the past 12 months. If any trend can be detected in comparison with previous years it is rather a slackening in tempo. The generation of young novelists and poets who became known after the Civil War and gave rise to the hope of a certain awakening seems to have, at least for the moment, reached an impasse and no new book has appeared lately to foster that hope. This slackening in tempo and the scarcity of new works are parallel no doubt to what is happening in other European countries as a result of the insecurity and transitional character of our time, but is also due to the peculiar circumstances of Spanish life under the present regime.

In contrast with the dearth of new literary values are still the considerable amount of books that are published under the auspices of the Superior Council for Scientific Research and the thriving business of some editorial houses with numerous series of "Complete Works" of classic as well as modern, and of foreign as well as Spanish writers, or with the ever-increasing number of translations of well known and popular European and American writers.

Survival of the Past. A simple gaze at any bibliography or book catalog leaves the very clear impression that the Spanish literary and intellectual production leans heavily toward religious and ecclesiastical subjects. The works on theology, philosophy and history of religion, and Biblical and canonical studies probably outnumber the publications in any other field. Historical subjects, studies on archeology, and editions or commentaries of Spanish classics come in second place.

Centennial commemorations, such as Cortés' and Cervantes' last year, are given much prominence. This year those of the 16th century philosopher Francisco Suárez, the dramatist Tirso de Molina, and the 19th century thinker Jaime Balmes have been celebrated with great pomp, a wealth of lectures and committees, and the same doubtful results, as far as lasting contributions are concerned. If to this is added that the contemporary authors who still are in the limelight are the survivors of the "generation of '98," the conclusion that the clock has stopped or at least slowed down considerably cannot be escaped.

Azorín, for instance, has been the most prominent author of the year. He was the object of two important testimonial homages and the publication of his complete works, now in the 8th volume, together with his new book *Con permiso de los cervantistas*, a collection of articles on Cervantes, have attracted much attention. Baroja's "complete works" are also being published with great success and the 5th volume of his *Memoires (La intuición y el estilo)* has been widely read.

In the languid life of the Spanish theater the veteran Jacinto Benavente, close to his 83d birthday, has been once more the author of the two most successful and valuable plays of the season: *El divorcio de las almas* and *Abdicación*. He received, besides, the Prize Mariano de Cavia intended to stimulate young journalists, for his article "Al dictado." The great scholar Ramón Menéndez Pidal was reappointed Director of the Spanish Academy, after 8 years of an unfair separation from that office, which he held before 1936. Writers like Eugenio d'Ors, Concha Espina, or Doctor Gregorio Marañón have been also much in the public light for different reasons.

José Ortega y Gasset, who seems to have gone back to Spain permanently after 12 years of self-imposed exile, although we do not know of any new book of his published this year, is still the leader of intellectual life in Spain on its highest levels. This impression of the lack of new stimulus in Spanish letters is strengthened when we consider that probably the two most interesting books of criticism—Melchor Fernández Almagro's *En torno al 98: Política y literatura* and Victoriano García Martí's *El Ateneo de Madrid* (1935-1935)—deal with the forces and atmosphere which shaped the trend of Spanish literature and life at the beginning of the century.

Fiction, Poetry, and Drama. The first two are the fields in which, as in previous years, the new generations are more active. As we have already said, nothing strikingly new has been produced, but a few books deserve to be mentioned.

Among the novels: *El destello* by Ricardo Gullón; *La sombra del ciprés* by Miguel Delibes, which received the Nadal Prize awarded to the most promising new novelist; *Hospital General* by Pombo Angulo; and *Caminos de noche* by Sebastián Juan Arbó. Of the better known young novelists, Camilo José Cela seems to have abandoned fiction for a moment and has published a book of travels through the central plateau, *Las botas de siete leguas* and a *Cancionero de la Alcarria*.

Poetry continues to be the literary genre which has the greatest attraction for young writers, due as we pointed out last year to the impulse given to this form of expression by previous generations. The "Collection Adonais" has reached already its 51st volume. Among the new volumes are *Señal de vida* by José María Souviron; *Contemplación del tiempo* by Eugenio de Nora; *Las incredulidades* by Rafael Montesinos; *Elegías* (1943-45) by Dionisio Ridruejo; *Vacación de estío* by Guillermo Díaz Plaja; and an interesting translation of English metaphysical poets, *Poetas ingleses metafísicos*, done by Mauricio Molho and Blanca G. Escandón.

At the same time two new collections have begun publication. One is "El viento Sur," in which the volume *Soria* by Gerardo Diego, the best known of Spanish poets living in Spain, is to be published shortly (it may have appeared already). The other is "Norte" which includes three volumes of translations (Rilke, William Blake, and Rimbaud) and three by Spanish poets: Gabriel Celaya, *Movimientos elementales*; Rafael Múgica, *La soledad cerrada*; and Leopoldo de Luis, *Huésped de un tiempo sombrío*. Of the older poets, Vicente Aleixandre has published *En la muerte de Miguel Hernández* and Rafael Murube, *Tierra y canción*.

Nothing remarkable has been produced in the theater. As we pointed out, Benavente is the most successful dramatist and producers try to infuse some new life by constant revivals of old plays. The actress Catalina Bárcena has reappeared in Madrid after a long absence, with the same plays

by Martínez Sierra which made her known 30 years ago. *Juan José* by Dicenta, a social play, which stirred audiences at the beginning of the century, has also been revived. Of new plays only two deserve mention: *El beso de la bella durmiente*, by Agustín de Foxá (produced in Madrid), and *El aprendiz de amante* by Víctor Ruiz Iriarte (produced in Barcelona).

Erudition and Literary Criticism. This is perhaps the field in which Spanish letters as a whole show greatest activity at present, or should we say in which Spanish writers feel themselves on safer ground. We should therefore note a few additions to the literary knowledge of the past. First in importance comes the newly revised and amplified edition of the *España del Cid* by Menéndez Pidal, the master of Spanish historians and critics, who also contributed to the Cervantes centennial with a remarkable essay, *Cervantes y el ideal caballeresco*.

Deserving of first place among editions of Spanish classics is the translation done by Lorenzo Ribera of the Complete Works of Luis Vives, the greatest Spanish humanist of the Renaissance. Mention is also due the edition of Fernando de Herrera, *Rimas inéditas*, by José Manuel Blecua. Although of a purely philological interest, the first fascicle (letter A) of the *Tesoro lexicográfico español* by S. Gili Gaya is of great value for the study of the Spanish language. Other books which should receive the attention of scholars and students of Spanish letters are: the study of Garcilaso de la Vega by Rafael Lapesa, now at Princeton University; *Los tratados sobre educación de príncipes*, by María Angeles Galino; *La mala vida en la España de Felipe IV* by José Deleito y Pifuel; *La Condamine en la América Central*, by Ricardo Majó Framis; and *Antonio Alcalá Galiano*, by Felipe Ximénez de Sandoval.

New Reviews—Significant Trends—Varia. A curious and at the same time interesting phenomenon is this—that while Spanish writers as far as original creations are concerned seem to be fighting against the vacuum produced by isolation in a semitotalitarian regime; they are giving, nevertheless, many signs of vitality. Of these one is especially noticeable; the abundance of new literary reviews, some of them of considerable interest, such as *Finisterre* (reappeared after a long interruption), and although of minor character, *Doncel* and *Raíz*.

Two of these reviews should be mentioned separately: *Cuadernos Hispanoamericanos* and *Mundo Hispánico*, for together with many other trends—such as the constantly increasing numbers of Spanish intellectuals crossing the Atlantic toward the South and the invitation to visit Spain extended to Spanish-American writers sympathetic with the present Spanish regime, etc.—they show a decided and strong trend toward the "rapprochement" of the Spanish-speaking countries under the aegis of the "Hispanidad" movement.

Of a different nature, in the sense that it is not official but the result of an imperative longing, are the few attempts to bridge the gulf with Spanish writers in exile. A few, like Benjamin Jamés, have returned lately to the fatherland; books before forbidden are beginning to be reprinted; homages have been published or organized in Spain in honor of writers like Juan Ramón Jiménez and Jorge Guillén; and the contributions of many writers whose names could not even be mentioned two or three years ago, appear in increasing numbers in Spanish reviews and periodicals. In this the literary magazine *Insula*, a true island in the Spanish atmosphere, leads the way.

Three writers, identified in the past decades with youthful movements of renovation, have been received in the Spanish Academy: the poet Gerardo Diego, one of the leaders of the "ultraist" movement in the twenties, and the critics Dámaso Alonso, the main exponent of neogongorism, and José María Cossío.

No writer of great prominence has died within the year. The best known among those who passed away are María de Maeztu, who died in Argentine, Pedro de Répide, and Francisco Camba.

Literature in Exile. After covering at some length the literary events in Spain itself, it should be recalled that a number of the most prominent Spanish writers are still living in exile. They are scattered in many countries, especially in Mexico, South America, and the United States; they are forced to make their living by teaching, writing for reviews and magazines, working in some editorial enterprises, or in occupations alien to their main interests. Their books, published mainly in South America, are slow in reaching us. For these reasons it is not easy to follow their activities nor to sum up briefly their literary accomplishments.

It can be stated however that the most valuable Spanish books are today published outside Spain. Such is the case for instance of Américo Castro's *España en su historia, cristianos, moros y judíos*, probably the most important book published in Spanish in 1948. It is a profound and scholarly work interpreting Spanish culture as an integration of European and Oriental elements. It is worthy of occupying a distinguished place at the side of the great works about Spain of men like Unamuno, Ortega y Gasset, or Menéndez Pidal. Very valuable are also two books of criticism by Pedro Salinas, *Jorge Manrique o tradición y originalidad* and *La poesía de Rubén Darío*, or the book by Ferrater Mora, *El sentido de la muerte*, a remarkable philosophical essay. Although published in English, Madariaga's *The Fall of the Spanish American Empire* could also be included. Poetry, fiction, and drama are not lacking among the exiled Spanish writers, but no book has appeared during 1948 in these fields, as far as we know, which can compare in importance with those mentioned.

—ANGEL DEL RÍO

SPANISH SAHARA. A Spanish colony in northwest Africa, comprising two zones: Río de Oro (73,362 sq. mi.), and Sekia el Hamra (32,047 sq. mi.). Population: 37,000, exclusive of some 31,000 nomads. The colony is under the administration of the High Commissioner of Morocco.

SPICES. The continuance of political uncertainty in Indonesia in 1948 has had a direct effect on the supply and price of pepper, the world's most important spice. Before World War II Indonesia (The Netherlands East Indies) supplied 90 percent of the world's pepper. Neglect of vines during the Japanese occupation sharply curtailed pepper exports from the ancient "Spice Islands." The Indonesian 1948 pepper crop is estimated at only 11 million lb., less than one-tenth of prewar, and about 18 percent of total world production.

The following statement from the American Consulate General in Batavia illustrates the outlook in the Banka area: "Replanting took place steadily, and was particularly heavy in February and March, 1948. This replanting, however, decreased with the coming of the dry season in May. At the end of May a total of 371,500 vines were standing (prewar 12 million), of which about 180,000 were bearing. Many of these old vines, how-

ever, are not being allowed to bear, being used for producing seedlings."

While Indonesia has been losing ground, India has risen to the opportunity and is today the world's leading pepper exporter, accounting for about 80 percent of the world's production. India's 1947-48 crop, harvested from December to March, was about 38.1 million lb. The 1948-49 crop is estimated at 40 percent above last year's, or about 50 million lb., of which the United States may receive about half.

In a visit to the United States in December, 1948, Vallabdas V. Mariwala, president of an Indian trade group, predicted that his country will retain much of its present expanded business.

Despite the increase in Indian production, total world production for 1948 is estimated by the United States Department of Commerce at about 35 percent of prewar. United States prewar imports of pepper alone have at times exceeded today's total world production. Although the desire of Indian exporters for dollar credits tended to favor the United States in 1948, warehouse stocks of pepper in the Port of New York has been less than 2 million lb. since June, 1946, as opposed to about 94 million lb. in 1938-39. Imports have moved directly into consuming channels. Active bidding forced quotations for black pepper warehoused in New York from about 40¢ per lb. in March to 80¢ in December, 1948.

During 1948 pepper traders have been looking forward eagerly to a solution of the Indonesian-Dutch difficulties which would bring peace to Indonesia and result in opening up the pepper-producing districts. A resumption of pepper shipments would greatly ease the present world shortage and probably result in a downward readjustment of prices.

The 1948 price and supply of other spices and seeds remained about the same as 1947, close to prewar levels.

Production of mustard seed in the United States for 1948 is predicted at only about 14.5 million lb., compared with 20,990,000 in 1947. This is due to crop conditions. The United States still produces almost all the mustard seed that it consumes. The same is not true, however, of domestically-grown sage, which boomed during the war and has slipped badly since. High growing costs in this country invited the postwar reentry of quality Dalmatian sage, and our imports are almost back on a prewar footing.

The report on the first of Zanzibar's two annual clove crops indicates production in 1948 of 9,473,000 lb., just slightly above the lowest crop on record. The 1948 Spanish paprika crop is estimated at 31,856,000 lb., about the same as 1947. United States imports for the first six months of 1948 totaled 1,815,000 lb., and 4,046,000 lb. in 1947. Portugal's paprika crop will be lower in 1948, estimated at 2,204,600 lb. In 1947 the United States imported 1,116,000 lb. from Portugal. Production of ginger root on the island of Jamaica is estimated at 3.5 million lb., slightly larger than 1947. There was a slight increase in Cassia imports despite China's civil strife.

At their 43rd annual convention in May, 1948, members of the American Spice Trade Association voted to assess themselves one dollar per thousand dollars of sales volume to finance research and public relations programs. The research program started in 1947 was continued and expanded. A "Spice of the Month" promotional campaign was launched in September, 1948, to help homemakers understand the proper use of spices. Emphasis in this

program is on basic, rather than gourmet, foods.

Wartime rationing and postwar high food costs have resulted in increased consumer awareness of the value of proper seasoning in the American cuisine. Numerous sources report a definite trend toward cooked dishes using lower-cost ingredients but calling for greater skill in preparation. The American Spice Trade Association has received an unprecedented number of requests for food information and recipes calling for spices, seeds, and herbs, and reports a new tendency on the part of the homemaker to experiment with well-seasoned foreign dishes to give variety to her cuisine.

—BERNARD L. LEWIS

STATE, U.S. Department of. Under the direction of Secretary of State George C. Marshall, the Department of State in 1948 engaged in activities aimed at achieving national security, world-wide economic reconstruction, and a lasting peace.

In pursuance of these and related objectives, the Department arranged for and coordinated American participation in the United Nations, in other international bodies, and in international conferences, including a large number on professional and scientific subjects. This participation involved attendance at the Second Special (Palestine) Session and the Third Regular Session of the General Assembly, discussions in the Security Council and the other basic organs, and activities in relation to the specialized agencies. The Department, with Congressional authorization, formally accepted membership in the World Health Organization (a specialized agency of the United Nations), the South Pacific Commission, and the Caribbean Commission, all three of which had been organized with the active help of the United States or (in the case of the Caribbean Commission, in 1942) on the initiative of this country.

Among the international meetings in which the United States participated in 1948 were the Geneva Conference on Freedom of Information, the Geneva Maritime Conference, and the Habana Conference on Trade and Employment (all three of which were held under the auspices of the United Nations). In addition, this Government took part in the Special Paris Meeting of the Council of Foreign Ministers on the disposition of former Italian colonies, the Belgrade Conference on Navigation of the Danube, the Ninth International Conference of American States at Bogotá, the London Conference on Safety of Life at Sea, and talks in London regarding the future government of Germany and international control of the Ruhr. Outstanding achievements of these Conferences included the signing of charters at Bogotá for the Organization of American States, at Habana for an International Trade Organization, and at Geneva for an Intergovernmental Maritime Consultative Organization, as well as the drafting of three conventions on freedom of information by the Geneva Conference on that subject.

The Department continued its efforts to achieve the settlement of territorial, treaty, and control problems arising from the war. In Korea, the Department cooperated with a United Nations commission which carried out the terms of the General Assembly resolution of Nov. 14, 1947, resulting in the establishment of a Republic of Korea recognized by the United Nations. The Department took part in discussions concerning an Austrian treaty in meetings of the Deputies of the Council of Foreign Ministers and on a proposed protocol to the Italian treaty, with respect to Italian colonies, in meetings of the Deputies and of the Foreign Min-

isters. Negotiations regarding Japanese problems were continued in the Far Eastern Commission. The Soviet blockade of the western sectors of Berlin was the subject of discussions at Moscow and Berlin, which were recounted in a documented narrative published by the Department.

As an important step toward the realization of collective security and world order, the Department encouraged the development of a western European union and engaged in conversations with representatives of Belgium, Canada, France, Luxembourg, the Netherlands, and the United Kingdom on security problems of common interest in relation to the Vandenberg Resolution of June 11, 1948. In furtherance of the objective of the United States to achieve world peace through economic security, the Department maintained close liaison with the Economic Cooperation Administration, developing policy on foreign-assistance programs, aiding in the development and conclusion of agreements with the participating countries, and currently exchanging pertinent information with the Administration and its staff. Two United States observers were sent by the Department to the Rome Manpower Conference attended by representatives of the 16 countries which had participated in the Paris Conference of the OEEC (Organization for European Economic Co-operation).

Developments in the organizational structure of the Department during the year included the reorganization of the overseas-information and educational-exchange units; the designation of public leaders to comprise Advisory Commissions for Information and Educational Exchange; the establishment of media for close coordination with the Economic Cooperation Administration regarding foreign-policy aspects of the European recovery program; and the establishment of an Interim Office for German Affairs, to perform consular functions for German nationals in the United States.

In the Foreign Service, diplomatic missions were newly established in Ceylon, Israel, and Korea, and the Legation in Afghanistan was elevated to Embassy status. Personnel changes in the Foreign Service included the appointment of new or first Ambassadors to 19 countries and new or first Ministers to 5 countries. Realignment of consular work in various parts of the world to meet changed conditions involved the closing of 19 Consulates, the opening of 13, and changes in the status of 9 other posts. Paul C. Daniels was appointed as the first United States Representative on the Council of the Organization of American States, established in accordance with the Charter adopted at Bogotá.

High-ranking officers of the Department as of Dec. 20, 1948, were as follows: Secretary of State, George C. Marshall; Under Secretary of State, Robert A. Lovett; Counselor, Charles E. Bohlen. The six positions of Assistant Secretary of State and the incumbents were: Economic Affairs, Willard L. Thorp; Political Affairs, vacant, Norman Armour having resigned during the year; Occupied Areas, Charles E. Saltzman; Transportation and Communications, Garrison Norton; Public Affairs, George V. Allen, who was appointed in 1948; and Administration, John E. Peurifoy. Ernest A. Gross was Legal Adviser, and W. Park Armstrong, Jr. was appointed as Special Assistant for Research and Intelligence.

Assisting the Secretary and the Under Secretary were: George F. Kennan as Director of the Policy Planning Staff; Michael F. McDermott as Special Assistant to the Secretary for Press Relations; George C. McGhee as Coordinator for Aid to Greece and Turkey; and Carlisle H. Humelsine as

Director of the Executive Secretariat. Two newly created posts were occupied by Henry R. Labouisse, Jr., as Coordinator for Foreign Aid and Assistance, and Wilbert Chapman as Special Assistant for the handling of international fisheries and wildlife problems.

The organization of the Department is indicated below.

1. The Assistant Secretary for Political Affairs administers four Offices, those dealing with European, Near Eastern and African, Far Eastern, and American Republic Affairs. These Offices consist respectively of (1) Divisions dealing severally with the British Commonwealth, central Europe, northern Europe, eastern Europe, southern Europe, and western Europe; (2) Divisions concerned with the Near East, south Asia, Africa, and the Greek-Turkish-Iranian area; (3) the Divisions of Chinese, Northeast Asian, Southeast Asian, and Philippine Affairs; and (4) Divisions dealing with special inter-American affairs, Mexico, Caribbean republics, Central American republics and Panama, Brazil, countries on the north and west coast of South America, and River Plate countries.

2. The Assistant Secretary for Economic Affairs administers the Offices of International Trade Policy, of Financial and Development Policy, and of the Foreign Liquidation Commissioner, consisting respectively of (1) Divisions dealing with commercial policy, international resources, petroleum, and international labor and social affairs; (2) the Divisions of Financial Affairs, Investment and Economic Development, and Economic-Property Policy; and (3) the Research and Statistics, Administrative, Budget and Accounting, Compliance, and General Disposals Divisions.

3. The Assistant Secretary for Transportation and Communications has jurisdiction over the Office of Transport and Communications, consisting of the Aviation and Telecommunications Divisions.

4. The Assistant Secretary for Public Affairs has under his jurisdiction the UNESCO Relations Staff, the Public Affairs Overseas Program Staff, and the Offices of Public Affairs, International Information, and Educational Exchange. The three Offices consist respectively of (1) the Divisions of Public Liaison, Public Studies, Historical Policy Research, and Publications; (2) the Secretariat of the United States Advisory Commission on Information, and the International Press and Publications, International Broadcasting, and International Motion Pictures Divisions; and (3) the Secretariats of the United States Advisory Commission on Educational Exchange and of the Interdepartmental Committee on Scientific and Cultural Cooperation, and the Divisions of Libraries and Institutes and of Exchange of Persons.

5. The Assistant Secretary for Administration is responsible for four Offices, concerned with the Foreign Service, Departmental administration, budget and planning, and controls, and consisting respectively of (1) the Divisions of Foreign Service Planning, Foreign Service Personnel, Foreign Reporting Services, Foreign Service Administration, and Foreign Buildings Operations, and the Foreign Service Institute; (2) the Divisions of Departmental Personnel, Central Services, Communications and Records, Cryptography, International Conferences, and Language Services; (3) the Divisions of Finance and of Organization and Budget; and (4) Divisions responsible for policies concerning passports, visas, protective services, security, and munitions.

6. The Assistant Secretary for Occupied Areas is responsible for the coordination of Department

of State policies with respect to the occupation and government of occupied areas, to arms and armament matters, to refugees and displaced persons, and to questions coming before the Far Eastern Commission. He provides Department of State representation on the State-Army-Navy-Air Force Coordinating Committee.

7. The Legal Adviser is responsible for all matters of a legal character concerning the Department and the Foreign Service. His Office includes Assistant Legal Advisers for Political Affairs, International Claims, Administration and Foreign Service, Public Affairs, International-Organization Affairs, Economic Affairs, Military Affairs and Occupied Areas, and Special Problems, and an Assistant for Treaty Affairs.

8. The Special Assistant to the Secretary for Research and Intelligence has jurisdiction over the Office of Intelligence Research and the Office of Libraries and Intelligence Acquisition, consisting respectively of (1) the Divisions of Research for American Republics, Europe, Far East, and Near East and Africa, and the Division of International and Functional Intelligence; and (2) the Divisions of Library and Reference Services, Acquisition and Distribution, and Biographic Information.

9. The Office of United Nations Affairs, comprising the Divisions of United Nations Political Affairs, United Nations Economic and Social Affairs, International Security Affairs, and Dependent Area Affairs, serves as the focal point of the Department for coordination and integration of matters relating to American participation in the United Nations and in related specialized and regional international organizations.

SUEZ CANAL. A sea-level canal, 103 miles long, across the Isthmus of Suez, connecting the Mediterranean and the Red Sea. It is owned by the French Compagnie Universelle du Canal Maritime de Suez, in which the government of Great Britain holds 295,026 shares of a total of 652,932. A board of 32 administrators governs the canal. In June the former U.S. Ambassador to Turkey, S. Pickney Tuck, was appointed a member of the board, the first American to act in that capacity. The concession held by the French company will expire on Nov. 17, 1968, when it will revert to the Egyptian government.

The number of ships passing through the canal in 1939 and 1946, with net tonnages, and total receipts, are shown in the accompanying table.

Year	Ships	Net tonnage	Receipts (francs)
1939.....	5,277	29,573,394	1,389,199,381
1946.....	5,235	33,239,833	6,523,785,799

Of the total number of ships (excluding military vessels) passing through the canal in 1946, Great Britain led with 2,311 ships aggregating 12,711,578 net tons, followed by the United States with 785 ships of 5,645,750 net tons; Norway 312 ships, 1,816,297 net tons; Netherlands 244 ships, 1,735,071 net tons; France 95 ships, 640,331 net tons. A total of 1,046 warships and transports of 9,008,589 net tonnage passed through the canal in 1946. In the same year 925,924 civil and military passengers went through the canal.

SUGAR. The world output of beet and cane sugar for the 1948-49 season was estimated at 37,664,000 short tons (raw value), 11 percent more than the 33,869,000 tons produced in 1947-48. Major increases in Mexico, Europe generally, the U.S.S.R., India, Pakistan, the Philippines, Formosa, Java,

Australia, and Hawaii more than offset decreases in the United States and Cuba. The world output for 1948-49 (considering the production in India and Pakistan in terms of gur—a low grade of brown sugar) was the largest on record and compared with the previous high of 36,238,000 short tons produced in the 1939-40 season.

In North and Central America, including the West Indies, the output of sugar was estimated at 11,285,000 short tons, compared with 12,004,000 tons in 1947-48. Sugar production in South America was expected to total 3,151,000 tons in 1948-49, compared with 3,171,000 tons in 1947-48. The preliminary estimate of sugar output in the United States for 1948-49 was 1,850,000 short tons, compared with the 1947-49 output of 2,208,000 tons.

SULFUR. Heavy domestic and world demand for sulfur caused domestic producers to mine more than 4.8 million long tons in 1948 (1947: 4,441,214 tons), about 600,000 tons above total world estimated production in 1946. Apparent consumption by domestic and foreign consumers was higher than that of the record year 1947, 4,839,548 long tons. Mines in Texas produced the major share of this all-time-high output, the remainder coming mainly from Louisiana.

SUPREME COURT OF THE UNITED STATES. In 1948 the Supreme Court was composed of the following members: *Chief Justice*, Fred M. Vinson (1946); *Associate Justices*: Hugo L. Black (1937); Stanley Reed (1938); Felix Frankfurter (1939); William O. Douglas (1939); Frank Murphy (1940); Robert H. Jackson (1941); Wiley Rutledge (1943); Harold H. Burton (1945); *Associate Justice* (resigned), Owen J. Roberts (1930).

The dates used indicate the year which included nomination, confirmation, and entry upon duty. Under present law a justice who retires remains a "member of the Court."

The officers of the Supreme Court, in 1948, were: Clerk, Charles Elmore Cropley (1927); Marshal, Thomas E. Waggaman (1938); Reporter, Walter Wyatt (1946); Librarian, Helen Newman (1947). See **LAW**.

SURINAM (Netherlands Guiana). A colony on the northern coast of South America, belonging to the Netherlands. Area, 54,291 square miles. Population (1946), 203,580, including the Negroes and Indians living in the forests. Chief towns: Paramaribo (capital), 73,067 inhabitants, Nieuw Nickerie, 5,000, Albina, Coronie, and Moengo. Education (1945): 115 schools and 26,496 students. The principal agricultural products are sugar, rice, maize, coffee, cacao, balata, bananas, oranges, molasses, rum, and timber. Minerals produced include bauxite, gold, and salt. Trade (1946): imports 15,710,868 guilders; exports 11,513,612 guilders. Shipping (1946): 381 vessels of 747,128 register tons cleared. Finance (1947): revenue 9,207,000 guilders; expenditure 9,216,000 guilders. The executive authority and administration are under a governor, assisted by an advisory council. There is a representative body called the States of Surinam consisting of 15 members (5 appointed by the governor and 10 elected by the voters). Governor: Willem Huender.

SVALBARD (Spitsbergen). An arctic archipelago (10° to 35° E. and 74° to 81° N.) owned by Norway. The principal islands are West Spitsbergen (or Mainland), North East Land, Prince Charles Foreland, Edge Island, Barents Land, King Karl's Land,

Hope Island, and Bear Island (69 sq. mi.). Total area, 24,294 square miles. Population on Jan. 1, 1940, about 1,000. Green Harbor (capital), New Aalesund, Coles Bay, Longyearbyen, and Braganza Bay were the main settlements, all on the western coast of West Spitsbergen. Coal is the chief product (342,000 metric tons in 1947 and 429,600 in 1948).

SWAZILAND. A British protectorate in southern Africa, at the southeastern corner of the Transvaal. Area, 6,705 square miles. Population (1946 census): 186,880, including 183,362 Bantu natives, 2,871 Europeans, and 641 colored. Capital, Mbabane. Agriculture and cattle raising are important occupations of the people. Cotton, tobacco, maize, sorghums, pumpkins, groundnuts, beans, and sweet potatoes are the main agricultural products. Livestock (1947): 434,995 cattle, 25,865 sheep, 125,503 goats, and 7,769 pigs. Minerals produced included asbestos, tinstone, and gold. Swaziland is united with the Union of South Africa for customs purposes, and receives a proportionate share of the customs dues collected. The territory is administered by a resident commissioner acting for the High Commissioner for the British High Commission Territories in South Africa. Native chiefs continue to rule their tribes.

SWEDEN. A constitutional monarchy of Scandinavia. Capital, Stockholm. Sovereign, Gustav V, who succeeded to the throne on Dec. 8, 1907.

Area and Population. Area, 173,398 square miles. The estimated population, on July 1, 1947, was 6,803,000. Vital statistics (1947): birth rate, 18.9 per 1,000; death rate, 10.8; marriage rate, 8.6. Chief cities (with 1948 est. pop.): Stockholm, 703,000 (Greater Stockholm, 895,000); Gothenburg, 337,000; Malmö, 181,000.

Education and Religion. Education in the public elementary schools is free and compulsory. Children not attending schools under government supervision must furnish proof of having been privately educated. In 1944 the elementary schools had 519,302 students. The 203 secondary schools, in 1946, had a total of 63,826 students; in addition there were military, navigation, agriculture, veterinary, and other special schools. In 1946 the universities at Gothenburg, Lund, Stockholm, and Uppsala had a total of 9,122 students enrolled. The majority (90 percent) of the population adhere to the Lutheran Protestant Church. Protestant Dissenters, Roman Catholics, Jews, and some others make up the minority.

Production. Sweden's harvest of bread grains in 1948 amounted to about 950,000 tons. This is 75 percent more than in 1947, when the crops failed, but 12 percent less than the average. Livestock (1946 census): 2,869,429 cattle; 1,165,234 swine; 592,782 horses; 482,013 sheep; 9,055,916 chickens.

Mining is the leading industry of Sweden. Mineral and metallurgical output (in metric tons) during 1947 included: iron ore (for 1946), 6,867,000; pig iron, 718,800; steel ingots, 1,188,000. Other principal mineral and metallurgical products were ferro-alloys, manganese ore, tungsten, copper, zinc, aluminum, peat, and shale oil. Ball bearings, cream separators, lighthouse apparatus, telephone supplies, motors, and many kinds of electrical machinery are produced by the metallurgical industries.

The public forests cover approximately 7½ million hectares and yielded 7,961,000 cubic meters of timber in 1944. Value of sawmill production in 1945 was 432 million kronor, that of furniture fac-

tries 408 million kronor, and wood-pulp factories 433,450,000 kronor.

Fur production in 1946 totaled 71,011 pelts of several varieties of fox fur. At the end of 1947 there was a total of 200,000 gross tons of merchant shipping under construction in Swedish yards.

Foreign Trade. Sweden's imports in 1948 were valued at 4,876 million kronor (10 months actual, 2 months estimated), considerably less than the 1947 figure of 5,175 million. Exports for the same periods were 3,750 million and 3,220 million kronor, respectively.

Finance. Government revenue for 1948-49 was estimated at 4,769 million kronor in the budget presented to the Riksdag on Jan. 12, 1948. Expenditures were set at 4,230 million kronor. Total national debt on Sept. 30, 1947, amounted to 11,015 million kronor.

Transportation. The roads of Sweden, on July 1, 1947, totaled 56,100 miles. At the end of 1945 the railroads totaled 16,717 kilometres, of which 12,041 kilometres miles were owned by the state. Commercial airlines link the chief cities and maintain services, together with foreign companies, with nearby foreign countries. The Swedish mercantile marine, on July 1, 1947, comprised 2,078 ships aggregating 1,755,060 gross tons.

Government. The Constitution of 1809, as subsequently amended, vested executive power in a hereditary King, acting under the advice of a Council of State (Cabinet), which is responsible to the Diet or Riksdag. The Upper Chamber of the Riksdag has 150 members, one-eighth of whom are elected annually by provincial and city councils; the Lower Chamber has 230 members, elected by direct male and female suffrage for four years. Party strength in this House, as a result of the general election of Sept. 19, 1948 (see below, under *Events*): Social Democrats, 112; People's Party (Liberals), 57; Farmers' Union, 30; Conservatives, 22; Communists, 9. Prime Minister (appointed Oct. 10, 1946): Tage Erlander.

Events, 1948. "In the present situation, Great Britain appears to realize better than the faraway United States that a well-armed, neutral Sweden is a not entirely useless breakwater on the other side of the North Sea." With this commentary, the *Morgon Tidningen*, mouthpiece of the Erlander Government, sounded the keynote of Swedish policy in an editorial published in mid-October. By that time it had become clear that Sweden, unlike her Scandinavian neighbors, was relying on her armed strength and time-tested neutrality, rather than the protection of the Western European bloc or of the proposed Atlantic Union, to safeguard her freedom and independence in the event of a third world war.

For Sweden, the situation in 1948 was not much different from what it had been in the heyday of Hitler's power. By their national aspirations and ideological sympathies, the Swedes were unmistakably in the Western camp, yet at the same time they were uncomfortably aware of the overpowering nearness of a strong and ruthless neighbor, inclined to take umbrage at the slightest provocation. Under the circumstances the Swedes could hardly be blamed for putting their trust once again in absolute neutrality.

In the face of several fairly plain hints from the West that a Scandinavian defense pact, analogous to that of the five-power Western Union, was regarded as an indispensable prerequisite to western European security, Sweden stood her ground. She was ready to talk joint defenses with Denmark and Norway, but only on condition that there be no

tie-up with the military system sponsored by the United States and Britain.

This Swedish attitude found expression both in the preparatory talks leading to the establishment of the Scandinavian Defense Committee on October 15 (see also *NORWAY*) and in the subsequent deliberations of that body. The decision to form such a committee was made at a conference in Stockholm (September 8-9) of the Defense Ministers of Sweden, Norway, and Denmark. The Committee itself also held a series of meetings in Stockholm (November 15-17). While no communique was issued, it was officially stated that the delegates had reached an understanding of the three countries' strategic problems, which made for a clearer valuation of a defense cooperation.

Twice during the year, in March and in November, General Helge Jung, commander-in-chief of Sweden's armed forces, called for a strengthening of national defenses in view of the growing international tension. An additional defense appropriation of 205 million kronor for the purchase of new material, especially for the Air Corps, was submitted to the Riksdag late in April. In every branch of the armed forces, measures were taken to bring military preparedness up to, or even beyond, the levels maintained during World War II. Security regulations, especially in the strategic northern provinces, were tightened.

Count Folke Bernadotte, a nephew of the King, was appointed United Nations Mediator in Palestine on May 21, 1948. On September 17, upon his return to Palestine from Crete, he was assassinated in Jerusalem. (See also entry under *NECROLOGY*.)

The General Election. On the domestic scene, the principal event of the year was a general election to the Second Chamber of the Riksdag, held on September 19. The very lively campaign centered around economic issues. In a determined attempt to end the alleged "economic misrule" of the Social Democrats, the three non-Communist opposition parties (Conservatives, Liberals or People's Party, and the Farmers' Union) banded together in one election bloc. This arrangement made it possible for the three parties to pool their votes when one of their candidates failed to secure a separate majority.

The combined onslaught failed, however, to attain its goal. While one of the opposition groups, the People's Party, scored an impressive victory, more than doubling its strength in the Riksdag, its gains were made for the most part at the expense of the partners in the election bloc. The Social Democrats did lose a good deal of votes to the opposition bloc as a whole, but they were able to recoup part of their losses by cutting heavily into Communist strength. The Communists' poor showing was due largely to the popular reaction against events in Czechoslovakia and Finland. The total vote was substantially higher than in 1944. Here are the detailed figures, with those for the preceding election (1944) shown in brackets:

Social Democrats: 1,701,957 votes and 112 seats [1,436,571 and 115]; People's Party: 814,123 votes and 57 seats [398,293 and 26]; Farmers' Union: 474,075 votes and 30 seats [421,094 and 35]; Conservatives: 448,308 votes and 22 seats [488,921 and 39]; Communists: 237,135 votes and 9 seats [318,466 and 15].

Although the Social Democrats retained a slight margin of control in the House—except in the unlikely event of a joint opposition vote including the Communists—Premier Erlander immediately after the election made a bid for Agrarian support. He offered to form a coalition government of his own

party and the Farmers' Union, but rejected the latter's proposal that the Liberals and Conservatives should also be included, as during the war. "To join formally in one Cabinet forces which strive at different directions, and therefore can be expected to neutralize each other, would mean to paralyze the power of action which today is so necessary in order to pursue a clear and determined economic policy," Erlander declared. As a result, the Farmers' Union, on October 18, declined to enter the Government. Thus the Social Democratic Cabinet remained in power, except for a minor reshuffle of portfolios on October 28. (Previously, on September 22, Minister of Trade Axel Gjoeres had been replaced by John Ericsson in a policy disagreement.)

The Economic Situation. Economic conditions showed signs of improvement during the year, with the outlook at the end of 1948 considerably better than it had been a year earlier. The dollar shortage continued, though somewhat less acute, and rigid import controls had to be maintained. Only bread was taken off the rationing list, early in October, while meat, fats, butter, sugar, coffee, and gasoline stayed on the list.

Industrial production was at a high level throughout the year. The export of iron ore, which had slumped after the war, increased substantially as both Western Germany and the Polish-Czech economic combine in Silesia contracted for new deliveries. By 1949, iron-ore shipments were expected to reach the 12 million-ton level again.

The drive to increase exports while restricting the importation of all but essential goods paid off during the year. In October, Sweden's foreign trade, for the first time since January 1946, showed a modest export surplus. For the year taken as a whole, there would still be an import surplus, which was expected, however, to be less than half that of 1947.

—JOACHIM JOESTEN

SWEDISH LITERATURE. On the whole, the year 1948 was an uneventful one on the Swedish book market. Few Swedish authors gave their very best; no new talent of real size appeared; the literary debate went on without raising remarkable issues or giving impressive answers. The situation in Sweden was rather like that in America, in England, in France, and in the other Scandinavian countries; the comparative meagerness of the Swedish crop is not surprising.

There were, however, in Sweden as in other countries, some exceptions from the universal rule. Harry Martinson published a volume called *Vägen till Klockrike* (The Way to Klockrike). Some of his work has previously been translated into English; he came to literature from the forecastles of many freighters and has written poetry and prose, both equally imaginative and expressive, about his experiences as a sailor, his poor childhood in southern Sweden, and about the Swedish landscape. This new book is a novel, and a good one. It is about a hobo, who chooses to be one, and what it feels like to be an outlaw; it is an amusing book but also a serious one, containing an abundance of fanciful ideas and descriptions of persons and places, but also a vision of peacefulness which has a quality of almost mystic sincerity. From the beginning of his career, Harry Martinson has belonged to the artistic frontiersmen of Swedish literature.

The other prose writer who published a really outstanding book this year arrived at her present position by way of the trial and error method. She is Stina Aronson, who during her 25 years as an

author has written numerous books in various styles. In her two latest works, *Himlen* (This Side of Heaven), a novel; and *Sång till polstjärnan* (Chant to the Polar-Star), a collection of short stories in which she has used her experiences as the wife of a T.B. doctor in the Finnish-populated wilderness of northern Sweden. These two books are the first to describe these primitive souls with real insight; they also manage to reproduce the snowbound stillness of the country in a highly suggestive and remarkably artistic way.

If the year offered few literary top results, there appeared, however, an unusually large amount of serious, rather effective, and promising things; compared to the American book market, the proportion of pure entertainment is small. A choosy reader was able to find at least twenty prose books worth while; but it would be of little use to mobilize a company of names which an American reader had never heard of and probably never will hear of again.

Poetry. There was some good poetry published, especially in new volumes by Ragnar Bengtsson and Elsa Grave. The new Swedish poetry is written by people who are extremely well read in the works of their American, English, and French colleagues. The leading name in the whole phalanx is Erik Lindegren, a poet with several similarities to Dylan Thomas; in 1948 he started a new bi-monthly, *Prisma*, which attempts to be a Swedish counterpart to *Horizon*. It pays great attention to developments abroad and has supplied the debate with valuable stuff. Finally, there appeared half a dozen first novels or collections of stories that seemed at least promising.

Non-fiction. In the field of non-fiction, there were several events worth noting. The comparatively young Strindberg expert Torsten Eklund wrote an immense and interesting book on Strindberg's peculiarities, observed from the viewpoint of an Adler student, and the old Strindberg expert Martin Lamm published a learned and readable exposé of modern drama from Scribe to Lorca. From a Marxist position, Per Olof Zennström explained Picasso in a way that could please readers of other denominations, too, and Oscar Reuterswärd published a study on Monet and the impressionists, which should be worth the attention of an international public. Sten Selander, poet and critic of Stockholm extraction, who is also a botanist of some standing, has spent his last forty summers in the high mountain area of western Lapland. His new book on that country, its landscape, flowers, and few inhabitants, is probably the best thing he has ever written. Herbert Tingsten, editor-in-chief of *Dagens Nyheter*, Sweden's largest, militantly liberal, and anti-isolationist newspaper, published a selection of his beliefs and dissections, *Argument*. He would remind an American reader of Parrington, Hayek, and Edmund Wilson (the critic).

Despite what has been said, there is, on the whole, no reason for book-minded Swedes to lament conditions. During the last ten years or so, there has been a remarkable increase in the interest in good books; and the impression of growing maturity was confirmed during the last year. The sales figures for valuable literature have risen considerably, while the interest in things of no consequence is on the downgrade.

Translations. Most American and English—and some German, French, and Italian—novels of importance are translated shortly after their publication in their home countries. Among translations which appeared in Sweden during 1948, and which aroused great interest, were Thomas Mann's

Doctor Faustus, T. S. Eliot's *Four Quartets*, Graham Greene's *The Heart of the Matter*, Edmund Wilson's *Memoirs of Hecate County*, Christopher Sykes' *Four Studies in Loyalty*, and Carlo Levi's *Christ Stopped at Eboli*. There were also quite a few new editions of the classics, including some minor American classics, which previously had been overlooked by Swedish publishers, among them Faulkner's *As I Lay Dying*, John O'Hara's *Appointment in Samarra*, and Eudora Welty's *A Curtain of Green*.

Reprints. Perhaps the most important feature of the book year, however, was the large amount of good books in cheap editions. Although the number of bookstores in Sweden is relatively much larger than that in America—and also the stores are much better stocked—there are naturally vast areas in the country where no books are available; and Sweden has no book clubs of the American type. During 1948, the 6½ million Swedes bought well over 2 million books in cheap editions, comparable for instance to Bantam Books, at a price of about 40 cents a copy; the main outlets were newsstands and tobacconists. This is much more than any previous year, and might be of great value for the education of a literary public in the future.

Awards. Sweden's largest and most coveted literary prize, awarded by *Samfundet De Nio* (The Society of Nine), went to Sigfrid Lindström, a poet and writer of philosophical *contes*, who has a small but fastidious and fanatical following.

—THORSTEN JONSSON

SWIMMING. Feats of American swimmers in the Olympics, when men and women from the United States scored the most impressive triumph in the history of the games, proved the high mark of the sport in 1948. As is customary in the aquatic sport, records tumbled so frequently that scorers had a hard time keeping in the swim.

A feature of the campaign was the comeback of Alan Ford, free-style star. Among the new world standards was Ford's mark of fifty-five and four-tenths seconds (0:55.4) for 100 meters. Ford also combined with his New Haven S.C. teammates, Edward Hueber, Frank Dooley, and Howard Johnson to establish relay marks of 3:23.8 for 400 yards and 3:48.6 for 400 meters.

Allen Stack of the New Haven S.C. established backstroke times of 1:04 for 100 meters and 5:03.9 for 400 meters, while Joe Verdeur of the Atlantic City Brighton-Drake S.C. continued his assault on breast-stroke records with a clocking of 2:14.7 for 200 yards and 2:30 for 200 meters. Michigan University's medley trio of Harry Holiday, Robert Sohl and Richard Weinberg clipped the 300-yard relay standard from 2:50.5 to 2:49.2.

Ohio State University's squad captured the national A.A.U. indoor championship, the outdoor team honors going to the Brighton-Drake S.C. The Crystal Plunge squad of San Francisco, led by comely Ann Curtis who later turned professional, swam away with team crowns in both women's national A.A.U. meets. Ohio State was dethroned by Michigan as National Collegiate Athletic Association ruler.

Men's national A.A.U. outdoor champions were: Robert Nugent, New York A.C., 100 meters free style; Ed Gilbert, Austin, Texas, 200; Jimmy McLane, New Haven S.C., 400 and 800; Jack Taylor, Firestone Club, Akron, Ohio, 1,500; Allen Stack, 100 back stroke; Joe Verdeur, 200 breast stroke and 300 medley; Brighton-Drake S.C., 300 medley relay; New Haven S.C., 800 free-style relay; Bruce

Harland, Ohio State, three and ten meter dives; Forbes Norris, Harvard, long distance; University Circle Y.M.C.A. of Cleveland, long distance team.

Senior indoor champions follow: Wally Ris, Iowa, 100-yard free style; Bill Smith, Ohio State, 220 and 440 free style; Allen Stack, 150 back stroke; Joe Verdeur, 220 breast stroke; Miller Anderson, Ohio State, one and three meter dives; Michigan, 300 medley relay; New Haven S.C., 400 relay.

Women's national A.A.U. outdoor title winners were: Ann Curtis, 100, 400, and 800 meter free style; Joan Mallory, Crystal Plunge, 1,500 free style; Sue Zimmerman, Multnomah A.C. Portland, Ore., 100 and 200 back stroke; Jeanne Wilson, Lake Shore A.C., Chicago, 100 and 200 breast stroke; Barbara Jensen, Athens A.C., Oakland, Calif., 300 medley; Los Angeles A.C., 300 medley relay; Crystal Plunge, 800 free style relay; Zoe Ann Olsen, Athens A.C., one and three meter dives; Jean Lutyena, Riviera Club, Indianapolis, long distance; Riviera Club, long distance team.

Women's A.A.U. indoor champions were Marie Corridon, Women's Swimming Association, New York, 100-yard free style; Sue Zimmerman, 100 and 200 back stroke; Carol Pence, St. Louis, 100 breast stroke; Ann Curtis, 220 and 440 free style; Clara Lamore, Providence, R.I., 220 breast stroke; Mrs. Nancy Merki Lees, Multnomah A.C., 300 medley; Multnomah A.C., 300 medley relay; Crystal Plunge, 400 free-style relay; Mrs. Victoria M. Draves, Los Angeles, one meter dive; Zoe Ann Olsen, three meter dive. See OLYMPIC GAMES.

—THOMAS V. HANEY

SWITZERLAND. An independent Federal Republic in the center of Western Europe, bounded on the north by Germany, east by Austria and Liechtenstein, south by Italy, and west by France. Area: 15,944 square miles. Population (1948 est.): 4,588,000. Chief cities: Bern (capital), population 140,000; Zurich, 377,000; Basle, 173,000; Geneva, 146,000; Lausanne, 103,000. There are four national languages, German, French, Italian, and Romansch. German is spoken by 71.9 percent of the population and is the official language of the majority of the inhabitants in 19 cantons; French by 20.4 percent, the official language of 5 cantons; Italian by 6 percent, in the canton of Ticino, and Romansch by 1.1 percent, in the canton of Grisons. Vital statistics (1947): births, 87,724; deaths, 51,384; marriages 39,401.

Education. Primary school attendance is compulsory and free. There were 430,332 children attending primary schools, and 51,000 secondary schools in 1947. Commercial, technical and vocational schools form an important part of the educational system, and private schools have a high reputation. Seven cantons have their own universities—Basle, Bern, Fribourg, Geneva, Lausanne, Neuchâtel, and Zurich. Other institutes of higher learning include the Swiss Federal Institute of Technology in Zurich, and the Swiss School of Economics and Public Administration in St. Gall.

Religion. The population of the country includes 2,457,242 Protestants; 1,724,205 Catholics; 19,429 Jews. The Protestants are in a majority in 12 cantons, of which 9 are German and 3 are French-speaking; the Catholics in 10 cantons, of which 7 are German and 2 partly French, with one Italian-speaking.

Production. Dairying and stock raising prevail in the mountain regions, while crops are grown chiefly in the lowlands. In 1947 grain crops totaled 95.1 million Swiss francs; potatoes, 126.5 million Swiss

francs; vintage grapes, 130.0 million Swiss francs; fruits, 143.7 million Swiss francs; vegetables 165.2 million Swiss francs. The gross income from agricultural products in 1948 is estimated at 2,130.5 million Swiss francs. Livestock (1948 census): 142,085 horses, 1,424,113 cattle, 766,957 hogs. In 1947 the production of milk totaled 20,600 quintals. In the same year the vineyards yielded 880,907 hectoliters of wine. Machinery, textiles, clothing, chemicals, metals, and watchmaking are the main industries. Other manufactured products are foodstuffs, lumber, paper, and printing. In December, 1947, there were 11,215 factories, employing 520,806 workers. In September, 1948, the cost of living index was 163.2 (1939 = 100).

Foreign Trade. In 1948 Switzerland's imports were valued at 5,004 million Swiss francs; exports at 3,432 million francs. Principal exports (in millions of Swiss francs) were: machinery 648.6; instruments and apparatus, 203.4; watches and watch parts, 743.5; dyes, 269; pharmaceutical products, 210; chemical products 121.7.

Transportation. In 1947 the state owned 92 percent of the railroads, which comprised 1,767 miles of standard gage and 45 miles of narrow gage lines, 1,476 miles being electrified. The river port of Basle affords, through the River Rhine, a vital link with several seaports in northwestern Europe. In 1948, the freight handled in that port amounted to 2,779,266 tons. Switzerland's first merchant fleet which arose as a result of the war emergency in 1941 consists of 13 vessels (2 under construction) totaling approximately 40,000 dead weight tons. Swissair is the only civil aviation company operating international lines. Airports for the continental air traffic are located at Zurich, Basle, and Geneva. Geneva and Kloten, near Zurich, are the airports of inter-continental traffic.

Finance. According to the 1947 budget, revenue amounted to 812,932,000 Swiss francs; expenditure 803,925,000 Swiss francs. The main source of revenue is customs; defense the major item of expenditure. Customs receipts for 1947 amounted to 464,484,000 Swiss francs.

Government. The Swiss Confederation is a federal republic consisting of 22 Cantons, three of them being further sub-divided into half-cantons. Present Federal Constitution has been in force since May 29, 1874. It vests supreme authority in a bicameral Federal Assembly (Council of States and National Council), and a Federal Council (the executive authority). The Council of States has 44 members, two from each Canton and one from each half-canton, elected according to the legislation of each Canton. The National Council represents the people. Its members are elected for a period of four years, each representing 22,000 citizens. Every male citizen, upon his 20th year, may vote and is eligible for election; clergymen, however, cannot be deputies. Swiss representatives have great freedom of action since they are not bound to their party.

Bern is the seat of the Federal Council, the 7 members of which are elected every four years by the Federal Assembly (both chambers united). The President and Vice President of Switzerland are elected, for terms of one year only, by the Federal Assembly and they are the first magistrates of the Republic. The President has no special power. However, he presides over the Federal Council and represents Switzerland with foreign nations. President for 1949 is Ernest Nobs; Vice President, Max Petitpierre. The Federal Council may initiate legislation and its members may be present at the deliberation to defend the proposed measure; rejection of such measures does not lead to resigna-

tion of the Federal Council. On the other hand the Federal Council has no veto power over the measures approved by the Federal Assembly.

The cantons are autonomous states with jurisdiction in civil and criminal law, justice, police, public works, and education. Their own constitution is adapted to their needs and varies in form from the ancient institution of the citizens' assembly (Landsgemeinde) to the parliaments of the large cantons. Active participation by Swiss voters is by the initiative and the referendum. By federal initiative, 50,000 citizens may demand a direct public vote on questions or amendments of the Federal Constitution. By the right of referendum, 30,000 voters or 8 cantons can force the federal law to the plebiscite, even though this law may have been passed by both chambers. These two measures, the initiative and the referendum, are also granted by the cantons' constitutions and serve as checks against despotism and party rule.

Events, 1948. Swiss voters elected their representatives to the National Council (see *Government* above) and as a result of the election the standing of the various political parties is as follows: Progressive Democrats 51, Conservative Catholics 44, Socialists 49, peasants, artisans, and bourgeois 21, Landessing 9, Liberals 7, Democrats 5, Workers' Party (Communists) 7, without party affiliation 1. The Council of States consists of Progressive Democrats 11, Conservative Catholics 18, Socialists 5, peasants, artisans, and bourgeois 4, Liberals 2, Democrats 2, without party affiliation 2.

With the reservation not to enter into any engagements which are incompatible with her principle of traditional neutrality, Switzerland cooperates in the realization of the Marshall Plan. Switzerland's goal remains the most intensive development of her trade relations with as many countries as possible and she has during the past years granted credits to other nations to the amount of approximately 1,000 million Swiss francs.

Although Switzerland has not applied for membership in the United Nations, by reason of her strict neutrality, she was anxious to demonstrate her ardent desire for international collaboration in all the United Nations organizations which do not deal with political problems. Switzerland has a seat in the International Labor Organization, International Civil Aviation Organization, the Food and Agricultural Organization, the World Health Organization, the UNESCO, the International Telecommunications Union, the Universal Postal Union, the International Court of Justice. Switzerland is participating in the United Nations Conference on Trade and Employment in Geneva. She is also a member of the International Children's Emergency Fund and has taken an active part in the United Nations Appeal for Children. The Swiss Government contribution to this organization has amounted, in 1948, to \$1,609,317. Switzerland's share in the United Nations Appeal for Children is put at \$156,101.

—H. W. HIRS

SYRIA. An Arab republic with a short coastline on the northeastern corner of the Mediterranean. (See also ARAB LEAGUE AFFAIRS and PALESTINE.)

Area and Population. Area: 54,000 square miles of which 8,000 are cultivated and 8,000 more cultivable. Population: three million. Chief cities: Damascus (capital) with over 346,000 inhabitants; Aleppo, 337,700. The majority are Arabs (including 300,000 Beduin nomads) with Kurdish, Armenian, and Jewish minorities. The overwhelming proportion are Sunni Arabs with some other Moslem sects represented and an important minority of Christians divided into several sects.

Education. The new government is strengthening and expanding a national system of public instruction. In 1945-46 there were over 1,000 Syrian primary schools (one-third private) with 147,000 pupils, and 64 secondary schools (more than half of them private) with some 11,500 pupils. Among the 39 foreign primary and secondary schools with over 4,000 pupils are Aleppo College (American) and the young American College at Damascus started at the special request of the Syrian Ministry of Education. The 7 technical schools had almost 1,000 students, and the Syrian University (with schools of law, medicine, pharmacy, and dentistry) had over 1,000 students.

Production. Almost all the cultivated land depends on rainfall and even half of that lies fallow much of the time because of the population's maldistribution. River water is abundant for irrigation but only a fraction of it is used. Wheat and barley are the leading cereals; 1948's wheat crop was estimated at 500,000 tons, 200,000 tons for export (the 1947 harvest having been bad). Tobacco, olives, fruits, vegetables, and nuts are produced. Hemp and silk cocoons are important industrial crops, but agricultural industries are still limited. Cement production has gone up although sale is restricted due to loss of the Palestine market. The few other industries including textiles, soap-making, tanning, and canning are protected by relatively high tariffs, modified in certain instances by Syria and Lebanon's adherence to the 1947 Geneva General Agreement on Tariffs and Trade.

Foreign Trade (Syria and Lebanon). Chief exports are agricultural: vegetable products, textile materials, and goods. Among the many imports are textile materials and goods, vegetable and mineral products, metals and metal work, machinery, and means of transport. In 1947 exports totaled £\$83.6 million, chiefly to Palestine, France, the United States, and Egypt; imports totaled £\$13.5 million, chiefly from the United States, Great Britain, and France.

The huge deficit in the foreign trade balance became even larger in the first half of 1948, exports amounting to £\$23.3 million and imports to £\$228.9 million. Figures for 1948's first six months revealed an increase in exports to the United States over the equivalent 1947 period, and a decrease in imports. The growing overall deficit is no longer offset by the revenue from certain types of invisible exports such as the tourist trade and remittances from emigrants.

Transportation and Communication. There are over 500 miles of railway owned by three companies—not enough to fill the need. However, through the 1940 completion of the "Berlin to Baghdad" railway, it is possible to travel by train from Europe to Baghdad across Syria. The 4,000 miles of road are not as good as those in Lebanon except for the one connecting Damascus and Beirut. American, British, Egyptian, and Iraqi airlines service Damascus. The government operates the Syrian Broadcasting Corporation and telephone and telegraph facilities.

Finance (Syria and Lebanon). The 1948 regular Lebanese budget was initially estimated at £\$67 million and the Syrian at £\$127.9 million. The removal of military installations and the withdrawing of foreign armies had an immediate effect on employment. The deteriorating situation was reflected in a decrease in bank deposits, shrinking money in circulation, diminishing stocks, and increasing bank credits. In July currency in circulation amounted to £\$379 million. In September of 1948 the cost of living index was still at a high

of 495 (1939 = 100) although it had dropped from the 1945 peak of 607. In October the official exchange rate was £\$2.202 to the U.S.\$.

Government. The Republic's independence was proclaimed by the Free French in 1941 but it was not evacuated by French troops until 1946. The President (Shukri al-Kuwatli elected in 1943) is elected by the Chamber of Deputies for five years. In conjunction with his Ministers he is responsible to the Chamber. Deputies are elected by universal suffrage every four years.

Events, 1948. As part of Syria's economic development program, plans were made to start work on Syria's only significant port, Latakia, early in 1949. Swiss experts came to Aleppo to make recommendations for Euphrates irrigation projects. The cultivation of sugar beets was intensified and the machinery and equipment for a sugar refinery in Homs ordered from Czechoslovakia.

Faris al-Khoury represented Syria as a nonpermanent member of the United Nations Security Council for 1947 and 1948. In November he was elected a member of the UN International Law Commission to codify international law.

Relations with France and Lebanon. In January, Syria refused France's offer for a renewal of the financial agreement providing, among other things, for a continued backing of Syrian currency by French francs. Its ability to acquire foreign exchange was a little stronger than was Lebanon's and it did not depend so closely upon trade with France. In June, Syria modified her opposition to Lebanon's ratifying the Lebanese-French agreement. Both Syria and Lebanon recognized that economic friction should be kept at a minimum, even though the currencies were separate, so the Customs Union was maintained.

Palestine Problem. December, 1947 witnessed the first demonstrations against the Palestine partition plan with attacks on the American and French Legations and on the Syrian Communist headquarters. The December mustering of fighting men was followed by January laws forbidding the unauthorized movement of Jews and the expulsion of Palestinian Jews. On May 15 a state of emergency was declared and in June Damascus experienced its first Israeli air raids. Although President al-Kuwatli started his second term, Prime Minister Jamil Mardam Bey's Cabinet resigned in August and he formed a new one.

In early December dissatisfaction (possibly fired by the reactionary Moslem Brotherhood) with the Palestinian turn of events and with the economic situation exploded in Damascus. For several days general strikes and demonstrations assumed such proportions that all legations were heavily guarded, city activity suspended, and troops put in charge. Mardam Bey's Cabinet was forced to resign and not until December 17 was another leader, Khaled al-Azam, Foreign Affairs and Justice Minister in 1939, able to form a new Cabinet.

—DOROTHEA SEELYE FRANCK

TANGANYIKA. A trust territory in East Africa, administered since Dec. 13, 1946, by Great Britain under a trusteeship agreement with the United Nations. Area: 362,688 square miles. Population (1946 estimate): 5,648,015 natives, 7,245 Europeans, and 57,765 Asiatics. Dar-es-Salaam, the capital, had 64,200 inhabitants. Education (1946): enrollment in government-operated schools for natives totaled 29,601. There are schools for Europeans and Indians, the latter receiving grants in aid. Most of the people are pagans. Of 680,000 Christian Africans, 433,000 are Roman Catholics.

Production and Trade. Tanganyika has extensive forests which yield mvule, podo, certain mahoganies, and camphor. In 1946 the timber output amounted to 2.1 million cu. ft., valued at £1 million. Agriculture, the principal occupation of the people, furnishes a variety of cereals, vegetables, and fruits for home consumption, as well as the country's principal export—sisal. In 1946 the export of sisal amounted to 106,806 tons. Mineral output in 1946 was valued at £1,623,863—the chief minerals mined being gold, diamonds, lead, and mica. Foreign trade, excluding silver bullion and specie (1947): imports were valued at £13,680,000; exports, £11,280,000. Cotton piece goods, foodstuffs, cigarettes, kerosene and gasoline, machinery other than electrical, building materials, iron and steel manufactures, liquor, and sugar were the principal imports.

Finance. In 1947: revenue was estimated at £5,766,100 (£5,146,761 actual in 1946); expenditure, £5,808,600 (£5,140,443 actual in 1946).

Government. Tanganyika is administered by Great Britain under trusteeship from the United Nations. Administration is by a governor, aided by an executive council created by the Tanganyika Order-in-Council of 1920. Laws of the territory, since 1926, are made by the governor with the advice and consent of the legislative council (constituted in 1926), composed of 15 official and 14 unofficial members; of the latter, 3 are Asian and 2 are African. Governor: Sir William Battershill (appointed Apr. 28, 1945). See EAST AFRICA HIGH COMMISSION.

TANGIER. An Internationalized Zone in northwestern Morocco at the Atlantic entrance to the Strait of Gibraltar. Area, 225 square miles, and population (1947), about 103,000. Over half the population dwells in the city of Tangier.

Tangier forms part of the Empire of Morocco, the Sultan being represented there by a Mendoub. The official languages in the Tangier Zone are French, Spanish, and Arabic. The education of the native Moslems is left largely to the Koranic schools, though both the French and Spanish authorities maintain several educational institutions, to some of which natives are admitted.

Production. The Tangier Zone has very little agricultural production and must import much of its food. Through its port, however, passes a considerable transit commerce, much of which is carried over the railway to Fez and other points in the French Zone. As a rule imports exceed exports in a ratio of eight or more to one.

Foreign Trade. In 1946 imports were valued at 3,561 million francs and exports at 486.7 million francs.

Finance. Ordinary budget estimates (1948): revenue 583,381,000 francs; expenditure 561,479,000 francs. The extraordinary budget was balanced at 289,150,000 francs.

Government. The provisional international administration, set up in pursuance to an agreement signed at Paris on Aug. 31, 1945, is headed by an administrator. In the legislative assembly, France and Spain have 4 members each; Great Britain and Italy 3 each; the United States, Belgium, Netherlands, and Portugal 1 each. The natives are also represented by several members, chosen by the Mendoub. See *Events*.

Events, 1948. The Soviet government, after several months of delay, finally agreed on February 22 to let Italy resume participation in the international administration of Tangier. Meanwhile, the Powers appeared to come no closer to a permanent settlement of the Tangier problem. The

city still continued to be administered under a provisional agreement that originally was to have lasted six months, but was by late 1948 approaching its fourth year of existence.

The Soviets continued in their refusal to participate in the government of the international zone as long as Franco Spain was one of the parties to the agreement. The Sultan of Morocco also made clear his wish to join in the joint administration, since after all Tangier formed part of the Sherifian Empire of which he was the titular ruler. The Moorish inhabitants of Tangier likewise complained that they were grossly underrepresented in the Tangier Assembly, despite their preponderance in the total population, and they objected strongly to the ban on the publication of Arabic newspapers in the zone.

Early in the spring the Administrator of the International Zone, Admiral Luiz Antonio de Magalhaes Correia of Portugal, resigned, though he continued to serve several months while his successor was chosen. In the fall this ticklish job was filled by Jonkheer Henri F.L.C. van Vredenburg, a Dutch diplomat.

In November Spain instituted a blockade of Tangier along the frontier between the International and Spanish Zones. Tangier depends for its food chiefly on French Morocco. The Spanish used various pretexts to hold up shipments of food across their zone, while the Spanish press opened a campaign for the annexation of Tangier, which during the recent war had been occupied by Spanish troops. The Madrid government was also suspected of using the blockade as a means of forcing the International Administration to issue a license for the operation of a radio station in Tangier, already partly erected. In any case, by the end of November the blockade was sufficiently effective to oblige the International Administration to charter a ship to make weekly trips from Casablanca carrying flour and other provisions. There was also talk of an airlift but this seemed unnecessary since Tangier, unlike Berlin, was on the open sea.

Late in March Tangier was the scene of a conference attended by several hundred leaders of the Moslem natives of North Africa, chosen principally from the various independence movements of Morocco (Spanish and French), Algeria, and Tunisia. They heard and debated two reports: the first, on the attitude of the Arab League toward North Africa brought from Cairo by Abd el Khaleq Torrais, nationalist leader in Spanish Morocco; the second, from the North African unofficial delegate to the United Nations in Lake Success. The message from the Arab League was to the effect that North Africa, a probable battleground in a third world war, should remain neutral—a policy which, after warm debate, was rejected by the majority of the conferees at Tangier. —ROBERT GALE WOOLBERT

TARIFF COMMISSION, U.S. An independent nonpartisan agency of the U.S. Government created by Congress Sept. 8, 1916, to supply factual information to the President, the Congress and the Committees of Congress that handle tariff legislation. Special functions of a continuing nature respecting rate changes, unfair practices, and discriminations were added by the Tariff Acts of 1922 and 1930. The Trade Agreements Act (1934) named the Tariff Commission as a source of information and advice for the President in conducting negotiations. The Trade Agreements Extension Act of 1948 and Executive Order 10004 of Oct. 5, 1948, extend the Commission's functions respecting trade agreements. Section 22 of the Agricultural Adjustment

Act, as amended, authorizes the President to direct the Tariff Commission to make an investigation of articles imported under conditions that interfere with agricultural support programs. Section 504 of the Philippine Trade Act of 1946 provides for investigation by the Tariff Commission as to limitations on certain imports.

The full Commission consists of six Commissioners, appointed by the President and confirmed by the Senate for terms of six years each, one term expiring each year. Not more than three Commissioners may be of the same political party. The Chairman and Vice Chairman are designated by the President annually from the members of the Commission.

The work of the Commission falls into two groups: (1) general administrative and auxiliary services under the Secretary; and (2) professional, scientific and technical work under the Planning and Reviewing Committee.

During 1948 the Commission issued several reports. These include: *The Operation of the Trade Agreements Program 1934-Apr. 1948*; *United States Import Duties, 1948 (rates)*; *The Import Quota on Long Staple Cotton (1948)*; and *Plastics Products*. Chairman: Oscar B. Ryder.

TAXATION. The year 1948 was featured by the passage of a new Revenue Act which provided the first substantial tax reduction in many years. The measure, which reduced the tax yield by about \$4,800 million, was strongly opposed by the Administration but was quickly passed over the President's veto.

The Revenue Act of 1948. Despite the President's warning that the huge needs of the Government for national defense and other purposes made large-scale tax reduction inadvisable, Congress passed the Revenue Act of 1948 by overwhelming majorities. In the Senate the vote was 78 to 11 and in the House, 289 to 67. Approximately the same proportion of legislators voted to over-ride the President's veto, which was sent to Congress on April 2 and rejected within a matter of hours. Many Democrats elected to oppose the President's wishes by voting for the Republican-sponsored bill. The new lower taxes were made retroactive to Jan. 1, 1948, but the lower withholding taxes took effect May 1.

The new law provided income tax reductions of 12.6 percent on the first \$2,000 of taxable income, of 7.4 percent on incomes between \$2,000 and \$136,719, and 5 percent on all incomes above this figure. Personal exemptions were increased from \$500 to \$600, while an additional special \$600 exemption was given taxpayers over 65 years old and to blind persons. The standard deduction that may be taken in lieu of contributions, interest payments, etc. was increased to 10 percent of the gross income up to a maximum of \$1,000 from the former 5 percent and \$500 limit.

An important change was that permitting taxpayers in non-community property States to get split-income benefits by dividing in half the total taxable income of husband and wife and paying the surtax at the lower rates prevailing on the smaller incomes. By applying this provision to estate and gift taxes as well, these taxes were reduced by about 25 percent.

Under the new law the maximum total tax was set at 77 percent of the net income as compared with 85½ percent under the old law. The effective tax rate on an income of \$100,000 received by a married person with two dependents was reduced from 62.30 to 45.64 percent; on an income of \$10,-

000, from 18.62 to 13.61 percent, with corresponding reductions on intermediate incomes. Measuring the tax relief in another way, of the increment of income between \$90,000 and \$100,000 the individual was permitted to retain 36.75 percent under the new law as against 17.92 percent under the old; of the part of the income between \$20,000

and \$25,000 the taxpayer could keep 68.25 percent as against 47.37 percent. The over-all cut in individual taxes was estimated at \$4,774 million.

The Administration had opposed the tax reduction on the ground that it would eliminate most of the budget surplus and thus make it impossible to effect a further substantial reduction in the large public debt. Because the nation faced such heavy demands, it was pointed out, it was essential that receipts be kept at the highest possible level. Moreover, it was charged that the House bill distributed the tax relief inequitably and gave inadequate relief to the taxpayers with the lowest incomes.

Acknowledging the need for tax relief to offset in part the hardship caused to low income groups through the rapid rise in prices, the President recommended a straight tax credit of \$40 per capita. To make up the \$3,200 million loss that a cost-of-living adjustment would cause, he proposed that the excess-profits tax on corporations be reenacted, with some reductions from the 1945 rate. This tax, it was pointed out, would apply only to 22,000 corporations with the largest excess profits, out of a total of 360,000 taxable corporations.

In support of the tax cuts it was argued that, due to the large surplus, there was room for adequate defense and foreign aid programs and for tax reduction as well. In addition, it was asserted that maintenance of taxes at levels sufficiently high to produce a very large budget surplus weakened the incentive to reduce non-essential expenditures. It was claimed that individual tax rates were so high as to prevent saving and discourage business enterprise. Finally, it was pointed out that the existence of a substantial surplus made the time propitious to reduce the tax burden and relieve inequities in the tax structure.

On July 27, the President, among the measures he submitted to the special session of Congress called to combat inflation and to take up other matters left over from the regular session, again proposed the reestablishment of an excess-profits tax on corporations. No action, however, was taken on this proposal.

Internal Revenue Collections. During the fiscal year ending June 30, 1948, internal revenue collections of the Government totaled \$41,865 million, as

compared with \$39,108 million the year before. A large part of the increase was accounted for by individual income taxes, which amounted to \$20,998 million for the fiscal year. Taxes on corpora-

INTERNAL REVENUE COLLECTIONS
[Millions of dollars. Fiscal years ending June 30]

Tax	1947	1948
Individual income.....	\$19,343	\$20,998
Corporation income and profits.....	9,676	10,174
Old-age insurance.....	1,459	1,613
Unemployment insurance.....	186	209
Railroad retirement.....	380	560
Estate and gift.....	779	899
Liquor.....	2,475	2,255
Tobacco.....	1,238	1,300

Manufacturers' and retailers' excise.....	1,940	2,119
Miscellaneous.....	1,552	1,659
Total.....	39,108	41,865

tion income and profits yielded \$10,174 million, a rise of \$498 million over 1947. Employment taxes totaled \$2,381 million, social security taxes making up more than three-fourths of this sum. Liquor taxes, primarily the \$9 per gallon tax on distilled liquors and the \$8 per barrel tax on beer, amounted to \$2,255 million.

Another important excise tax, that on tobacco, brought in \$1,300 million, the major component being the tax of \$3.50 per 1,000 cigarettes. Manufacturers' and retailers' excise taxes yielded \$2,119 million, the largest revenue coming from such items as gasoline, automobiles, and jewelry. Miscellaneous taxes on theater admissions, transportation, telephone service, and a number of other items brought in \$1,659 million.

The accompanying table shows collections by principal taxes for the fiscal years 1947 and 1948.

—SAMUEL S. SHIPMAN

TAX COURT OF THE UNITED STATES, The. An independent agency of the U.S. Government which adjudicates, after trial, controversies involving the existence of overpayments in income, excess profits, estate, gift and unjust enrichment taxes, and personal holding company surtaxes in cases where deficiencies have been determined by the Commissioner of Internal Revenue; similarly to adjudicate controversies relating to excess profits on Navy contracts and Army aircraft contracts, suits for refunds of processing taxes and for determination of the amount of excessive profits on war contracts in cases brought by contractors aggrieved by determinations made under the Renegotiation Act. Hearings are held at Washington and, for the convenience of taxpayers, at other places within the United States. Practice is limited to practitioners enrolled under the rules.

In cases arising under Section 721 (a) (2) (C)

and Section 722 of the Internal Revenue Code and those arising under the Renegotiation Act, the decisions of the Tax Court are final. All other decisions are subject to review by the United States Court of Appeals^a for the prescribed circuit, or, by agreement, by the United States Court of Appeals for the District of Columbia, and thereafter by the Supreme Court of the United States, upon the granting of a writ certiorari. Presiding Judge: Bolon B. Turner.

TEA. In 1948 the world's tea industry saw the war-born gap between supply and demand being gradually closed by increased production from areas which were not contributing to the market during the war and immediate postwar years. Although it is estimated that it will be a few years before prewar production is reached, good progress has been made in the rehabilitation of the tea estates of Java-Sumatra despite a chaotic political situation.

In 1947, the last year for which complete figures are available, India—the major supplier of tea to the consuming countries—reported the highest tea production on record, 592½ million lb. And 1947 tea production figures for Ceylon, the second most important tea exporting country, showed a 19 million lb. gain from 280 million to 299 million lb. Prospects for Pakistan production are also heartening. The comparatively new tea industry in British East Africa reported a rise from 30 million lb. in 1946 to 32 million lb. in 1947.

World supplies of tea climbed to 981 million lb. in 1947, compared to 941 million lb. in 1946.

^a Tea passed by the examiners for admission. ^b Years ended June 30.

These figures include total production in India, Ceylon, Pakistan, Java-Sumatra, and British East Africa, plus exports from all other producing countries. Actual production or consumption figures are not available for China, Japan, or Russia. Analyzing both production and consumption figures, in-

^a Public Law 773, enacted by the 80th Congress, 2nd Session, revising, etc. Title 28—Judiciary and Judicial Procedure—of the United States Code, in Section 43, changed the name of the United States Circuit Court of Appeals to United States Court of Appeals.

formed sources have estimated that by 1950 world consumption will be 1,095 million lb. and world production will be 1,115 million lb.

Hampering the return to prewar normalcy are continued labor shortages everywhere, spiral-rising production costs, and general political unrest. All these factors create grave problems. Higher costs and the imposition of export duties by their respective governments have inevitably lifted the world's price of tea, and United States retail prices have naturally reflected this trend.

During the war years, price controls kept United States tea prices at prewar level until October, 1946. With the dropping of governmental controls, the price of tea took a sharp increase in 1947. In 1948, prices edged up a little higher.

The United States continues to be the second largest importing country, behind the United Kingdom, the number one importer in the world. Among the importing countries, the United States is second in consumption and fourth among all the nations of the world. In 1948, a total of 83.8 million lb. of tea went into retail channels. This is 2 million lb. under 1947 figures but almost twice 1943's figures which marked the wartime's lowest ebb.

This 84 million lb., enough tea to make approximately 20,000 million cups, was supplied last year primarily by Ceylon, India, Africa, Formosa, Congou China, and Java-Sumatra, in their respective order of importance. Before the war and the resulting debilitation of tea estates, India, Ceylon, and Java-Sumatra were responsible for most of the black tea moving in world commerce.

—ANTHONY HYDE

TELEVISION. One of the youngest and fastest growing of American industries may be said to have come of age in 1948. Television began the year with less than 200,000 receivers in operation; manufacturers produced only 30,000 in January but in November 120,000 were produced. Max F. Balcolm, President of the Radio Manufacturers Association, estimated the year's total production at 850,000. The new medium was considered to account for one-third of the radio manufacturers' dollar volume of about \$700 million. At the end of the year about 50 stations were operating and 74 had construction permits. Two States levied taxes on receivers used for entertainment in public places.

This tremendous growth was made in spite of certain restrictions. The Federal Communications Commission decreed a "freeze" on September 30 on television station allocations and applications in order to permit studies of interference problems and spacing between stations. The number of channels available for broadcasting was reduced from 13 to 12, and the maximum number of channels assigned in any given area was limited to 7. Production of picture tubes was hampered by a shortage of glass blanks, but one manufacturer developed a tube using metal sides and a glass face.

In Canada television reception was limited to the Toronto-Hamilton-Windsor area where programs from the United States could be received. Further development was awaiting the approval of the Canadian Broadcasting Corporation, which deferred action pending completion of policy decisions on station licensing and use of government funds.

According to David Sarnoff, President of the Radio Corporation of America, television so appealed to the public that by the end of 1948 the industry was two years ahead of the dates set by the most optimistic forecasts made at the end of

the war. Television receivers were made available in a price range from less than \$150 to the thousands, with the average slightly more than \$300. The higher-priced models generally included reception of standard and frequency modulation radiobroadcasts, together with an automatic changer for playing phonograph records. Both direct-view and projection tubes were used, the largest diameter of the former being 20 inches. Projection systems beginning with screen sizes of 12 by 16 inches provide sizes beyond the largest practicable direct-view tubes.

Rapid progress was made toward the completion of a television network to parallel the existing transcontinental radiobroadcast network. Television requires a system capable of transmitting a wide band of frequencies, a requirement that has been met by coaxial cable and radio-relay systems which were developed primarily for long-distance telephone service. On September 20 a midwestern network was placed in commercial operation to join the cities of St. Louis, Mo.; Chicago, Ill.; Toledo, Ohio; Detroit, Mich.; Cleveland, Ohio; Buffalo, N.Y.; and Milwaukee, Wis. Service is furnished by coaxial cables except for the Toledo-Detroit and Chicago-Milwaukee links, where radio relays are used.

By the end of the year the joining of this network to the already operating eastern network which includes Boston, Mass., New York, N.Y., Philadelphia, Pa., Washington, D.C., and Richmond, Va., was imminent. Construction of a new radio-relay system was begun between New York and Chicago and eventually may provide additional channels for television. The relay systems operate on microwaves of a frequency approximating 4,000 megacycles per second.

Tests were continued on another method of extending television coverage to which the name "stratovision" has been given by its sponsors, the Westinghouse Electric Corporation and the Glenn L. Martin Company. Based on the premise that the range of high-frequency radio waves is limited by the distance from the antenna to the horizon and can be increased by raising the antenna, the system uses transmitters carried in airplanes cruising at an altitude of 30,000 ft.

A method for decreasing television station interference in areas where two stations are received on the same channel was tested between New York and Washington by the Radio Corporation of America. Known as television carrier synchronization, it limits interference to only the first minute of each 15-minute period while the transmitters are being synchronized. The range of effectiveness is believed to extend to about 65 miles from a transmitter. Engineers of the same company made a new study of radio frequencies above 500 megacycles as a medium for the expansion of television broadcasting.

Toward the end of the year manufacturers introduced some new features with the changeover to new models, and began a trend toward lower prices. The availability of a 16-inch tube with metal sides in particular was said to make receivers more adaptable to mass production, thereby lowering the cost. Receivers using the tube were priced tentatively at \$500 or less.

One manufacturer announced a new receiver in which the viewer, by means of a switch on a long cord, could enlarge a conventional 10-inch rectangular picture to a circular picture using the full face of a 12-inch tube, but with the loss of the "fringe areas" of the picture. The device permits the viewer to enlarge the picture for close-ups of

faces or specific scenes and return to the conventional size when the entire scene is desired, and is applicable to tubes of various sizes.

While demand for tubes for new receivers continued at a high level, a large market for replacements began to appear. Work also was begun on the installation of more than 1,200 receivers with 10-inch picture tubes and 5-channel selectivity in the 1,600-room Park Central Hotel in New York, said to be the first major hotel installation of television in every room or suite.

With the rapid expansion of television programs there were many "firsts." One was the celebration of the Christmas mass at midnight in St. Patrick's Cathedral in New York with Francis Cardinal Spellman, Archbishop of New York, officiating. The program was broadcast by the New York television transmitters of the American, Columbia, and National broadcasting systems. A major television broadcast that required considerable advance planning and arrangement of technical details was the coverage of the national conventions of the Republican and Democratic Parties, both of which were held in Philadelphia. Additional channels were added to the existing television network, and the program was distributed to Baltimore, Md., and Newark, N.J., in addition to Richmond, Washington, New York, and Boston.

As the year ended, a United States court decision was near on an anti-trust action begun in 1945 based on the restriction of the use of patents and processes of Scophony Ltd. of London, England. The patents cover a method of television reproduction completely different from the cathode-ray tube method commonly used in the United States.

—G. ROSS HENNINGER

TENNESSEE. An east south central State. Area: 42,246 sq. mi. Population: (July 1, 1948) 3,149,000, compared with (1940 census) 2,915,841. Chief cities: Nashville (capital), 167,402 inhabitants in 1940; Memphis, 292,942. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$127,967,000; total expenditure, \$123,700,000.

Elections. Truman won a plurality of about 67,000 over Dewey. Thurmond ran about 197,000 behind Truman. Of the 12 electoral votes, 11 went to Truman and 1 to Thurmond. In the Senate race, Congressman Estes Kefauver, Democrat, beat Republican Carroll Reece. The 10 House seats remained as before—8 Democrat, 2 Republican. Gordon Browning, Democrat, Governor in 1937, won the gubernatorial contest. No other statewide officers are popularly elected.

Officers, 1948. Governor, Jim Nance McCord; Lieut. Governor, None; Secretary of State, Joe C. Carr; Attorney General, Roy H. Beeler; State Treasurer, C. C. Wallace; State Comptroller, Jared Mad-dux.

TENNESSEE VALLEY AUTHORITY (TVA). An independent corporate agency of the United States Government created by Congress in 1933 to provide for the unified development of all the resources of the 40,910-square-mile watershed of the Tennessee River and its tributaries. Development of the Valley includes control of the Tennessee River for navigation, flood control and power production; soil and forest conservation; agricultural and industrial development, and national defense. The area contains portions of 7 southern States—Alabama, Georgia, Kentucky, Mississippi, North Caro-

lina, Tennessee, and Virginia—and supports a population of approximately three million. Wilson Dam and the World War I nitrate plants at Muscle Shoals in northern Alabama were transferred to TVA in 1933. The system of 26 dams includes 16 constructed by TVA, 5 acquired by transfer and purchase and 5 privately owned projects operated as a part of the system under contractual agreement. Two dams, the Watauga and South Holston projects, are now under construction in upper East Tennessee. Closure of Watauga Dam was effected and storage of water begun Dec. 1, 1948, and the South Holston Dam is scheduled for completion late in 1950.

The complete reservoir system is estimated to be capable of reducing Mississippi River flood peaks at Cairo, Ill., by 2.5 to 3 feet. TVA engineers estimate the average annual direct benefits from TVA flood control operations to amount to almost six million dollars in the lower Ohio and Mississippi Valleys, in addition to about five million dollars in the Tennessee Valley.

A 630-mile channel for nine-foot navigation is now complete from Knoxville, Tenn., to the mouth of the Tennessee at Paducah, Ky., making the Tennessee a part of the nation's 6,000-mile interconnected inland waterway system. River traffic increased from 33 million ton-miles in 1933 to more than 400 million ton-miles in 1948, with particular gains in the movement of petroleum products, grain, automobiles, and coal.

The Muscle Shoals plant, supplying phosphorous, ammonium nitrate, and calcium carbide for war, in peacetime produces improved high analysis phosphatic fertilizers used in test-demonstrations by practical farmers in 26 states. TVA's power system now produces 15,000 million kilowatt-hours of electricity annually—the largest single integrated system in the United States. Power is sold at wholesale to 141 municipalities and rural cooperatives (reaching more than 850,000 consumers) and to some large industrial customers. Unique features of TVA are location of the principal offices in the region rather than in the national capital, and the widespread participation of Tennessee Valley people and institutions in the program. TVA is headed by a board of three directors. Chairman Gordon R. Clapp and Director James P. Pope are the present members. The third position on the Board is vacant.

TENNIS. American tennis stars maintained their hold on the major prizes, retaining both the Davis and Wightman Cups, symbols of world supremacy.

Meeting Australia in the challenge round at Forest Hills in September, the United States men triumphed by 5-0. Ted Schroeder of La Crescenta, Calif., defeated Adrian Quist, 6-3, 4-6, 6-0, 6-0, and Billy Sidwell, 6-2, 6-1, 6-1, while Frank Parker of Los Angeles, Calif., conquered Sidwell, 6-4, 6-4, 6-4, and Quist, 6-2, 6-2, 6-3, in singles matches. Billy Talbert of New York and Gardnar Mulloy of Miami, Fla., annexed the doubles by halting Sidwell and Colin Long, 8-6, 9-7, 2-6, 7-5.

United States women defeated their British sisters, 6-1, to keep the Wightman Cup. Louise Brough of Beverly Hills, Calif., set back Mrs. Betty Hilton, 6-1, 6-1, and Mrs. Jean Bostock, 6-2, 4-6, 7-5; Doris Hart of Miami subdued Joy Gannon, 6-1, 6-4; Mrs. Margaret Osborne duPont of Wilmington, Del., defeated Mrs. Bostock, 6-4, 8-6, and Mrs. Hilton, 6-3, 6-4. In the doubles, Mrs. Molly Blair and Mrs. Bostock won from Miss Hart and Mrs. Patricia Canning Todd of La Jolla, Calif.,

6-3, 6-4, for England's lone win, while Miss Brough and Mrs. duPont beat Mrs. Hilton and Mrs. Kay Stammers Menzies, 6-2, 6-2.

The national championships followed the Davis Cup matches in September at Forest Hills and a comparative unknown, 20-year-old Richard (Pancho) Gonzales of Los Angeles, battled his way to the throne left vacant when Jack Kramer joined the pro ranks in 1947. One of the youngest players ever to win the title, the promising coast star vanquished Eric Sturgess of South Africa, 6-2, 6-3, 14-12, in the final. Mrs. duPont crowned years of effort in the women's singles by upsetting Miss Brough, defending champion and winner at Wimbledon, 4-6, 6-4, 15-13. The mixed doubles honors went to Miss Brough and Tom Brown of San Francisco.

In the national doubles at Brookline, Mass., Mulloy and Talbert won the men's title and Miss Brough and Mrs. duPont retained the women's laurels.

Talbert also added the U.S. indoor title to his collection in the March tourney in New York, the women's crown going to Mrs. Todd. Jean Borotra and Marcel Bernard of France won the men's doubles while Talbert and Miss Hart took the mixed doubles.

The Wimbledon championship in July saw Bob Falkenburg of Hollywood, Calif., win the men's singles, but only after a battle with Bromwich that ended at 7-5, 0-6, 6-2, 3-6, 7-5. Miss Brough shared three crowns, winning the singles, the doubles with Mrs. duPont and the mixed doubles with Bromwich. Bromwich and Frank Sedgman, brilliant Australian, triumphed in the men's doubles.

Title winners in the French international tourney were Parker, singles; Jaroslav Drobny of Czechoslovakia and Lennart Bergelin, Sweden, doubles; Mrs. Nell Landry, France, women's singles; Mrs. Todd and Miss Hart, women's doubles, and Mrs. Todd and Drobny, mixed doubles.

Singles winners in some of the other major tournaments follow: Parker and Mrs. Todd, Belgian; Bromwich and Miss Hart, New South Wales; Bill Tully of Bronxville, N.Y., Canadian; Sturgess and Mrs. Todd, Argentina; Drobny and Mrs. Sheila Summers of South Africa, Pan American; Talbert and Miss Hart, Bermuda; Schroeder and Miss Gertrude Moran of Santa Monica, Calif., national hard-court; George Stewart of Panama and Althea Gibson of Wilmington, N.C., American (Negro) Tennis Association.

Professional racquet-swingers capped a big campaign with the world championships at Forest Hills in June, when Kramer turned back Robert L. Riggs of Altadena, Calif., 14-12, 6-2, 3-6, 6-3, in the final. Kramer, ranked as the No. 1 pro, added another title when he and Francisco Segura of Ecuador defeated Riggs and Don Budge, defenders, 4-6, 5-7, 6-2, 7-5, 8-6, in the doubles.

—THOMAS V. HANEY

TEXAS. A west south central State. Area: 265,896 sq. mi. Population: (July 1, 1948) 7,230,000, compared with (1940 census) 6,414,824. Chief cities: Austin (capital), 87,930 inhabitants in 1940; Houston, 384,514. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended August 31, 1946, total revenue amounted to \$304,285,000; total expenditure, \$272,250,000.

Elections. Truman won a majority over Dewey, Thurmond, Wallace and other candidates, and carried the 23 electoral votes. Democratic Congress-

man Lyndon B. Johnson won the Senate race. Democrats were reelected to all State offices, including: Governor—Beauford H. Jester; Lieutenant Governor—Allan Shivers; Attorney General—Price Daniel; Comptroller—George H. Sheppard; Treasurer—Jesse James; Land Commissioner—Bascom Giles; Superintendent of Public Instruction—L. A. Woods. Proposals popularly approved abolish the State-levied property tax; provide for the succession when the governor-elect dies; and provide for automatic reapportionment of the legislature.

Officers, 1948. Governor, Beauford H. Jester; Lieut. Governor, Allan Shivers; Secretary of State, Paul Brown; Attorney General, Price Daniel; State Treasurer, Jesse James; State Auditor, C. H. Cavness; Comptroller, George H. Sheppard.

TEXTILE FOUNDATION, Inc. This Foundation was created by the U.S. Congress in 1930 to engage in Economic and Scientific Research for the benefit of the textile industries and their allied branches, including raw materials. It operates with private funds. Over 25 research workers in Foundation Laboratories at Princeton, N.J., are engaged on fundamental research problems related to textiles and textile products, including projects for the U.S. Navy, Signal Corps, and Q.M.C. The Foundation also engages in economic research such as studies of marketing, management, textile education, etc. It is managed by 5 directors (the Secretary of Agriculture, the Secretary of Commerce, and 3 others appointed by the President of the United States).

TEXTILES. The volume in lb. of textile production in 1948 was 1.59 percent above 1947 and was exactly the average of the 8 high-level years 1941-1948. These 8 years are actually 60 percent above the average for the 8 preceding years, 1933-1940. The excellence of 1948 as a whole in textiles is sometimes forgotten by those who remember principally its last few months when there were price declines, curtailment, and compressed profit margins.

The year was probably the greatest ever experienced in the category of expenditure for expansion, modernization, and renovation of textile mills with reliable estimates of the figure running in excess of \$500 million. This was nearly 20 percent over 1947's \$414 million. The similar figure for 1946 approximated \$300 million and for 1945, \$200 million. Despite the fact that, with late 1948, competition returned to textile markets as a whole—or perhaps because of that, projected capital expenditures by textile mills for 1949 are estimated at close to \$450 million or a near duplication of 1948. These great capital investments come largely from profits rather than from borrowings, and have been stimulated by the urge to mechanize every process to the utmost and to reduce the burden of labor cost per unit of product to the minimum. Such modernization is one of the recognized means for giving hope of company survival in the era of keen competition which apparently is now near at hand.

Because of management readiness to buy any machinery or equipment which by its savings would pay for itself in a short time, machinery makers have continued their introduction of new and improved devices at a steadily increasing pace. The year saw the introduction of new looms, new wool preparatory machines, improved cotton combs, and substantial developments in tensionless finishing with the object of reducing the residual shrinkage in the finished fabric.

CARONIA, the world's largest postwar liner, was completed during 1948. Built by John Brown & Company of Clydebank, Scotland, the over-all length of the *Caronia* is 715 feet, breadth moulded, 91 feet, draught moulded, 30 feet. The gross tonnage is approximately 34,000. Propulsion is by twin screw triple expansion impulse reaction turbines.

Courtesy of United Fruit Company

S.S. YAQUE, completed in 1948 for the United Fruit Company, has an over-all length of 386 feet, displacement of 9,338 tons, and a speed of 16 knots. There are cabins for 12 passengers. She has 197,000 cu. ft. of refrigerated cargo space.

A MOBILE X-RAY MACHINE of 250,000-volt capacity is built for the laboratories of the Pennsylvania Railroad at Altoona, Pa. The unit is shown in operation examining the interior structure of the high-tensile steel used in a side frame for a high speed freight car truck. Such internal defects as concealed cracks and imperfectly welded joints are revealed clearly by this technique, which grew out of rapid wartime technical progress in the field of radiographic testing of metals. The entire unit is mounted on wheels so that it may be moved about the laboratory building or, when it is necessary, to a considerable distance away.

A MOBILE NEWSREEL THEATER is installed in a luxurious recreation car on the Pennsylvania Railroad's all-coach streamliner *The Jeffersonian*, operating on the run between New York and St. Louis. The photograph shows the theater's full capacity—six persons.

TABLE 1—INDEX OF TEXTILE ACTIVITY

Year	Index	Year	Index	Year	Index
1939.....	100	1943.....	142	1946.....	142
1941.....	142	1944.....	134	1947.....	138
1942.....	150	1945.....	131	1948.....	140

Textile activity based on total consumption of the chief fibers—cotton, rayon, and wool—was close to equaling the big years of 1941, 1943, and 1946. It was greater than in 1944, 1945, and 1947 and below the all-time high year of 1942 by only 6½ percent (see Table 1). Production of various types of textiles in 1948 compared with 1947 as follows: cotton broad woven goods, 5 percent less; woolen and worsted fabrics, 3 percent more; rayon broad-woven fabrics, 14 percent more; synthetic filament and staple, 14½ percent more; hosiery, 2½ percent less.

A prime reason for the lessening of cotton goods production in 1948 and for the price weakness in the latter half of the year was the falling off by about 42 percent of the previously large exports which had reached a record high of nearly 1,500 million yards in 1947. Since there is no immediate expectation of export revival, 1949 will have to progress without this supporting influence. Con-

TABLE 2—PRODUCTION OF COTTON AND WOOL GOODS

Year	Cotton broad woven goods (linear yards)	Woolen and worsted fabrics (square yards)
1939.....	8,287,000,000	482,000,000
1940.....	(not given)	444,000,000
1941.....	10,432,000,000	650,000,000
1942.....	11,108,000,000	685,000,000
1943.....	10,568,000,000	661,000,000
1944.....	9,536,000,000	658,000,000
1945.....	8,724,000,000	608,000,000
1946.....	9,144,000,000	645,000,000
1947.....	9,808,000,000	555,000,000
1948.....	9,500,000,000 ^a	560,000,000 ^a

^a Estimated.

tributing causes of export decline were scarcity of dollar exchange among consuming nations and rapid rehabilitation of war-damaged mills abroad and growth of wholly new industries in previously agricultural nations. However, yardage production of cotton and wool goods in 1948 compares favorably with recent years (see Table 2).

The average number of wage earners in the textile industry during 1948 was 1,275,000 which was 2½ percent above the 1947 figure of 1,244,000. The average, however, does not disclose the high point of 1,312,000 in March; nor does it include the 1,150,000 persons employed in the apparel manufacturing industry. Average hourly earnings in the textile industry closed the year near \$1.18 which is 14 percent above the 1947 average and 134 percent over 1939. The average hourly rate

TABLE 3—INDICES OF TEXTILE-MILL EMPLOYMENT

Year	Em- ployees	Pay- rolls	Year	Em- ployees	Pay- rolls
1939.....	100	100	1944.....	99	175
1940.....	98	101	1945.....	94	174
1941.....	112	136	1946.....	104	179
1942.....	112	163	1947.....	108	250
1943.....	107	177	* 1948.....	111 ^a	290 ^a

^a Estimated.

for 1948 was about \$1.15. Average weekly earnings in 1948 were about \$45.04, which was about 10 percent over 1947. Rates in the three main branches of the industry indicate that workers in wool mills earn the most, with rayon and silk mill employees next, followed by cotton mill workers. The hourly rates near the close of 1948 were \$1.31, \$1.18, and \$1.10 respectively (see Table 3).

Prices and Production. Wholesale prices for all textiles passed the point at which they doubled the 1935-39 average late in 1947. The high point came in April, 1948, when prices were 111 percent over that base period. At the end of 1948, this average had declined again to the "double point," or about 101 percent over 1935-39. Previous to April, 1948, the rise had been virtually continuous with only slight interruptions since 1939 (see Table 4).

TABLE 4—INDICES OF WHOLESALE PRICES

(Adapted from Rayon Organon)

Year	All Textiles	Cotton woven fabrics	Woolens and worsteds	Hosiery and underwear	Rayon yarn and staple fiber
1935-39.....	100	100	100	100	100
1940.....	104	94	106	101	96
1941.....	120	123	119	102	97
1942.....	136	148	135	113	98

1948.....	210 ^a	277 ^a	181 ^a	170 ^a	133 ^a

^a Estimated.

Cotton goods show the greatest percentage rise, averaging in 1948 177 percent over 1935-39; wool goods were up only 81 percent; hosiery and underwear, 70 percent; rayon filament and staple, 33 percent. Cotton goods, perhaps because of their greatest advance, were the first to succumb to readjustment in the second half of 1948. Prices on the more important gray goods constructions declined 20 to 30 percent from the peak in the first half of 1948 to the valley near the end of that year. Making this decline possible without elimination of all profit, a decline in raw cotton prices brought the fiber down from about 37 cents to 31 cents, or about 16 percent off. Labor rates, however, went up 5 percent in the same period.

Wool goods were slightly higher from the mill in the fall of 1948 than in the spring, a change induced almost wholly by the sharp rise in raw wool prices in Australia forced by unexpectedly large raw-wool buying there by the U.S.S.R., and by continuing decline in the size of the United States domestic wool clip. Retail prices on wool products were weak as the year closed. Hosiery and underwear prices were shaded as the year progressed, but the primary rayon market was firm with small advances.

Economists believe that the readjustments of 1948 will steer textiles into a fairly steady period both as to prices and demand for the first part of 1949—after that, domestic labor and tax legislation and foreign developments will be the governing factors for gain or loss. Textile inventories as reported for 1948 touched the highest figures in the war and postwar years, but it should be remembered that these figures are in dollars. With textile

TABLE 5—INDEX OF TEXTILE INVENTORIES ^a

(Adapted from Rayon Organon)

Year	Inven- tories	Year	Inven- tories	Year	Inven- tories
1939.....	100	1943.....	141	1946.....	199
1941.....	131	1944.....	142	1947.....	224
1942.....	157	1945.....	152	1948.....	257 ^a

^a Estimated.

inventories at an index number of 257 for 1948 (see Table 5) and textile prices at 210, it is obvious that stocks in physical volume are only slightly (about 20 percent) above 1939, the base year.

Among various trends which continued through 1948 on an important scale was the growth in pro-

duction and use of synthetic fibers. Rayon filament and staple for the first time passed the 1,000 million lb. mark in annual production recording 1,100 million lb., divided into 834 million lb. of filament and 266 million lb. of staple. Of this rayon, viscose process (plus a small amount of cupra process) accounted for 66 percent of the filament and 68 percent of the staple, acetate process rayon accounting for the remainder. The total figure for 1948 marks a gain of 16 percent over 1947 and is double the 1938 output. Unless considerable new capacity comes to view in 1949, and which is not in sight as the year begins, the gain of rayon output in the United States in 1949 will be relatively small.

Synthetics, other than rayon, including nylon, saran, Vinyon, Velon, Fiberglas, etc. have also been growing. Although there is no authoritative figure for production of these fibers, it is probable that they barely pass an 80 million lb. total, with nylon and Fiberglas being the most important. Among the new fibers introduced in 1948 are Orlon, the DuPont development which has properties that lie between rayon and nylon, and a new group of Vinyons made by Carbide & Carbon Chemicals Corporation which seem at present to have more important industrial than apparel uses.

New Machines and Technology. Among the new machines made available to the industry in 1948 are several notable looms. The Kellogg loom is a conventional bobbin-changing type, with pressed steel replacing castings in its frame, ball or roller bearings throughout, unit-assembly design of the major loom motions, and a speed said to be 20 to 30 percent higher than similar previous types. The Warner & Swasey loom, based on a Sulzer Swiss design, has a new system of filling insertion which does away with conventional shuttles, picker sticks, bobbins, etc.; makes single-width or multiple-width fabrics up to or totaling 110 inches; has speed in excess of 215 picks per minute which is equivalent to 430 picks on 54-inch goods, a rate hitherto unachieved.

The Baker loom for woollens and worsteds is a conventional type with many engineering improvements. Two circular looms came out of France—the Fayolle-Ancet, said to produce 15 sq. yd. of cloth per hour, and the Saint Frères, designed for tubular jute bagging but said to be adaptable for cotton, rayon, and wool.

A machine for direct conversion of rayon tow into sliver, with or without blending with other fibers, was offered by the Warner & Swasey Company on Pacific Mills design. Saco-Lowell Shops offered a direct spinner which will produce spun yarn directly from synthetic fiber tow. A new woolen card of European design was offered by Duesberg-Bosson. A new and much improved cotton comber was introduced by Whitin Machine Works. A new method of spinning into a cup with the winding achieved centrifugally was designed by Prince-Smith & Stells, Ltd., of England. In rayon manufacture the swing toward continuous spinning processes was further advanced by the Nelson process developed in England and the Filamatic process of American Viscose Corporation.

Knitting techniques advanced principally through the introduction of high-speed multi-feed machines which have immense production rates going up to as high as 125 yd. per hour of 60 inch jersey. The Redman shrinking machine for tubular knit goods was put on the market after three years of development. It removes relaxation shrinkage to the point where the product can be guaranteed to have not over 5 percent residual shrinkage.

For finishing woven goods the Rodney Hunt Ma-

chine Company offered a group of machines with the Tensitrol principle which permits high-speed, tensionless processing. Stainless-steel has come to be the standard material for most dye vats, washers, etc. Continuous-range finishing continued to develop, and the problem shifted during the year from the mere design of ranges to the engineering of the most efficient means of operating them. Printing has been speeded up with smoother-running rotary machines and mechanized screen printers.

In the wool field solvent scouring of wool, in place of caustic baths and washing, gives promise of increasing acceptance. One mill has carried on this process alone for nearly 12 years, but the broadening interest at present is due to high cost of soap, Government drives against stream pollution by wool-scouring wastes, and the desire for economical recovery of the lanolin removed from the wool. Experimentation looking toward continuous dyeing of wool goods has been in progress, but little acceptance of such processes has been gained. Shrink-proofing and moth-proofing of wool made great progress in acceptance during 1948, and these finishes are at last appearing in retail offerings to the consumer.

Research in textiles was still on the up-curve during 1948. Numerous new laboratory machines and devices for testing and recording were introduced and early experiments made in textiles with radio-active isotopes from the atomic pile at Oak Ridge. Fibers, finishes, machines, and techniques are all under experimentation in the various research centers. In particular, there is interest in a wool project initiated in 1948 which is aimed at improving the drape, feel, and other properties of medium and coarser wools now somewhat neglected in favor of fine wools, so that they can be used to augment the supplies of fine wools now relatively high in price because short in supply.

—WILLIAM B. DALL

THEATER. Animation and variety characterized the New York theatrical season of 1948. Healthy critical and public controversy intensified interest in plays by Tennessee Williams and Maxwell Anderson. Tallulah Bankhead, extreme individualist, precipitated discussion on the nature of acting. Musical comedy, throwing off the shackles of convention, took on new life with modest productions like *Small Wonder* and *Lend an Ear*. As a whole, thanks to importations like *Edward*, *My Son*, *Red Gloves*, and *The Mad Woman of Chaillot*, the New York stage represented the best current works of the Continent.

Anne of the Thousand Days. As a dramatist, Maxwell Anderson demonstrated again that he can no longer write a suspenseful play, and his effort to combine prose and poetry resulted in grandiloquence rather than powerful dialogue. Otherwise, his presentation of Henry VIII was so comprehensive and real that he compelled attention through scattered episodes while wooing, winning, and murdering an Anne who seemed a bit too lofty for historic confirmation.

As the Girls Go. Low comedy at its lowest and best was what Bobby Clark dispensed at the Winter Garden. Repetitious, as usual, and unrestrained in his consideration of manners and morals, Bobby made Michael Todd's comeback a box office success. Irene Rich, also effecting a comeback, made an attractive and deft lady president. The beautiful girls in the old Ziegfeld revue tradition were emphasized as a drawing-card, and luckily, because the singing, songs, comedy, and scenery were only negligible assets.

Bravo. Edna Ferber and George Kaufmann, authors of *The Royal Family*, turned out a dud. Immersed in a plethora of amateur talk about players and playwrights, an earnest plea for the fair treatment of refugees sank, hopelessly.

The Cup of Trembling. For those who follow, thirstily, the case histories of Alcoholics Anonymous, this play, written by Louis Paul from his novel, *Breakdown*, was brim-full of interest. Others pushed the cup aside, and the more quickly because of Elizabeth Bergner's precious artistry.

Don't Listen, Ladies. Artificial comedy rarely pleases an American audience, for it is seldom content to follow dialogue for the sake of dialogue. "Too talky" was the customary criticism.

Edward, My Son. One of the biggest hits of the season, imported from England with the original stars, Robert Morley, co-author, and Peggy Ashcroft. These two managed handsomely to cover the life span of the two leading characters by way of episodes which seemed much more substantial than they really were. Novelty, surprise, contrasting scenes, and a trick titular device were only a few of the features that made this play extraordinary entertainment.

Goodbye, My Fancy. As soon as the veterans noticed Madeleine Carroll's name in electric lights, they rushed affectionately to see her in a play about a congresswoman, college life, and ethics.

Hold It! A musical flop, introduced to Broadway a millionaire producer, Anthony B. Farrell, who retaliated for box office neglect by buying his own theater, naming it the Mark Hellinger, paying performers while out of work, and readying a new musical for the next season.

Howdy, Mr. Ice! The new name for the old frozen-water show at the Center Theatre, which delighted audiences made up largely of out-of-towners.

Inside U.S.A. Nomenclature served as the come-on for the Howard Dietz-Arthur Schwartz musical. Other resemblances to John Gunther's book ceased with the mention of the title. What the audience did get was a conventional revue with the queen of clowns, Beatrice Lillie, mincing, side-stepping, and imitating superlatively. Her co-star, Jack Haley, seemed somewhat tepid in comparison, but Herb Shriner, the oncoming Will Rogers, precipitated a cascade of laughter. Valerie Bettis and Eric Victor won the dance honors.

Joy to the World. Poor Hollywood came in for another exposé in this loose comedy. Again the movie dictator blustered and ordered his slaves about. And again promiscuity and injustice flourished. As compared, though, with newspaper headlines of movie colony goings-on, the revelations were tame, synthetic and even silly.

Kiss Me, Kate. Unanimously hailed as an overnight hit was this musical which brought back Cole Porter's tunes to Broadway, shreds of *The Taming of the Shrew*, and enough laughs to purge the soul.

The Leading Lady. Written by Ruth Gordon and starring her, this was about a famous actor and his actress wife, and what is called professional jealousy. He died of it; the rest of the play was spent in a tedious effort to make his actress widow forget him and marry someone worthy who really loved her. By the time that happened, the play, the patience of the audience, and the run of the play was over.

Lend an Ear. Though entertainments that take their origin in Chicago and other points west rarely meet with New York approval, this play won immediate attention, critical praise and audience support. A company of talented young people put the entertainment in the hit class.

Life with Mother. Pleasurable was the encounter with old friends provided by Russel Crouse and Howard Lindsay in their sequel to *Life With Father*. Again Clarence strutted and cried, "Oh Gawd!" and again Vinnie was insistent, wily, and completely captivating. If this beloved pair could only continue thus throughout the years, even though their vehicle be attenuated, transparent, and obviously a tour de force, the whole world of theatergoers would rejoice.

Light Up the Sky. Exposé permeated the staid atmosphere of Moss Hart's newest comedy; and whether or not the characters concerned were true to certain originals or not, their behavior resembled certainly that of actors, playwrights, and producers during the trying days of a try-out. The laughter, at any rate, was almost continuous, thanks to the juicy parts which Moss gave such fine actors as Virginia Field, Sam Levene, Glenn Anders, and Phyllis Povah.

The Linden Tree. There's an old wheeze about English plays not succeeding in these United States and J.B. Priestley had proved it and disproved it intermittently. In this case he proved it, conclusively, for the public was not at all interested in the story of domestic troubles encased in volubility.

Look, Ma, I'm Dancin'! Some skilled young people and a backstage ballet revolution hoisted this play over a comparatively long engagement. Certain critics regarded Nancy Walker as an important addition to comedy ranks; an overvaluation, certainly, if spontaneity and charm are essential to a comedienne who expects to gain the stature of a Fannie Brice or a Beatrice Lillie.

Love Life. One hundred and fifty years of American marriage supplied the somewhat somber background in this play by Alan Jay Lerner and Kurt Weil. The approach was new, yet not particularly successful, for there was too much stress on heart-break and disillusion for a musical.

The Mad Woman of Chailot. Even though fantasy served as the background, the characters concerned were delightful and the humor fresh. Martita Hunt, Estelle Winwood and Vladimir Sokoloff made the fantastic characters believable, in spite of their deviations from the so-called normal. The outdoor cafe setting was simultaneously the most realistic and the most imaginative replica of the al fresco scene that has ever come to Broadway.

Magdalena. Saturated with excellencies, yet badly edited. Though the score by Villa-Lobos never equaled the melodic charm of his famous cello composition, it boasted a brilliant mechanical piano number. The most original musical to reach Broadway in years and also the best sung, *Magdalena* was doomed from the first by an old-fashioned story that throttled a production which should have run for months.

Make Mine Manhattan. The outstanding features of this musical by Arnold Horwitt and Richard Lewine were Sid Caesar's reverse onomatopoeic numbers in which he imitated everything from a machine gun to a slot machine, Dave Burns' diver's sketch, and a take-off on a movie director with a cloak-and-suit training. The dances were attractive, the singers pleasant, and the music forgettable.

Me and Molly. In spite of the fact that Gertrude Berg, actress-author, overweighted this domestic comedy with hokum, the play rang true, had an authentic feeling for Jewish family life, several touching scenes, three or four fine characterizations, and many laughs.

Mister Roberts. Good dramatizations of novels

are so rare that only two or three of them brighten stage history. This war play, however, was so good that it surpassed the original book by Thomas Heggen. The play was so good, indeed, that even though it was out-and-out theater, it was easy to accept as real life. This play should run forever.

My Romance. Anne Jeffreys, vocally excellent and notably beautiful, did as much as possible with an evaporated version of what was once a turbulent prima donna role. And although Sigmund Romberg has written some of the loveliest melodies in the history of the American stage, he failed to lift this score to his customary heights.

Power without Glory. Largely because its theme was not unified and the ending confused, this English importation did not achieve a profitable run. A second-act scene in which a sister, in the presence of her family, decided to betray her brother as a murderer, was one of the most powerful dramatic incidents of the season.

The Rape of Lucretia. Majorie and Sherman Ewing, who entered the producing ranks last year with *Angel in the Wings*, returned with an impressive production by Andre Obey, made into a music drama by Ronald Duncan and Benjamin Britten, composer of the grand opera, *Peter Grimes*. His score, in this instance, was so lacking in sustained melodies and hovered so near dissonance that it had little appeal for the popular audience. Kitty Carlisle, in the role which Katharine Cornell created here, sang well and looked handsome.

Red Gloves. The most discussed play of the season was Jean-Paul Sartre's Paris hit, *Les Mains Sales*, produced here by Jean Dalmryple. Being largely a controversy on Communism, the piece recalled Arthur Koestler's self-analyses in *Darkness at Noon*. Academic rather than dramatic, only three scenes had enough action to relieve the monotony of interminable dialogue: a bomb blast, a pistol frisking, and a murder. Charles Boyer, making his American debut, was excellent as the Communist leader.

The Respectful Prostitute. The dramatist who practically dominated the New York season was a Frenchman, the versatile existentialist, Jean-Paul Sartre. He was represented by four plays: *Red Gloves*, *The Respectful Prostitute*, *The Victors*, and two revivals of *No Exit*. *The Respectful Prostitute* was simultaneously excellent theatre and an effective attack on race discrimination in the South. To establish his urgent principles, the dramatist stacked the cards, almost shamelessly. Yet his message came through surely to hundreds of his audiences; and his characters, though drawn on too broad lines, must have left a deep impression. The play practically established Meg Mundy as an actress of noteworthy ability.

Set My People Free. The superb acting of Juano Hernandez and one exciting scene—a Negro's assumption of spiritual and political power during a church ceremony—were the only justifications for this play by Dorothy Heyward.

The Silver Whistle. A modern histrionic Atlas, Jose Ferrer held the entire weight of this play by Robert E. McEnroe on consciously talented shoulders, but shoulders that were also grateful. For his role of vagabond was a lush one, a composite of François Villon, Omar Khayyam, and Cyrano de Bergerac, garnished with poetry excerpts, preaching, mugging, and courting. That wondrous actress, Doro Merande, provided laughable foiling as an inmate of a poorhouse. The play itself was an attenuated retelling of the miracles wrought by personality in old plays like *The Servant in the House* and *The Passing of the Third Floor Back*.

Skipper Next to God. The Experimental Theatre, borrowing John Garfield from Hollywood, produced a drama about a Dutch sea captain and his cargo of refugees. Though confused in its purposes, the piece carried on for a time, yet not long enough to insure the future of the Experimental Theatre.

Small Wonder. One act was enough. That act, however, had the brilliant young comedian, Tom Ewell, who is a complete entertainment in himself. As a skilled raconteur and facial expressionist, he gave personal continuity to the varied sketches. Mary McCarty and the dancing-singing chorus of youngster principals performed small wonders with repetitious stepping numbers and synthetic songs.

Summer and Smoke. Tennessee Williams' newest play presented a consistent study of man and woman in their relation to soul and body. It had conviction and poetry. Though it lacked the action and suspense of *A Streetcar Named Desire*, the characters were compelling. The prologue recalled Frank Wedekind's pioneer play of adolescence, *The Awakening of Spring*. The subsequent adult conflict between passion and conscience, convention and fear was embellished with dialogue that was intentionally euphemistic at times and deliberately crude at others. An illuminated chart of the male body and off-stage incidental music gave new life to the old story of the saint who became a sinner and the sinner who took on sanctity.

Where's Charley? Veteran of many revivals, *Charlie's Aunt* bobbed up again under the title *Where's Charley?* Ray Bolger supplied a satisfactory answer by clowning all over the place, singing, dancing, and shifting attire with easy indecorum.

The Young and Fair. Life in a girl's school was used as the medium for a plea for democracy in this play written by N. Richard Nash and presented by Vinton Freedley. One girl was a female Hitler, another an ostracized Jewess, and still another a Gestapo member, intent on pinning a theft on an innocent schoolmate. The plot was reminiscent of many other schoolgirl feuds and too fragile to hold its lofty content.

Plays with brief runs. Among the less fortunate productions were: *Seeds in the Wind*; *Doctor Social*; *The Hallams*; *The Vigil*; *For Heaven's Sake*; *Mother*; *Kathleen*; *The Survivors*; *Harvest of Years*; *The Last Dance*; *Make Way for Lucia*; *Minnie and Mr. Williams*; *The Men We Marry*; *Sundown Beach*; *Oh! Mr. Meadowbrook*; *Time for Elizabeth*; *Sally*; *Strange Bedfellows*; and *Jenny Kissed Me*, starring the character actor Leo G. Carroll.

Repertory. Varied in range was the work of the repertory companies. Their bills included plays by Shakespeare and Henrik Ibsen. The D'Oyly Carte Company, happily returned to these shores, made an artistic and financial success. The Dublin Gate Theatre Players pleased with their acting, though not with their plays; and the Habima company drew its customary Yiddish theater enthusiasts.

Revivals. Tallulah Bankhead, in Noel Coward's *Private Lives*, transformed the piece into an exhibitionistic debauch and packed the house with gasping, shocked, but never outraged audiences. But Gertrude Lawrence wasn't able to revivify the same playwright's outmoded *Tonight at 8:30*. Though several decades old, *The Play's the Thing*, starring the suave actor, Louis Calhern, enjoyed an extensive run.

London Season. Plays which attracted audiences in London included *The Chiltern Hundreds*, *Edward*, *My Son*, *Don't Listen*, *Ladies*, and a revival of *The Relapse*, by Sir John Van Burgh. Popular also were the American importations *Oklahoma*, *Annie Get Your Gun*, and *Diamond Lil*.

Paris Season. Outstanding favorite of the Paris season was Jean Louis Barrault, whose repertory ranged from Shakespeare and drawing-room comedy to pantomime scenes from the motion picture *Les Enfants de Paradis*. Important also were Jean-Paul Sartre's *Dirty Hands*, *Invitation to the Chateau*, and *The Little Hut*. The musical hits included *Imperial Violets*, *The Folies Bergère*, and a musical version of *Madame Sans-Gêne*.

—BERNARD SOBEL

THEOSOPHISTS. The three main objectives of this group are: (1) To form a nucleus of the Universal Brotherhood of Humanity without distinction of race, creed, sex, caste, or color; (2) to encourage the study of comparative religion, philosophy, and science; (3) to investigate the unexplained laws of nature and the powers latent in man.

The Theosophical Society in America. Chartered in 1866 as a branch of the Theosophical Society, with international headquarters in Adyar, India, which was founded in New York in 1875. A National Convention and a Summer Training School for workers are held annually. President, James S. Perkins. Headquarters, P. O. Box 419, Wheaton, Ill.

TIBET. An autonomous country in central Asia, north and northwest of the Himalayas. Chinese sovereignty over Tibet was established in the 18th century, but all Chinese officials were expelled from the country in 1912. Since 1939 however, the Chinese Republic has had a representative at Lhasa, the capital. Area, 469,294 square miles. Population, 3,772,061 (1946 estimate). Agriculture, stock raising, wool spinning and knitting are the chief occupations. Principal minerals are gold, borax, and salt. There is a large trade with China and India. The government is a theocracy, ruled by the 14th Dalai Lama through a regent. Lamaism, a modified form of Buddhism, is the religion of the people.

TIMOR, Portuguese. The areas in the Malay Archipelago, consisting of the eastern part of the island of Timor, together with the territory of Ambeno and the nearby islands of Pulo Gambia and Pulo Jako. Total area: 7,330 square miles. Population: 463,796. Capital: Dilly (Dilli). Coffee, sandalwood, sandalroot, copra, and wax are the principal export products. For the year 1946, estimated revenue and expenditure were balanced at 9,430,000 escudos. Public debt (Jan. 1, 1947): 34,488,000 escudos. A governor heads the government of the colony.

TIN. World production of tin showed a substantial increase in 1948 due to improved facilities, supplies, and conditions of labor in Malaya and the Netherlands East Indies, the principal producing areas. World production of tin in concentrates was approximately 150,000 long tons, not quite as high as the prewar average of 170,000 tons (1947: 113,500 tons). World smelter production of tin metal was 159,300 long tons (1947: 124,500 tons), reflecting some reductions in stocks of concentrates.

World consumption of tin, limited by allocations of the Combined Tin Committee and conservation measures imposed by government, for the first time since 1944 did not exceed production. World consumption was approximately 140,000 long tons (1947: 132,600 tons). The United States is currently consuming about 45 percent of world production, largely for tinplate used as canmaking stock, the balance for solder, babbitt, bronze, tubes, and foil. Restrictions on use, orders M-43 and M-81, were extended to June 30, 1949.

The Combined Tin Committee which sits in Washington includes members from the United States, Great Britain, Netherlands, France, Belgium, China, India, and Canada. Its specific function is to allocate tin metal among the importing nations based on the total pool of metal made available by the main producing nations.

An International Tin Study Group was organized in 1947 to study problems or difficulties not likely to be resolved by the ordinary development of world trade in tin. At the second meeting of the Group in Washington in April, the Group acted to set up a Working Party to study the practicability of framing an intergovernmental agreement on tin conforming to the principles of the International Trade Organization.

At the third meeting at the Hague in October it was agreed to submit a proposal for such an agreement to the member governments, final details to be worked out at an intergovernmental tin conference. The present membership of the Tin Study Group includes Australia, Belgium, Bolivia, British Colonies, Canada, China, Czechoslovakia, France, India, Italy, Netherlands, Siam, United Kingdom, and United States.

The production of tin in the form of concentrates by principal producers was approximately as follows: Malaya, 44,381 long tons (1947: 27,026 tons); Bolivia, 36,500 tons (1947: 33,259 tons); Netherlands East Indies, 29,000 tons (1947: 15,915 tons); Belgian Congo, 14,500 tons (1947: 14,897 tons); Nigeria, 9,300 tons (1947: 9,139 tons).

The 1948 production of the tin smelter operated by the United States government at Texas City, Tex., was approximately 33,000 long tons. The price of Grade A tin was held at 94 cents per lb. until June 1 when it was raised to \$1.03 and held there for the balance of the year 1948.

—JOHN ANTHONY

TOBACCO. The 1948 tobacco crop of the United States was estimated at 1,897,926,000 lb., compared with the 1947 crop of 2,109,581,000 lb. and the 10-year average (1937-46) of 1,664,265,000 lb. Yields of the chief producing States of the United States for the years 1947 and 1948, with acreage harvested, are presented in the accompanying table.

State	Acreage harvested		Production (Thousand lb.)

TOGOLAND, British. A United Nations Trusteeship territory since Dec. 13, 1946, administered by the United Kingdom. Area: 13,041 square miles. Population (1940), 391,473 natives. Chief exports are

cacao, coffee, kola nuts, palm kernels, and palm oil. Trade, finance, and education figures are included with those of the Gold Coast.

TOGOLAND, French. A United Nations trusteeship territory under French administration since Dec. 13, 1946. Area under French administration, 21,893 square miles. Capital, Lomé. Total population in 1946 was 918,000 natives and 638 Europeans. The majority of the population is pagan; by 1946, however, 87,425 natives had embraced Catholicism, and about 29,000 the Protestant faith.

Agriculture and grazing occupy most of the people. Chief crops are cocoa, yams, millet, cotton, and palm kernels. Native industries include weaving, pottery, woodcarving and straw-plaiting. Chief exports: palm-kernels, cocoa, ginned cotton, copra, coffee, and groundnuts.

TOKELAU (Union Islands). A group of islands in the Pacific consisting of three clusters of islets (Faka-ono, Nukunono, Atafu) in Lat. 8° to 10° S. and Long. 171° to 172° W. Formerly a part of the Gilbert and Ellice Islands colony, the islands were transferred to the jurisdiction of New Zealand on Feb. 11, 1926. Area: 4 square miles. Population: 1,388 (1945 census). Copra is the principal export. Tokelau is administered by New Zealand through its High Commissioner for Western Samoa.

TONGA (Friendly Islands). An independent Polynesian kingdom under British protection since 1899. Situated about 180 miles southeast of Fiji, Tonga comprises 150 islands and islets forming three main groups called respectively Tongatabu, Haapai, and Vavau. Total area: 250 square miles. Population: 40,670. Capital, Nukualofa, on Tongatabu. Native produce consists almost entirely of copra and bananas. Citrus fruits, taro, breadfruits, yams, and fish also are important. In 1946 exports were valued at £230,117; imports, £273,125. The 1947 revenue amounted to £159,200; expenditure to £106,600. Queen, Her Majesty Salote Tubou. British agent and consul, C. W. T. Johnson.

TRACK AND FIELD ATHLETICS. With the Olympics as an incentive, stars the world over put on their greatest shows of all time during the long indoor and outdoor campaigns of 1948, the climax coming at the London games when men and women of 58 nations competed for coveted medals.

One of the year's outstanding men was Harrison Dillard of Baldwin-Wallace College in Ohio, who set a world record of thirteen and six-tenths seconds (0:13.6) for the 120-yard high hurdles in April. After dominating all rivals to compile an amazing streak of 82 straight victories, Dillard had his string snapped in the national A.A.U. championships when he attempted to qualify in both sprint and hurdles for the final Olympic tryouts. A week later, smashing into the hurdles, Dillard failed to qualify in his specialty, but he did make the team as a sprinter and went on to take the 100-meter dash at London in the Olympic-tying time of 0:10.3.

The triumph of Bob Mathias, 17-year-old schoolboy from Tulare, Cal., in the national decathlon and his subsequent triumph in England were other highlights. The retirement of Gil Dodds after a successful indoor season also marked 1948. After setting an indoor mile record of 4:05.3, Dodds was felled by mumps. He later took the national outdoor 1,500-meter title, but strained an Achilles tendon in training and hung up his spikes.

Mel Patton became the first in history to run 100

yards in 0:09.3, but he lost to Barney Ewell in the final 100-meter Olympic trial. Chuck Fonville of Michigan set a world shot put mark of 58 feet, three-eighths inches, but a back injury kept him from qualifying for the Olympics.

Herb McKenley from Jamaica, B.W.I., flew to world records of 0:45.9 for 400 meters and 0:46 for the 440-yard dash. Another athlete from the Caribbean, Lloyd La Beach of Panama, tied the listed world standard of 0:10.2 for 100 meters.

National A.A.U. senior outdoor champions follow: Barney Ewell, Lancaster, Pa., 100 meters; Lloyd La Beach, 200; Herb McKenley, 400; Herb Barten, University of Michigan, 800; Gil Dodds, Boston A.A., 1,500; Curtis Stone, Shanahan C.C. of Philadelphia, 5,000; Edward O'Toole, New York A.C., 10,000; Henry Laskau, Maccabi A.C. of New York, 3,000 walk; Forest Efav, Stillwater, Okla., 3,000 steeplechase; William Porter, Northwestern University, 110 low hurdles; Roy Cochran, Los Angeles A.C., 400 hurdles; Madill Gartiser, University of Missouri, 200 low hurdles; Francis Delaney, San Francisco Olympic Club, 16-pound shot put; Fortune Gordien, University of Minnesota, discus; Stephen Seymour, Los Angeles A.C., javelin; Robert Bennett, Rhode Island A.A., 16-pound hammer throw; Henry Dreyer, New York A.C., 56-pound weight throw; Fred Johnson, Michigan State College, broad jump; Gaylord Bryan, Stanford University, running hop, step and jump; Tom Scofield, University of Kansas, and William Vessie, New York A.C., tie in high jump; A. R. Morcom, New Hampshire State A.A., and Robert Richards, Illinois A.C., tie in pole vault; New York A.C., team; Russell Thomas, Jeannette, Pa., pentathlon; Bob Mathias, decathlon.

A.A.U. indoor winners follow: William Mathis, Urbana, Ill., 60 yards; Dave Bolen, Boulder, Colo., 600; Philip Thigpen, Seton Hall College, 1,000; Thomas Quinn, New York A.C., one mile; Curtis Stone, three miles; Harrison Dillard, 60-yard high hurdles; Henry H. Laskau, one-mile walk; Lorenzo Wright, Wayne University, broad jump; John Vislocky, New York A.C., high jump; Robert Richards, pole vault; Norman Wasser, University of Illinois, 16-pound shot put; Robert Bennett, Providence, R.I., 35-pound weight throw; Seton Hall College, one-mile relay; Manhattan College, two-mile relay; New York Pioneer Club, medley relay; New York A.C., team.

Team championships in both the women's A.A.U. indoor and outdoor meets were won by Tuskegee Institute of Alabama. Mabel Walker of Tuskegee, Alice Coachman of Albany State College in Georgia, Juanita Watson of Tuskegee, and Stella Walsh of the Polish Women's A.C. of Cleveland, Ohio, were among the United States leaders. Stella Walsh captured three titles in the A.A.U. outdoor tests, taking the 100 and 200 meter dashes and the running broad jump. See OLYMPIC GAMES.

—THOMAS V. HANEY

TRADE, U.S. Foreign. During the calendar year 1948, general imports into the United States reached a new record high of \$7,070.3 million, or 23.3 percent above the 1947 value of \$5,733.4 million. Imports of vegetable foods registered the largest increase from \$129.6 million in November to \$182.7 million in December reflecting sharp increases in imports of cocoa beans, raw coffee, and sugar. Imports of inedible vegetable products advanced 82 percent from the November value of \$53 million to a December value of \$96.6 million, with the chief increases in imports of crude rubber and copra. Textile imports rose from \$45.7 million in Novem-

ber to \$67.7 million in December, metal imports from \$74.5 million to \$115.6 million reflecting increased imports of several metals including refined copper, reclaimed scrap lead, and tin blocks, bars, and pigs. On the other hand imports in December of edible animals and animal products dropped sharply from \$39.6 to \$29.8 million as cattle imports slumped from the relatively high levels of September, October, and November. Table 1 records the value of general imports and imports for consumption into the United States, month by month, for the calendar years of 1947 and 1948.

TABLE 1—U.S. IMPORTS OF MERCHANDISE
(Millions of dollars)

Month	General imports ^a		Imports for Consumption ^b	
	1947	1948	1947	1948

^a Army Civilian Supply exports, initiated during World War II to furnish relief to the civilian populations of occupied countries, are not included in 1947 figures but are included in those for 1948. Exports under this program were valued at \$901 million for the calendar year 1948 (\$910.5 million for 1947). ^b Preliminary.

All commodity groups showed increased exports from November to December with exports of machinery and vehicles amounting to \$360.3 million in December, compared with \$204.7 million in November. Among other important commodity groups showing large gains in exports from November to December of 1948 were metals and manufactures from \$63.6 to \$112.5 million; textiles from \$126.5 to \$185.7 million; vegetable foods from \$150.2 to \$192.7 million; and inedible vegetable products from \$35.9 to \$73.2 million.

Exports under the Department of the Army Civilian Supply Program rose slightly from \$40 million in November to \$45.8 million in December. While exports under the European Cooperation

Administration, and other United States foreign relief programs are included in the export figures contained in this summary, separate figures are not available for exports under any of these programs except the Department of the Army Civilian Supply Program.

TRANSJORDAN. An Arab kingdom, east of Palestine. Area: 34,700 square miles. Population: over 340,000, of which about 190,000 are settled and the rest nomadic. The capital, Amman, had about 20,000 inhabitants before its population was almost doubled by the influx of Palestinian Arab refugees. Some 281 miles of the Hejaz railway pass through Transjordan to beyond Maan. Over 1,400 miles of asphalted roads link Amman with all parts of the state and with neighboring countries. Most of the people are Sunni Moslems, and a few are Christians.

Education. In 1944 the 175 schools (both government and foreign) had some 16,000 students. The Islamic Higher College was scheduled to open in the fall of 1948.

Production. In addition to the 2,000 square miles of land cultivated fairly steadily there are at least 1,000 cultivable, the rest being desert. Essentially an agricultural country, especially in the western part, Transjordan produces varied crops: wheat, maize, barley, sesame, and vegetables. The estimated record cereal crop for 1948 was 450,000 tons of which only 50,000 were needed for local consumption.

Cattle breeding is important and a large number are exported; other livestock are also produced in substantial quantities and exported. The few industrial establishments include tobacco, cloth-weaving, and leather. Among minerals exported are phosphate, silica sand, and manganese. Petroleum Development (Transjordan Ltd.), a subsidiary of the Iraq Petroleum Company, in which American and French interests own 23.75 percent each, was prospecting for oil.

Foreign Trade. Exports additional to those mentioned above are cereals, skins and hides, and wool; most of the exports go to neighboring countries. Principal imports include animals, food, soap, olive oil, gasoline, kerosene, clothing, iron, timber, and paper—the chief suppliers were neighboring countries, Great Britain, and the United States. Trade (1946): imports were valued at £P6,607,233, and exports at £P2,044,171. Since Palestine played an important part in both exports and imports the trade pattern was drastically altered in 1948. In May all imports were subjected to import licenses for the first time.

Finance. For the first three-quarters of 1947 government expenditure totaled £P2,298,523 and revenue amounted to £P3,006,732. The currency used was the Palestinian pound (£P), equivalent to the pound sterling, and worth U.S.\$4.03. When in February Palestine's large sterling balances were blocked and Palestine left the sterling area, Transjordan followed suit, but planned to return with its own currency.

Government. King Abdullah Ibn Hussein of the Hashemite family (and great uncle of Iraq's young king) was appointed Emir of Transjordan in 1921 under the British Mandate and crowned king in 1946 at the Mandate's end. He is assisted by a Cabinet consisting of the Prime Minister and not more than five other Ministers, and a Parliament made up of a House of Representatives (elected for four-year terms) and a House of Notables (half as large) appointed by the King (for eight-year terms).

Events. Relations with Great Britain. Concern over the effect of the Palestine problem on British-Transjordan relations was reflected in a British government announcement in January. It stated that if the Arab Legion should cooperate in an attack on any Jewish state following British withdrawal from Palestine, the Legion's annual British subsidy of about £2 million would be withdrawn. In March the two countries signed a new 20-year treaty of alliance, replacing the 1946 one, to strengthen Transjordan's legal independence. Article 3 provided that either party would come to the aid of the other in case of war. In May the British cabinet decided to withdraw seconded officers from service with Transjordan's Arab Legion and to reconsider giving aid to other Arab armies. Although the British government withdrew its quarterly subsidy in July, it was resumed three days later as a result of Transjordan's acceptance of the Palestine truce requested by the United Nations Security Council.

Palestine Problem. On Dec. 2, 1947, both houses of Parliament voted unanimously to support Arab interests in Palestine, which were threatened by the United Nations Palestine partition vote. After active Arab Legion fighting in Palestine, June 1 was marked by the first Israeli bombing of Amman. In July, King Abdullah personally calmed the second of two demonstrations, in which shouts of "Down with the British" and "Down with Truman" were heard. In August the King reported that Transjordan was spending about £P250,000 monthly for aid to Palestine refugees. The year was marked by Abdullah's conferences with Iraqi and other Arab leaders, both in Amman and other capitals, and was climaxed by his unilateral action in Palestine described in ARAB LEAGUE AFFAIRS. See PALESTINE. —DOROTHEA SEELYE FRANCK

TREASURY, U.S. Department of the. A Department of the U.S. Government which was composed in 1948 of the following principal branches.

- Bureau of Accounts
- Bureau of Customs
- Bureau of Engraving and Printing
- Bureau of Federal Supply
- Bureau of Internal Revenue
- Bureau of the Mint
- Bureau of Narcotics
- Bureau of Public Debt
- Committee on Practice
- Comptroller of the Currency
- Division of Tax Research
- Office of Administrative Services
- Office of Contract Settlement
- Office of the General Counsel
- Office of International Finance
- Office of the Secretary
- Office of Tax Legislative Counsel
- Office of the Technical Staff
- Office of the Treasurer of the United States
- United States Coast Guard
- United States Savings Bonds Division
- United States Secret Service

The Secretary of the Treasury in 1948 was John W. Snyder. See the separate listing of important bureaus; BANKS AND BANKING; COAST GUARD; FINANCIAL REVIEW; PUBLIC FINANCE; SILVER; TAXATION.

TRIESTE, Free Territory of. A United Nations protectorate on the northeastern Adriatic which came into existence on Sept. 15, 1947, as a result of the terms laid down in the peace treaty with Italy, signed at Paris, Feb. 10, 1947. As defined in the peace treaty with Italy, the Free Territory of Trieste covers an estimated area of 276 square miles; 80 miles of coastline and 67 miles of land boundary. On Dec. 1, 1946, the inhabitants numbered 262,514.

Government. A governor, to be appointed by the Security Council of the United Nations for a term of 5 years, will be assisted by a council of government and a popularly-elected unicameral assembly. Neither the governor, nor the director of public safety whom he appoints, may be an Italian or Yugoslav national. The Free Territory is garrisoned by 5,000 American and 5,000 British troops.

Events, 1948. The Security Council was unable in 1948 to agree on a candidate for the governorship of Trieste, so that the post remained vacant. On March 20, the United States, Great Britain, and France jointly proposed that the Free Territory of Trieste should be returned to Italian sovereignty.

Three Agreements covering the supply to the British-United States Zone of the Free Territory, of currency, finance and foreign exchange were signed at Rome on March 9. On April 16, an Agreement was initiated between the Allied Military Government of the British-United States Zone of the Free Territory and the Italian Ministry of Foreign Trade, defining the procedure for implementing the Financial Agreements of March 9.

The representative of Yugoslavia, on July 29, requested the Security Council to consider the question of the independence and integrity of the Free Territory, and in particular to examine the legality of the agreements of March 9 and of April 16 concluded by the administration of the British-United States Zone of the Free Territory with the Government of Italy. He further requested the Council: to declare that the above-mentioned agreements were violations of those provisions of the Treaty of Peace with Italy which pertain to the Free Territory of Trieste; to undertake the measures it considered necessary and sufficient to nullify these agreements; and to assure the respect of the Governments of the United States and Great Britain of their international obligations, thus guaranteeing the independence of the Free Territory.

The representative of Yugoslavia, invited to participate in the Council's discussion of the Yugoslav complaint, submitted to the Council a draft resolution, which was supported by the representative of the Ukrainian S.S.R., calling for those agreements to be declared null and void. The representative of the Ukrainian S.S.R. submitted a draft resolution to the effect that the Security Council consider it urgently necessary to settle the question of the appointment of the Governor of the Free Territory of Trieste. United States and British representatives called the Yugoslav charges flimsy and unwarranted. The Council on August 19 rejected both the Yugoslav and the Ukrainian resolutions.

On July 13, the Italian delegation to the Organization for European Economic Cooperation (OEEC), to which the governments of countries fully participating in the European Recovery Program (ERP) must belong, proposed to the Council of the Organization that the British-United States Zone of the Free Territory of Trieste should be admitted to membership. The proposal was accepted by the Council and was subsequently ratified. Prior to the formal ratification, provision was made for the Zone's requirements to be taken into consideration in all planning for the allocation of ERP material among the participating countries. In addition, the United States Foreign Assistance Act, on which the ERP was based, provided for the continued supply to the Zone, during the interim period prior to its formal admission to OEEC, of its basic requirements of food, fuel and medical supplies. These supplies had hitherto been furnished under the United States Foreign Relief Program which terminated on June 30, 1948.

As soon as the OEEC Council's acceptance of Trieste's membership became known, members of the staff of the Commander of the British-United States Zone of the Free Territory visited Paris and presented the Zone's ERP plan to the representatives of the United States Economic Cooperation Administration (ECA). The Allied Military Government's proposals for the use of the local currency counterpart of the ERP funds for which it had asked was approved by ECA and, on September 25, the OEEC announced that \$18 million had been provisionally allocated for the first year of the Zone's plan. The Commander of the Zone, Maj. Gen. T. S. Airey, announced that of this amount, approximately \$12 million would be required for the purchase of food and fuel, and the remainder for industrial raw materials and equipment.

In November the annual report of the Yugoslav Army Military Government on the administration of the Yugoslav Zone of the Free Territory was distributed to the members of the Security Council. The report, among other things, stated that the Zone which remained under the administration of the Yugoslav Army covers approximately 510 square kilometers with a population of 68,000. It stated that the Yugoslav Zone constitutes an administrative region composed of two districts with towns and localities. The organs of the people's authority in their administrative units are the elected regional, district, town and local people's committees, the assemblies of which take decisions within the sphere of their competence.

TRINIDAD AND TOBAGO. A British crown colony lying off the coast of Venezuela, comprising the islands of Trinidad (1,864 square miles), Tobago (116 square miles), and adjacent islands. Total population (1946 census, provisional); 568,619. Capital, Port of Spain (on Trinidad), 94,564 inhabitants. Under an agreement reached in 1941, the United States was granted 99-year leases on the islands for naval and air bases.

Most of the inhabitants are of African descent, but there is still a large number of East Indians (192,445), and a number of Chinese. There were 294 primary and intermediate schools in 1946 with 94,343 pupils.

Production, etc. Petroleum production and agriculture are the leading economic activities of the colony. Sugar, cocoa, rum and bitters, copra, coffee, grapefruit, tonka beans, and rubber are important crops. Foreign trade in Trinidad dollars (1947): imports \$118,783,075; exports \$87,115,147; reexports \$4,852,915 (\$1 U.S. = \$1.18 Trinidad).

Government. Finance (1947 est.): revenue \$35,946,944; expenditure \$37,444,750. The governor, Sir John Shaw (appointed Mar. 7, 1947), is assisted by an 8-member executive council and an 18-member legislative council. See **BRITISH WEST INDIES; CARIBBEAN COMMISSION.**

TRUCIAL OMAN. The Arab states (Abu Dhabi, Ajman, Debai, Shargah, Ras al Khaimah, and Umm ul Qawain) on the Persian Gulf. Area: 6,023 square miles. Population: estimated at 100,000. Chief capital: Abu Dhabi. Pearls are the chief export from the coast ports. The rulers of the six states are in treaty relations with Great Britain.

TUNGSTEN. Imports of tungsten ores and concentrates declined significantly in 1948, largely due to declining shipments from Bolivia, Brazil, Spain, and Siam, the first two being principal wartime producers. Imports from China and Korea represented 32 percent and 21 percent of receipts,

respectively, during the first 9 months. The approaching conquest of China by Communist forces is expected to jeopardize continued imports from this principal world producer. In terms of concentrates containing 60 percent WO_3 , imports in the 9 month period totaled 5,680 net tons (1947: 9,677 tons).

However, domestic production was at a significantly higher rate, 3,031 tons in 9 months (1947: 3,180 tons). Nevada, North Carolina, and California were the principal producing States. Domestic consumption of tungsten, used principally in the form of ferrotungsten and tungsten metal powder, reached a postwar high in 1948. Consumption in the first 9 months totaled 6,447 net tons (1947: 8,200 tons). Stocks of concentrates in the hands of producers, consumers, and dealers declined during the year. At the end of September, they totaled 4,783 net tons (60 percent WO_3 basis). On May 22, the duty on ores and concentrates was reduced to \$6.03 a net ton unit of WO_3 from the former rate of \$7.93.

—JOHN ANTHONY

TUNISIA. A protectorate of France on the coast of North Africa opposite Sicily. Under Article 60 of the 1946 constitution of France, Tunisia forms a part of the French Union and is at present classified as an "associated state."

Its area is approximately 48,332 square miles. Population (1946 census): was 3,232,383 of which 7.5 percent were Europeans (142,812 French), 87.6 percent Moslems (nearly all Arab-speaking), and 2.2 percent native Jews. The chief cities, with their 1946 populations, are: Tunis (the capital), 364,593; Sfax, 54,637; Bizerta, 39,327; Sousse, 36,566.

Production. Tunisia has from ancient times been a great grain-growing country. Despite the general impression of desert conditions, about one-third of the land is arable and one-tenth is in forests. But the crops vary greatly in volume from year to year, depending largely on climatic conditions. In 1946 the production of wheat was 325,000 metric tons, barley 156,000 tons, wine 548,628 hectoliters, and olive oil 11,700 short tons (1947). Principal mineral production (1947): iron ore 399,600 metric tons (55 percent metal content), phosphate 1,743,500 metric tons. Lead, zinc, manganese, copper, mercury, and a low grade of lignite are mined. Fishing is well developed and yields an average of 8,000 tons a year. Foreign trade (1947): imports 18,324,000,000 francs; exports 6,204,000,000 francs.

Government. Tunisia became a protectorate of France in 1881, and is under the supervision of the French Foreign Office, to which the Resident-General is subject. The latter, who is also Tunisian Minister of Foreign Affairs, in effect administers the country, though a Bey—Sidi Mohamed el-Amin—nominally reigns. He is assisted by ministers, but there are no representative institutions.

Events, 1948. The Tunisians have the reputation of being the most docile of the people of French North Africa, and their modern history supports this belief. At the same time, they are most closely in touch with affairs in the Arab-speaking Middle East and most susceptible to movements of opinion within the Arab League countries. The latter were desirous of discouraging France from pursuing a pro-Zionist policy in the United Nations, and they sought to achieve this end by exerting pressure through the peoples of French North Africa. It was assumed that the government in Paris would go to considerable lengths to avoid unnecessary trouble with its Moslem subjects.

In Tunisia a very sore point with the nationalists was the deposition and detention of Sidi Mohamed el-Moncef Bey. This ruler, belonging to a dynasty that had reigned in Tunisia since 1691, had been deposed on May 12, 1943, after occupying the throne for less than a year (having succeeded in June, 1942). He had been deposed by General Giraud on the charge that he had compromised the internal and external security of the Regency by assisting the occupying forces of the Axis—a charge which his supporters hotly denied. The deposed Bey had been deported to Madagascar and later obliged to live under guard at Pau in southern France.

At the end of August a representative of the Tunisian nationalists was in Lake Success to lay the groundwork for a formal complaint against France, charging her with repeated violations of the Treaty of Bardo of 1881, setting up the French protectorate in Tunisia. Such a protest would, in order to be entertained by the Security Council, have had to be presented by a member of the United Nations, but it was assumed that such a state could be found. Action would presumably have been asked under Articles 34 and 35 of the Charter, requiring the Security Council to investigate the situation as a threat to the peace and security of the area in question. However, on September 1 the exiled Bey, on whose behalf these steps were to be taken, died at the age of 67, thus forcing at least a temporary halt in the plans for a UN appeal.

By early 1948 much of the war damage suffered by Tunisia, and estimated to represent a loss of over 60,000 million francs, had been repaired. For example, 52 of the 58 major structures destroyed had been rebuilt (such as bridges, tunnels, and dams). The French government had undertaken to provide 80 percent of the cost of this rehabilitation and reconstruction. The French budget had also been called on to pay the deficit of some \$30 million a year in Tunisia's foreign trade since 1946.

Drought, which so often scourges Tunisian agriculture, was again wreaking havoc late in the winter, and appeals for help were sent to France, carried by the Resident General, M. Jean Mons. In September a group of French farm operators from Tunisia were in New York en route to Montana where they intended to study wheat-growing methods on Thomas Campbell's vast ranch. They reported that the 1948 wheat crop in the Regency would feed the people for only three months. Later in the fall Mr. Campbell himself went to French North Africa to give advice on the spot (see ALGERIA).

In mid-March Tunisia was hit by strikes in lead mines, textile, and other industries.

On July 25 Prime Minister Mustafa Kaak was attacked in a mosque by a fanatical nationalist student. The minister, who was also president of the Tunis Bar Association, belonged to the school of thought favorable to continuing the French connection for some time to come.

The French Assembly on August 20 passed a bill surrendering France's claim to Italian property in Tunisia. This renunciation of rights acquired under the Italian peace treaty was made in the interests of improving relations between the two countries.

—ROBERT GALE WOOLBERT

TUNNELS. Postwar improvement programs, both here and abroad, have called for the construction of new railroad and highway tunnels. In this country, dam construction has necessitated the relocation of two railroad tunnels.

Work on the Brooklyn-Battery vehicular tunnel is progressing and it should be opened early in 1950. The twin tubes under the East River in New York Harbor are 9,117 ft. from portal to portal and will be completed at a cost of \$77 million, exclusive of real estate.

The 1,200-ft., four lane, twin-bore tunnel through West Rock at New Haven was holed through on November 9. When completed it will form the final link in the Wilbur Cross-Merritt Parkway system. Construction on the Squirrel Hill tunnel on the Penn-Lincoln Parkway at Pittsburgh started this year. It will require about two years to complete the 4,225-ft. twin tubes. San Francisco plans a \$5 million tunnel under Russian Hill—to serve as an outlet to the congested financial district—which will require three years to complete.

In Spain, the Viella highway tunnel has been completed after 22 years of intermittent work. It serves a fertile valley at the head of the Garonne River which was cut off from the rest of the country six months each year. It extends 16,572 ft. and is said to be the longest highway tunnel in the world.

The 6,700-ft., \$8 million, double-track tunnel for the Union Pacific in western Wyoming will replace the old Aspen tunnel and eliminate the last stretch of single-track on the main line between Omaha, Neb., and Ogden, Utah. A Norfolk and Western double-track tunnel will replace the Elkhorn as part of a \$12 million relocation program and eliminate several heavy grades and sharp curves. This 7,050-ft. tunnel, started in January, 1948, will be completed early in 1950. Opening the 3,622-ft. Chesapeake and Ohio tunnel through Jenkins Mountain in February, opened up a vast unexploited coal region in Wise Co., Va.

The 7,100-ft. relocation tunnel on the Burlington should be completed in July, 1949. It was built by the Government in connection with the Boysen Dam project. Another relocation tunnel, for the Pennsylvania R.R., was made necessary because of the Conemaugh River Dam. This 2,660-ft. double-track tunnel near Saltsburg, Pa., is also nearing completion.

In France, 66 of the 70 railway tunnels damaged by the retreating Germans have been repaired and are in operation. In Yugoslavia a 1,128-ft. railway tunnel is being built to link the Trieste-Gorica line with Ljubljana and the rest of the Yugoslav railway system.

In England, several new tunnels are being built to facilitate electrification of the Manchester-Sheffield line. A single-track tunnel at Thurgoland was put into use in October for the down line while the up track will be centered in the old double-track tunnel. New twin-bore tunnels are being constructed at Woodhead to be completed early in 1952. Electrification will increase tunnel capacities 25 percent.

—J. W. HAZEN

TURKEY. A republic comprising Asia Minor and a narrow zone in Europe along the Straits between the Aegean and the Black Seas.

Area and Population. Area: 296,184 square miles. Population: over 19 million. Chief cities (1945 census): Ankara (capital) 226,712, Istanbul (Constantinople, port) 860,558, Izmir (Smyrna, port) 198,396. Ninety-five percent are Turks with Greek, Armenian, and Jewish minorities resident in the cities and the Kurds a restive element in eastern Turkey. Although Islam is no longer the state religion, most Turks are Moslems.

Communications. In 1947 there were over 4,700 miles of railway with extensions under construc-

tion. The 26,000 miles of roads are not nearly enough for the country's needs and many of them are poor. For that reason road improvement and road-building are an important part of the American aid program, with American equipment already at work. American, British, and French airlines connect Turkey with the rest of the world and Turkish State Airlines operates within Turkey and to Greece. New airports are being built. Radio, telegraph, and telephone facilities are operated by the government.

Education. High on the program of the new Turkish Republic was the establishment of a state educational system. Primary education is compulsory and all public education is free. In 1947-48 there were over 15,000 primary schools (private, public, and foreign) with almost 1,500,000 pupils; 265 secondary schools with 63,135 pupils; 86 lycées with 23,744 pupils, 231 vocational schools with 66,649 pupils; and 34 institutions of higher learning with 25,648 students. Among the latter are the (state) Universities of Istanbul and Ankara (with a number of faculties including law, medicine, and engineering) and the two American colleges, Robert College and Istanbul Women's College in Istanbul. Important in the overall educational program are the People's Houses founded to promote the intellectual and cultural development of the people, and the Rural Life Institutes established to train village leaders. In 1948 two thousand new school buildings were constructed.

Production. Forty million cultivated acres (one-third of them fallow) provide a living for two-thirds of the population; 20 million more are cultivable. Although such efforts are being made, production is still hampered by primitive techniques. Chief crops in 1948 were: wheat (155 million bushels), barley (90 million bu.), maize (23.6 million bu.), oats (21 million bu.), rye (15.5 million bu.), with vegetables, and fruit important. With the use of modern machinery wheat could be Turkey's most important export. A particularly fine tobacco is produced. Livestock breeding is widespread and the number growing, much of it being exported to Middle Eastern countries. Turkey has valuable forest resources.

Large-scale industry has developed steadily and rapidly since the first state five-year plan launched in 1934, except for a downward trend during World War II. Between 1936 and 1946 textile production almost doubled with the 1948 wool and cotton production total higher than the 1947. Sugar production is increasing. New industries including paper, glassware, iron and steel have been established. State control of industry is exercised through the Sümer Bank. Mining, under the government's Eti Bank, is also developing rapidly. Coal and chrome are the principal minerals. Coal production in 1947 (over 3.9 million metric tons) was 170 percent higher than in 1935 and the 1948 total was expected to be even higher. The 1947 chrome output of 117,975 metric tons was well over half the world's production. Chrome output will be increased when new American washing equipment is installed. Annual iron-ore production in 1947 was 12,133 metric tons. Other significant minerals are lignite, copper, and sulphur. In February oil was discovered in eastern Turkey.

Foreign Trade. The main exports are cereals, tobacco, minerals, dried fruits, livestock and products. Important imports include textiles, paper, machinery, vehicles, chemicals, tea, coffee, and cocoa. In 1947 total exports amounted to £T625 million (24 percent to the United States, the rest to Great Britain, Italy, and other countries) and

imports to £T685 million (33 percent from the United States, the rest from Italy, Great Britain, and other countries). Exports in the first six months of 1948 were 48 percent below those of 1947's corresponding period while imports were 30 percent higher. However, Turkey's exports in October, 1948, amounting to £T73.8 million were more than twice those of October, 1947, and imports at £T56.4 million were slightly higher than those of October, 1947. Thus the opening of the 1948-49 export season produced the first monthly export surplus of 1948.

Finance. The 1949 regular budget presented to the Assembly provided for expenditure of £T1,415.5 million (slightly larger than 1948's budget). This included large appropriations for defense, education, and capital expenditure. Revenues were to total £T1,295.5 million, the deficit to be made up by new taxes and long term public loans. As of July 1 Turkey's public debt was £T1,526 million, of which £T986 million was domestic and £T540 million was foreign. Currency in circulation in November amounted to £T984 million. In June, 1948, the cost of living index was 343 (1937 = 100) having remained fairly steady since the initial climb to 347 in 1943; in November of 1948 it was 353. Since 1947 the exchange rate has been £T2.83 to the U.S. dollar.

Government. The 1924 Constitution confers both executive and legislative power on the Grand National Assembly of 465 deputies elected every four years by universal direct suffrage. Its executive authority is exercised through the President of the Republic elected by it and through the Council of Ministers chosen by the President. President Ismet İnönü took over in 1938 following the death of the father of the Turkish Republic, Kemal Atatürk. The strict state control which was responsible for the country's initial extraordinary progress is being criticized both within and without the country by those who feel Turkey's citizens are now able to participate to a greater extent in governing themselves and developing their country.

Events, 1948. American Aid. The Foreign Assistance Act of 1948, in its Title III called the "Greek-Turkish Assistance Act of 1948," authorized the allocation of \$275 million for Greece and Turkey (in addition to the 1947 allocation of \$400 million, one-fourth of which went to Turkey). These funds were intended to continue military support and provide economic assistance under the European Recovery Program. Shipments of equipment (including vessels and planes) and assignment of personnel continued during 1948 with 349 Americans detailed to Turkey in the program as of June 30. In April a United States-Turkish Road Agreement was signed whereby the United States would help expand Turkey's road system. A five-member United States mission was despatched during November to study Turkish requirements for agricultural equipment; increased agricultural production was intended to help Turkey contribute its full share to Europe's economic recovery. In October Turkey signed a loan agreement with the Economic Cooperation Administration and the Export-Import Bank for \$30 million to finance industrial and agricultural projects.

Economic Development. A new five year over-all development plan was formulated which, if put into effect in toto, would require more than £T2,000 million excluding American aid. It was to be financed by taxation, internal loans, profits from state enterprises, and foreign credits such as the loan requested from the International Bank. About one-fourth of the expenditures was to be on trans-

portation. The production of marketable coal and lignite was to be doubled and that of iron raised. Three large power stations were to be established, an American concern having been awarded the contract to build a new dam north of Adana in southeastern Turkey.

Relations with other Countries. In March the 1939 Anglo-Turkish alliance was reaffirmed and in April the Turkish and Greek Foreign Ministers reaffirmed Greek-Turkish friendship, promising more effective economic cooperation. As an active participant in the European Recovery Program Turkey revised its trade and payments agreements with Italy, Belgium, and Denmark in order to fit their agreements more effectively into the ERP plans.

Trade agreements also were signed with Sweden, Finland, and Poland. In November a British Trade Mission started negotiating for a revival of Turkish-British trade, reduced as a result of the decline in Turkey's sterling balances and restrictions imposed on sterling imports. In December a trade agreement signed with Western Germany restored to Turkey part of one of her chief prewar markets.

Relations with the Soviet Union and its satellites remained wary although no major crisis developed. In May Foreign Minister Sadak presented the conditions under which Turkey and the Soviet Union (not specified by name) could establish friendly relations: abandonment of aggressive threats, non-interference in internal affairs; reciprocal understanding based on honor and self-respect. In August trade ministry officials announced a Soviet offer to buy valonia, the first time a Soviet offer had been made since 1939.

Domestic Politics. The government's Republican People's Party and the Grand National Assembly finally adopted several reform measures long supported by the opposition Democratic Party. On Dec. 9, 1947, President İnönü gave up the actual leadership of the People's party, thus symbolizing the recognition that a two-party system did exist and that the People's Party could not call itself the only "official" party any longer. On Dec. 23, 1947, the nine-year state of siege in six provinces was lifted. Although imposed at the beginning of World War II it had been criticized as a way of exerting government control by non-constitutional means.

On January 13 the People's Party approved the government's proposal to guarantee secret balloting and public counting at all elections; on January 21 the government ruled that all recognized opposition parties could use radio facilities at election times; and on February 21 an article of the Police Law involving a denial of habeas corpus was revoked. In May the People's Party adopted a resolution permitting religious teaching in schools, banned since 1923. The undercurrent of concern over Turkish-Russian relations and reaction against Communism was revealed in a December demonstration by right-wing students memorializing the wrecking three years previously of two liberal newspapers. The meeting was boycotted by liberal students.

Archbishop Spyrou Athenagoras of New York, primate of the Orthodox Church in North and South America, appointed Patriarch of the Greek Orthodox Church, returned to Istanbul after giving up his American citizenship to resume Turkish citizenship.

The Executive Council of the United Nations Educational Social and Cultural Organization met in Istanbul in November to draw up the agenda for the UNESCO conference in Beirut in Decem-

ber. Turkey was appointed a member of the three-country United Nations Palestine Conciliation Commission. —DOROTHEA SEELYE FRANCK

TWENTIETH CENTURY FUND. A nonprofit organization for research and public education on economic questions. The Fund was founded in 1919 and endowed by the late Edward A. Filene, Boston merchant and philanthropist. Its entire income, administered as a public trust by a Board of Trustees, is devoted to its own research and educational activities. For each major investigation the Fund appoints a special research staff and an impartial committee of qualified persons who use the factual findings of the staff as a basis for recommendations on public policy. The Fund issues its reports in book form and supplements these with news releases, pamphlets, magazine articles, and other material, including educational films and radio programs. Active contact work is maintained with national organizations and educational institutions.

In 1948 the Fund published *Cartels or Competition?*, the second volume in a broad survey of the economic effects of international cartels and domestic monopolies. A report on *Electric Power and Government Policy* was also published during the year. In the field of labor relations, the Fund's Labor Committee completed a special report entitled, *Partners in Production: A Basis for Labor-Management Understanding*. The first of three surveys of economic and social conditions in foreign countries was published in 1948 under the title, *Report on the Greeks*. Similar reports were completed on investment and development possibilities in Turkey and Brazil.

As part of its program of public education, the Fund collaborated in the publication of a pamphlet, "Power, Machines, and Plenty" and the production of a forthcoming motion picture based on its 1947 survey of *America's Needs and Resources*. A graphic presentation of this survey entitled *USA: Measure of a Nation*, was also completed during 1948, as well as a supplementary report on future construction and capital requirements of the United States.

Officers: President, John H. Fahey; Chairman, Executive Committee, Henry S. Dennison; Treasurer, A. A. Berle, Jr.; Executive Director, Evans Clark; Economist, J. Frederic Dewhurst. Address: 330 West 42 St., New York 18, N.Y.

UGANDA. A British protectorate in East Africa, under British administration since 1894. Area, 93,981 square miles, including 13,680 square miles of water. Population (1947 estimate), 4,110,370, including 3,530 Europeans and 31,840 Asiatics. Capital, Entebbe (7,321); trading center, Kampala.

A government educational scheme has supplemented the earlier mission schools. In 1945, a total of £247,843 from public funds was expended for education. For the same period enrollment in various schools totaled 260,903.

Production and Trade. Agriculture and cattle raising are the chief occupations of the people. Cotton, the chief product, occupied 1,072,495 acres in 1946-47, yielding 231,678 bales. Other products are coffee, sugar, oil-seeds, sisal, tin, hides, ivory and tobacco. There are valuable forests. Total imports in 1946 amounted to £5,157,773; total exports were valued at £9,657,026. The chief imports are manufactured goods and cotton fabrics. There is a uniform customs tariff for Uganda, Kenya, and Tanganyika.

Finance. In 1946 revenue amounted to £3,891,000; expenditure (excluding loans) £3,566,000.

Public debt, Dec. 31, 1946, amounted to £2,850,000.

Government. The whole protectorate is under administration, but the native kings or chiefs, whose rights are in some cases regulated by treaties, are encouraged to conduct the government of their own subjects. Buganda is recognized as a native kingdom under a Kabaka. He is assisted by three native ministers and a native assembly. In Buganda (and in Bunyoro, Ankole, and Toro, also ruled over by native chiefs, as well as in most other parts of the protectorate more directly administered), purely native matters are dealt with by the various native councils, but in serious cases there is an appeal to British officers or courts. The chief representative is the governor, who (with the assistance of the executive and legislative councils) makes ordinances for the administration of justice, the raising of revenue, and for other purposes. Governor: Sir John Hathorn Hall. (See EAST AFRICA HIGH COMMISSION.)

UNESCO (United Nations Educational, Scientific, and Cultural Organization). A Conference for the Establishment of an Educational, Scientific, and Cultural Organization of the United Nations was convened by the Government of the United Kingdom in association with the Government of France, and met in London Nov. 1-16, 1945.

It was attended by representatives of 44 governments and by observers from a number of international organizations.

UNESCO came into being on Nov. 4, 1946, when the instruments of acceptance of 20 signatories of its Constitution had been deposited with the Government of the United Kingdom. The first session of the General Conference met in Paris from Nov. 19 to Dec. 10, 1946.

The purpose of UNESCO is to "contribute to peace and security by promoting collaboration among the nations through education, science, and culture in order to further universal respect for justice, for the rule of law, and for the human rights and fundamental freedoms" for all, which is affirmed by the Charter of the United Nations.

To realize this purpose, UNESCO: 1. collaborates in the work of advancing mutual knowledge and understanding of peoples through all means of mass communication; 2. gives fresh impulse to popular education and to the spread of culture; 3. maintains, increases, and diffuses knowledge. In carrying out these functions, UNESCO works with the United Nations and the other specialized agencies, with national groups and individuals, and with international non-governmental agencies through working agreements and grants-in-aid.

The program of UNESCO falls under six broad headings: reconstruction, communication, education, cultural interchange, human and social relations, and natural sciences.

Reconstruction. This work is concerned with encouraging and assisting the restoration of the educational, scientific, and cultural life of countries which were devastated by the war. To carry out this task UNESCO works through the Temporary International Council for Educational Reconstruction (TICER).

It is estimated that by May, 1948, approximately \$150 million worth of materials and services were supplied through voluntary organizations in donor countries for educational reconstruction in the war-torn areas.

Communication. This field includes those projects intended to increase understanding across national frontiers by various means, such as the exchange of

persons and closer relations between peoples through their films, press, radio, and libraries, and through their publications.

An Office for the Exchange of Persons has been set up in Paris to develop exchange-of-persons programs and to relate them to similar activities being carried on by international, national, and private agencies throughout the world. Reports from Member States will form the basis of a world handbook on international fellowships and related opportunities which, it is hoped, will be issued annually.

An International Ideas Bureau will be created to foster the spread of information about cooperation in education, science, and the arts. Special emphasis is being given to the encouragement and development of public libraries. A Book Coupon Scheme is permitting the purchase in any Member State of the literature of the other, despite existing currency restrictions. A further project is to explore ways of encouraging the inexpensive production of books and periodicals.

Education. In this field, UNESCO is concerned especially with the promotion of a world-wide campaign of Fundamental Education, with efforts to increase education for a world society and with a program to raise educational standards in all member states.

The Fundamental Education program is designed to bring a basic minimum of education to all under-privileged peoples. "Pilot Projects" are being undertaken in Haiti, China, East Africa, and Peru. A large number of national experiments in Fundamental Education in all parts of the world will also be linked to UNESCO's program to form a network of "Associated Projects." In adult education, UNESCO will act as a clearing house of information, and it is intended to produce materials on international affairs suitable for adaptation and extensive use by adult study groups.

During July and August, 1948, three seminars were held: one in London on the education and training of teachers; a second in Prague on childhood education; and the third in New York on teaching about the United Nations and specialized agencies in the school systems of Member States. A fourth seminar was held at Caracas, Venezuela, in August-September in cooperation with the Pan American Union.

A Preparatory Conference of Representatives of Universities was organized by UNESCO, in collaboration with the Netherlands Government. It met at the University of Utrecht in August. Representatives from 34 countries attended. Action was deferred on the preparation of a Teacher's Charter and the Educational Charter for Youth. In 1947 a program was begun for the improvement of textbooks and teaching materials.

Cultural Interchange. This covers UNESCO's work in the fields of philosophy and the humanities, museums, arts and letters, and the translation and wider exchange of classics and great books. An International Theatre Institute to facilitate the interchange of representative theatrical works and to aid the freer travel of personnel across frontiers was established in 1948. Preliminary steps were taken toward the establishment of an International Music Institute. UNESCO continued to organize the International Pool of Literature, which was begun in 1947. An ambitious project for the survey of existing color reproductions of works of art and the stimulation of further production was given special attention in 1948.

In pursuance of its task of increasing international understanding, UNESCO hopes, in the next few years, to present to the peoples of the world

a small bookshelf, the titles of which will read: "The American Way of Life"; "The Brazilian Way of Life"; "The British Way of Life"; "The Indian Way of Life"; and so on for all the principal peoples of the world.

Human and Social Relations. In this part of its program UNESCO seeks to strengthen understanding among peoples by studying the tensions, the prejudices, and ignorances which separate them and by finding means to overcome these barriers to international cooperation. UNESCO has also been authorized to prepare a Source Book describing the work already under way in Member States in the study of tensions which arise from technological improvements and the resulting shift in populations.

Natural Sciences. In this field UNESCO works to make possible greater collaboration between scientists around the world, to help lighten the so-called "dark zones" of science and technology in certain regions, and to assist man better to appreciate and make effective use of his natural environment. Field science cooperation offices—in Rio de Janeiro, Cairo, Nanking, and Delhi—have been established to serve as liaison centers for science and technology between deficiency regions and the more highly developed areas of the world.

Member States. As of Dec. 31, 1948, there were 45 states which were full members of UNESCO: Afghanistan, Argentina, Australia, Austria, Belgium, Bolivia, Brazil, Canada, China, Colombia, Cuba, Czechoslovakia, Denmark, Dominican Republic, Ecuador, Egypt, El Salvador, France, Greece, Haiti, Honduras, Hungary, India, Iran, Iraq, Italy, Lebanon, Liberia, Luxembourg, Mexico, Netherlands, New Zealand, Norway, Peru, Philippines, Poland, Saudi Arabia, Switzerland, Syria, Turkey, Union of South Africa, United Kingdom, United States of America, Uruguay, and Venezuela.

Officers. Members of the Executive Board for 1949: Sir Sarvepalli Radhakrishnan (India), Chairman; C. Parra-Perez (Venezuela), Vice Chairman; Roger Seydoux (France), Vice Chairman; Ronald Walker (Australia); Alf Sommerfelt (Norway); Stanislaw Arnold (Poland); Paulo Carneiro (Brazil); Guillermo Nanetti (Colombia); Chen Yuan (China); Victor Dore (Canada); Shafik Ghorbal Bay (Egypt); Resat Nuri Guntekin (Turkey); Manuel Martinez-Baez (Mexico); Sir Jogn Maud (United Kingdom); Alex Photiades (Greece); George D. Stoddard (United States); Louis Verniers (Belgium); Count Stefano Jacini (Italy). Director General: Jaime Torres-Bodet (Mexico).

The organs of UNESCO include: a General Conference which meets annually; an Executive Board of 18 members which meet at least twice a year; a Secretariat responsible for the implementation of programs of action. Permanent Headquarters: UNESCO House, 19 Ave. Kleber, Paris 16^e, France.

Events. The Third Session of UNESCO's General Conference was held in Beirut, Lebanon from Nov. 17-Dec. 11, 1948, with delegates from 33 nations present. A far-reaching program in the fields of education, science, and culture, designed to promote peace and international understanding, was adopted. Dr. Julian Huxley, whose term expired, was succeeded by Jaime Torres-Bodet of Mexico. The Conference adopted a 1949 budget of \$7,780,000, an increase of \$97,363 over the 1948 budget.

Foremost among the new schemes is the continuation and extension of UNESCO's work in Germany and the launching of an educational program in Japan. Emphasis will also be placed on problems affecting the various trust territories.

UNION OF SOVIET SOCIALIST REPUBLICS (U.S.S.R.). A state occupying eastern Europe and northern and central Asia. Capital, Moscow.

Area and Population. Total area of the U.S.S.R. (1946), including territory acquired since 1939, was 8,708,070 square miles; total population, 193,200,000 (estimated). The 16 constituent republics, with their capitals, areas, and populations, are listed in the accompanying table.

U.S.S.R. CONSTITUENT REPUBLICS

<i>Republics</i>	<i>Capital</i>	<i>Sq. mi.</i>	<i>Population</i>
Russian S.F.S.R.	Moscow	6,444,000	109,279,000
Ukrainian S.S.R.	Kiev	223,000	40,000,000
Byelorussian S.S.R.	Minsk	89,000	10,386,000
Azerbaijan S.S.R.	Baku	33,000	3,210,000
Georgian S.S.R.	Tbilisi	27,000	3,542,000
Armenian S.S.R.	Erivan	12,000	1,300,000
Turkmen S.S.R.	Ashkhabad	187,000	1,254,000
Uzbek S.S.R.	Tashkent	158,000	6,282,000
Tajik S.S.R.	Stalinabad	55,000	1,485,000
Kazakh S.S.R.	Alma-Ata	1,056,000	6,146,000
Kirghiz S.S.R.	Frunze	78,000	1,500,000
Karelo-Finnish S.S.R.	Petrozavodsk	76,000	500,000
Moldavian S.S.R.	Kishinev	13,000	2,200,000
Lithuanian S.S.R.	Vilna	24,000	2,880,000
Latvian S.S.R.	Riga	25,000	1,971,000
Estonian S.S.R.	Tallinn	18,000	1,131,000

The populations of the 38 leading cities, including the capitals of the 16 constituent republics, are shown in the accompanying table.

POPULATION OF CITIES

<i>City</i>	<i>Population</i>	<i>City</i>	<i>Population</i>
Moscow	4,137,018	Voronezh	326,836
Leningrad	3,191,304	Yaroslavl	298,065
Kiev	846,293	Ivanovo	285,069
Kharkov	833,432	Archangel	281,091
Baku	809,347	Omsk	280,716
Gorky	644,116	Chelyabinsk	273,127
Odesa	604,223	Tula	272,403
Tashkent	585,005	Vilna	250,000
Tbilisi	519,175	Minsk	238,772
Rostov-on-Don	510,253	Alma-Ata	230,000
Dnepropetrovsk	500,662	Vladivostok	206,432
Stalino	462,395	Erivan	200,000
Stalingrad	445,476	Stalinsk	169,538
Sverdlovsk	425,544	Tallinn	147,000
Novosibirsk	405,589	Ashkhabad	126,800
Kazan	401,665	Kishinev	110,000
Kuibyshev	390,267	Frunze	93,000
Riga	385,000	Stalinabad	83,000
Saratov	375,860	Petrozavodsk	70,000

Education and Religion. Elementary and secondary education in the ten-year schools is free and compulsory. Small tuition charges have been made in higher schools since 1940. The number of trade schools and factory apprentice schools (about 3,000 of each in 1947) was appreciably increased in 1948. Approximately $\frac{3}{4}$ of a million students were enrolled in 1,000 universities, professional schools, and institutes. Illiteracy was reduced to about 15 percent of the adult population, for the most part in remote rural areas.

The 1936 Constitution guarantees freedom of conscience, separation of church and state, separation of church and school, freedom of religious worship, and freedom of anti-religious propaganda (Art. 124). In 1946, there were 22,000 actively functioning Greek Orthodox congregations; one Patriarch, 6 Metropolitans, 75 Archbishops and Bishops, 10 seminaries, 3 theological academies, and 87 monasteries and convents.

Production. The 4th Five-Year Plan, launched in 1946, has set 205,000 million rubles as the 1950 goal for industrial output, with total capital investments for the period of the Plan fixed at 157,500 million rubles. Most Soviet statistics, as made public, give no figures on total volume of production in various lines but merely record percentages of increase over preceding years and percentages of fulfillment of the Plan. In most lines production

during 1948 was restored to the 1940 level. The following figures in millions of metric tons (oil in millions of barrels) indicate probable total output during 1948, with the production goals of 1950 indicated in parentheses: pig iron, 15.0 (19.5); steel, 18.3 (25.4); coal, 166.0 (250.0); oil, 226.5 (257.0).

On other aspects of production and foreign trade, see *Events* below.

Finance. Under the terms of the budget approved by the federal Supreme Soviet on Feb. 4, 1948, estimated 1948 revenue was 429,150 million rubles; expenditure, 388,041 millions. Military expenditure was set at 66,000 million rubles, a reduction of 2,500 millions from the 1947 level. According to the reports of Finance Minister Zverev, revenue collected in 1946 (in millions of rubles) totaled 325,000, and in 1947 totaled 385,200, while expenditure for the same years was 307,000 and 361,200.

Communications. Of the 66,000 miles of railway (1945), 30 percent is double-gage. Highways extended 1,682,000 miles in 1940. There are 68,000 miles of navigable inland waterways and several thousand miles of canals. In 1946 a regular passenger air service between Moscow and Vladivostok was inaugurated. There are daily flights between Moscow and the capitals of the Union Republics.

Government. Under the Constitution of Dec. 5, 1936 (Art. 30), "the highest organ of state authority of the U.S.S.R. is the Supreme Soviet of the U.S.S.R.," consisting of two chambers, each elected for a term of four years by universal, direct suffrage and secret ballot. The present Soviet of Nationalities, or upper chamber, and the Soviet of the Union were elected on Feb. 10, 1946 (for composition, see *YEAR BOOK, Events* of 1946, p. 664). The Presidium of the Supreme Soviet consists of a President (Nikolai Shvernik, elected Mar. 19, 1946), 16 Vice Presidents (1 for each Union Republic), 24 Members, and a Secretary. Under the terms of the Constitution, the Council (Soviet) of Ministers (Cabinet) is chosen by, and responsible to, the Supreme Soviet.

Communist Party. The Communist Party of the Soviet Union (Bolshevik)—C.P.S.U. (B.)—is the only legal political party in the U.S.S.R. Its highest organ, the Party Congress, has not met since 1939. No Party Conference has been held since 1941. The Central Committee (71 members, 68 alternates) elects the Politburo, the Orgburo, the Secretariat, and the Commission of Party Control.

At the close of 1948 the Politburo consisted of Joseph B. Stalin, Vyacheslav M. Molotov, Nikolai Shvernik, Lazar M. Kaganovich, Klimenty E. Voroshilov, Nikita S. Krushchev, Andrei A. Andreyev, Anastas I. Mikoyan, Lavrenti P. Beria, and Georgi M. Malenkov, with Nikolai A. Voznesensky, Alexei N. Kosygin, and Nikolai Bulganin as alternates.

Events, 1948. On New Year's Day of 1948 *Izvestia* surveyed the old year and contemplated the new. Its editors opined that the "consolidation" of the forces of "world democracy" during 1947 would bring no comfort to "the dark forces of reaction assembled under the banner of Wall Street. . . . The struggle between two world outlooks and two systems—an ideological and diplomatic struggle—will of course continue in 1948. . . . (We shall win because) peoples do not want to serve the god of war and gold."

The "struggle" became in fact more extended, more intensified, and more embittered. Its imperatives, real or imagined, shaped all major decisions in domestic and foreign policy. Its conclusion was brought no nearer, despite gestures looking toward

a settlement. Its cessation remained an impossibility, since neither protagonist found means of compelling the other to yield, while each feared a fatal loss of prestige and power should it break off the engagement or make serious proposals for compromise. The outcome remained uncertain, despite heavy blows given and received. That the combat was waged in most arenas of rivalry with words and goods rather than with guns left it none the less a "war," albeit frigid rather than torrid.

Though all were free to express their doubts, few Americans doubted the official thesis that the conflict was due to Soviet aggression, Communist conspiracy, and a diabolical plot, directed from Moscow, to enslave the world. Though none was free to express his doubts, most Soviet citizens were apparently persuaded, with equally firm conviction, of the correctness of the official thesis that the conflict was due to American aggression, capitalist conspiracy, and a diabolical plot, directed from Washington, to enslave the world. The tenacity with which these views were held, and the ardor with which they were documented and publicized, measured the chasm between the Super-Powers. Since the waging of total war comports ill with political democracy and personal freedom, these values—loudly praised by both American and Soviet spokesmen—were jeopardized in the U.S.A. by the exigencies of battle and were left in the U.S.S.R. in the realm of verbal abstractions unsullied by contact with everyday human experience.

Politics and Politicians. Under these circumstances, the long-deferred 19th Congress of the C.P. (originally scheduled for 1942 under the rules adopted in 1939) was not held, nor were explanations offered of the delay or of a possible future convocation. Neither was any Party Conference summoned, despite the fact that the last was held in February, 1941, and that the 1939 rules called for an annual meeting. The C.P. Central Committee continued to meet. Its Politburo continued to determine policy in secret sessions. In the absence of any evidence regarding its deliberations, rumors abroad regarding rivalries and schisms among its members continued to be speculations or fabrications.

Andrei A. Zhdanov—member of the Politburo, Party boss in Leningrad, head of the Cominform, and allegedly Stalin's successor-designate in the Premiership and in the leadership of the C.P.—died of heart disease on August 31, at the age of 52. He was buried in Red Square below the Kremlin wall on September 2 in an impressive State funeral in which Molotov delivered the principal address. Zhdanov's passing reduced the number of full members of the Politburo from 10 to 9. Whether, as some gossipers abroad contended, the influence of Malenkov was herewith significantly increased could not be ascertained. The Politburo, like the C.P. as a whole, continued to present itself to the Soviet public and to the world as a monolithic citadel of political wisdom. Its members appeared wholly united behind the incessantly eulogized leadership of Stalin, whose 69th birthday was observed on December 21.

During 1948 death removed from the Soviet scene several lesser celebrities: Sergei Eisenstein (February 10), most famous Soviet cinema director; Leonid K. Ramzin (June 29), scientist and engineer who achieved distinction despite his having been sentenced in 1930 to a ten-year jail term for treason; Marshal Pavel S. Rybalko (August 28), commander-in-chief of armored, tank, and mechanized troops; Ludwig K. Martens (October 20), engineer and first Soviet Ambassador-designate to

the U.S.A., whence he was ordered deported in 1921; and Prof. A. Vishnevsky (November 13), well-known neurologist.

No Union-wide elections were held during 1948. The session of the supreme Soviet which adjourned on February 4 voted the budget; ratified the 1947 decrees of its Presidium abolishing the death penalty in peace-time and forbidding Soviet citizens to marry aliens; and approved the replacement of Minister of Justice Nikolai M. Rychkov and Chairman of the Cabinet Committee on Arts Mikhail B. Khrapchenko by Konstantine P. Gorshenin and Polikarp I. Lebedev, respectively.

On February 17, Finance Minister Arseny Zverev was replaced, after a 9-year term of office, by Alexei N. Kosygin. On August 12, Ivan T. Tevosyan was named head of the newly merged Ministries of Ferrous and Non-Ferrous Metallurgy. Other mergers of federal Ministries (Food Reserves and Material Reserves, Timber Industry and Paper and Pulp Industry, Chemical Industry and Rubber Industry) reduced the total number from 62 to 58. Other changes of administrative personnel announced on September 2 made Alexei D. Krutikov a Deputy Chairman of the Council of Ministers; M.A. Menshikov First Deputy Minister of Foreign Trade; V.P. Popov First Deputy Minister of Finance; and Ivan I. Maslennikov and A. Panyukov Deputy Ministers for Internal Affairs. In mid-October Nikolai I. Smirnov succeeded V.V. Vorobev as Minister of the Meat and Dairy Industries. On November 12 Marshal Alexander M. Vasilevsky was replaced as Chief of the General Staff by Gen. S.M. Shtemenko to relieve him of an excessive burden of work. Vasilevsky retained his post as Deputy Minister of the Armed Forces.

Industry and Finance. The progress of Soviet economy was hampered by the burdens of the "cold war," by the still gigantic tasks of reconstruction in the devastated areas, by industrial inefficiency and occasional dishonesty, and by continued low standards of living and of labor productivity. Despite these and other obstacles, much progress was made toward the goals set in the current Five-Year Plan. The currency reform of December, 1947 (see *YEAR BOOK, Events of 1947*, p. 515), achieved its major objectives. Rationing was abolished. Increased output of consumers' goods made possible a progressive reduction of prices. Since wages and salaries were not reduced, the result was a general rise of real incomes, albeit still of such modest proportions by American standards as to make the lot of the ordinary Soviet worker one of comparative penury.

On April 9, the Cabinet followed up the price reductions of Dec. 14, 1947, with new cuts: 10 percent for motor cars, sewing machines, radios, cameras, cigarettes, etc., and 20 percent for bicycles and motorcycles, vitamins, vodka, wines, beer, and soft drinks. The third annual 20,000 million ruble issue of lottery bonds was announced on May 3, with the bonds maturing in 20 years and affording prize money equivalent for the whole issue to 4 percent interest. Consumers' goods became more abundant month by month. Distribution was improved through the opening of some 16,000 new stores and restaurants during the year by the consumers' cooperatives. A decree of the federal Presidium of August 29, based on Art. 10 of the Constitution, authorized all citizens to build or buy for their own use private homes of not more than two storeys and containing not more than 5 rooms. Thanks in part to an expansion of prefabricated housing, some 19 million square metres of living space were made available during 1948,

representing a total 50 percent above 1947 and equal to total construction and reconstruction during 1946 and 1947 combined. By year's end thousands of new neon signs in Moscow were advertising a wide variety of products.

These improvements in living standards resulted from a general increase of production rather than from any shift of capital and labor from producers' to consumers' goods. Investment in heavy industry in relationship to total national income was in fact much larger than in the prewar years. The State Planning Commission reported in January that during the last quarter of 1947 industrial and agricultural output reached the average quarterly level of the last prewar year, 1940. In considering the budget for 1948, the Budget Committee of the Supreme Soviet sharply criticized inefficiency and excessive costs in industry, waste in local government, budgetary deficits in several of the Union Republics, and failures to meet quotas of housing construction. Coal production during the first quarter of the year registered a 20-percent gain over 1947. A spring campaign to cut costs put some factories hitherto "in the red" on a profit-making basis by summer. The labor shortage, felt acutely in the postwar years despite extensive demobilization, was alleviated through the currency reform which, by reducing hoarded savings and increasing the buying power of the ruble, brought new recruits into the labor market. The Komsomol organization directed the "mobilization" of almost three-quarters of a million young people into "labor reserves," assigned to two years of training in industrial and trade schools. The Five-Year Plan contemplated the training of 4,500,000 new skilled workers by 1950.

A July report of the State Planning Commission asserted that during the second quarter of 1948 industrial production had exceeded the planned quota by 6 percent and was 24 percent higher than in 1947. New industrial construction was up 26 percent and home building 42 percent. Total wages were up 8 percent. Retail sales topped 1947 levels by 83 percent for sugar, 50 percent for bread, 38 percent for cotton fabrics, 34 percent for silk fabrics, 29 percent for meat and candies, 31 percent for shoes, and 14 percent for vegetables. Planned quotas were not attained in fishing, special steels, combines, heavy motors and generators, steam turbines, and light motor cars. In October it was announced that total industrial production in the first 9 months of 1948 exceeded the 1940 level by 14 percent. These and other indices of output suggested, even to skeptical foreign observers, that the Soviet objective of fulfilling the Five-Year Plan in four years, i.e. by the end of 1949, would probably be achieved.

Agriculture. In spite of a late spring and subnormal rainfall in the Volga area, the harvest of 1948 was larger than the excellent crop of 1947. This favorable result, which made possible a substantial increase in Soviet grain exports, was attributable to an increase of the area under cultivation by 27 million acres as compared with 1947; to more rapid and efficient sowing, cultivation, and reaping; to improved equipment and service on the part of the machine-tractor stations attached to the collective farms; and to the diffusion of improved farming methods and of new high-yield varieties of grains and vegetables, some of which were credited to T.V. Lysenko. While All-Union production figures for 1948 were not yet available at the time of writing, the crop in the Ukraine yielded 2,500,000 more tons of marketable grain than in 1947 and 550,000 more tons than in 1940.

Party and press continued their drive against "grafters and idlers" among collective farmers, reserving their sharpest barbs for those who spent more time cultivating their household plots than participating in socialized agriculture. That these rural elements were hardest hit by the currency reform did not, seemingly, modify their addiction to "private" rather than collective enterprise. In June the Council of Ministers decreed incentive payments, based on productivity, to farm executives; differential compensation to each group of farm workers in terms of crop yields; reexamination of work norms; reallocation of "labor days" (the unit of agrarian accounting) in the interests of economy and efficiency; and a maximum use of piece-work methods in fixing compensation. A decree of July 13 increased taxes (8-11 percent in the lowest brackets to 30-40 percent in the highest) on farmers' incomes derived from individual peasant farms or, for members of collectives, from cultivation of personal plots.

On October 24, the Council of Ministers and the Central Committee of the C.P. jointly announced a 15-year reclamation and development project covering 300 million acres, embracing 80,000 collective farms in the Volga basin, the North Caucasus, the eastern Ukraine, and central Russia. The plan was aimed at soil conservation through defense of the black-earth areas against desiccation and erosion caused by the winds sweeping westward from the deserts of Central Asia. It contemplated the planting of 4 forest belts between the Caucasus and the southern Urals, totaling 3,000 miles in length, the additional planting of 15 million acres of forest for local protection of collective farms, the construction of 45,000 reservoirs and ponds for irrigation and maintenance of ground water levels, and a new program of crop rotation. This ambitious scheme—glorified in the Soviet press with the usual fanfare, and minimized in the American press with the usual contempt—offered tangible promise of conserving and expanding the productivity of the most fertile lands of the Soviet Union.

The Heresy-Hunters. To most Western liberals the image of a Soviet society busily engaged in increasing production, reducing prices, raising living standards, and planning boldly for social welfare could not be reconciled with the image of a Soviet society dedicated to political dictatorship, ideological fanaticism, and intolerance of all dissent. Yet both images mirrored reality. The latter was indeed the prerequisite of the former rather than its antithesis under the conditions of "cold war" and the injunctions of the Stalinist version of Marxism-Leninism.

Private enterprise moves mountains in America. But in the U.S.S.R. mountains are moved only by faith. True fervor in the one true faith is more than ever needed when the faithful are engaged in extending the faith or in defending it against the devilry of the infidels. Hence the assumed necessity in the Soviet Union of 1948 for rulers to insist more emphatically than ever upon undeviating loyalty to the prevailing orthodoxy on the part of the ruled.

Since there was no occasion for such insistence in the realm of politics as conventionally defined, the Inquisitors directed their energies toward the arts, the sciences, and the "private" lives of citizens. Soviet nationals were forbidden to leave their country unless sent abroad on public business. Aliens were discouraged from entering the U.S.S.R., unless they were diplomats, journalists, or business men. Even these were viewed with suspicion and

restricted in their activities. Citizens who had married aliens during the war were forbidden to join their spouses abroad. "Bourgeois" morality, art, and science were all denounced anew as evil fruits of decadence.

In late December, 1947, Alexander Fadeyev, President of the Soviet Writers' Union, Stalin prize winner, and author of *Young Guard* (which had gone through 25 editions, totaling 1,160,000 copies) agreed "attentively and lovingly" to rewrite his novel to meet complaints in *Pravda* and in *Culture and Life* that he had glorified the Komsomols in their wartime role at the expense of the C.P. Economist Eugene Varga, already criticized and demoted in 1947, was again assailed by *Pravda* in January, and by many of his colleagues at a colloquium in May, for his "false Marxist-Leninist views"—i.e. his contention that a major capitalist crisis was remote and that public planning against depression was possible in bourgeois states. But he remained an editor of *Economic Questions*, successor to his own *Journal of World Economy and Politics*. In February the C.P. Central Committee accused the "big three" of Soviet music, Dmitri Shostakovich, Aram Khatchaturian, and Sergei Prokofiev, of "smelling strongly of the spirit of the modern bourgeois music of Europe and America" and indulging in "formalistic distortions" and "esthetic individualism." In April Stalin prizes of 100,000 rubles went to Lithuanian composer Josef Tallat-Kepsha ("Cantata About Stalin") and Reinhold Gliere ("Red Poppy Ballet") for their "classicism" and "realism." Writers and artists were told that their patriotic duty was to produce works intelligible to the masses, glorifying Soviet socialism.

In August the old biological controversy between Trofim D. Lysenko (President of the All-Union Academy of Agricultural Sciences, and a disciple of the late Ivan V. Michurin, the "Soviet Burbank") and the followers of Gregor Mendel and T.H. Morgan became a matter for political decision. The issue, vastly oversimplified, was that of the inheritance of acquired characteristics, with Lysenko contending that heredity could be affected by environment as shown by his own experiments in "vernalizing" winter wheat and in grafting and cross-breeding other plants. The Central Committee decided in favor of Lysenko. On August 27 the Academy of Sciences abolished the Cytogenetics Laboratory of Prof. N.P. Dubinin and "freed from their duties" Academician L.A. Orbeli, Secretary of the Section on Biological Sciences, and Prof. I.I. Schmalhausen, Director of the Institute of Evolutionary Morphology. Biology teachers were warned to shun "Darwin's Malthusian errors" as used by "the ideologists of modern imperialism" and to embrace "Bolshevik partisanship" as represented by the views of Michurin and Lysenko. On September 30, Prof. H. J. Muller, Nobel prize winner and geneticist at the University of Indiana resigned in protest from the Soviet Academy of Sciences, accusing Lysenko of being a "charlatan" and of indulging in "naïve and archaic mysticism."

The scientific questions here posed were not to be disposed of so readily as the American press assumed. But their politicalization by the C.P. built new barriers between East and West. In November *The American Review of Soviet Medicine*, long edited by Dr. Henry E. Sigerist, suspended publication "for reasons which are so obvious that we need not elaborate on them." Shortly thereafter Sir Robert Robinson, President of the Royal Society, denounced the political suppression of the classical school of genetics in the U.S.S.R.

Heretics and Émigrés. If the Communist leaders of

the U.S.S.R. were gratified over their success in regimenting writers, artists, and scientists at home, they could scarcely avoid serious concern over the actions abroad of other Soviet citizens, attracted by the freedom, or the fleshpots, of the West. Desertions by Soviet officers and soldiers in Central Europe were estimated (by Western observers) to have averaged 1,000 per month during 1948. Anti-Soviet Ukrainians in the U.S.A. boasted, perhaps with more poetry than truth, of a "Ukrainian Insurgent Army" north of the Black Sea, supplied by the "American Organization for the Defense of the Four Freedoms in the Ukraine." The "International Peasant Union" (headed by Mikolajczyk, Matchek, Nagy, Buzesti, Gavrilovich, and Georgi M. Dmitrov) sought in vain to promote a UN inquiry into "Soviet aggression" in Eastern Europe and the Balkans. Victor Kravchenko ("I Chose Freedom") brought a libel suit in April against *Les Lettres Françaises* of Paris for calling him an embezzler and a stool pigeon.

More serious were the desertions to the "enemy" of other Soviet citizens, scarcely counterbalanced by a few counter-desertions on the other side. In the latter category was Annabel Bucar (February) and Sgt. James M. McMillan (May), both of the U.S. Embassy staff in Moscow, who left their posts and refused to return to the U.S.A. Conversely Col. J.D. Tassoyev (G. Takoyev), originally alleged by *Tass* to have been kidnapped in Bremen by British secret service agents, declared in London in September that Moscow was using "slave labor" to prepare a war of "imperialism" and "aggression." Alexander Barmine ("One Who Survived"), prominent among earlier émigrés, married as his third wife Edith Kermit Roosevelt, granddaughter of T.R., on Sept. 8, 1948.

Meanwhile the most sensational developments of the year centered around two Soviet teachers in the U.S.A., Mrs. Oksana Stepanova Kosenkina and Mr. Mikhail L. Samarin, who defied orders to return home. On August 7, Soviet Consul General Jacob M. Lomakin announced in New York that Mrs. K., scheduled to sail on July 31, had been "kidnapped" by White Russians and detained at Reed Farm, Valley Cottage, N.Y. (operated by the "Tolstoy Foundation, Inc."), whence she had been "rescued," in response to a letter appealing for help, and brought to the Consulate by Lomakin.

On August 9, it became known that Samarin had placed himself—as it later appeared, with the aid of Victor Kravchenko and Vladimir Zenzinov—in the custody of the F.B.I. to avoid being sent back to Russia. On the same day Ambassador Alexander S. Panyushkin formally demanded that the State Department release Samarin to Lomakin and protested that the Tolstoy Foundation was an anti-Soviet "criminal organization," maintained in "direct violation" of the Litvinov-Roosevelt agreement of 1933. Karl Mundt, Acting Chairman of the House Committee on Un-American Activities, sought both teachers for questioning in connection with the "Soviet spy" inquiries initiated by the "confessions" of Elizabeth T. Bentley and Whittaker Chambers that they had acted as Communist espionage agents in Washington prior to World War II. On August 10, the Committee subpoenaed Samarin, who was in hiding near New York.

On August 11–12, as Miss Bentley testified that she had received \$2,000 in October, 1945, from Anatol Gromov, First Secretary of the Soviet Embassy, in payment for services as a courier for a Communist spy ring, Molotov declared that Mrs. K. had been kidnapped on July 31 and taken to the apartment of "White Guard" Zenzinov and thence

to the farm maintained by the "White Guard gang" headed by Alexandra Tolstoy. He accused U.S. authorities of connivance in the "criminal actions" against Kosenkina and Samarin, and demanded the latter's transfer to the Soviet Consulate and "punishment of all persons who have taken part in the kidnapping of Soviet citizens." At the same time Panyushkin protested to the State Department against the writ of *habeas corpus* issued by Judge Samuel Dickstein to Lomakin, requiring him to produce Mrs. K. in the State Supreme Court on the morning of the 12th. The writ had been issued at the request of Christopher Emmet, Chairman of "Common Cause, Inc."

The State Department asked Gov. Dewey to suggest to Judge Dickstein that he take the case "under advisement" as an "appropriate interim measure," since "service of process upon the Consul raises complex questions of serious legal and policy nature." Samarin told the House Committee that if he returned to the U.S.S.R. he would be shot or sent to a concentration camp for life, but his testimony, according to J. Parnell Thomas, was "not of pertinent significance" to the investigation of spy rings.

L'Affaire Kosenkina; Rupture of Consular Relations with the U.S.A. Meanwhile, at 4:00 p.m., August 11, Mrs. K. jumped out of a third floor window at the Soviet Consulate in New York; landed in the courtyard with broken bones and internal injuries; was carried back into the Consulate; was removed therefrom by local police to the Roosevelt Hospital; and asserted she had been "held a prisoner" and had been visited by the Soviet Ambassador who sought to induce her to sign an affidavit that she was not being detained against her will. On August 13, as Lauchlin Currie and Harry D. White (who dropped dead shortly thereafter) denied before the House Committee the Bentley-Chambers charges that they had aided "Red spies," the State Department denied Molotov's charges and offered asylum to the two Russian teachers. A *Tass* statement accused the U.S. of violating the immunities of the Consulate. On August 14, Panyushkin formally protested against the alleged violation of consular extraterritoriality by the N.Y. police.

On August 15, *Pravda* declared that Lt. Robert Dreher, U.S. Assistant Naval Attaché, who left Moscow May 1, had been "caught in espionage," had confessed, and had been recalled at the request of the Foreign Ministry. The State Department replied that the case against Dreher (arrested by the M.V.D. on April 23) was a "plant." Two days later Lomakin declared that Mrs. K. had been terrorized by the "White Guard fiends" headed by Countess Tolstoy, had been further unbalanced by hostile publicity and curious crowds, and had attempted suicide by virtue of being driven to a "nervous breakdown" by her kidnappers and by U.S. officials. On August 19, Secretary Marshall, in a note to Ambassador Panyushkin, "categorically" repudiated Soviet protests and accusations and demanded Lomakin's recall for having "abused" his position and "grossly violated" proper standards of official conduct.

On August 25, Moscow replied by repudiating the American statements as "unfounded and contrary to fact"; repeated its charges and its insistence on access to Mrs. K. and Samarin; declared that "the normal execution of their functions by Soviet Consulates in the U.S." had been rendered "impossible"; and announced its decision to close immediately its two Consulates (N.Y. and San Francisco), to terminate the U.S. Consulate in Vladivostok, and to cancel previous arrangements

for the opening of a U.S. Consulate in Leningrad. Vice-Consul Zot I. Chepurnykh and his family sailed for home the preceding evening. Lomakin followed suit on August 29.

Mrs. K. told the press that her husband had been liquidated in the purge of 1937, that her son had been killed in the war, and that she had long ago decided to leave the U.S.S.R. forever. "Actually they made a big mistake in bringing me here from Russia." She was visited by Samarin and Countess Tolstoy. "Common cause" established the "Kosenkina Fund for Victims of Communism." Mrs. K. left the hospital in November, after writing her life story with the aid of Isaac Don Levine, whose subsequent mention of Laurence Duggan was used by Karl Mundt to implicate Duggan, immediately after his strange death, as a "Soviet spy." Advance proceeds from the syndication of the story enabled Mrs. K. to pay a hospital bill of \$8,000. Like Elizabeth Bentley and Louis Budenz, she subsequently embraced the Catholic faith. The American market for ex-Communists continued to boom, despite a constant increase in the supply.

Cominform and Satellites. The inability of the Kremlin to prevent the desertion of some of its citizens abroad was matched on the diplomatic stage by its inability to hold all of its allies in line. The "Soviet bloc" was further consolidated. But the defection of Tito's Yugoslavia raised questions as to whether the Red Empire had not perhaps been overextended to a point at which centrifugal forces were proving more potent than the attraction of the central sun.

The Communist coup of February in Czechoslovakia coincided with the signing in Moscow on the 18th of a 20-year mutual aid treaty between the U.S.S.R. and Hungary, pledging common defense against future aggression by Germany "or any other State which would directly or in any other form unite with Germany in a policy of aggression." On March 18 a similar treaty was signed between the U.S.S.R. and Bulgaria. The treaty of April 6 with Finland differed from its counterparts in that it ran for only ten years; pledged mutual respect for sovereignty, independence, and non-interference in internal affairs; and did not obligate Helsinki to come to Moscow's military aid in any war arising out of a direct attack on the U.S.S.R. Finland merely pledged herself to resist, jointly with the U.S.S.R., any military aggression by Germany or its allies against Finland or "against the Soviet Union across the territory of Finland" (Art. 1).

On June 28, the Cominform issued a long statement expelling the Yugoslav C.P. from membership and accepting the view of the Central Committee of the C.P. of the U.S.S.R. "which assumed the initiative in unveiling the wrong policy of the Central Committee of the C.P. of Yugoslavia and especially the wrong policy of Comrades Tito, Kardelj, Djilas, and Rankovitch." They were accused of "a hateful policy in relation to the Soviet Union"; discrediting, and spying upon, Soviet military specialists; "identifying the foreign policy of the Soviet Union with that of the imperialistic Powers"; disseminating "slandorous propaganda borrowed from the arsenals of counter-revolutionary Trotskyism"; fostering "capitalist elements" and "kulaks" in the villages; relying on the peasantry rather than the proletariat; subordinating the Party to the People's Front; ignoring the principles of intra-party democracy, elections, and self-criticism; choosing members of the Central Committee by cooptation instead of election; displaying "exaggerated ambition, megalomania, and conceit" in

rejecting earlier criticisms; and indulging in "adventurism," "opportunism," "anti-Marxism," and "nationalism." Cominform Headquarters were transferred from Belgrade to Bucharest. *Pravda* on July 1, in predicting Tito's downfall, accused him of "Bonapartism" and his followers of "idolatry."

Counter-charges and rejoinders continued intermittently, with no apparent weakening of Tito's position, no Yugoslav shift to a "pro-Western" orientation, and no change in treaty relations between Belgrade and the Soviet bloc. By year's end it appeared that Eastern economic pressure against Yugoslavia was beginning to pinch. Behind a semantic façade, the actual sources of the breach were practical rather than ideological. Soviet desire to compromise with the West regarding a treaty for Austria had been frustrated in May by Tito's insistence on reparations and on annexation of part of Carinthia. Letters exchanged from March to May between Central Committees, and secretly circulated within Yugoslavia in August, indicated that Tito was under attack for allegedly expecting the U.S.S.R. to go to war, if need be, to secure Trieste for Yugoslavia, resenting Soviet direction of Belgrade's diplomacy and military policy, condemning "spheres" and "blobs," and championing "neutrality" in any conflict between East and West.

Red Danube. The Moscow-Belgrade rift had no outwardly visible effects on the diplomatic conference which met in the Yugoslav capital on July 30 to discuss a new regime for the Danube. The Western Powers, represented by Cavendish Cannon, Sir Charles Peake, and Adrien Thierry, were outnumbered by the States in the Soviet orbit, represented by Vyshinsky, A.K. Baranowski (Ukraine), Clementis, Eric Molnar, Anna Pauker (Rumania), Eugeni Kamenov (Bulgaria), and Ales Bebler (Yugoslavia). The Yugoslav delegation voted consistently with the Soviet bloc. Vyshinsky's proposal, presented in a "take it or leave it" spirit, contemplated a Danube Commission limited to the seven riparian States, with France and Britain excluded from the participation they enjoyed under the Convention of 1921. Ambassador Cannon withdrew the U.S. draft proposal and vainly sought to amend the Soviet draft—which, said he on August 14, despite its lip-service to free and equal navigation for all, would permit "the continuation of exclusion, discrimination, yes, even imperialism on the river."

The outcome, when the conference ended on August 18, was a new convention, approved by unvarying votes of 7 to 3, which the U.S.S.R. and its satellites signed but which the Western Powers refused either to sign or to recognize as legally valid. The State Department condemned "Soviet manipulation of the six votes of its puppet States to impose a convention which legalizes its monopoly of Danube shipping. . . . The unhappy subservience of the Danube peoples to Soviet imperialism was never more clearly manifested." Except for its upper waters in Austria and Germany (both unrepresented at Belgrade), the Danube seemed likely to remain under the control of the U.S.S.R. and its allies—at least until such time as America and Britain might conceivably achieve the geopolitical objective espoused by Byrnes, Bevin, Churchill, and Marshall, i.e. putting an end to Communist rule and Soviet influence throughout Eastern Europe and the Balkans. This, however, seemed likely to remain unattainable short of a decisive Western victory in World War III. See DANUBE CONFERENCE.

Relations With U.S.A.: War Guilt. That the two Super-Powers were moving steadily during 1948

toward an ultimate trial by battle was taken for granted by the American public, doubted with dark foreboding in the U.S.S.R., and grimly suspected in Western Europe and elsewhere. Yet "cold war" or "hot peace" was preferred to open violence by top policy-makers on both sides: in Washington because "firm containment" of "Communist imperialism" was deemed likely to promote the contraction and later the disintegration of Soviet power; and in Moscow because an extension of the anti-Communist program of the "Wall Street imperialists" was deemed likely to weaken American democracy, bankrupt American capitalism, and foster the spread of Communism more effectively than the Kremlin could ever hope to do. The struggle of the giants therefore took the form of a contest in invective, evasion, and endurance, with neither side prepared as yet to open a war of extermination or conclude a peace of compromise.

The stage was set for the 1948 phase of the conflict by the deadlock over Germany reached at the London meeting of the Council of Foreign Ministers in December, 1947. Molotov reiterated Soviet demands for Four-Power control of the Ruhr and \$10,000 million in reparations from current German production. Marshall reiterated his categorical rejection of both proposals and urged a restoration to the Reich of part of the new Poland. The stalemate caused Washington to move more rapidly toward the establishment of a West German government, and caused Moscow to maneuver for a resumption of negotiations, with the double objective of delay and of putting the onus for refusal on the U.S.A.

On Jan. 22, 1948, as tentative Soviet overtures were allegedly made to Robert Murphy in Berlin, the State Department released a 357-page volume of 260 documents on *Nazi-Soviet Relations, 1939-1941* (Washington, D.C., Government Printing Office), selected and translated from material in the archives of the German Foreign Office, captured by U.S. forces in Germany in 1945. This allegedly "sensational" publication was presented in the American press as further evidence of Soviet "deceit," "perfidy," and "imperialism," and as a powerful reply by Marshall and Truman to Soviet charges of U.S. "imperialism." In fact the "revelation," albeit a fascinating record of German-Soviet relations as reflected in Nazi documents (which may or may not be reliable), revealed little not already known or suspected from other sources. By omitting all references to the diplomacy of 1933-38, all material bearing on Nazi relations with the Western Powers, and all of the Wehrmacht documents used at Nuremberg, this compilation conveyed a seriously distorted impression of the events and decisions of the period covered.

Moscow replied with an extensive pamphlet, "Falsificators of History" (Embassy of U.S.S.R., Washington, February, 1948), and, in May, with a two-volume collection of captured German data, *Documents and Materials Relating to the Eve of the Second World War, 1937-1939* (International Publishers, New York, 1948), selected to demonstrate that Anglo-French appeasement of Hitler was motivated by the hope of deflecting Nazi aggression against the U.S.S.R.

In years to come objective observers, if any, may well conclude that the Kremlin won the 1948 battle of the documents and also scored more points than its opponent in the battles of diplomacy and day-to-day propaganda. On Nov. 19, 1947, the *Literary Gazette* of Moscow reproduced a *New York Times* dispatch of June 24, 1941, quoting Harry S. Truman: "If we see that Germany is

winning, we ought to help Russia, and if Russia is winning we ought to help Germany, and in that way let them kill as many as possible." The Communist coup in Prague in February was for Moscow a political victory but a propaganda defeat.

According to the Hoover Commission Report released in December, faulty intelligence regarding Soviet moves, submitted by the U.S. armed forces (identity unspecified), created a "war panic" in Washington in March. The signature of the Brussels Pact and President Truman's appeal for universal conscription, selective service, and E.R.P. (both March 17) reflected acute Western fears.

Relations With U.S.A.: Comedy of Errors. On April 15, the Soviet Foreign Ministry ordered NBC correspondent Robert Magidoff to leave the country, on the ground that his American secretary had exposed his "espionage" activities. He ascribed his expulsion to the "hate campaign" against all foreigners from the West. Such episodes were soon overshadowed by events of graver import. On May 4, with no publicity and no communication of intent to London or Paris, Ambassador Smith presented a note to Molotov which was apparently inspired by anxiety lest the Kremlin overestimate Washington's overestimation of alleged Soviet readiness to risk war. The U.S.A., asserted the note, wishes to "make it unmistakably clear that (it) has no hostile or aggressive designs whatever with respect to the Soviet Union. . . . As far as the U.S. is concerned, the door is always wide open for full discussion and the composing of our differences. My Government earnestly hopes that the members of the Soviet Government will not take lightly the position of the U.S. Government as here expressed. . . . It is our earnest hope that they will take advantage (of their opportunities to alleviate tension). If they do, they will not find us lacking in readiness and eagerness to make our own contributions to a stabilization of world conditions entirely compatible with the security of the Soviet peoples."

Ambassador Smith at once left Moscow to go fishing in Normandy. On May 11, *Tass* released his statement, along with Molotov's reply which repeated familiar denials and countercharges. But "the Soviet Government views favorably the desire of the U.S.A. to improve relations . . . and agrees to the proposal to proceed, with this end in view, to a discussion and settlement of differences."

As millions of peoples throughout the world breathed a brief sigh of relief, Truman and Marshall felt obliged to deny that any negotiations were intended or any change of policy contemplated. On May 10, Henry A. Wallace had released an "Open Letter to Premier Stalin," calling for a peace settlement based on disarmament, non-export of weapons, resumption of unrestricted trade, free movement of tourists, students, journalists, and scientists between the two countries, peace treaties with Germany and Japan, withdrawal of troops from China and Korea, and mutual respect for sovereignty and the principle of nonintervention. "There is no misunderstanding or difficulty between the U.S.A. and the U.S.S.R. which can be settled by force or fear, and there is no difference which cannot be settled by peaceful, hopeful negotiations. There is no American principle or public interest, and there is no Russian principle or public interest, which would have to be sacrificed to end the cold war."

In a public reply of May 17 Stalin gave guarded praise to the Wallace statement as "an open and honest attempt to give a concrete program for a peaceful settlement. . . . As far as the Govern-

ment of the U.S.S.R. is concerned, it considers that Mr. Wallace's program could serve as a good and fruitful basis for such an agreement and for the development of international cooperation." The State Department on May 18 declared this opinion "encouraging," but asserted that the issues mentioned by Stalin "are not bilateral issues" but "are of intimate and compelling interest to many countries"—e.g. as shown by the 200 meetings of the UN Atomic Energy Commission where agreement was blocked "because of the adamant opposition of two of its members, the Soviet Union and the Ukraine, to proposals which were acceptable to the other nine nations represented." On May 26, Marshall, in a letter to the Senate Foreign Relations Committee, listed 37 Soviet "violations of agreements."

In June the Soviet press resumed its attack on American "war-mongers." On June 9, Moscow protested at a *Newsweek* report of May 17 recounting General Kenney's plan for the atomic annihilation of the U.S.S.R. in the event of an attack on the U.S.A. Marshall rejected the protest in the name of freedom of the press. The summer crises are dealt with above and below. On October 8, it became known that President Truman had considered sending Chief Justice Fred M. Vinson to Moscow on a special diplomatic mission and had planned a radio broadcast on the subject, only to be dissuaded by Marshall and Lovett. If Henry Wallace's meager electoral support on November 2 was disappointing to Moscow, Truman's victory over Dewey was none the less described by Molotov as a defeat for a program of reaction and aggression. Post-electoral hints from Moscow regarding the desirability of resuming negotiations evoked no response from the President-elect save general denials and expressions of devotion to peace.

Meanwhile U.S. exports to the U.S.S.R. declined from a monthly average of \$7 million early in the year to \$23,000 for June (as compared with \$4,262,000 in June of 1947), thanks to Washington's refusal to license the sale of goods of potential military value to Eastern Europe. Moscow protested but did not retaliate, preferring on the contrary to increase its sales to the U.S.A., including manganese and chrome. In July American sales to the U.S.S.R. totaled \$400,000 and purchases \$5,700,000. The corresponding figures for August were \$1,200,000 and \$8,500,000, and for September \$100,000 and \$9,800,000. At the end of the year, for the first time since 1912, Russia had a "favorable balance of trade" with the U.S.A.

This result suggested to the Kremlin that Washington was unwilling to subordinate its crusade against Communism to the quest for markets, except when the latter could be made the instrument of the former. Another event indicated that the U.S.A. continued to place moral principles above political expediency. On July 26, Dr. Alfred Bilmanis, Latvian Minister, died. His country, along with Estonia and Lithuania, had been incorporated into the U.S.S.R. in July, 1940. His death offered the State Department an opportunity, if it desired one, to acknowledge (as Washington had contended between 1917 and 1922) that the three Baltic States were properly part of Russia. But on August 12, Marshall greeted Anatol Dinsbergs as Latvian *Chargé d'Affaires*, and on September 23, the Department officially acknowledged him as Acting Consul. He declared that his chief task would be to acquaint America with the progress of Latvia's struggle to "regain freedom" from the "illegal and ruthless" Soviet occupation. Estonian and Lithuanian "diplomats" also continued to be

accredited in Washington, presumably as symbols of the happy day to come when their lands should be liberated from Communism.

Battle for Berlin. In the interim, Soviet-American relations were dominated by the struggle over Germany. As early as Nov. 28, 1947, Molotov had vainly sought to commit Marshall and Bevin against a separate regime for the Western zones in the event that no agreement could be reached for a national government. On Jan. 20, 1948, Sokolovsky demanded, also in vain, the dissolution of the new German agencies in "Bizonia." Early in March the Soviet press condemned emerging plans for a West German regime as "hypocritical" and an "outrageous violation" of Potsdam. Moscow formally protested to Paris, London, and Washington. On May 28, Maj. Gen. Alexander G. Kotikov, Soviet spokesman on the Allied Kommandatura, twice referred to Berlin as part of the Soviet zone, thus hinting at things to come should the Western Powers persist in their project.

The project was finally agreed upon in June, to the accompaniment of a currency reform in the Western zone. Moscow had already imposed a series of restrictions on trade and travel between the Western zone and the Western sectors of Berlin. On June 23-24, Molotov met in Warsaw with the Foreign Ministers of the satellites. Their communiqué asked for a German peace treaty, based on a provisional all-German regime, withdrawal of all occupation troops within a year, demilitarization, reparations, and Four-Power control of the Ruhr. When this overture was ignored, Moscow instituted a full "blockade" of the Western sectors of Berlin—on the pretext of preventing the introduction of the new Western marks and on the apparent premise that the Western Powers would thereby be compelled either to negotiate a settlement for all of Germany on terms acceptable to the U.S.S.R. or to quit the former German capital and partition the Reich between East and West at the Elbe. Thanks to General Clay's initiation of the "airlift" in late June, the Western Powers refused to accept either alternative.

A complete stalemate presently developed because of the inflexible refusal of the Kremlin to acquiesce in a Western-sponsored German regime in Trizonia and the equally inflexible refusal of Washington, followed doubtfully by London and Paris, to abandon the enterprise or to quit Berlin. The U.S. protest to Moscow of July 9 expressed willingness to resume Four-Power negotiations, but only on condition that the Berlin blockade first be lifted. The Soviet reply of July 14 contended that Western rights in Berlin were contingent upon quadripartite control of Germany as a whole, that they had been invalidated by Western action, and that the U.S.S.R. would neither lift the blockade nor negotiate regarding Berlin *per se*. On July 26, the Western Powers reiterated their determination to establish a West German government and imposed a counter-blockade against the Soviet zone of Germany by stopping all railroad traffic.

In the complex negotiations which ensued in Moscow (July 31-August 30) among Molotov, Stalin, Bedell Smith, Frank Roberts, and Yves Chataigneau—despite Western "refusal" to negotiate under "coercion"—a "compromise" was seemingly reached in the "directive" of August 30 to the Military Governors in Berlin: the West agreed to the introduction of Soviet-zone currency throughout Berlin, subject to Four-Power supervision; the Kremlin agreed to a Berlin settlement without reference to the whole Reich. But by September 8, the Governors were deadlocked. Following further

inconclusive discussions, the three Western Powers on September 29 referred the issue to the UN, charging that the Soviet blockade was a threat to international peace and security. Vyshinsky denied the competence of the Security Council to consider the issue, but informed Juan Bramuglia on October 13 that the U.S.S.R. would lift the blockade if the Western Powers would withdraw their complaints and recognize the validity of the accord of August 30.

The six "neutral" members of the Council, with the approval of the Western Powers, finally proposed a "compromise" resolution calling for immediate lifting of the blockade, resumption of negotiations among the Military Governors on the basis of the August 30 directive, and a meeting of the Council of Foreign Ministers on the whole German question. In the Soviet view, this formula required the U.S.S.R. to abandon its major bargaining weapon in exchange for nothing save further discussion of a problematical settlement. On October 25, the Security Council voted on the resolution, 9 to 2, with the U.S.S.R. and the Ukraine in the negative. This Soviet "veto" killed the proposal.

Tyrgve Lie and Herbert Evatt nevertheless persisted in an effort at settlement by proposing anew a meeting of the Council of Foreign Ministers and a Berlin currency settlement based on the directive of August 30. At the close of the year a commission of financial experts was scheduled to make recommendations early in 1949. But no settlement was in sight. Moscow had evidently lost the battle for the German public mind, and was experiencing economic difficulties in its zone because of the counter-blockade. The West had demonstrated its capacity via air power to feed Western Berliners on a low level, if not to keep them warm or provide full employment. But the airlift was costing almost \$1 million per day and taking an increasing toll of lives. Each side had long since made the issue one of prestige. Therefore neither could yield to the other. Neither side was prepared to risk an open test of force. The costly stalemate therefore continued.

U.S.S.R. and UN. With Washington committed to using the UN as a diplomatic weapon against Moscow, the role of Soviet representatives was that of obstructionists and propagandists against "American imperialism." Chile's proposals in mid-March to indict the U.S.S.R. before the Security Council as responsible for the Communist coup in Czechoslovakia led to a Soviet double veto in late May. On April 25, the U.S.S.R. joined the Trusteeship Council. On May 13, it was announced that Gromyko would be replaced by Jacob A. Malik as the chief Soviet spokesman at UN. On May 17, Moscow granted de jure recognition to the new state of Israel.

At the third session of the General Assembly in Paris, Vyshinsky on September 25 accused the U.S.A. of plotting war and proposed a general one-third cut in armaments during the next year. On October 2 he departed from the previous Soviet position to propose the simultaneous signing of two conventions on atomic energy, one to prohibit atomic weapons and the other to provide international control. Warren Austin questioned his sincerity, called his formula a "skin-deep Oriental device," and, on October 12, rejected the Soviet disarmament proposals on the ground that the U.S.A. could never disarm so long as the U.S.S.R. recognized "aggressive war" as a means of extending Communism over the world.

Here, as in other fields, the UN did not, be-

cause it could not, bring the Soviet-American "war" to an end. Moscow continued to boycott the Little Assembly, the Balkan Commission, and the UN Commission for Korea—from which Soviet troops were withdrawn at the end of the year.

Since the premise of the Charter was the unity of the Great Powers, and since this premise was denied in Moscow and Washington alike, the UN could make no peace. Its role was to register discord, to furnish a forum for invective, and to demonstrate that the lofty ideals of law, order, and justice in the community of nations could not be realized so long as the Super-Powers were fighting one another for mastery of the globe.

Box Score. The verdict of events at the close of the year was much more favorable to the U.S.S.R. than seemed likely in mid-summer, given the course of politics in France, Italy, and Germany, the "success" of the Marshall Plan, and the steadily rising tide of anti-Soviet sentiment in the Atlantic communities. This reversal of probabilities was due to the failure of the U.S.A. to weaken Soviet power in Eastern Europe (despite the Moscow-Belgrade schism), to wipe out the Communist guerrillas in Greece, or to save Chiang Kai-shek from crushing defeat at the hands of the Chinese Communists. French inability to suppress the rebels in Indochina, British difficulties with colonial revolt in Malaya, and Dutch aggression against the Republic of Indonesia in late December all furnished fuel for the fires of Communism and thereby strengthened the international position of the U.S.S.R. These developments in turn were partially attributable to the essentially negative character of the American-led campaign against Moscow and to Western reliance in many areas upon anti-Communist groups which had no popular support. The men of the Kremlin were thus encouraged in their belief that time was on their side and that American capitalism might yet break down under the strains imposed upon it by a global crusade against Communist sin.

In a *Pravda* interview of October 28, Stalin accused the Western Powers of repudiating the "agreement" of August 30 on Berlin and the "agreed draft decision" of Dr. Bramuglia because of their rejection of all cooperation. "Those gentlemen are obviously lending their support to a policy of aggression, to a policy of unleashing a new war. . . . (But this) can only end in an ignominious failure. . . . The horrors of the recent war are still too fresh in the memories of peoples and the public forces favoring peace are too strong for Churchill's pupils in aggression to overpower them and to set the course for a new war."

—FREDERICK L. SCHUMAN

UNITARIANS. A movement in Congregationalism at the close of the 18th century, which confesses belief in one God in one person as opposed to

the Trinity. Total world membership: 2,100,000.

American Unitarian Association. Established in 1825, its National Conference was organized in 1865. The denomination has 365 churches, 460 ministers, and 75,000 members in the United States. Its Sunday or Bible schools have a membership of 20,000. Seven educational, and 12 benevolent institutions are maintained by the Church, which also has 150 workers engaged in humanitarian work in Europe. President, Rev. Frederick May Elliot; Treasurer, Frank B. Frederick; Secretary, Rev. Dana McL. Greeley. Headquarters: 25 Beacon St., Boston 8, Mass.

UNITED BRETHREN, Evangelical. This communion is a result of the organic union in 1946 of the former Evangelical Church and the former Church of the United Brethren in Christ. Both stem from the evangelistic movement in Pennsylvania in the early 19th century. Arminian in doctrine, the church is Methodist in government. As of Jan. 1, 1948, the group had 4,654 churches, 3,452 ministers, and 712,616 members in the United States. There are 89 foreign missionaries serving 30,984 members. The church maintains 11 educational institutions and 9 homes for the care of children and the aged. Church property is valued at \$77,800,653 while income from contributions totals \$21,436,029. General Conference is held quadrennially, the next being in 1950. Headquarters, U. B. Building, Dayton, Ohio.

UNITED CHURCH OF CANADA, The. The designation applied to the single body formed by the union, in 1925, of the Congregational, Methodist, and Presbyterian churches in Canada; the Methodist churches of Newfoundland and Bermuda also are included. In 1947 there were in Canada, Newfoundland, Bermuda, 6,580 preaching places (including home missions) in 2,708 pastoral charges; 780,234 communicant members; and 1,839,895 persons under pastoral care. A total of \$18,787,719 was raised for all purposes. At the Thirteenth General Council held in Montreal, Quebec, in September, 1948, the Rev. Willard Brewing, D.D., was chosen Moderator for the ensuing biennium. The Rev. Gordon A. Sisco, D.D., is General Secretary. Headquarters: 421 Wesley Building, Toronto 2B, Ont., Canada.

UNITED NATIONS (UN). The United Nations is an organization of States which have accepted the obligations contained in the Charter of the United Nations, drafted at the United Nations Conference on International Organization held at San Francisco from April 25 to June 26, 1945. The Charter was signed by representatives of 50 nations on June 26, 1945, and came into force on Oct. 24, 1945, according to its terms, after having been ratified by China, France, the U.S.S.R., the United Kingdom, the United States, and by a majority of the other signatory States.

The Charter established six principal organs of the United Nations: a General Assembly, a Security Council, an Economic and Social Council, a Trusteeship Council, an International Court of Justice, and a Secretariat.

United Nations Structure (as of January, 1949):

THE GENERAL ASSEMBLY

PRESIDENT

Dr. Herbert Vere Evatt, Australia

VICE PRESIDENTS

Dr. Wang Shih-chieh, China; Robert Schuman, France; Luis Padilla Nervo, Mexico; Zygmunt

Modzelewski, Poland; Andrei Y. Vyshinsky, U.S.S.R.; Ernest Bevin, United Kingdom; and George C. Marshall, United States.

MEMBER NATIONS

Afghanistan	Iraq
Argentina	Lebanon
Australia	Liberia
Belgium	Luxembourg
Bolivia	Mexico
Brazil	Netherlands
Burma	New Zealand
Byelorussian S.S.R.	Nicaragua
Canada	Norway
Chile	Pakistan
China	Panama
Colombia	Paraguay
Costa Rica	Peru
Cuba	Philippines
Czechoslovakia	Poland
Denmark	Saudi Arabia
Dominican Republic	Siam
Ecuador	Sweden
Egypt	Syria
El Salvador	Turkey
Ethiopia	Ukrainian S.S.R.
France	Union of South Africa
Greece	U.S.S.R.
Guatemala	United Kingdom
Haiti	United States
Honduras	Uruguay
Iceland	Venezuela
India	Yemen
Iran	Yugoslavia

COMMITTEES

General (Steering)—Composed of 14 members, namely the President of the Assembly, the 7 Vice Presidents, and the Committee chairmen listed below:

1. Political and Security.
Paul-Henri Spaak, Belgium
2. Economic and Financial,
Hernan Santa Cruz, Chile
3. Social, Humanitarian and Cultural,
Dr. Charles Malik, Lebanon
4. Trusteeship,
Nasrollah Entezam, Iran
5. Administrative and Budgetary.
L. Dana Wilgress, Canada
6. Legal,
Dr. Ricardo Alfaro, Panama

(These 6 committees are composed of representatives of all Member nations.)

THE SECURITY COUNCIL

PRESIDENT

The Presidency of the Security Council is held in turn by the members of the Security Council in the English alphabetical order of their names. Each President holds office for one calendar month.

MEMBERS

Argentina (Until Jan. 1, 1950)	Canada (Until Jan. 1, 1950)
China (Permanent)	Cuba (Until Jan. 1, 1951)
Egypt (Until Jan. 1, 1951)	France (Permanent)
Norway (Until Jan. 1, 1951)	Ukrainian S.S.R. (Until Jan. 1, 1950)
U.S.S.R. (Permanent)	United Kingdom (Permanent)
	United States (Permanent)

MILITARY STAFF COMMITTEE

The Chiefs of Staff (or their representatives) of China, France, the U.S.S.R., the United Kingdom, and the United States.

ATOMIC ENERGY COMMISSION

The members of the Security Council and Canada when it is not a member of the Security Council.

COMMISSION FOR CONVENTIONAL ARMAMENTS

The members of the Security Council.

THE ECONOMIC AND SOCIAL COUNCIL

PRESIDENT

Dr. Charles Malik, Lebanon

MEMBERS

Australia	Belgium
(Until Jan. 1, 1951)	(Until Jan. 1, 1952)
Brazil	Byelorussian S.S.R.
(Until Jan. 1, 1951)	(Until Jan. 1, 1950)
Chile	China
(Until Jan. 1, 1952)	(Until Jan. 1, 1952)
Denmark	France
(Until Jan. 1, 1951)	(Until Jan. 1, 1952)
India	Lebanon
(Until Jan. 1, 1952)	(Until Jan. 1, 1950)
New Zealand	Peru
(Until Jan. 1, 1950)	(Until Jan. 1, 1952)
Poland	Turkey
(Until Jan. 1, 1951)	(Until Jan. 1, 1950)
U.S.S.R.	United Kingdom
(Until Jan. 1, 1951)	(Until Jan. 1, 1951)
United States	Venezuela
(Until Jan. 1, 1950)	(Until Jan. 1, 1950)

COMMISSIONS OF THE ECONOMIC AND SOCIAL COUNCIL

1. Economic and Employment Commission (15 members)
 - (a) Sub-Commission on Employment and Economic Stability (7 members)
 - (b) Sub-Commission on Economic Development (7 members)
2. Transport and Communications Commission (15 members)
3. Fiscal Commission (15 members)
4. Statistical Commission (12 members)
 - (a) Sub-Commission on Statistical Sampling (5 members)
 - (b) Committee on Industrial Classification (6 members)
5. Population Commission (12 members)
6. Social Commission (18 members)
7. Commission on Human Rights (18 members)
 - (a) Sub-Commission on Freedom of Information and of the Press (12 members)
 - (b) Sub-Commission on Prevention of Discrimination and Protection of Minorities (12 members)
8. Commission on the Status of Women (15 members)
9. Commission on Narcotic Drugs (15 members)
10. Economic Commission for Europe (18 members)
11. Economic Commission for Asia and the Far East (13 members and 6 associate members)
12. Economic Commission for Latin America (24 members)

THE TRUSTEESHIP COUNCIL

PRESIDENT

Liu Chieh, China

MEMBERS

Australia	} Administering Trust Territories
Belgium	
France	
New Zealand	
United Kingdom	
United States	
China	} Permanent members of the Security Council not administering Trust Territories
U.S.S.R.	
Iraq	} Elected by the General Assembly to serve until Jan. 1, 1950
Mexico	
Costa Rica	} Elected by the General Assembly to serve until Jan. 1, 1951

THE INTERNATIONAL COURT OF JUSTICE

PRESIDENT

José Gustavo Guerrero (El Salvador)

VICE PRESIDENT

Jules Basdevant (France)

JUDGES

Nine-Year Term of Office, terminating on Feb. 5, 1955:

Alejandro Alvarez (Chile)
 José Philadelpho de Barros e Azevedo (Brazil)
 Jules Basdevant (France)
 José Gustavo Guerrero (El Salvador)
 Sir Arnold Duncan McNair (United Kingdom)

Six-Year Term of Office, terminating on Feb. 5, 1952:

Isidro Fabela Alfaro (Mexico)
 Green Haywood Hackworth (United States)
 Helge Klaestad (Norway)
 Sergei Borisovitch Krylov (U.S.S.R.)
 Charles De Visscher (Belgium)

Three-Year Term of Office, terminating on Feb. 5, 1949: *

Abdel Hamid Badawi Pasha (Egypt)
 Hsu Mo (China)
 John Erskine Read (Canada)
 Bohdan Winiarski (Poland)
 Milovan Zoričić (Yugoslavia)

THE SECRETARIAT

SECRETARY GENERAL

Trygve Halvdan Lie (Norway)

ASSISTANT SECRETARIES GENERAL

Arkady Alexandrovitch Sobolev (U.S.S.R.)—Assistant Secretary General in charge of Security Council Affairs
 Arthur David Kemp Owen (United Kingdom)—Assistant Secretary General in charge of Economic Affairs
 Henri Laugier (France)—Assistant Secretary General for Social Affairs
 Victor Chi-Tsai Hoo (China)—Assistant Secretary General in charge of the Department of Trusteeship and Information from Non-Self-Governing Territories

* The General Assembly and the Security Council at simultaneous but independent elections on Oct. 22, 1948, reelected these Judges to a Nine-Year Term of Office, terminating on Feb. 5, 1958.

Benjamin A. Cohen (Chile)—Assistant Secretary General, Department of Public Information
 Ivan Kerno (Czechoslovakia)—Assistant Secretary General for Legal Affairs
 Adrian Pelt (The Netherlands)—Assistant Secretary General for Conference and General Services
 Byron Price (United States)—Assistant Secretary General for Administrative and Financial Services

SPECIALIZED AGENCIES

The formally constituted agencies are: International Labour Organization (ILO); Food and Agriculture Organization of the United Nations (FAO); United Nations Educational, Scientific and Cultural Organization (UNESCO); International Civil Aviation Organization (ICAO); International Bank for Reconstruction and Development; International Monetary Fund; Universal Postal Union (UPU); International Telecommunications Union (ITU); World Health Organization (WHO); and International Refugee Organization (IRO).

Two other agencies exist in preparatory form: International Trade Organization (ITO), which is working through an Interim Commission; and Intergovernmental Maritime Consultative Organization (IMCO), which is working through a Preparatory Committee. The World Meteorological Organization (WMO), which is in the process of formation, will take the place of the International Meteorological Organization (IMO), now functioning.

Events, 1948. During the year 1948, the United Nations continued growing and taking on new functions, and its organs and subsidiary bodies were able to devote more time to substantive rather than organizational matters. During the year Burma became the 58th member of the organization. The General Assembly held its second special session in New York from April 16 to May 14. The first part of its third session was held in Paris from September 21 to December 12.

The Security Council held 168 meetings in 1948 (11 of which were private). Of these meetings 128 were held at the headquarters of the United Nations at Lake Success, and 40 in Paris where the Council moved for the duration of the first part of the third session of the General Assembly. After the Assembly adjourned on December 12, the Council continued to meet in Paris until the end of the year. It resumed its work at Lake Success on Jan. 7, 1949. The Economic and Social Council held its sixth session at Lake Success from February 2 to March 11, and its seventh session at Geneva from July 19 to August 29. The Trusteeship Council held the second part of its second session from February 18 to March 10, the third part of its second session from April 20 to May 5, and its third session from June 16 to August 5. All meetings of the Council were held at Lake Success. The International Court of Justice delivered its first advisory opinion and continued its study of the Corfu Channel case.

THE GENERAL ASSEMBLY

The General Assembly consists of all of the Members of the United Nations. It may discuss any matters within the scope of the Charter or relating to the functions and powers of any organ of the United Nations, and may make recommendations on any such questions or matters excepting those of which the Security Council is seized.

Second Special Session. The Security Council on April 1 (see *Security Council* below) adopted a

resolution requesting the Secretary General to convoke a special session of the General Assembly (the Assembly's second) to consider further the question of the future government of Palestine.

The Assembly convened on April 16. On April 19, it referred the further consideration of Palestine's future government to its First (Political and Security) Committee, which debated at length a United States draft trusteeship agreement, circulated as a working paper. The First Committee's debates showed conclusively that it would be impossible to muster a two-thirds vote in favor of the United States proposals for trusteeship. On May 3, the United Kingdom representative proposed a temporary provisional regime to hold assets, to further mediation, and to work toward a solution.

On May 4, the Committee established a sub-committee and charged it with formulating a proposal for a provisional regime in Palestine. The sub-committee was also to take into account whether such a proposal was likely to commend itself to the Jewish and Arab communities, whether it could be implemented and made workable, and its approximate cost. Another sub-committee was established on May 11 to deal with the question of further measures for the protection of the City of Jerusalem and its inhabitants. It consulted with the Arab Higher Committee and the Jewish Agency.

While the Assembly was discussing the proposals of the First Committee and its subsidiary bodies, the British mandatory administration over Palestine came to an end (12:01 a.m., May 15 in Palestine; 6:01 p.m., May 14 in New York). Shortly afterwards, the United States delegation confirmed its Government's *de facto* recognition of the new Jewish State of Israel, proclaimed by Jewish authorities immediately after the termination of the British mandate over Palestine.

Two and a half hours after the British mandatory administration in Palestine came to an end, the second special session of the General Assembly adjourned. During its final hours, the Assembly authorized the appointment of a United Nations Mediator, who was to offer his good offices to arrange for the operation of common services in Palestine, to protect the Holy Places, and to promote a peaceful adjustment of the future situation. (See *Security Council* below.)

The Assembly failed, however, to obtain the necessary majority vote to establish a temporary regime for Jerusalem. The Palestine Commission, relieved by the Assembly at its second special session from the further exercise of responsibilities, on May 17 adjourned *sine die*.

On May 20, a committee of the Assembly, composed of representatives of China, France, the U.S.S.R., the United Kingdom, and the United States, chose Count Folke Bernadotte (Sweden), the Vice President of the International Red Cross, as United Nations Mediator in Palestine.

First Part of Third Regular Session. The Advisory Committee on the Site of the third session of the General Assembly—established at the Assembly's second session—agreed unanimously, on the basis of data submitted, that Paris was the most suitable location for the site of the third regular session. Accordingly, the Assembly held the first part of its third session there. The French Government offered the use of the Palais de Chaillot, generally referred to as the Trocadero. At its Paris session, the Assembly worked for nearly 3 months on a great number and variety of world problems. It could not, however, dispose of all the items on its agenda, and it therefore decided to hold a second part of this session in New York beginning Apr. 5, 1949.

The Assembly elected Cuba, Norway, and Egypt to the Security Council in succession to Belgium, Colombia, and Syria. China, France, India, Peru, Belgium, and Chile were elected to the 6 vacancies on the Economic and Social Council. The Assembly also approved recommendations of the Fifth Committee concerning vacancies on a number of subsidiary bodies, including the Advisory Committee on Administrative and Budgetary Questions, the Committee on Contributions, the Board of Auditors, and the Investments Committee. The Assembly approved the 1949 budget of the United Nations at U.S.\$43,487,128.

The main subjects deferred to the second part of its third session were the question of the former Italian colonies, Freedom of Information, the Report of the Security Council, establishment of a United Nations Guard Force, Treatment of Indians in South Africa, the question of repatriation, resettlement, and immigration of refugees and displaced persons.

The following were among the main decisions taken by the General Assembly:

Political and Security Questions. The General Assembly, deeply concerned over the impasse which had been reached in the work of the Atomic Energy Commission, by a vote of 40 to 6, with 4 abstentions, adopted a resolution on November 4 approving the general findings, recommendations, and specific proposals of the Commission as constituting the necessary basis for establishing an effective system of international control.

The Assembly also asked the 6 permanent members of the Commission—the permanent members of the Security Council and Canada—to consult together in order to determine whether there exists a basis for agreement on international control, and to report to the Assembly the results of their consultation not later than its next regular session.

It called upon the Atomic Energy Commission to resume its sessions, to survey its program of work, and to proceed to the further study of those subjects in its program which it considers to be practicable and useful. By a vote of 40 to 6, with 5 abstentions, the Assembly rejected a U.S.S.R. proposal for simultaneously prohibiting atomic weapons and establishing international control.

Recognizing the fact that 3 years after victory the Great Powers have not yet concluded the peace treaties, and that the disagreement in this matter is of vital importance to all of the United Nations, the Assembly on November 3 made a unanimous appeal to the Great Powers. The Assembly appeal, which had been sponsored by Mexico, called upon the Great Powers to compose their differences and establish a lasting peace. Specifically, the appeal endorsed the Yalta declarations of February, 1945; recommended the Powers signatories to the Moscow agreements of December, 1945, and the Powers which subsequently acceded to the agreements to redouble their efforts to secure peace; and recommended the Great Powers to associate with them, in the effort to secure peace, the States which had subscribed and adhered to the Washington Declaration of January, 1942.

Lengthy discussions on reduction of armaments and armed forces were touched off by a U.S.S.R. proposal calling for a one-third reduction of armaments and armed forces by the 5 permanent members of the Security Council within one year, and for prohibition of atomic weapons and for establishment of a control organ to supervise implementation of both measures. This proposal, however, was rejected by the Assembly by a vote of 6 in favor, 33 against, and 5 abstentions.

A Polish resolution similar to the Soviet resolution but specifying that the basis for arms reduction should be the Powers' strength as of Jan. 1, 1948, was likewise rejected by a vote of 6 in favor, 33 against, with 5 abstentions.

A composite resolution was finally adopted on November 19. This declares that the aim of the reduction of conventional armaments and armed forces can be attained only in an atmosphere of real and lasting improvements in international relations, which implies in particular the application of control of atomic energy involving the prohibition of the atomic weapon.

It recommends that the Security Council should pursue the study of such regulation and reduction through the Commission for Conventional Armaments in order to obtain concrete results as soon as possible. It also proposed that the Commission should devote first attention to formulating proposals for the receipt, checking, and publication, by an international organ of control within the framework of the Security Council, of full information to be supplied by all Member States on their effective armed forces and armaments. The resolution was adopted by a vote of 43 to 6, with 1 abstention.

On November 27, the General Assembly adopted a resolution on the Balkan situation which called on Albania, Bulgaria, and Yugoslavia to cease forthwith rendering support or assistance in any form to the Greek guerrilla forces. The 3 northern neighbors of Greece were warned that continued aid to the guerrillas endangers peace in the Balkans, threatens the political independence and territorial integrity of Greece, and is inconsistent with the purposes and principles of the Charter. All Members of the United Nations were asked to refrain from any action designed to assist, directly or through other governments, any armed group fighting against the Greek Government.

The Assembly resolved to maintain for a further year the United Nations Special Committee on the Balkans. It decided that the Special Committee should have its principal headquarters in Greece. With the cooperation of the government or governments concerned, the Committee may perform its functions in such places as it may deem appropriate for the fulfilment of its mission. The Committee was authorized to consult, in its discretion, with the Interim Committee.

In another resolution the Assembly called on Greece, on the one hand, and Albania and Bulgaria, on the other, to renew diplomatic relations. The Assembly recommended that Greece, Albania, Bulgaria, and Yugoslavia renew the previously operative conventions for the settlement of frontier questions or conclude new ones, and that they settle the question of refugees in the spirit of mutual understanding.

On the same day, the Assembly adopted without objection a resolution dealing with the fate of Greek children who are at present outside their own country. It asked for the immediate return to their homeland of all such children who themselves ask to be returned, or whose parents or close relatives request their return. The International Red Cross, the Red Crescent, and National Red Cross organizations were asked to assist in this repatriation.

Another unanimous action taken by the Assembly called for conciliation talks to be held in Paris, between the representatives of Albania, Bulgaria, Yugoslavia, and Greece, under the auspices of the United Nations and in the immediate presence of the President of the Assembly, the Secretary Gen-

eral, and the Chairman, and the Rapporteur of the First Committee.

In a statement issued on December 4, Dr. Evatt, the President of the Assembly, said the talks had made very substantial progress and that a draft agreement had been prepared after the acceptance of many points by all parties concerned. Dr. Evatt expressed the hope that the work of conciliation begun so successfully would be completed at the Assembly's resumed session in New York in April. Meanwhile, the good offices of the President and the Secretary General were to be available to all 4 parties concerned in the question.

By a vote of 40 in favor, 6 against, with 1 abstention, the General Assembly on December 3 decided to reestablish its Interim Committee. In taking this action despite the strenuous opposition of the U.S.S.R. and 5 other Members, the Assembly declared that effective performance of its duties under the Charter for promoting and adjusting situations likely to impair general welfare and friendly relations between nations made such a body necessary. At the same time, the Assembly recognized fully that primary responsibility for prompt and effective action for the maintenance of international peace and security rests with the Security Council. As in the last year, the Interim Committee, now reestablished until the 1949 regular session, is to be composed of one representative from each Member State. It is to be a subsidiary organ of the Assembly.

Opposition to this resolution was on the grounds, broadly, that it was unconstitutional, unnecessary, and a device to by-pass the Security Council. The prevailing opinion, however, was that the record of last year had justified the proposal, that the Committee could provide continuous contact and be a means of harmonizing conflicting views and interests, and that it could, by its preliminary studies, save the time of the Assembly and improve the value of the Assembly's decisions.

The Assembly approved a number of resolutions on the admission of new Members. One resolution recommended that members of the Security Council should act in accordance with the opinion on membership as given by the International Court of Justice (see section on the Court below).

In another resolution, the Assembly noted a general sentiment in favor of the universality of the United Nations and asked the Security Council to reconsider individually the hitherto unsuccessful applications of 12 States—Albania, Austria, Bulgaria, Ceylon, Finland, Hungary, Ireland, Italy, Portugal, the People's Republic of Mongolia, Rumania, and Transjordan.

The Assembly itself then dealt with individual applications. It determined that Finland, Ireland, Italy, Portugal, and Transjordan, whom 9 Council members had supported, fulfill the requirements of Article 4, and should therefore be admitted to Membership. It requested the Council to reconsider these applications, in the light of this determination and of the Court's advisory opinion. It also reaffirmed the view that opposition to these applications was based on grounds not included in Article 4 of the Charter.

In another resolution, the Assembly, pointing out that 9 members of the Security Council supported Ceylon's application for membership, and considering that the records of the discussions in the *ad hoc* Political Committee revealed a unanimous opinion that Ceylon is a peace-loving State and should therefore be admitted to membership in the United Nations, requested the Security Council to reconsider at the earliest possible moment the ap-

plication of Ceylon. The Assembly also requested reconsideration of Austria's application, which had been favored by 8 Security Council members.

The General Assembly on December 11 adopted a resolution on Palestine. It created a three-member Conciliation Commission and instructed it to take steps to assist the governments and authorities concerned to achieve a final settlement of all questions outstanding between them. The Commission was to assume any necessary functions of the United Nations Mediator; was to carry out specific functions and directives, which may be given by the Assembly or by the Security Council; and was to undertake, upon the request of the Security Council, any functions now assigned by the Council to the Mediator or the United Nations Truce Commission. The Assembly called upon the Governments and authorities concerned to seek agreement by negotiations conducted either with the Conciliation Commission—which was requested by the Assembly to begin its functions at once—or directly, with a view to final settlement of all questions.

In another part of the resolution, the Assembly resolved that the Holy places in Palestine, including Nazareth, should be protected and free access to them assured, and that arrangements to this end should be under effective United Nations supervision. The Commission was to present to the next regular session recommendations concerning Holy places in Jerusalem, and was, in addition, to call on the political authorities to give formal guarantees regarding the protection of Holy places in the rest of Palestine.

The same resolution declared that, in view of its association with three world religions, the Jerusalem area should be accorded special and separate treatment from the rest of Palestine and should be placed under effective United Nations control. The Security Council was requested to take further steps to ensure the demilitarization of the area at the earliest possible date, and the Conciliation Commission was instructed to present at the next session detailed proposals for a permanent international regime—providing for the maximum local autonomy for distinctive groups consistent with the special international status of the Jerusalem area. The Assembly also called for the freest possible access to Jerusalem by road, rail, or air, pending agreement on more detailed arrangements, and instructed the Commission to report to the Security Council any attempt to impede such access. The Commission was also instructed to seek arrangements to facilitate the economic development of this area.

The Assembly resolved that the refugees wishing to return to their homes and live at peace with their neighbors should be permitted to do so at the earliest practicable date. Compensation is to be paid for the property of those choosing not to return and for damage to property. The Commission was instructed to facilitate the repatriation, resettlement, and economic and social rehabilitation of the refugees and the payment of such compensation.

The Assembly resolution authorized the Commission to have its official headquarters at Jerusalem, and instructed it to render progress reports periodically to the Secretary General for transmission to the Security Council and Member States. Later the Assembly accepted the proposal submitted by 4 of the 5 permanent members of the Security Council that the Conciliation Commission should be composed of France, Turkey, and the United States. The U.S.S.R. had opposed this

choice, wishing to see a Commission of 5 members, one of which should be Poland.

On December 12, the General Assembly, by a vote of 48 in favor, 6 against, and with 1 abstention, adopted a resolution on Korea. The Assembly endorsed the Government elected in Southern Korea under the observation of the United Nations Temporary Commission on Korea.

It set up a new Commission on Korea, consisting of Australia, China, El Salvador, France, India, the Philippines, and Syria, for the purpose of good offices and observation. The resolution further recommended that Member States and other nations, in establishing their relations with the Government of Korea, take into consideration the Assembly's declaration that a lawful government had been established in Korea. It also recommended that the occupying Powers withdraw their occupation forces from Korea as early as practicable.

Economic and Social Questions. A significant action taken by the Assembly at its Paris session was the adoption of a Universal Declaration of Human Rights. Forty-eight Members voted for the Declaration, 9 abstained, and none voted against it. Among those who abstained was the U.S.S.R., whose chief representative, Andrei Vyshinsky, declared that many improvements were essential and the U.S.S.R. thought it necessary to give the subject more time and effort. The Declaration, adopted on December 10, defines on an international basis the inherent freedoms and rights of all men.

The General Assembly, considering the adoption of the Declaration an historic act destined to consolidate world peace, and considering that the text of the Declaration should be disseminated among all peoples of the world, adopted a resolution requesting the Secretary General to publish and distribute texts in all possible languages and by every means at his disposal. Specialized agencies and non-governmental organizations were invited to do their utmost to bring the Declaration to the attention of their members.

Articles dealing with the rights of petition and the rights of minorities were not included in the Declaration. To meet this omission the Assembly passed two further resolutions, asking the Economic and Social Council, through the Commission on Human Rights, to give further examination to the problem of petitions and of minorities when studying a draft Convention on Human Rights.

On October 8, the General Assembly unanimously approved a Protocol to bring new synthetic narcotic drugs within the scope of the 1931 Limitation Convention and thus strengthened international control of narcotic drugs. The Protocol supplements the 1931 Convention for Limiting the Manufacture and Regulating the Distribution of Narcotic Drugs by placing under international control drugs, particularly synthetic drugs, capable of producing addiction, but not covered by the 1931 Convention. The Protocol limits by international agreement the manufacture of such new drugs to the world's legitimate requirements for medical and scientific purposes, and regulates their distribution. On November 19, representatives of 41 Members of the United Nations and 6 non-Members signed the Protocol at the Palais de Chaillot; since then 5 more countries have signed.

On December 8, the General Assembly voted to continue the United Nations Appeal for Children (see below) during 1949, but on a new basis. By the action of the Assembly, the Appeal's administrative organization will be placed under the United Nations International Children's Emergency Fund and all future proceeds of collections will go

entirely to this agency. UNICEF will become responsible for the coordination of all national campaigns conducted by governmental and non-governmental appeals for children. The Children's Fund, in addition, will be designated as the agency with special responsibility for the emergency needs of children in all parts of the world.

Also on December 8, the Assembly adopted a resolution, which, *inter alia*, drew the attention of Members to the necessity for prompt contributions from governments to enable procurement of supplies and, generally, to meet the objectives for which the Fund was established.

The Assembly on December 4 adopted a number of resolutions regarding the needs of underdeveloped countries. In one resolution, the Assembly recommended that the Economic and Social Council and the specialized agencies give further and urgent attention to all aspects of the economic development of underdeveloped countries. It asked the Council to report to the next session on measures already taken and proposals for further measures. The resolution added, in particular, the hope that the International Bank will take immediate steps for the early realization of development loans, especially in the underdeveloped areas.

In another resolution the Assembly authorized the Secretary General to give, at the request of Member Governments, several kinds of assistance. Where appropriate, this will be done through the related specialized agencies. Broadly, the scheme comprises: arranging for international teams of experts; arranging facilities for training experts abroad; and obtaining technical personnel, equipment and supplies. Organization of seminars on special problems of economic development and exchange of technical information are included within the scope of the scheme. The resolution laid down the basis on which the costs of these services are to be borne. It also provided that such assistance should not be a means of foreign economic or political interference. The Secretary General was requested to report to the Economic and Social Council on measures taken under this scheme.

In a third resolution to aid underdeveloped countries, the Assembly requested the International Labour Office to consider how best to facilitate the admission to world training centers of technical workers and other qualified personnel from these countries.

Turning to the needs of one particular underdeveloped region, the Assembly in a further resolution asked the Economic and Social Council to expedite consideration of the Establishment of an Economic Commission for the Middle East.

A resolution on wastage of food was adopted by the Assembly on December 8. The resolution put the blame for the present undernourishment of large numbers of people on insufficient production, wastage, war-devastation, underdevelopment of large areas, lack of purchasing power, and fear of unstable prices. To remedy this situation, the Assembly declared that steps should be taken, especially in underdeveloped and war-devastated countries, to raise productivity, avoid losses, and improve marketing and distribution. Second, burdensome taxes which hamper sale and consumption of foodstuffs must be reduced appreciably. Further, the resolution pointed out, profiteering in the marketing of essential foodstuffs is an obstacle to equitable distribution.

The Assembly invited Member States to give high priority to measures to remove these difficulties. It called on the Economic and Social Council, in consultation with the FAO and other specialized

agencies, to continue efforts to improve world food production and trade. In doing so, the Assembly resolution urged that special consideration should be given to the technical, financial, and supply problems of underdeveloped and war-devastated countries. Other measures to raise the nutrition levels of undernourished population groups should also be studied.

On November 19, the Assembly unanimously adopted plans for a \$29.5 million voluntary relief program for over half a million Palestinian refugees, made homeless by the fighting in the Holy Land. The Secretary General was authorized to advance up to \$5 million from the United Nations working capital fund, in order to launch as soon as possible a campaign for voluntary contributions, either in money or in kind. Contributions will also be accepted from non-Member States.

The Assembly appealed further for active co-operation from such specialized agencies as the World Health Organization, the International Refugee Organization, the Food and Agriculture Organization, and other appropriate international agencies. To plan and administer the program, the Assembly created the new post of Director for the United Nations Palestine Refugee Relief. To this position the Secretary General appointed on December 4, Stanton Griffiths, United States Ambassador to Egypt, who assumed his duties immediately.

The subject of a Declaration of Old Age Rights came briefly before the Assembly on a resolution from its Third Committee. The representative of Argentina had introduced the matter by proposing a draft resolution. The Committee decided to communicate the draft to the Economic and Social Council for study and report. This was agreed to by the Assembly on December 4.

The General Assembly on November 18 recommended that the Economic and Social Council continue its examination of the activities of the organs having responsibilities in the field of coordination, with a view to suggesting further improvements and the possibility of restricting to a minimum consistent with efficiency the number of specialized agencies in the framework of the United Nations.

The Assembly at the same time requested the Secretary General, in consultation with the Advisory Committee on Administrative and Budgetary Questions and the Administrative Committee on Coordination, to continue the efforts further to improve administrative and budgetary coordination between the United Nations and the specialized agencies, including consideration of the possibility of developing a joint system of external audit and for common collection of contributions.

Trusteeship Questions and Matters Affecting Non-Self-Governing Territories. On November 18, the General Assembly approved 4 resolutions dealing with trusteeship questions. In the first resolution, the Assembly took note of the Trusteeship Council's report, and recommended that the Council consider at its next session the comments and suggestions made during the Assembly's discussion of this report.

The second resolution dealt with administrative unions affecting Trust Territories. The resolution noted that the Trusteeship Agreements for some Trust Territories authorize the Administering Authority concerned to constitute the Territory into a customs, fiscal, or administrative union or federation with adjacent territories under its sovereignty or control. The resolution recalled, however, that the Assembly approved these Agreements on the assurance of the Administering Authorities that the unions would not involve annexation of the

Trust Territories in any sense or have the effect of extinguishing their status. The resolution then recommended five measures for the Trusteeship Council to undertake. The Council is to investigate in all its aspects the question of administrative unions with special reference to unions already constituted or proposed, and in the light of the terms of Trusteeship Agreements and the assurances given by the Administering Authorities in this connection.

In the light of this investigation, the Council is to recommend such safeguards as it may deem necessary to preserve the distinct political status of the Trust Territories. Whenever appropriate, an advisory opinion may be requested of the International Court of Justice as to whether such unions accord with the Charter and the Trusteeship Agreements. The Council is to invite the Administering Authorities to make available to the Council such information relating to administrative unions as will facilitate the investigation by the Council. Finally, the Council is to report to the next regular Assembly session on the result of its investigations and on action taken.

The third resolution dealt with educational advancement in Trust Territories. The resolution took note of the plans of the Administering Authorities to extend educational facilities in their respective Territories. The Assembly recommended that the Trusteeship Council propose to the Administering Authorities that primary education should be free and that access to higher education should not be dependent on means. Among other things, the Council was requested to study a further expansion of existing facilities for higher education in Africa, including the possibility of establishing a university in 1952 to meet the needs of the inhabitants of the Trust Territories in Africa.

In the fourth resolution, the Assembly recommended that the Administering Authorities take all measures to improve and promote the political, economic, social, and educational advancement of the inhabitants of Trust Territories. It also recommended that they take all possible steps to accelerate progressive development towards self-government or independence.

On November 3, the Assembly adopted a number of resolutions dealing with information from non-self-governing territories. The Assembly reconstituted the Special Committee to examine information transmitted under Article 73 (e) of the Charter. Such a committee functioned in 1948. The Assembly decided that a similar body should meet in 1949—not later than three weeks from the opening of the next regular session—and charged it with examining and reporting on the information received. The Special Committee is composed of the following elected members: Brazil, China, the Dominican Republic, Egypt, India, Sweden, the U.S.S.R., and Venezuela; and the following Members transmitting information: Australia, Belgium, Denmark, France, the Netherlands, New Zealand, the United Kingdom, and the United States.

Another resolution, initiated by India, noted that in respect of certain non-self-governing territories, the Member States concerned did not transmit information in 1947 or 1948 and have not furnished any explanation of the omission. The resolution welcomed any development of self-government which might have taken place but added that it was essential that the United Nations should be informed of any change in constitutional position and status as a result of which the government responsible thought it unnecessary to transmit information. The Members concerned were therefore requested by the resolution to give the Secretary

General full information on such constitutional changes.

Another resolution adapted and amplified earlier resolutions in order to secure the most up-to-date information and avoid duplication. It also set up a new system for the Secretary General's summaries and analyses of the information. In two other resolutions the Assembly adopted recommendations for closer liaison between the Special Committee and the Economic and Social Council, and for the counsel and assistance of the specialized agencies.

The future of South-West Africa was discussed in the Assembly for the third year in succession. In a resolution adopted on November 26 by 43 votes to 1, with 5 abstentions, the Assembly maintained its earlier position that South-West Africa should be brought within the Trusteeship System. It noted with regret that the Union of South Africa had not complied with the recommendation to this effect first made in 1946 and reaffirmed in 1947.

The resolution further took note of the Union Government's statement that it would continue to administer the Territory in the spirit of the League of Nations mandate. It also noted the Union Government's assurances that its proposals for closer association between South-West Africa and South Africa did not mean incorporation and would not mean absorption of the Territory by the administering authority. The resolution recommended, too, that until it reaches an agreement with the United Nations on the future of South-West Africa, the Union Government should continue to furnish information about the Territory annually. The Trusteeship Council was requested to continue to examine such information and to submit its observations on it to the General Assembly.

Administrative Questions. The General Assembly adopted the annual budget and scale of contributions for 1949, approved supplementary estimates for 1948, and maintained the Working Capital Fund at \$20 million. It accepted the financial report and accounts for the financial period ended Dec. 31, 1947, for the United Nations and for the International Children's Emergency Fund, and it took note of the second annual report of the Staff Benefit Committee to the Assembly.

It requested the Secretary General to pursue the inquiries and negotiations which he had already initiated with respect to the idea of establishing a United Nations postal administration—which the Assembly approved in principle—and requested him to present a report to the next regular session of the Assembly. It noted with approval the progress made by the Secretary General in the field of geographical distribution of the staff, and adopted—beginning Jan. 1, 1949—a staff assessment plan.

The Assembly approved in principle the establishment of a United Nations telecommunications system and authorized the Secretary General to present to the Assembly at its regular session of 1950 such recommendations as he deems necessary to establish such a system.

It approved the Agreement between the Secretary General and the Director General of the United Nations Relief and Rehabilitation Administration relating to the transfer to the United Nations of the residual assets and activities of UNRRA, entered into on Sept. 27, 1948. It also resolved that the credits in the amount of \$10,809,529 arising from the transfer of the assets of the League of Nations to the United Nations should be made available to the Member States designated by the League of Nations in the percentages determined by the League of Nations.

The Assembly noted with satisfaction the con-

clusions of the Loan Agreement (approved by the Congress of the United States and signed by the President in August) for \$65 million between the United Nations and the United States, and expressed its appreciation of the cooperation extended by the Government of the United States, the State of New York, and the City of New York. The Secretary General was requested to report to the fourth regular session on the progress of the construction of the headquarters.

The Assembly resolved that an International Center for Training in Public Administration should be established under the direction of the United Nations. It requested the Secretary General to report detailed arrangements for such a center to the Economic and Social Council for consideration, and requested him to include in his budget estimates for the financial year 1950 a program implementing the objectives of the resolution.

Finally, the Assembly resolved that Spanish be included as a working language of the Assembly.

Legal Questions. What Dr. Evatt, President of the Assembly, described as "a significant advance in the development of international criminal law" was made on December 9, when, at a plenary meeting, the Assembly gave unanimous approval to the Convention on Genocide. The vote was 55 to 0, with no abstentions.

The Convention outlaws genocide as a crime under international law, whether it is committed in time of peace or in war. It binds the Contracting Parties to enact the necessary legislation both to prevent and punish the crime; defines genocide (destruction, in whole or in part, of a national, ethnical, racial, or religious group), and makes the crime itself as well as conspiracy, incitement or the attempt to commit it, or complicity in the act, punishable. The Contracting Parties further pledge themselves to grant extradition, if necessary, in accordance with their laws and treaties in force. This Convention was signed by 20 States, subject to ratification, on December 12.

The Assembly further approved a resolution inviting the International Law Commission (see below) to study the question of establishing an international judicial organ for the trial of those charged with genocide, giving particular attention to the suggestion of establishing a Criminal Chamber of the International Court of Justice.

In a second resolution, the Assembly recommended Parties to the Convention which administer dependent territories to take measures to extend the provisions to those territories as soon as possible.

The Assembly on November 18 voted to transfer to the United Nations the functions and powers exercised by the League of Nations under the international convention relating to economic statistics. The resolution approved the Protocol, and urged Member States who were parties to the 1928 League Convention to sign the Protocol and give effect to its provisions. The draft resolution contained a paragraph which directed that no action on this subject should be taken relating to Spain so long as the Franco Government is in power. This provision was deleted, however, on an amendment by Argentina, the voting being 21 to 14, with 13 abstentions. Many representatives who voted for the amendment explained that they had done so on technical grounds, Spain not having been a signatory of the League Convention of 1928.

On December 3, the Assembly, by unanimous decision, transferred to the United Nations certain functions in regard to the suppression of traffic in

women and children and in obscene literature. Previously, these functions of a secretarial character were exercised by the French Government in accordance with international agreements and conventions devised in 1904 and 1910.

Under the Charter, all Member States are obligated to register with the Secretariat every treaty and international agreement entered into by them after the coming into force of the Charter. At the last regular session, the Assembly drew attention to the Members of this obligation. Six hundred and fourteen treaties or international agreements, submitted by 22 Governments, and two specialized agencies, had been received, the Secretary General reported, as of July 1, 1948.

On November 3, the Assembly unanimously noted that relatively few treaties and other international agreements had been registered to date, and that less than half of the Members had registered any treaties or agreements. It requested each Member to take immediate steps to fulfil its obligation under the Charter. In a second resolution, the Assembly instructed the Secretary General to take all necessary steps to ensure that registered treaties or agreements be published with the least possible delay, and that the translations reach the highest possible level of accuracy and precision.

On October 16 the Assembly passed a resolution initiated by Argentina, inviting the Secretary General of the Organization of American States to attend all future sessions of the General Assembly as an observer.

The General Assembly on December 3 adopted two resolutions regarding permanent missions to the United Nations. The first of these noted that since the creation of the United Nations the practice developed of establishing at the seat of the organization permanent missions of Member States. In order to regulate the submission of credentials of permanent representatives, the Assembly recommended that the credentials of the permanent representatives should be issued either by the head of the State, or by the head of the Government, or by the Minister of Foreign Affairs, and should be transmitted to the Secretary General.

The second resolution instructed the Secretary General to study all questions relating to permanent missions, including those to the European Office, and, if necessary, to report on this subject to the next regular Assembly session.

The General Assembly on December 3, taking into consideration the series of tragic events which had lately befallen agents of the United Nations in the performance of their duties, decided to submit the following two questions to the International Court of Justice for an advisory opinion: (1) Does the United Nations have the legal capacity to bring an international claim against a State for damages caused to the United Nations, and to the victim or to persons entitled through him? and (2) If the United Nations can claim for damages to the victim, how is its claim to be reconciled with the rights of the State of which the victim is a national? The Assembly asked the Secretary General to report to the next session with proposals prepared in the light of the Court's opinion.

Twenty-four countries, the Secretary General reported at the beginning of the session, had acceded to the Convention on Privileges and Immunities of the United Nations. The Assembly on December 8, again urged Member States to approve the provisions of the Convention. Unanimous approval is essential, the resolution declared, if the United Nations is to achieve its purpose and perform its functions effectively. The Assembly also noted with

satisfaction the Secretary General's account of steps taken to bring into force the agreement between the United Nations and the United States on the Permanent Headquarters.

On December 11, the Assembly approved agreements to enable officials of three specialized agencies—ICAO, UNESCO, and FAO—to use the United Nations *laissez-passer* for official travel.

On November 3, the Assembly elected the following persons to serve a three-year term on the International Law Commission: Gilberto Amado (Brazil); Shuhsi Hsi (China); Jesus Maria Yepes (Colombia); Jaroslav Zourek (Czechoslovakia); Georges Scelle (France); Jean Spiropoulos (Greece); Sir Benegal Rau (India); Roberto Cordoba (Mexico); J. P. A. François (Netherlands); Ricardo Alfaro (Panama); A. E. F. Sandström (Sweden); Faris Bey el-Khoury (Syria); Vladimir Koretsky (U.S.S.R.); James Leslie Brierly (United Kingdom); and Manley Hudson (United States).

THE SECURITY COUNCIL

The Security Council is charged with the primary responsibility for the maintenance of international peace and security. According to the Charter, the Council may investigate any disputes which might threaten the maintenance of international peace and security and may make recommendations on appropriate procedures or actual terms of pacific settlement of such disputes. It is to determine the existence of any threat to the peace, breach of the peace, or act of aggression, and may take enforcement measures such as interruption of economic relations and severance of diplomatic relations or action by land, air or sea forces. The Council consists of 5 permanent members and 6 non-permanent members.

Each member of the Security Council has one vote. Decisions of the Security Council on procedural matters are made by an affirmative vote of 7 members. Decisions on all other matters are made by an affirmative vote of 7 members including the concurring votes of the permanent members; provided that a party to a dispute shall abstain from voting in decisions on pacific settlement of the disputes.

During 1948 the Security Council considered the following major questions:

Palestine Question. Following the General Assembly's approval, in November, 1947, of the plan to partition the Holy Land into Jewish and Arab States with an international regime for Jerusalem, the three units to be linked in economic union, tension between Arabs and Jews mounted in Palestine. The five-member Palestine Commission set up by the Assembly encountered increasing difficulties. Appearing before the Security Council on February 18, the Chairman of the Commission declared that unless an international force in effective strength could be provided, Palestine would, when the British left on May 15, become a scene of widespread strife and bloodshed.

On March 19 the United States submitted to the Security Council a proposal for a temporary trusteeship for Palestine under the Trusteeship Council, and a suspension of the efforts by the United Nations Palestine Commission to implement partition. A special session of the General Assembly was to be called to consider the Trusteeship proposal. The proposal to call a special session of the Assembly was adopted by the Council on April 1 (see above).

Shortly after the new State of Israel was proclaimed, a war which threatened to spread through-

out the Middle East engulfed that area. The Security Council intervened and ordered a truce in Palestine for a month. The truce became effective on June 11. Following the expiration of this first truce, there was a resumption of active hostilities in Palestine, which, however, was brought to a halt by a Security Council order on July 15 of a second truce of indefinite duration. The Council, in ordering its second truce, invoked, for the first time, Chapter VII of the Charter, declaring that failure by any of the governments or authorities concerned to comply with the truce would demonstrate the existence of a breach of the peace. It thus implied the use of sanctions or of military force against any violator of the truce.

In the attempt to preserve peace in Palestine, various United Nations officials lost their lives, including the Mediator Count Bernadotte, who was assassinated in Jerusalem on September 17. The General Assembly at its Paris session established in December a Conciliation Commission for Palestine (see above).

Hostilities broke out anew in southern Palestine on December 22. The Security Council on December 29 adopted a United Kingdom resolution ordering an immediate cease-fire in the Negeb area of southern Palestine. At the same time, the Council instructed its Committee on Palestine, which it had appointed in November, to meet at Lake Success on January 7 to consider the situation in southern Palestine and report to the Council on the extent to which the governments concerned had by that date complied with the Council's resolutions.

Berlin Question. In separate, but similar notes, the Governments of France, the United Kingdom, and the United States in October asked the Security Council to consider what they described as the blockade of Berlin by the U.S.S.R. and to bring about an ending of this situation. The matter was placed on the agenda in spite of the protest of the U.S.S.R. that the Berlin Question was beyond the competence of the United Nations and that it resulted from the non-observance of certain international obligations of the Western Powers.

A draft resolution was presented to the Council by the "neutral" members (Argentina, Belgium, Canada, China, Colombia, and Syria). It called upon France, the United Kingdom, the United States, and the U.S.S.R. to put into effect simultaneously the steps required for the fulfillment of the following measures: an immediate removal by all parties of all restrictions on communications, transport, and commerce between Berlin and the Western zones of Germany, and the restrictions on transport and commerce to and from the Soviet zones of Germany, an immediate meeting of the four Military Governors to arrange for the unification of currency in Berlin on the basis of the German mark of the Soviet zone; and a reopening of the negotiations in the Council of Foreign Ministers on all outstanding problems concerning Germany as a whole. This draft resolution, however, did not receive the support of the U.S.S.R., and was therefore not adopted.

From this it appeared that the main stumbling block to a settlement of the Berlin question was the currency problem. In an effort to solve the problem, Dr. Juan Bramuglia, President of the Security Council in December, acting in behalf of the "Six Neutrals," submitted to the four governments involved a proposal to solve the currency problem. The four governments on December 1, announced their acceptance of the proposal, that called for the creation of a committee of six financial experts—composed of representatives of the

"Six Neutrals"—which would meet in Paris during December to consider ways and means of establishing a single currency for Berlin. The committee was authorized to consult financial experts of the four occupation authorities of Germany, and was to submit its recommendations to the Security Council within 30 days.

Indonesian Question. As a result of negotiations carried on by the Security Council's Committee of Good Offices in Indonesia, a truce agreement between the Netherlands and the Republic of Indonesia was signed on January 17 aboard the U.S.S. *Renville*. Immediate and simultaneous cease-fire and stand-fast orders were issued to the forces of the two parties. At the same time both parties agreed to 12 political principles and, two days later, to 6 additional principles. These 18 principles were to form the basis for an attempt to settle the dispute in the islands of Java, Madura, and Sumatra. Agreement by both parties concerned to settle their differences peacefully, however, was not reached, and hostilities broke out anew toward the end of the year.

The resumption of hostilities in the latter part of December led to an emergency meeting of the Security Council in Paris. After several motions for stronger Council measures, including a resolution calling upon the parties concerned to withdraw their armed forces behind the demilitarized zones established by the truce agreement, were defeated, the Security Council on December 24 voted to call upon the Netherlands and the Indonesian Republic to cease hostilities immediately and asked for the immediate release of the president of the republic and other political leaders arrested by the Dutch.

At another meeting of the Council on December 29, the Dutch spokesman declared that the Netherlands Government, although it challenged the Council's competence in what it regarded as a domestic affair, promised to order a cease-fire in Java as of midnight, December 31, and in Sumatra a few days thereafter. He also declared that the detention of Republican leaders was a logical consequence of the military operations. He stated that since hostilities would shortly come to an end, the Netherlands Government would thereupon lift restrictions on the movements of the Republican leaders on the understanding that the persons concerned would refrain from activities endangering public security. He further declared that in order to rebuild cooperation in all of Indonesia, the Dutch Prime Minister would leave for Indonesia in a few days.

India-Pakistan Question. A dispute between India and Pakistan, involving in its most serious aspect the State of Jammu and Kashmir, was brought to the attention of the Security Council in January, 1948, by India. India charged that hostile tribes from outside the State were receiving aid from Pakistan in their invasion of Jammu and Kashmir, creating a situation fraught with the utmost danger. The main point at issue, it developed, was whether the State, whose princely ruler had opted for accession to India, should accede to that State or to Pakistan.

The Security Council, after first calling upon India and Pakistan to take all measures within their power to improve the situation and to refrain from making statements or from permitting acts which might aggravate the situation, on January 20 established a Commission for India and Pakistan composed of representatives of Argentina, Belgium, Colombia, Czechoslovakia, and the United States to bring about a cessation of hostilities in the area and to prepare the way for a plebiscite to determine

PALAIS DE CHAILLOT in Paris, the meeting place of the United Nations, is shown in a high view from the Eiffel Tower. Representatives of 58 nations met here in 1948 for the Third Session of the United Nations General Assembly.

whether the people of Jammu and Kashmir wished to join India or Pakistan.

The Commission on August 13 resolved to submit simultaneously to India and Pakistan proposals for a cease-fire order and a truce agreement. As 1949 dawned, India and Pakistan reported agreement on the mechanics of a plebiscite to be held in Jammu and Kashmir under United Nations auspices and ordered an immediate cease-fire. War on the subcontinent was thus averted.

Czechoslovak Question. The representative of Chile on March 12 asked the Security Council to examine the charges leveled against the Government of the U.S.S.R. two days previously by the then permanent representative of Czechoslovakia, Mr. Jan Papanek. Mr. Papanek, subsequently replaced as permanent representative of Czechoslovakia, had charged the U.S.S.R. with gross interference in the internal affairs of his country, and had asked the Council to consider the matter.

The Chilean request was admitted to the Council's agenda on March 17, by a vote of 9 to 2, the representative of the U.S.S.R. calling the charges a gross libel on his government and a pure product of the imagination, and consequently voting against admitting the matter to the agenda. The charges were repeated and elaborated by Mr. Papanek, who had been invited to the Council table over the objections of the Soviet and Ukrainian representatives. They were denied once more by the U.S.S.R. representative. The Czechoslovak Government later declined to accept an invitation, adopted by the Council, to attend Council meetings in connection with the matter.

A draft resolution, calling for the establishment of a Council Committee to gather evidence and receive testimony, was vetoed by the representative of the U.S.S.R. when it was put to the vote on May 24. The representatives of France, the United Kingdom, and the United States, characterizing the Soviet vote as an abuse of the veto privilege, announced to the Council that they would be prepared to obtain statements from Czechoslovak refugees who had relevant information and that they would make such statements available to the Council at a later time. No further action was taken, but the matter remains on the Council's agenda.

Hyderabad Question. Among the unfinished items on the Security Council's agenda is the question of Hyderabad. In placing the matter on its agenda in September, at the request of Hyderabad, the Council expressly declared that in so doing it was not deciding the question of its own competence to deal with the issue. Indian troops crossed the frontiers of the princely State of Hyderabad to put an end, according to the Indian Government's announcement, to a reign of terrorism and to reestablish law and order.

The Nizam of Hyderabad subsequently surrendered, dismissed the Cabinet which had filed the complaint against India with the Security Council, and asked that the case be withdrawn. This request for withdrawal of the case was supported by India, which had, from the beginning, denied the competence of the Council to deal with the matter, on the grounds that it was a domestic Indian issue. The Council, however, decided to retain the matter on its agenda for the time being.

Appointment of a Governor of the Free Territory of Trieste. The Security Council on Jan. 10, 1947, approved the annexes to the Peace Treaty with Italy, relating to the creation and government of the Free Territory of Trieste, including an arrangement for a free port. The Council thus accepted the responsibility of insuring the independence and

integrity of the Free Territory of Trieste, including the responsibility of appointing the Governor. The Council members, however, were unable in 1948 as in 1947, to agree on a candidate for the governorship, so that the post remained vacant.

The Question of the Free Territory of Trieste. The representative of Yugoslavia in August charged that the Anglo-American agreements with Italy regarding the Free Territory of Trieste were violations of the Italian Peace Treaty since they aimed at incorporation of the Anglo-American Zone of the Territory into the Republic of Italy. He submitted a draft resolution to the Council, supported by the representative of the Ukrainian S.S.R., calling for those agreements to be declared null and void.

The representative of the Ukrainian S.S.R. submitted a draft resolution to the Council under which the Council would have declared it urgently necessary to solve the problem of the appointment of a governor for the Free Territory. The representatives of the United States and the United Kingdom called the Yugoslav charges flimsy and unwarranted, and the Council on August 19 rejected both the Yugoslav and the Ukrainian resolutions.

Admission of New Members. The Union of Burma on Feb. 27, 1948, applied for membership in the United Nations. The Security Council on April 10 and the General Assembly on Apr. 19, 1948, decided in favor of Burma's admission, which became effective on the latter date.

Also on April 10, the Security Council reconsidered the applications of all States it had previously failed to recommend for membership (Albania, Austria, Bulgaria, Finland, Hungary, Ireland, Italy, Mongolia, Portugal, Roumania, and Transjordan). Only Italy's application was voted on. It received 9 affirmative votes, but because of the negative vote of a permanent member (U.S.S.R.), it was not approved. The consideration of the remaining applications was postponed.

The Security Council on August 18 rejected, because of the adverse vote of a permanent member, a Chinese proposal to recommend the admission of Ceylon to the United Nations. The vote was 9 in favor to 2 against (Ukrainian S.S.R. and U.S.S.R.).

By a letter dated November 29 from the Minister for Foreign Affairs, the Provisional Government of Israel applied for membership in the United Nations. Israel's application was rejected by the Security Council on December 17, when only 5 votes were produced in favor, with one country (Syria) voting against and 5 abstentions. According to the Charter, adoption of such a resolution needs 7 affirmative votes, including the concurring votes of the permanent members.

Acting on the resolution of the General Assembly regarding Ceylon's application for membership to the United Nations (see *General Assembly* above), the Security Council in December again considered the matter. Ceylon's application was again rejected by the Council on December 15, however, because of the negative votes of the U.S.S.R. and the Ukrainian S.S.R. The vote was 9 in favor and 2 against.

Military Staff Committee. Under Article 43 of the United Nations Charter all Members of the United Nations undertake to make available to the Security Council, on its call and in accordance with a special agreement or agreements, armed forces, assistance, and facilities necessary for the purpose of maintaining international peace and security. Article 47 of the Charter provides that a Military Staff Committee, composed of the Chiefs of Staff of the

permanent members of the Security Council or their representatives, be established to assist the Security Council on all questions related to the Security Council's military requirements, and the employment, command, and strategic direction of armed forces placed at the disposal of the Security Council.

During the year 1948 the Military Staff Committee, in accordance with directives issued by the Security Council, continued its examination of the provisions of Article 43 of the United Nations Charter from the military point of view. The question of the over-all strength and composition of the armed forces to be made available to the Security Council was also under consideration by the Military Staff Committee.

Atomic Energy Commission. On Jan. 24, 1946, the General Assembly unanimously resolved to establish a commission to deal with the problems raised by the discovery of atomic energy. This body is composed of one representative from each of the States represented on the Security Council and Canada, when Canada is not a member of the Security Council.

On May 17, 1948, the Atomic Energy Commission adopted a joint statement by France, the United Kingdom, and the United States indicating that it had reached an impasse in its work, and therefore could not prepare a draft treaty on the control of atomic energy. This statement said that the difficulties which confronted the Commission were first evidenced when the plan for the control of atomic energy, under consideration by most of the members, was rejected by the U.S.S.R., either as a whole or in its separate parts, on the ground that such a plan constituted an unwarranted infringement on national sovereignty.

For its part, the U.S.S.R. insisted that a convention outlawing atomic weapons and providing for the destruction of existing weapons must precede any control agreement. The majority of the Commission considered that such a convention, without safeguards, would offer no protection against non-compliance.

Because of the failure to achieve agreement on the international control of atomic energy, the joint statement went on to say, the Commission concluded that no useful purpose could be served by carrying on negotiations at the Commission level. It recommended that such negotiations should be suspended until such time as the permanent members of the Commission (Canada, China, France, the U.S.S.R., the United Kingdom, and the United States) found, through prior consultation, that there existed a basis for agreement on international control.

In view of the nature of the impasse in the Atomic Energy Commission, the representative of the United States submitted a draft resolution to the Security Council on June 11, which among other things, called on the Security Council to accept the first three reports of the Atomic Energy Commission and to approve certain of its findings and recommendations.

This draft resolution was put to the vote on June 22. The result was 9 in favor and 2 against, but since one of the two opposing members (U.S.S.R.) was a permanent member of the Security Council, the resolution was not adopted. The Council then adopted a Canadian draft resolution which directed the Secretary General to transmit to the General Assembly and to the Member nations of the United Nations, the first three reports of the Commission, together with the record of the deliberations of the Security Council on this subject, as a matter of

special concern (see *General Assembly* above).

Commission for Conventional Armaments. On Dec. 14, 1946, the General Assembly adopted a resolution recommending that "the Security Council give prompt consideration to formulating the practical measures, according to their priority, which are essential to provide for the general regulation and reduction of armaments and armed forces and to assure that such regulation and reduction of armaments and armed forces will be generally observed by all participants and not unilaterally by only some of the participants." In order to work out the practical measures for giving effect to this resolution and in accordance with Article 26 of the Charter, which places upon it the responsibility for the establishment of a system for the regulation of armaments, the Security Council on Feb. 13, 1947, established a Commission for Conventional Armaments. The Commission was instructed to submit proposals to the Council within three months.

The Commission for Conventional Armaments on Aug. 12, 1948, approved two resolutions previously adopted by its Working Committee. The first resolution stated that it considered all armaments and armed forces, except atomic weapons and weapons of mass destruction, as falling within its jurisdiction. Weapons of mass destruction were defined in the resolution to include atomic explosive weapons, radioactive material weapons, lethal chemical and biological weapons, and any weapons developed in the future which have characteristics comparable in destructive effect to those of the atomic bomb or other weapons mentioned above. The Commission proposed to proceed with its work on the basis of the above definition.

The second resolution embodied a number of general principles which should govern the regulation and reduction of armaments and armed forces. The resolution stated that a system for such a regulation and reduction should provide for the adherence of all States, and that initially it must include at least all States having substantial military resources. It went on to state that such a system could only be put into effect in an atmosphere of international confidence and security. It listed the following examples of conditions essential to international confidence and security: the establishment of an adequate system of agreements under Article 43 of the Charter; the establishment of international control of atomic energy; and the conclusion of the peace settlements with Germany and Japan.

The second resolution further stated that to conform with Article 26 of the Charter, armaments and armed forces, under an effective system for their regulation and reduction, must be limited to those consistent with and indispensable to the maintenance of international peace and security, and must not exceed those necessary for the implementation of Members' obligations and the protection of their rights under the Charter. To ensure observance, such a system, it was stated, must include adequate safeguards, including an agreed system of international supervision. Finally, the resolution stated that provision should be made for effective enforcement in the event of violation.

The Commission, on Aug. 17, 1948, completed a paragraph-by-paragraph study of its second report to the Security Council, in the course of which some amendments were made. No vote was taken on the report but the Commission was agreed that if no delegation requested a final reading before September 15, the report would be considered as approved. On September 14, however, the U.S.S.R. informed the Commission that it could not agree with the draft of the Commission's report. (For

further developments, see *General Assembly*, above.)

ECONOMIC AND SOCIAL COUNCIL

The Economic and Social Council, operating under the authority of the General Assembly, initiates studies and makes recommendations with respect to international economic and social matters; promotes respect for, and observance of, human rights and fundamental freedoms; prepares draft conventions and calls international conferences with respect to matters falling within its competence. It enters into agreements with specialized agencies and coordinates the policies and activities of such agencies. The Council consists of 18 members elected by the General Assembly for three-year terms. During the year the Council held two sessions—its sixth and seventh. Some of the major economic and social problems tackled by the Economic and Social Council and its subsidiary bodies are summarized below.

One of the essential activities of the United Nations in the economic field is the preparation of surveys and reports on the basis of which action can be taken or recommended. Among the economic reports prepared by the Secretariat during 1948 were a report on the salient features of the world economic situation from 1945 to 1947, a survey of the economic situation and prospects of Europe, and an economic survey of Asia and the Far East in 1947.

The work of the regional economic commissions has been outstanding. The Economic Commission for Europe, established in March, 1947, has now built up its organizational structure so as to deal with many problems of shortages which hamper the recovery of European trade. Although much of its work has been concentrated on the collection and exchange of information, its work has in some fields resulted in increased production. As an example, the Commission, late in the year, reported that one of the major bottlenecks in steel production—the shortage of coke—had been virtually eliminated.

Increases of production have also been noted in the case of fertilizers and silica bricks. The Commission through its various subsidiary bodies has also considered housing needs and programs, requirements for building materials and measures to economize the use of scarce materials; has made recommendations concerning the allocation of coal and has dealt with questions concerning mining equipment and pitwood. It has carried out studies on the coordinated development of European power resources and facilitated the negotiation of international agreements for the supply and exchange of electrical energy.

With the FAO, it is considering the problems of the European timber situation and, with the ILO, problems concerning manpower. It has also taken a number of measures to restore European inland transport facilities and to ensure their most effective use—for example, through securing a large measure of agreement on regulations governing the exchange of railway-wagons in international traffic and through securing the lifting of some of the restrictions on the freedom of the road.

The Economic Commission for Asia, established at the same time as the Economic Commission for Europe, has considered, *inter alia*, the problem of flood control, which is vital to the economy of the area in which it operates. A Bureau of Flood Control is being established which is to contain flood control experts, to provide technical advice to the Commission.

A working party of the Commission is preparing, in collaboration with the governments concerned, a survey of the economic and industrial development of the region, studying, in the first place: fuel and power, transport and transport equipment in relation to industry, fertilizers and agricultural requisites, basic materials including ores and metals, textiles, and heavy engineering industries. The Commission appealed to advanced industrial nations for capital goods and basic materials needed for rehabilitation and recovery and asked the countries of its region to specify their short-term needs and their long-term plans for industrial development.

During its sixth session, the Economic and Social Council on February 25 established an Economic Commission for Latin America. The principal tasks of this Commission are to assist concerted action for dealing with economic problems arising out of the war, for raising the level of economic activities of the countries of Latin America, and for maintaining and strengthening the economic relations of Latin American countries, both among themselves and with other countries of the world. The Commission held its first session in Santiago de Chile in June. Among other things, it requested its Executive Secretary to present to its next session an economic survey of Latin America and to make a preliminary study of the needs of Latin American countries for technical and administrative personnel, means and facilities, and their present availability.

As part of its statistical activities, the Statistical Commission, in order to meet the most pressing needs and especially those which national governments will face in their plans for the censuses of agriculture and population in 1950 census programs, is studying means whereby technical advice and assistance may be rendered to national governments with a view to developing more adequate statistics and improving the comparability of data available to international organizations.

Three types of statistical publications arise out of the work of the Statistical Office of the United Nations as part of its program in the collection and publication of statistics and the development of statistical standards. The first consists of economic and social statistics of current interest of international organizations and Members of the United Nations published in the *Monthly Bulletin of Statistics*. A second type of statistics covering a much wider field of statistics is collected by the United Nations and published in the *Statistical Yearbook* and the *Demographic Yearbook*. The third type arises out of the specific projects of research or special studies. Such studies include a report on *National Income Statistics of Various Countries 1938-1947*.

Following a recommendation of the Transport and Communications Commission, a United Nations Maritime Conference met in Geneva from February 19 to March 6. The Conference prepared and opened for signature and acceptance a Convention, providing for the establishment of the Intergovernmental Maritime Consultative Organization.

Another conference held in 1948 was the United Nations Conference on Freedom of Information which met at Geneva from March 23 to April 21. The Conference prepared the following three Draft Conventions: (1) Draft Convention on the Gathering and International Transmission of News; (2) Draft Convention concerning the Institution of an International Right of Correction; and (3) Draft Convention on Freedom of Information. The Con-

ference also adopted a number of resolutions grouped under the following headings: (1) general principles; (2) measures to facilitate the gathering and international transmission of information; (3) measures concerning the free publication and reception of information; (4) continuing machinery to promote the free flood of information; (5) miscellaneous, and (6) possible modes of action by means of which recommendations of the Economic and Social Council can best be put into effect.

Still another conference held was the United Nations Conference on Trade and Employment which met at Havana, Cuba, from Nov. 21, 1947, to Mar. 24, 1948. The Conference drew up the Havana Charter for an International Trade Organization.

The International Children's Emergency Fund, under the jurisdiction of the Economic and Social Council, is now bringing a supplementary meal to over 4 million children and nursing or pregnant mothers in various European countries. It has embarked, in collaboration with the WHO and the Danish Red Cross and its Scandinavian associates, upon an antituberculosis vaccination program which will cover more than 50 million children in Europe alone. The Fund is also starting an antivenereal disease project and a regional malaria-control project for children and mothers. The Fund's feeding program in Asia is well under way, and it has sent supplies for Arab and Jewish refugee children in the Near East.

A United Nations Appeal for Children was launched in 1948. This Appeal, which is a worldwide appeal for funds for children, adolescents, and nursing and expectant mothers, by the beginning of December passed the \$30 million mark in worldwide contributions. Fifty countries and 28 Non-Self-Governing Territories participated in the Appeal during 1948. Through its Advisory Social Welfare Program the United Nations continued to provide consultants, fellowships, prosthetic appliances, literature, and films; it also held special welfare seminars at the request of Member Governments.

At its second session, held at the headquarters of the United Nations in January, 1948, the Commission on the Status of Women noted with satisfaction that, since its first session, Argentina and Venezuela had granted women full political rights, and it expressed the hope that plans for similar action by Costa Rica, Colombia, Peru, and Chile might be completed as soon as possible.

Other actions initiated by the Economic and Social Council or its subsidiary bodies were successfully brought to an end by the General Assembly. Among these may be mentioned the Universal Declaration of Human Rights, the Convention on Genocide, and the protocol extending existing conventions for the control of traffic in narcotic drugs to include new synthetic products.

TRUSTEESHIP AND NON-SELF-GOVERNING TERRITORIES.

Under Chapters XI, XII, and XIII of the Charter, the work of the United Nations in the field of Non-Self-Governing Territories falls into two categories: (1) the duties and functions of the Trusteeship Council with respect to those territories placed under the Trusteeship System; and (2) the responsibility of the Secretary General in connection with information on all Non-Self-Governing Territories other than Trust Territories.

Trusteeship Council. In pursuance of a resolution adopted by the General Assembly on Dec. 14, 1946, the Trusteeship Council was constituted as a

principal organ of the United Nations. The last such organ to come into existence, it convened for its first session at Lake Success on Mar. 26, 1947.

The administration of Trust Territories is subject to the supervision of the United Nations. Administering Authorities are required to render, from year to year, an account of their stewardship to the Trusteeship Council, and the latter, after examining these accounts, may make suggestions for improvements. In addition, the Council may entertain petitions from private persons or organizations regarding conditions in the Trust Territories and may dispatch regular or special visiting missions to these regions for studying conditions at first hand.

As at present constituted, the Council consists of 12 members. Australia, Belgium, France, New Zealand, the United Kingdom, and the United States are members by virtue of their being Administering Authorities. Two countries, namely China and the U.S.S.R., hold membership by virtue of being permanent members of the Security Council but not administering Trust Territories. The other 4 members—Costa Rica, Iraq, the Philippines, and Mexico—were elected for three-year terms by the General Assembly in accordance with Article 86, paragraph 1(c) of the Charter.

During 1948 the Trusteeship Council examined in detail reports on conditions in the Trust Territories of New Guinea, administered by Australia; Ruanda-Urundi, administered by Belgium; and Tanganyika, administered by the United Kingdom. Measures for the improvement of various aspects of life in those territories, whose total population is close to 9 million people, were proposed by the Trusteeship Council.

Among the many petitions considered by the Council was one from the Ewe people, a tribe whose members now are divided by the boundary lines of Togoland under French administration, Togoland under British administration, and the British Gold Coast. The Ewe, who were represented before the Council by one of their members to support their written petition, asked that the division of their tribe be brought to an end and that they be permitted to live under a single administration. The Council took note of a program worked out jointly by France and the United Kingdom to improve the position of the Ewe. At the same time the Council decided to take up the question again after hearing from a regular visiting mission of its own which would study the Togoland region in 1949.

Two special questions had been referred to the Council by the General Assembly: the problem of South-West Africa and that of Jerusalem. South-West Africa is a former German colony whose administration as a Mandated Territory had been entrusted to the Union of South Africa by the League of Nations. The Assembly had repeatedly requested the Union Government to place South-West Africa under the International Trusteeship System. The Union Government, however, declared itself unable to comply with this request. The Assembly had further decided that the report submitted on South-West Africa by the Union Government should be examined by the Trusteeship Council. This duty the Council discharged in 1948 (see also *General Assembly* above).

Under the original partition resolution on Palestine, the Assembly in November, 1947, had, among other things, asked the Trusteeship Council to prepare a Statute for the City of Jerusalem which was to have been placed under an international regime. When the Assembly held its second special session, the Trusteeship Council notified it that it had pre-

pared such a Statute, and asked the Assembly for further instructions. As no such instructions were given, and because of the changed conditions in the area, the Trusteeship Council did not formally adopt the Statute, nor did it take any further action on it.

The Council sent out its first Visiting Mission to inspect conditions in Ruanda-Urundi, Belgian Trust Territory in East Africa; and in Tanganyika, British Trust Territory. Reports of this Mission will be considered by the Council in 1949. The dispatch of a previous Visiting Mission to Western Samoa which had been sent in 1947 in response to a petition from the indigenous population led, with the cooperation of the Administering Authority of New Zealand, to a substantially increased measure of self-government for the inhabitants of that area.

Non-Self-Governing Territories. The role of the United Nations with respect to non-self-governing territories not placed under Trusteeship is much more limited. Those responsible for the administration of such territories have pledged themselves in the Charter to recognize the principle that the interests of the inhabitants of such areas are paramount and to accept, as a sacred trust, the obligations to promote to the largest possible extent the welfare of such peoples. Furthermore, the Metropolitan Powers are bound by the Charter to submit reports on all but political aspects of developments in such non-self-governing territories. While no machinery is provided in the Charter for the purpose of examining these reports, the Assembly decided in 1946 to establish a special committee for that purpose. The Special Committee met in 1947 and again in 1948, examining in the course of the latter year reports covering more than 60 non-self-governing territories. The Committee formulated a number of proposals and recommended the re-establishment of the Special Committee in 1949. These recommendations were endorsed by the Assembly (see above).

THE INTERNATIONAL COURT OF JUSTICE

The International Court of Justice is the principal judicial organ of the United Nations. It functions in accordance with its Statute, which is based upon the Statute of the Permanent Court of International Justice, and forms an integral part of the Charter. All Members of the United Nations are *ipso facto* parties to the Statute of the International Court of Justice.

The International Court of Justice in 1948 continued its study of the Corfu Channel incident. The Security Council on Apr. 9, 1947, had recommended that the dispute, which concerned an incident in which two British warships were damaged in the Corfu Channel on Oct. 22, 1946, be referred to the Court. On Mar. 25, 1948, the Court delivered a judgment rejecting the Albanian objection (that the United Kingdom was not entitled to refer this dispute to the Court by unilateral application) on the grounds, *inter alia*, that the Albanian Government's letter of July 2, 1947, in the opinion of the Court, constituted a voluntary and indisputable acceptance of the Court's jurisdiction.

The Court held that there was nothing to prevent the acceptance of jurisdiction, as in the present case, from being effected by two separate and successive acts, instead of jointly and beforehand by a special agreement. The Court also held that the reservations stated in the Albanian Government's letter were intended only to maintain a principle and to prevent the establishment of a precedent for the future. The Court maintained

that the reservation of Albania therefore did not enable Albania to raise a preliminary objection based on an irregularity of procedure, or to dispute thereafter the Court's jurisdiction on the merits.

Immediately after the delivery of judgment, the agents for the Albanian and United Kingdom Governments announced to the Court the conclusion between their respective governments of a Special Agreement, drawn up as a result of the resolution of the Security Council of Apr. 9, 1947, for the purpose of submitting to the Court for decision the following questions:

"1. Is Albania responsible under international law for the explosions which occurred on October 22, 1946, in Albanian waters and for the damage and loss of human life which resulted from them, and is there any duty to pay compensation?"

"2. Has the United Kingdom under international law violated the sovereignty of the Albanian People's Republic by reason of the acts of the Royal Navy in Albanian waters on October 22 and on November 12 and 13, 1946, and is there any duty to give satisfaction?"

Proceedings on the case are continuing.

The Court on May 28, 1948, delivered its first advisory opinion on the question of the admission of Members to the United Nations. By a vote of 9 to 6 the Court declared that it was of the opinion that a Member is not juridically entitled to make its consent to the admission of a state dependent on conditions not expressly provided in Article 4, paragraph 1 of the Charter, and that, in particular, a Member may not make its affirmative vote for the admission of any State subject to the admission of other States.

On July 28, Switzerland became the first non-Member of the United Nations to become a party to the Statute of the International Court of Justice.

UNITED STATES. The area of the United States proper, or the 48 States and the District of Columbia, is 3,022,387 square miles, excluding inland waters having an area of 45,259 square miles. The non-contiguous lands subject to the authority of the United States (Alaska, American Samoa, Guam, Hawaii, Panama Canal Zone, Puerto Rico, Trust Territory of the Pacific Islands, and Virgin Islands) comprise 696,721 square miles.

The population of continental United States (Sixteenth Census) April, 1940, was 131,669,275. On July 1, 1947, the population was estimated by the Bureau of the Census to be 143,382,000, and on Jan. 1, 1949, it was estimated to be 147,946,000.

On Nov. 2, 1948, the date of the national election, the population of the United States 21 years old and over, including persons in the armed forces overseas, was estimated at 94,641,000. In all States except Georgia the population 21 years old and over is the population of voting age. Women of voting age were estimated to outnumber men by about 1,670,000. The increase in the population of voting age, including persons in the armed forces overseas, between 1940 and 1948 is estimated at about 10,644,000, or about 13 percent. It represents a male increase of about 4,481,000, or nearly 11 percent, and a female increase of about 6,163,000, or almost 15 percent.

In addition to the above divisions listed in the table the United States also possesses, or claims possession of the following Pacific Islands: Baker, Howland, and Jarvis Islands, fringing the equator in mid-Pacific about 1,000 miles S.S.W. from Honolulu; Johnston Island (q.v.), Midway Islands (q.v.); Palmyra Island (q.v.), and Wake Island

(q.v.). Canton Island (q.v.) and Enderbury Island are under joint Anglo-American administration. The Security Council of the United Nations on Apr. 2, 1947, adopted the Trusteeship Agreement for the former Japanese Mandated Islands (approved by the Congress of the United States, July 18, 1947) by which the United States of America was designated as the administering authority of the Trust Territory of the Pacific Islands (land area: 715 sq. mi.; population, July 1, 1947: 50,537; seat of government: Guam). (See PACIFIC ISLANDS.)

AREA AND POPULATION OF UNITED STATES, ITS TERRITORIES AND INSULAR POSSESSIONS

^a Territory. ^b Census taken Oct. 1, 1939. ^c Panama Canal Zone leased from the Republic of Panama in perpetuity. ^d Office of the Governor.

The population 21 years old and over is generally regarded as the maximum population eligible to vote. This maximum has never been attained because it includes a large number of persons who, though old enough to vote, may not do so because they have not satisfied the requirements of citizenship, residence, registration, or payment of poll taxes. Although the alien population 21 years old and over has declined considerably from the 3,335,932 enumerated in 1940, there were still in the neighborhood of 2 million aliens of voting age in the United States on Nov. 2, 1948. Among the persons of voting age there are persons not qualified to vote because of confinement to penitentiaries, mental hospitals, and the like, and still others who reside elsewhere than in the State in which they have voting privileges. This group includes persons in the armed forces away from their place of voting residence, either in this country or abroad. Furthermore, there is an unascertainable number of persons in the District of Columbia who lack voting residence in any State.

See VITAL STATISTICS; POPULATION. For aliens, see IMMIGRATION. For populations of individual States, see the separate State articles, as: ALABAMA; ARIZONA; etc.

Agriculture. See AGRICULTURAL COOPERATION; AGRICULTURE; AGRICULTURE, U.S. DEPARTMENT OF. Chief crops, as CORN; COTTON; HAY; OATS; POTATOES; TOBACCO; WHEAT; etc.

COMMISSION; MOTOR VEHICLES; RAILWAYS; ROADS AND STREETS; WATERWAYS.

Events, 1948. The election overshadowed everything else and was a part of everything else in 1948. Otherwise, in its domestic aspects, 1948 differed only incidentally from other prosperous peacetime years. The election set the year apart, not only in its impact on the many months from January to Election Day but in its significance for the full year in both national and international affairs. In addition the election symbolized a facet of this country's way of life so cherished by Americans—the victory of the “little fellow,” and through him all the little people, and the triumph of the underdog.

No one, months after the election, was able to assert with certainty that the decisive votes had been cast for Harry S. Truman or against the Republican candidate, Governor Thomas E. Dewey of New York. In terms of issues, however, it was clear that the voters rejected what the Republicans offered and endorsed the stands on international matters and domestic affairs espoused by President Truman. The people manifestly favored the foreign policy followed by the Government. They also made it clear that it was not Franklin D. Roosevelt alone, as a vote-getting magnet, who drew the populace, but that the general philosophy of the New Deal, instead of having been weakened, was still a vital force on the American political scene. Contrary to the embarrassed poll-takers, who suffered a devastating blow by the wide inaccuracies of their predictions, the almost unparalleled upset of the election definitely marked a return to the political ideas that had swayed the nation for a decade and a half.

The cross-currents of the election process, in a free nation, pervaded all aspects of life in the United States as well as life beyond the United States. In 1948 this country reached a milestone toward which it had been moving for years, slowly and hesitantly. The nation gave evidence, through action and resolve, that its commitment to a world role was complete. The United States shouldered the responsibilities of a divided world, of the schism between the West and the East that was reflected in the continuing “cold war.” On the continents of Europe and Asia and in the forum of the United Nations, American representatives spoke out, and their words were backed by deeds and dollars. The Economic Cooperation Act came into being and the economic aid of the Marshall Plan absorbed billions of United States dollars and proved itself a potent weapon in democracy's counterattack against the push of totalitarianism.

In foreign affairs an atmosphere of tension, engendered by the struggle between the Soviet bloc and the democracies, had pervaded the nation and “war jitters” seemed to pop up every time an American cast his troubled glance beyond the borders, toward both the Atlantic and the Pacific. Yet, perhaps with repeated shock, the anxiety appeared to be dulled. The East-West conflict came to be regarded as almost an inseparable element of the international way of life—a manageable conflict that would not lead to war.

The people of the United States, in 1948, sought peace, and sought it as fervently as ever. Yet with the desire for peace the people unflinchingly supported calculated risks that might have brought on war. The decision was made and widely endorsed not to abandon the shattered nations of Europe to the onslaught of surging totalitarianism. The course, manifested without fanfare in the day-to-day operations of the Marshall Plan, was drama-

tized by the Berlin airlift, predominantly an American answer to the Russian blockade of Berlin. In other words, during the year, there grew up a wean-business approach to peace. After an internal struggle of necessity versus conscience and tradition, the country put its stamp of approval on the first peacetime draft in its history, a burgeoning Army, Navy, and Air Force, a record rearmament burden. Although, in an election year, partisan politics held the stage, party differences were subordinated in international affairs and a bipartisan foreign policy functioned with a remarkable degree of success.

America's role in the affairs of the world hinged on the strength of the United States economy. The state of the union was good. Statistically, at least, the country was riding on the crest of a wave of unprecedented prosperity. National income hit a peak of about \$211,000 million. National productivity, goods and services, was \$252,700 million. New records were set for production and employment. In terms of graphs and curves of statistical tables, the economic welfare of the country was as sound as a dollar.

But the dollar, or rather what the dollar was worth, was one of the big constants in the changing 1948 scene. Inflation on the spiral caused distress to millions. Wages went up and living costs bounded after them as prices went up in the ever-circling ascent. Housing was expensive and scarce; rents, although under control, crept up. Only at the end of the year were there signs that inflation might have spent its force, and that the browbeaten consumer might again be coming into the happy state of a sellers' market.

The domestic economy was a study of superlatives. Unemployment was virtually unknown. During the year an all-time employment peak of 63,342,000 persons was attained, in July. Corporation profits after taxes set a new record of \$21,700 million. Labor wrangled with industry over the cost of living, but strikes were at a postwar low. The year produced the biggest harvest in history, and the crop of about 3 million babies pushed the population of the United States to a new high of 148 million. The country had nearly 35 million married couples, but more than 3 million families were living "doubled up" with other families.

The year had its quota of tragedy and lightness, solemnity and gaiety—it was a characteristically good American peacetime year. In one of the worst disasters in aviation chronicles a four-engined, speedy, luxurious airliner crashed suddenly on a ridge in eastern Pennsylvania, killing 43. The city of Vanport, Ore., was wiped off by a great Northwest flood. Death took General John J. Pershing, commander of all American land forces in Europe in World War I; Charles Evans Hughes, retired Chief Justice of the United States; and Babe Ruth.

The nation's laboratories, meanwhile, produced two new antibiotic medicines—chloromycetin and aureomycin, to be added to the fight against disease along with streptomycin and penicillin. Venereal disease finally ceased to be a tabooed word and the campaign against VD was actively pushed. The most talked-of book was a treatise on the *Sexual Behavior of the Human Male*.

The headlines told of a Rockefeller heir marrying a daughter of immigrants, giving actuality to an American fable, while the utopian Shmoo zoomed from the comics into a national fancy. The New York subway, traditionally the greatest nickel pargain in the country, went up to a dime. Man flew faster than sound, without meeting himself coming back or suffering disastrous effects. The

old country store appeared in a 1948 garb, when women took to bearing the laundry, or, better still, sending their husbands, to community clusters of automatic washing machines and "Lauderettes" became the rage. The "give-away" quiz programs on the radio dominated the networks, while television passed from the experimental category to an accepted place in American life.

The Presidency. For three quarters of the year the man who sat in the White House was a thoroughly discredited individual, the butt of wisecracks from all directions. No one questioned the foregone conclusion that he was doomed to defeat, so all the heat and controversy was generated about his possible successor and the policies to be pursued by the new man. The Republican-dominated Congress ignored him; even his own Democratic party sought to jettison him for another candidate. Throughout these nine months of 1948 the President adhered steadfastly, despite mounting rebuffs from all sides, to the advocacy of his program, moving gradually from what was fundamentally a holding operation to continue generally the New Deal doctrine to the espousal of advances beyond the course of Franklin D. Roosevelt. The day after Election Day Mr. Truman, winner in a race nobody but himself was sure he could win, found himself vindicated not only in a personal triumph but in the acceptance of the policies he put forth.

Many of these policies were contained in his annual State of the Union Message of January 7, before a joint session of Congress. The President called for swift action to check "the spiral of inflation," prompt enactment of the European Recovery Program, an alleviation of a tax burden by a cut of \$40 a year a person, and the implementation of these five major goals during the next decade:

1. *Human Rights*—"Secure fully the essential human rights of our citizens," an attack against continued racial and religious discrimination supplemented by a subsequent special message. He renewed his request for statehood for Hawaii and Alaska.

2. *Human Resources*—"Protect and develop our human resources." He advocated the extension of unemployment compensation and old-age and survivors' benefits "to millions who are not now protected." He stressed the need of a national health program and a comprehensive insurance program against ill-health and insecurity. He called for the provision of "adequate education for every person," and the establishment of a new Cabinet post for health, security and education. The President asked for the immediate enactment of a long-range housing program, to reduce housing costs and provide low-cost public housing, for "in the next decade we must see that every American family has a decent home." On rents, he said that "until we can overcome the present drastic housing shortage we must extend and strengthen rent control."

3. *National Resources*—"Conserve and use our national resources by the most effective means possible"—through the stockpiling of scarce materials, battling against erosion, the expansion of reclamation, the protection and restoration of forests and the construction of more "multiple purpose" dams.

4. *Living Standards*—"Lift the standard of living for all our people." Although the average individual income had advanced more than 50 percent in the last ten years the country's objective should be a doubling of the living standard in the next decade. Price support for farm commodities should be maintained. Cooperatives should be encouraged. Extension of the school lunch and rural

electrification programs should be fostered. Over the next few years industry should invest "at least" \$50,000 million in expanded production. The minimum wage should be raised from 40 cents to 75 cents an hour. The President maintained his criticism of the Taft-Hartley Labor Relations Act.

5. *Peace*—"Achieve world peace based on principles of freedom and justice and the equality of all nations." He asserted that "we are giving and will continue to give, our full support to the United Nations." Inasmuch as the United States could be "an effective force for world peace only if it is strong," universal military training was urged. The country's assistance to Greece and Turkey was enabling them to combat "foreign pressures." The United States should lead the way and allow the entry of "many thousands of displaced persons." By the nurturing of world reconstruction, by the easing of tariff barriers, and, most important, by the global assistance program, "we are moving toward our goal of world peace."

Taking cognizance of the third party movement, led by Henry A. Wallace, that denounced the nation's international policies as "war mongering," the President said:

"We are fighting poverty, hunger and suffering. This leads to peace—not war. We are building toward a world where all nations, large and small alike, may live free from the fear of aggression. This leads to peace—not war. Above all else, we are striving to achieve a concord among the peoples of the world based on the dignity of the individual and the brotherhood of man. This leads to peace—not war."

The Chief Executive warned that inflation contained the seeds of "another depression," as both wholesale and retail prices were mounting, and requested again his anti-inflation program, including stand-by wage and price and rationing controls. His \$40 tax-cut proposal was designed to relieve taxpayers in the lower brackets, but would be compensated for by an increase in corporation taxes.

Cabinet. The Executive team, carrying out the laws of the land under the direction of the President, consisted of the following members of the Cabinet:

Secretary of State—George C. Marshall
 Secretary of the Treasury—John W. Snyder
 Secretary of Defense—James Forrestal
 Postmaster General—Jesse M. Donaldson
 Attorney General—Tom C. Clark
 Secretary of Agriculture—Charles F. Brannan
 Secretary of Labor—Maurice J. Tobin
 Secretary of Interior—J. A. Krug
 Secretary of Commerce—Charles Sawyer

Two of the Cabinet members were newcomers, Messrs. Brannan and Tobin. Mr. Brannan, Assistant Secretary since 1944 and before that an official of the department, succeeded Clinton P. Anderson, who resigned to run for the Senate from New Mexico. Mr. Tobin, former Mayor of Boston and Governor of Massachusetts, replaced Lewis Schwollenbach, who died.

Directly behind the Cabinet officers was a corps of officials that approached Cabinet status. In this group were the three armed services chiefs under the Defense Secretary—Kenneth C. Royall, Army; John Sullivan, Navy; and W. Stuart Symington, Air—and Robert A. Lovett, Under Secretary of State, who ran the department during Mr. Marshall's absences abroad on United Nations business and during his operation at the year's closing. In addition to these men there was still another group, such as Clark Clifford and John Steelman, who

were Presidential assistants and advisers and held high rank and influence in Administration circles.

The two Presidential appointments during the year that attracted the most attention were those of Paul G. Hoffman and Thomas B. McCabe. Mr. Hoffman, president of the Studebaker Corporation and one of the nation's leading industrialists, was named as chief of the Economic Cooperation Administration, handling the European Recovery Program. Mr. McCabe was appointed chairman of the Federal Reserve Board, while Marriner S. Eccles, one of the last holdovers from the New Deal era, whose financial policies were at odds with the President's advisers, was demoted to vice chairman.

The White House. During the year the White House was very much in the news, in more ways than one. A furor was stirred by President Truman's plan to construct a \$15,000 second-story porch or balcony inside the pillars of the south portico for the use of the Presidential family. The move was deplored by many on aesthetic grounds. Banknotes bearing a picture of the structure would have to be changed, and the President's use of the balcony would be very limited. The tempest subsided, the balcony was built and it made virtually no difference in the appearance of the White House. More important, however, was the closing of the White House after the election because the 150-year-old mansion was unsafe. The grand staircase was sagging, the original second-hand bricks were disintegrating and the "second floor is staying up there purely from habit." It was estimated that it would cost \$1,000,000 to make the mansion fireproof and secure.

Congress. The President made the record of the Republican Congress, selected by the voters in 1946, the predominant issue of the year, characterizing it as a "do nothing" body and the worst or almost the worst group of legislators in the nation's history. The Congress countered by assailing the stewardship of the President, the policies he had followed and advocated, and his administration of the Federal structure, and indignantly retaliated by describing Mr. Truman as the worst President in history.

Yet, despite the repeated clashes between the Executive and Legislative branches, there was not a complete deadlock legislatively. Under the aegis of Senator Arthur H. Vandenberg, Republican, of Michigan, the chairman of the Foreign Relations Committee, bipartisan support was molded for the containment of Communist totalitarianism. On the other hand, on the domestic side, aside from moves to strengthen defense, few measures pushed by the Administration were enacted. The desire to get out to the hustings and campaign and the conviction of a certain Republican victory led to the postponement of a number of social measures that had bipartisan support and might have been passed otherwise.

Legislation Enacted. The measures enacted by the second session of the 80th Congress principally served to maintain and strengthen the United States role in world affairs. Only a few of the President's economic or civil rights proposals were enacted, either in the regular session or the July 25–August 7 sitting of Congress, after its recall by the President. Taxes led the roster of domestic measures. The major legislation enacted by the 1948 session of Congress was as follows:

The Economic Cooperation Act
 Military Aid for China
 Peacetime Selective Service
 Authorization of a Seventy-Group Air Force

Voice of America Act

A restricted extension of the Trade Agreements Act

A foreign policy resolution voicing support for a united Western Europe

Limited, compromise relaxation of immigration quotas for displaced persons

A \$4,800 million tax reduction

A limited long range farm program

A compromise extension of the terms of the Atomic Energy Commission

A modified extension of rent control

A \$65 million loan for the United Nations headquarters

Of the vetoes of general legislation, as apart from private relief bills, made by the President five were overridden by the Republican Congressional majority, abetted by a substantial number of Democrats, and one was sustained. Vetoes overridden were the income tax reduction, the exemption of news vendors from social security coverage, legislation limiting old-age insurance, an appropriation measure carrying a rider transferring the United States Employment Service from Labor Department to the Federal Security Agency and a measure exempting railroad rate agreements from anti-trust statutes. The veto sustained was of a bill for investigation by the Federal Bureau of Investigation of appointees to the Atomic Energy Commission. Six of President Truman's vetoes altogether were overridden by both sessions of the Eightieth Congress, the most in one Congressional term since Andrew Johnson's day. A record was set when Congress overrode three—social security, Labor-Federal Security, and rail rates—all in one week.

During the recalled session after the conventions Congress passed a limited bank and consumer credit control bill and a bill to stimulate housing, both of which were a far cry from the President's stipulations. None of the rest of the program he submitted to the "special" session was touched, save the loan for the United Nations headquarters in New York City.

Legislation Unpassed. Although the President sought, through public pressure and special messages, to spur enactment of various measures, there is a long list of legislation that failed to be enacted, as follows:

Inflation Controls

A long-range housing program

Expanded social security

Health insurance

Aid to education

Increased minimum wage

Control of tideland oil reserves

Revision of the tax structure

Proposed outlawry of the Communist party

Legislation tightening Government loyalty tests

Legislation against lynching and against the poll tax

A proposed equal rights amendment

Universal military training

Statehood for Hawaii

Elimination of restrictions on oleomargarine

Foreign Legislation. An historic program to maintain a free world and contain the sweep of Communist Russia was embodied in the Foreign Economic Cooperation Act, enacted by Congress with unparalleled swiftness as Czechoslovakia was swept under, Scandinavia was threatened and the fate of Italy and France hung in the balance. Under the program, dedicated to European stability as an integral element of world peace, the following were authorized: \$5,300 million for the nations participating in the ERP; \$275 million for military

aid to Greece and Turkey; \$463 million for aid to China; \$20 million for rehabilitation in Trieste; \$60 million for the UN Children's Emergency Fund. A House Republican clique, using what Senator Vandenberg called "meat-axe techniques," sought to trim the program. Finally \$6,031 million was appropriated.

The Information and Educational Exchange Act of 1948 granted legislative sanction to the Voice of America overseas broadcasts and authority to the State Department to disseminate information through various media and to exchange educational data and students.

The extension of the Reciprocal Trade Agreement measure, for only one year, with modifications and impairments, instead of three years, was denounced by the Administration as a drastic blow against "the cornerstone and keystone of our foreign economic policy."

The foreign policy resolution adopted by Congress condemned the unrestrained use of the United Nations veto, but principally endorsed "the association of the United States" with collective arrangements by other nations, affecting its national security. Participation in a number of UN agencies was approved by Congress. The Senate ratified peace treaties with Italy, Rumania, Hungary, and Bulgaria. The demands of the cold war on the American taxpayer for 1948 in recovery, relief, and defense activities amounted roughly to \$20,000 million.

Inflation Legislation. Congressional committees held innumerable hearings on the problems of inflation but the mountain of labor produced what might by courtesy be called a mouse. The President wanted stand-by powers to ration and impose ceilings on commodities in limited supply, wage ceilings when necessary, certain inventory controls, and a number of other powers. Congress passed only the credit controls.

Rent. The Housing and Rent Act of 1948 was accepted by the President with the observation "I had no choice but to sign." Between April, 1942, when Federal rent control was set up, and June, 1946, rents rose slightly more than one percent. Since then rents went up about six percent, fundamentally because of the relaxations in last year's act. The new act continued the policy of relaxation, while generally holding the line for the rentals of 50 million persons in 13 million controlled housing units. The act did the following: extended the 15 percent voluntary increase provision though it barred pyramiding, decontrolled non-housekeeping rooms in private dwellings, provided for the relief of landlords able to show operating losses because of controls and permitted evictions, on 60 days' notice, for remodeling or occupancy by the landlord's family. The Emergency Court of Appeals was authorized to review differences between local rent advisory boards and the Federal Housing Expediter, administering rent control.

Housing. Congress had before it, with the backing of the President, the Taft-Ellender-Wagner long-ranging housing bill. What Congress enacted was a much weaker measure. It provided government guarantees up to 90 percent of loans to builders of apartment houses costing no more than \$8,100 per unit; guarantees up to 80 percent for construction of houses \$6,000 or less; guarantees to insurance companies for large rental projects; and guarantees for houses in the \$6,000-\$11,000 bracket. The pressing need—low-cost housing in volume—was passed over. It was estimated that the construction of new units in 1948 would be about 800,000, less than 1947's figure of 849,000 and

1925's record of 937,000. Continued high costs coupled with growing buying resistance had a definite impact on housing.

Defense Legislation. The United States military establishment—land, sea, and air—cost about \$11,750 million this fiscal year. In a special rearmament message, the President advocated quick adoption of universal military training and temporary restoration of selective service to show that the United States would “remain strong enough to support those countries of Europe which are threatened with Communist control and police-state rule.” Over Administration protests against military unbalance Congress overwhelmingly approved legislation for a 70-group Air Force. The Navy bill provided for an aircraft carrier for jet-propelled long-range planes and new anti-submarine craft.

Women's reserve units in the armed services received regular status. Legislation reforming court-martial procedure was adopted. The Army's organized reserve components were strengthened, and a number of minor actions were taken to benefit veterans of World War II.

Draft. While universal military training was left up in the air, Congress pushed through, over formidable opposition, the Selective Service Act of 1948. The measure's main provisions provided: registration by all men 18 through 25 years of age at local draft boards; the drafting of men 19 through 25 by age and birth dates rather than by a lottery; service for 21 months; voluntary one-year enlistments by 18-year-olds that would free them from subsequent service; deferments for married men, men with dependents, men with essential jobs, students of certain classes; exemption for veterans of at least 90 days' service or members of National Guard or reserve units.

The stroke of the President's pen signing the measure set in motion a wide expansion of the armed forces, designed to bring the Army, needing the bulk of the draftees, from 548,000 to 790,000; the Navy from 389,086 to 434,675; the Marine Corps from 81,723 to 89,225; and the Air Force from 382,000 to 444,500. With other legislation, the total authorized strength of the armed services was set at 2,160,200.

At the closing of the year Secretary Forrestal issued his first annual report, in which he found still a number of kinks in the unification of the armed services and urged strengthened authority for the head of the National Defense Establishment and for authority to aid allies of the United States militarily without Congressional sanction.

The report also revealed bizarre advances in military science as it told how the armed forces were studying rocket space-ships in the light of a possible military outpost, an “earth satellite vehicle,” that would revolve around the earth like a little moon.

Atomic Energy. The veil of secrecy hung over the world's most potent force both for peace and war, the development of atomic energy. Control of the force was a major issue in international forums, without a satisfactory conclusion. At home the continuing struggle for atomic control between the military and civilian scientists found the civilians still on top, though controversy was aroused at a Republican political “compromise,” in response to the President's renomination of the five Atomic Energy Commissioners for staggered terms as required by the Atomic Energy Act. The Republicans did not want the AEC's membership—particularly Chairman David E. Lilienthal—frozen when they were expecting a GOP victory. As a result the terms of all the commissioners, amidst cries of

“politics,” were extended to June 30, 1950. United States laboratories applied atomic energy for peace as well, shipping radioactive isotopes, principally radio-active phosphorus, for the treatment of leukemia and other blood diseases, to 21 countries during the year.

Fiscal Legislation. Expenditure during the current fiscal year was estimated at slightly more than \$42,000 million and revenue, as a result of increased national income, was estimated at least at a par to bring about a balanced fiscal picture. Defense took more than a quarter of the national budget, international affairs took a little more than one-eighth, so did veterans' affairs, the interest on the public debt represented slightly less than one-eighth, and all other expenditures consumed more than one-quarter.

Excise taxes were continued at their wartime rates. Increases in certain postal rates were enacted, effective Jan. 1, 1949. The lending authority of the Reconstruction Finance Corporation was limited.

Taxes. In 1948, after having been set back twice in 1947, the Republican Congress finally got through, over another Presidential veto, the tax reduction measure it had pledged in the last campaign. Although castigated by the President as a measure that would “undermine the soundness of our Government finances at a time when world peace depends on the strength of the United States,” the bill was carried by substantial margins in short order. It provided the following: increases for each taxpayer and dependent in personal exemptions from \$500 to \$600; nation-wide application of the “community-property” pooled return provisions for married couples; rate cuts of 12.6 percent on taxable income up to \$2,000, 7.4 percent from \$2,000 to \$136,719, and 5 percent on incomes above the latter figure. It was estimated that the cuts entailed a revenue loss of close to \$5,000 million.

Displaced Persons. In 1948, many, many months after the ending of the war and after initial action had been proposed, the United States finally lived up to its great tradition as a haven for the oppressed and the homeless. Almost three and a half years after the end of hostilities a boatload of 800 of Europe's displaced persons reached our shores, the vanguard of the 205,000 DP's to be admitted under immigration quota relaxation adopted by Congress. The President, who had repeatedly asked Congress for legislation to allow a substantial number of DP's to come in accepted the measure as better than nothing but assailed it as discriminatory. The legislation, which charged up DP's against future immigration quotas and stipulated exhaustive investigation to weed out Communists, imposed severe limitations and classifications and was criticized as operating against Jews and Catholics, many of whom had been the prime victims of Hitler's persecutions. Nevertheless, the first trickle did toward the close of the year pass by the statue of Liberty, a harbinger of more to come and of new strength for the nation.

Farm and Economic Legislation. There was little activity, with farmers riding on a crest of prosperity, in the agricultural field. In a special message to Congress the President submitted a consolidated long-range farm program covering a wide range of agricultural economics and agronomy. In Congress preliminaries advanced for the development of a permanent long-range farm program, but there was disagreement between the two Houses and there was finally enacted a continuation of the existing price support program until June 30, 1950,

under which cotton, wheat, corn, rice, peanuts, tobacco, hogs, poultry, eggs, dairy products, and potatoes would be supported at 90 percent of the parity price, while the supports for certain other commodities, including soybeans and flaxseed, could be cut from 90 percent to a 60 percent minimum at the discretion of the Agriculture Secretary. The joint United States-Mexico program to eradicate the foot-and-mouth disease south of the border was, after much tribulation and dubious success because of peon opposition, finally abandoned during the year.

The most outstanding development in the agricultural field was the legislation that almost passed. For 60 years, since oleomargarine first was produced, the butter substitute had been surrounded by state and Federal restrictions. The sale of colored margarine is banned or taxed; margarine producers and retailers are required to pay Federal license fees. With butter prices soaring there was increasing consumer pressure to end the restrictions on the less expensive substitute. Cottonseed and soybean interests supported the move, dairy interests opposed it. It was a fight of long standing, and in 1948 the margarine forces broke through the barricaded pigeonholes of part of Congress when a repealer passed the House, only to lose out in the Senate where small dairy states carry as much weight as large urban states and where the measure was tabled under the pressure of time. It was the most notable advance by the margarine forces in years.

Congress in 1948 scrutinized its work in the labor field during the previous session—the Taft-Hartley Labor-Management Relations Act and the anti-Portal-to-Portal Pay Act—and found them good. As a result no important legislative activity in the labor field took place. There were a number of investigations of the influence of Communists in certain unions.

Social Legislation. There was substantial support in both Houses of Congress for a rise in the 40-cent minimum wage of the Fair Labor Standards Act. But this measure, equally important in the labor field, made no progress, and neither did any other social legislation despite promptings by the President. The various proposals for aid to education, increased social security, and health insurance made little headway, though a fractional part of the Chief Executive's program made some progress through the House. It would have extended old-age insurance to only 3,500,000 persons employed by tax-exempt institutions and state and local governments. The Republican confidence in a November election victory was to a great degree responsible for the feeling that social legislation could be shelved safely for at least a year.

Civil Rights. The implementation of the civil rights guaranteed by the Constitution received much attention in the country. It was a factor in the elections, when southern Democrats, upholding the traditional mores, rebelled against their party's stand and formed another party, the Dixiecrats. In Congress problems of race received probably more attention than at any time since the days of Reconstruction after the Civil War. Although the results were negligible, the effect was salutary. A number of aspects of racial segregation also were pricked by Supreme Court rulings.

Twenty states still have laws making obligatory racial segregation in public places. In 17 states compulsory segregation is applied in public schools. Poll-tax requirements hamper the right to vote in 7 states. There have been at least 44 lynchings in the United States since 1936. Latent prejudice—

and some of it not very sub rosa—against minority groups manifested itself in many aspects of economic and social life. The Ku Klux Klan showed signs of regained strength and was on the march in some southern areas, particularly Georgia. Crosses were burned in front of Negro and Jewish dwellings.

Against this background President Truman submitted to Congress a special civil-rights message, calling for the enactment of the following 10-point program:

Establishment of a permanent commission on civil rights, a joint Congressional committee on civil rights and a civil rights division in the Department of Justice.

The strengthening of existing civil rights statutes.

The classification of lynching as a Federal offense, taking its prosecution out of the jurisdiction of local and state governments.

More adequate protection of the right to vote, accompanied by the abolition of the poll tax and the "white primary."

Establishment of a Fair Employment Practice Commission to prevent unfair employment discrimination.

The outlawry of "Jim Crow" restrictions in transportation facilities, restaurants and schools.

The provision of home rule and suffrage in Presidential elections for the voteless residents of the District of Columbia.

The granting of statehood for Hawaii and Alaska and a greater degree of self-government for United States territorial possessions.

Equalization of the opportunities of residents to become United States citizens.

Settlement of the evacuation claims of Japanese-Americans.

In Congress an anti-poll tax bill sailed by the House, but was relegated to a secondary place on the theory that an anti-lynching bill would command more Senate support. In the closing days of the session an anti-lynching bill was produced by a Senate committee but it was lost in the legislative jam of adjournment. Civil rights also came up as riders to various appropriations and other measures to keep the pot boiling through the session, but the only step to get by Congress was an amendment to the draft law exempting from poll taxes members of the armed forces, which had been in effect during the war and even this was beset by strong opposition from southern legislators.

After six years of social and economic upheaval some 60,000 Japanese-Americans were back on the West Coast and were encountering first hostility, then, acceptance with public enthusiasm and private reserve. These wartime victims also encountered much economic loss; many who had leased their lands were unable to regain control and the dominant position of the Japanese in West Coast agriculture disappeared. Half of the evacuees never returned and spread instead over the rest of the country. But there was progress to report in this civil rights sector, too.

Communism. The conflict between Eastern communism and Western democracy on the international scene was transmuted on the domestic scene. It was translated into a drive against domestic communism before a background of national security, on the one hand, and concern over the rights laid down by the Constitution, on the other. Allegations of subversive activities and Communist espionage, featuring episodes that appeared bizarre to most Americans, filled the air and the headlines for a good part of the year and the unresolved is-

sue of who was the liar—Hiss or Chambers—became a cause célèbre.

In Congress the Mundt-Nixon bill to curb the Communist party, that had been established in the United States in 1919 with seventy-six members and in 1948 claimed a membership of 75,000, was overwhelmingly approved by the House. Without specifically naming the Communists the measure sought to make illegal efforts "to establish in the United States a totalitarian dictatorship" under foreign control and to require registration of Communist party members. One of the most controversial bills to come before Congress, it was assailed as to its constitutionality and its effectiveness on the ground that its objectives would be nullified by driving the Communists even more underground. The measure was left locked in a Senate committee.

The Government's investigation of the loyalty of employees in the Federal establishment continued apace, with only a tiny fraction of a percent found even questionable. "Sensitive" agencies, such as the military, the State Department, the Atomic Energy Commission, received absolute authority to discharge "indiscreet or disloyal employees." One new anti-subversion measure was added to the statute books when the immigration laws were amended to deny admission to persons deemed by the Attorney General to be seeking entry "for the purpose of engaging in activities which will endanger the public safety."

After 13 months of investigation a continuing blue ribbon Federal grand jury in New York brought in indictments against the 12 ranking figures of the American Communist party on charges of having violated the Alien Registration Act by having conspired to overthrow the Government through violent and seditious means and through the issuance of printed material and other actions for this purpose. Best known of the 12 indicted were William Z. Foster, thrice the party's candidate for President; Eugene Dennis, general secretary; and Benjamin J. Davis, Communist member of the New York City Council.

New York was also the scene of another phase of the East-West clash—the case of the Russian school teacher's fight and flight for freedom, including a suicide leap. Mrs. Oksana Stepanova Kasenkina was scheduled to return to Russia, along with other teachers, upon the completion of their services at a Soviet private school here. The teachers, Mrs. Kasenkina and Mr. and Mrs. Mikhail Ivanovitch Samarin, stayed ashore. Mrs. Kasenkina took sanctuary at a white Russian refuge, a farm run by Countess Tolstoy. From this she was "rescued" by members of the Russian consular staff in New York and held incommunicado within the Consulate. Then she leaped from the third story building of the Consulate, either in an attempt at suicide or escape. The Russians continued to seek possession of Mrs. Kasenkina and the United States rejected the moves. Stiff notes were exchanged and the United States requested the withdrawal of the Soviet Consul General, Jacob M. Lomakin.

Un-American Activities. Moving into action in the wake of the Justice Department and its grand jury, the House Committee on Un-American Activities acted as usual, with a blaze of publicity, to develop publicly the findings in camera. The result was a series of spectacular and dramatic hearings, though inconclusive. The committee during the whole year failed to press its unsubstantiated allegations against Dr. Edward U. Condon, as one of the "weakest links" in atomic security. It also provided a dramatic twist of its own. Its chairman, Representative J. Parnell Thomas, Republican, of New

Jersey, was indicted by a Federal grand jury in Washington on charges of having misused fraudulently funds for his office and committee staffs. Mr. Thomas, who has deprecated the attitude of witnesses before his group for the disinclination to answer questions, especially on constitutional grounds, himself refused to answer questions—on the constitutional ground of self-incrimination.

Two repentant Communists filled the committee's hearing room with a plethora of charges and accusations, which the accused almost simultaneously denied. None of the charges, of deep significance to national security if valid, was proved to any degree of definiteness, though the fanfare of publicity was overwhelming. The hearings, at year's end, were still "in medias res."

The first outpouring of extravagant and unsupported charges came from Elizabeth T. Bentley, fortyish Vassar alumna, a Communist party member during 1935–44, during which time she said she transmitted much secret data from Washington to Soviet agents. The information was allegedly received from Government officials. Whittaker Chambers, a Communist during 1924–37, afterward an editor of *Time*, said he had been a "courier" for an "apparatus" engaged in infiltration work.

A parade of former Government officials appeared before the committee to deny the allegations by the two—Lauchlin Currie, former administrative assistant to President Roosevelt; William W. Remington, high official in the Commerce Department; Harry Dexter White, former Assistant Secretary of the Treasury and progenitor of the Bretton Woods agreement; and secondary executives. Some few of the latter parried interrogation or declined to answer on constitutional grounds. To the drama of the hearing, thronged with spectators, ablaze with the glare of television lights, was added the drama of Mr. White's death, shortly after questioning by the committee while suffering from a heart condition.

Hiss-Chambers. The whole pattern of contradiction, of charge and denial, became personified in the figures of two men—Mr. Chambers, senior editor of a responsible publication, and one of the chief targets of his accusations, Alger Hiss, executive secretary of the Dumbarton Oaks Conference, general secretary of the United Nations Charter Conference in San Francisco, adviser to President Roosevelt at Yalta, and currently president of the Carnegie Foundation for International Peace. Mr. Chambers alleged that an important official in the Roosevelt Administration, Mr. Hiss, former chief of the State Department's Office of Special Affairs, had been a dues-paying Communist and a valuable source of information. Mr. Hiss denied he was or had ever been a Communist, at first was unable to place his accuser, then identified him by another name as a man to whom he had sublet his apartment.

Pumpkins. The committee staged a public "confrontation" of the two men. Each labeled the other's story fabrication. When Mr. Chambers repeated his allegations on the radio outside the privileged committee room, Mr. Hiss brought suit for libel. In the course of pre-trial examination on this suit, Mr. Chambers drew forth documents allegedly stolen from the State Department. Later he led agents of the Un-American Activities Committee to his Maryland farm and there, from a scooped-out pumpkin, produced rolls of microfilms of state papers that he had had for ten years. He laid to Mr. Hiss the procurement of the papers—some 200 secret documents stolen from the State Department and copied for transmission to a for-

eign power, Soviet Russia. Mr. Hiss denied the Chambers accusations that he had taken and copied the papers. Toward the closing weeks of the year the New York grand jury brought in an indictment against Alger Hiss, charging him with perjury. Thus, in 1949, when the perjury charges come before the courts, it may be determined which of the two men was lying—the crucial question the committee never was able to decide.

Cost of Living. Although they were concerned with many things, foreign and domestic, the American people chiefly were concerned with the high cost of living. This was undoubtedly the chief issue in the election campaign, as the President assailed the lack of activity by Congress against the inflationary spiral and the Republican legislators pinned their faith on the operation of traditional economic laws. Certain labor groups got wage increases but still were squeezed, while unorganized labor, white collar workers, pensioners, and people living on fixed-incomes generally were hard put to make ends meet. Consumer resistance, although unmarshalled and not vociferous, was exercised by many segments of the population.

In the early part of the year there was a sharp break in the commodity market. Wheat, corn, and other grain commodities tumbled, and there was a slight decline in the non-food categories. But in a few short weeks the visions of hard-pressed consumers of lowered food prices and the fears of some economists that a "bust" had set in had all been dissipated. By the end of March the flurry of the commodity exchanges was over, and living costs were up again to their January peaks. Sparking the inflationary flame, aside from the speculative character of the commodity flurry, were the third round of wage rises and the purchasing of goods for the European Recovery Program. Along the middle of the year prices advanced in many fields. Automobiles went up again. So did household and electrical appliances and industrial equipment. Primary market prices edged up with advances for foods, chemicals, and allied products.

The "creeping" inflation, in which prices go up—not with the explosiveness of a "boom-and-bust" rampage—but gently enough not to arouse the citizenry to demonstrations or large-scale buying strikes, continued as Congress quit and the political conventions began. With 1935-9 as 100, food prices, according to the Bureau of Labor Statistics, stood around 215. The worth of the dollar in purchasing power, 68.2¢ in 1947, was 60.6¢.

Market-basket items carried these prices: a pound of round steak, 91¢; chuck roast, 64¢; a No. 2 can of corn, 20¢; a No. 2½ can of peaches, 31¢; a pound of butter, 94¢; a pound of coffee, 53¢; a dozen eggs, 65¢; and a delivered quart of milk, 21¢. In many communities, moreover, these average prices would have seemed low.

The state of the economy just around election time, as there occurred a fractional drop in the cost of living index, stood something like this in its course since the war:

Year	Prices	Wages	Profits
1945.....	100	100	100
1946.....	108.5	98.5	147.1
1947.....	124.0	110.9	208.0
1948.....	135.2	123.1	234.5

In the early fall, for the first time in a year, retail meat prices declined, and for the remainder of the year the inching-down process continued but in such tiny degrees that it was almost imperceptible. With the average family spending about 12 percent of its income on meat, this is the most

important food item in the outlay for the family larder. The following shows the course of meat prices over the last two years:

Meat	Oct. 7 1948	Aug. 15 1948	(OPA) Oct. 7 1946
	1948	1948	1946
Pork roast.....	\$0.73	\$0.83	\$0.43
Lamb shoulder.....	0.81	0.93	0.56
Sirloin steak.....	0.99	1.05	0.55
Chicken broilers.....	0.53	0.57	0.50

Toward the end of the year there were signs that the economic boom had lost its ruddy flush though the picture was one of continuing health rather than of sudden collapse. In some areas there was spotty unemployment and downward business trends, but prices were still way up, production rolling, and employment at high levels.

The whole year had been spent on a lofty economic plateau as far as most of the American people were concerned, and toward the end of 1948 there began to be discovered some valleys in the plateau. Prices of farm commodities were down; in some cases farm products were approximately at the Government price support level. Farm production, on the other hand, was up an estimated 8 percent above that of 1947.

Weak spots in the economy developed in textiles in particular among the soft goods, and sales of men's clothing and furnishings were reported lagging. Small durable goods, such as radios, vacuum cleaners, refrigerators, and electric toasters, also were encountering sales' difficulties.

Labor. The impact of labor unrest was felt less in 1948 than in 1947, though the two years were closely similar in being far below the record number of strikes in 1946. Strikes during the year cost the nation 33 million man-days in contrast to the 34,560,000 man-days of last year.

Labor began the year nursing its wounds. The "slave labor" Taft-Hartley Act had been imposed over its last-ditch opposition, and all that remained, aside from continued agitation for its repeal, was to growl at the "vested interests" that were back in the saddle. While supporters of the Taft-Hartley Act held that it had been effective in curbing certain types of strikes, such as secondary boycotts and jurisdictional disputes, opponents contended that the law had failed to reduce strikes and in some instances actually had fomented them. Labor also was faced with three crucial decisions: its attitude toward the third political party under the aegis of former Vice President Henry Wallace, its stand on the Marshall Plan to aid global recovery; and its position toward adjustments in the stratospheric cost of living picture. Particularly in the Congress of Industrial Organizations there was internecine strife between the Right and scattered unions dominated by Communists and fellow-travelers. Furthermore, the 1946 debacle, from labor's viewpoint, which had brought a changeover of Congress from Democratic to Republican control and the Taft-Hartley law, had left labor scared and determined to galvanize its cohorts into more spirited political activity.

The largest of all the strikes during the year was that of the soft-coal miners over pensions, involving some 350,000 miners. In March and April the United Mine Workers were out of their pits as a result of a dispute resulting from a proposal by their leader, John L. Lewis, of pensions of \$100 a month for those of age 60 and with 20 years' service—a proposal that the operators opposed because the inclusion of miners already retired would exhaust the union-industry pension fund.

Finally the pension deadlock was broken as Republican House Speaker Joseph W. Martin, Jr. intervened. The result was a notable triumph for the Republican labor leader and his miners. Mr. Lewis, who with the UMW, had only 13 months earlier suffered a crushing defeat by the Government and the courts and a \$710,000 fine, tilted again with the Government when Federal attorneys sought a contempt finding by the courts for his alleged defiance of a Government injunction against the strike.

Another major dispute along the same period was that of the CIO packing-house workers, in which 85,000 were idle and 3 were killed in picket line violence. The strike, called to obtain an increase of 29¢ an hour, was unsuccessful after one of the longest work stoppages of the year.

Third round wage differences mounted in intensity toward midyear, as labor contended that increases were due in view of the resumed climb in prices and the advance in corporate profits, 250 percent above 1939 and roughly 40 percent above 1946. Management, in turn, held that wages had to be held down to avoid further stimulus of the inflationary spiral. The principal areas of intensity were the railroad brotherhoods, the UMW and the CIO's United Automobile Workers. The Government seized the railroads before any work stoppage developed, but 45,000 auto workers went out at Chrysler. The miners won \$1 a day and other gains. John R. Steelman, Presidential labor adviser, after lengthy mediation, brought about a rail settlement. Chrysler workers won an increase of 13¢ an hour.

Without a strike a major settlement, likely to have an important influence on labor agreements, was achieved between the UAW and the General Motors Corporation. Although the principle of an "escalator" was in vogue in many contracts, the size of the bargaining parties gave it stature. Under the terms of the 11¢ increase part was allowed as a permanent bolster to living standards and part as a variable moving up or down in accordance with cost of living indices.

The other major strikes occurred on the maritime front—the three-month tie-up of 28,000 CIO longshoremen and seamen on the West Coast and the strike on the East Coast of longshoremen belonging to the American Federation of Labor. In the latter case the issue was wages; in the former the primary issue was the union hiring hall, which was opposed by employers as illegal under the Taft-Hartley Act. For a time, toward the latter part of the year, America's export-import trade and essential Marshall Plan aid shipments were at a standstill as both the East and West Coasts were paralyzed.

The West Coast strike was one directly involving the Taft-Hartley law, but it was an issue in labor management relations throughout the year. Most of the tests, however, were through the lengthy course of the judicial process, where the real meaning of its process was being determined. One of the principal points at issue, the law's ban against political expenditures by unions, was put to the test by Philip Murray, CIO president. The ban was ruled invalid by the courts. The law fostered some strikes—principally that by the printers. On the other hand, it reduced union jurisdictional disputes and made some headway in curtailing "featherbedding" practices. The real tests were still ahead—in the legal opinions of the courtrooms—when the reelection of President Truman became a harbinger of the repeal of many sections of the act.

The CIO lashed out against its leftists in its

annual convention in November, defeating their moves of sympathy with the Soviet Union and opposition to the Marshall Plan. The organization also rebuked its left-wing unions and took steps to trim the power of some.

Both the AFL and the CIO were highly active in the political campaign, and most observers credited their activities with a large share of responsibility for Mr. Truman's victory and the defeat of many Congressmen regarded as foes by labor.

—SAMUEL A. TOWER

UNIVERSAL DECLARATION OF HUMAN RIGHTS. The Universal Declaration of Human Rights, nearly three years in preparation, was adopted and proclaimed by the General Assembly of the United Nations on Dec. 10, 1948, in Paris. The vote was 48 to 0 (nine members abstained from voting—the U.S.S.R. bloc, Saudi Arabia, and the Union of South Africa). This Universal Declaration of Human Rights is the first part of an International Bill of Human Rights, the two other parts being a Convention on Human Rights and measures for implementation, on both of which work is going ahead. The complete text of the Universal Declaration of Human Rights, as approved by the General Assembly of the United Nations, follows:

International Bill of Human Rights

Universal Declaration of Human Rights

Preamble

WHEREAS the recognition of the inherent dignity and of the equal and inalienable rights of all members of the human family is the foundation of freedom, justice and peace in the world,

WHEREAS, disregard and contempt for human rights have resulted in barbarous acts which have outraged the conscience of mankind, and the advent of a world in which human beings shall enjoy freedom of speech and belief and freedom from fear and want has been proclaimed as the highest aspiration of the common people,

WHEREAS it is essential, if man is not to be compelled to have recourse, as a last resort, to rebellion against tyranny and oppression, that human rights should be protected by the rule of law,

WHEREAS it is essential to promote the development of friendly relations between nations,

WHEREAS the peoples of the United Nations have in the Charter reaffirmed their faith in fundamental human rights, in the dignity and worth of the human person and in the equal rights of men and women and have determined to promote social progress and better standards of life in a larger freedom,

WHEREAS Member states have pledged themselves to achieve, in co-operation with the United Nations, the promotion of universal respect for and observance of human rights and fundamental freedoms,

WHEREAS a common understanding of these rights and freedoms is of the greatest importance for full realization of this pledge,

NOW THEREFORE THE GENERAL ASSEMBLY

PROCLAIMS this universal declaration of human rights as a common standard of achievement for all peoples and all nations, to the end that every individual and every organ of society keeping this declaration constantly in mind shall strive by teaching and education to promote respect for these rights and freedoms and by progressive measures, national and international, to secure their universal and effective recognition and observance, both among the peoples of the Member states themselves and among the peoples of territories under their jurisdiction.

ARTICLE 1

All human beings are born free and equal in dignity and rights. They, endowed with reason and conscience, should act toward one another in a spirit of brotherhood.

ARTICLE 2

Everyone is entitled to all the rights and freedoms set forth in this declaration without distinction of any kind such as race, color, sex, language, religion, political or other opinion, national or social origin, property, birth, or other status.

Furthermore, no distinction shall be made on the basis of the political, jurisdictional or international status of the country or territory to which the person belongs, whether it be an independent, Trust, or Non-Self-Governing territory, or under any other limitation of sovereignty.

ARTICLE 3

Everyone has the right to life, liberty and the security of person.

ARTICLE 4

No one shall be held in slavery or servitude; slavery and the slave trade shall be prohibited in all their forms.

ARTICLE 5

No one shall be subjected to torture or to cruel, inhuman or degrading treatment or punishment.

ARTICLE 6

Everyone has the right to recognition everywhere as a person before the law.

ARTICLE 7

All are equal before the law and are entitled without any discrimination to equal protection of the law. All are entitled to equal protection against any discrimination in violation of this Declaration and against any incitement to such discrimination.

ARTICLE 8

Everyone has the right to effective remedy by the competent national tribunals for acts violating the fundamental rights granted him by the constitution or by law.

ARTICLE 9

No one shall be subjected to arbitrary arrest, detention or exile.

ARTICLE 10

Everyone is entitled in full equality to a fair and public hearing by an independent and impartial tribunal, in the determination of his rights and obligations and of any criminal charge against him.

ARTICLE 11

1. Everyone charged with a penal offense has the right to be presumed innocent until proved guilty according to law in a public trial at which he has had all guarantees necessary for his defense.

2. No one shall be held guilty of any penal offense on account of any act or omission which did not constitute a penal offense, under national or international law, at the time when it was committed. Nor shall a heavier penalty be imposed than one that was applicable at the time the penal offense was committed.

ARTICLE 12

No one shall be subjected to arbitrary interference with his privacy, family, home or corre-

spondence, nor to attacks upon his honor and reputation. Everyone has the right to the protection of the law against such interference or attacks.

ARTICLE 13

1. Everyone has the right to freedom of movement and residence within the borders of each state.

2. Everyone has the right to leave any country, including his own, and to return to his country.

ARTICLE 14

1. Everyone has the right to seek and to enjoy in other countries asylum from persecution.

2. This right may not be invoked in the case of prosecutions genuinely arising from non-political crimes or from acts contrary to the purposes and principles of the United Nations.

ARTICLE 15

1. Everyone has the right to a nationality.

2. No one shall be arbitrarily deprived of his nationality nor denied the right to change his nationality.

ARTICLE 16

1. Men and women of full age, without any limitation due to race, nationality or religion, have the right to marry and to found a family. They are entitled to equal rights as to marriage, during marriage and at its dissolution.

2. Marriage shall be entered into only with the free and full consent of the intending spouses.

3. The family is the natural and fundamental group unit of society and is entitled to protection by society and the state.

ARTICLE 17

1. Everyone has the right to own property alone as well as in association with others.

2. No one shall be arbitrarily deprived of his property.

ARTICLE 18

Everyone has the right to freedom of thought, conscience and religion; this right includes freedom to change his religion or belief, and freedom, either alone or in community with others and in public or private, to manifest his religion or beliefs in teaching, practice, worship and observance.

ARTICLE 19

Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.

ARTICLE 20

1. Everyone has the right to freedom of peaceful assembly and association.

2. No one may be compelled to belong to an association.

ARTICLE 21

1. Everyone has the right to take part in the government of his country, directly or through freely chosen representatives.

2. Everyone has the right of equal access to the public service in his country.

3. The will of the people shall be the basis of the authority of government; this will shall be expressed in periodic and genuine elections which shall be by universal and equal suffrage and shall be held by secret vote or by equivalent free voting procedures.

ARTICLE 22

Everyone, as a member of society, has the right to social security and is entitled to the realization through national effort and international co-operation and in accordance with the organization and resources of each state, of the economic, social and cultural rights indispensable for his dignity and the free development of his personality.

ARTICLE 23

1. Everyone has the right to work, to the free choice of employment, to just and favorable conditions of work and to protection against unemployment.

2. Everyone, without any discrimination, has the right to equal pay for equal work.

3. Everyone who works has the right to just and favorable remuneration insuring for himself and his family an existence worthy of human dignity, and supplemented, if necessary, by other means of social protection.

4. Everyone has the right to form and to join trade unions for the protection of his interests.

ARTICLE 24

Everyone has the right to rest and leisure, including reasonable limitation of working hours and periodic holidays with pay.

ARTICLE 25

1. Everyone has the right to a standard of living adequate for the health and well-being of himself and his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control.

2. Motherhood and childhood are entitled to special care and assistance. All children, whether born in or out of wedlock, shall enjoy the same social protection.

ARTICLE 26

1. Everyone has the right to education. Education shall be free, at least in the elementary and fundamental stages. Elementary education shall be compulsory. Technical and professional education shall be made generally available and higher education shall be equally accessible to all on the basis of merit.

2. Education shall be directed to the full development of human personality and to the strengthening of respect for human rights and fundamental freedoms. It shall promote understanding, tolerance and friendship among all nations, racial or religious groups and shall further the activities of the United Nations for the maintenance of peace.

3. Parents have the prior right to choose the kind of education that shall be given to their children.

ARTICLE 27

1. Everyone has the right freely to participate in the cultural life of the community, to enjoy the arts and to share in scientific advancement and its benefits.

2. Everyone has the right to the protection of the moral and material interests resulting from any scientific, literary, or artistic production of which he is the author.

ARTICLE 28

Everyone is entitled to a social and international order in which the rights and freedoms set forth in this declaration can be fully realized.

ARTICLE 29

1. Everyone has duties to the community, in which alone the free, full development of his personality is possible.

2. In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and the general welfare in a democratic society.

3. These rights and freedoms may in no case be exercised contrary to the purposes and principles of the United Nations.

ARTICLE 30

Nothing in this declaration may be interpreted as implying for any state, group or person any right to engage in any activity or to perform any act aimed at the destruction of any of the rights and freedoms set forth herein.

UNIVERSALIST CHURCH. A religious group which originated in the United States about 1785. The bond of fellowship in this Church "shall be a common purpose to do the will of God as Jesus revealed it and to cooperate in establishing the kingdom for which he lived and died."

The Universalist Church of America. Originally incorporated in 1866 as The Universalist General Convention, it changed to its present name in 1942. In the United States and Canada the group has 436 churches, 497 ministers, and a total of 44,599 members. Income from contributions amounted to \$50,241 in 1947. Total assets amounted to \$1,659,976. President and chairman of the Board: Harold S. Latham; General Superintendent, Dr. Robert Cummins; Secretary, Esther A. Richardson; Treasurer, A. Ingham Bicknell. Headquarters, 16 Beacon St., Boston 8, Mass.

UNIVERSAL POSTAL UNION (UPU). This organization was founded as a result of conferences held in Paris in 1863 and in Berne in 1874, and became a formal body when the International Postal Convention came into force in 1875. An agreement with the United Nations, designed to give the Union status of a specialized agency, was adopted by the Congress, and approved by the General Assembly of the United Nations, Nov. 15, 1947.

"The aim of the Universal Postal Union is to assure the organization and perfection of the various postal services and to promote, in this field, the development of international collaboration. To this end the Members of UPU are united in a single postal territory for the reciprocal exchange of correspondence." The agreement making the Universal Postal Union a specialized agency of the United Nations became formally effective July 1, 1948. UPU has 88 members.

UPU held its 12th Congress in Paris from May 7 to July 5, 1947. Since the Union had hitherto been without a body to act in the interim between congresses, an Executive and Liaison Committee of 19 members was created. It held its first formal session in Berne in October, 1948.

Changes in regulations governing membership were also made; new members will henceforth be admitted by a $\frac{2}{3}$ vote of the members of the Union. Applications from Latvia, Estonia, and Lithuania for separate membership were rejected. The membership of Spain was "temporarily suspended." It was decided that Germany, Japan, and Korea should be named as members of the Union, with a special paragraph stating that they were temporarily prevented from adhering to the Convention.

Technical changes in international postal regulations made by the Congress included lowering of certain postal rates, widened franking privileges, and changes to ensure better service for many types of international mail. A temporary Technical Transit Committee was established to find the most equitable basis for the computation of transit rates; it is to report to members of the UPU in 1950. The next meeting of the Universal Postal Congress is scheduled to convene in Brussels in 1952.

The President of the Executive and Liaison Committee is J. J. Le Moüel, Director General of the Posts in France. The Secretary General is Dr. A. Muri of Switzerland. Headquarters: International Bureau, Universal Postal Union, Case Berne 14, Switzerland.

UNIVERSITIES AND COLLEGES. The 1,788 universities, colleges, and professional schools of the United States had a total of 2,408,249 students (full-time, part-time, graduate, and undergraduate students, but excluding extension and correspondence students) of college grade enrolled in the fall term of 1948, an increase of 70,023, or 3 percent, over the number (2,338,226) enrolled in the fall term of 1947, according to the survey made by the U.S. Office of Education. In the accompanying table are listed the enrollment totals, by type of institution, for the fall terms of 1947 and 1948.

ENROLLMENT IN HIGHER EDUCATIONAL INSTITUTIONS, 1947-1948

Type of institution	Fall 1947	Fall 1948	% Change
All institutions	2,338,226	2,408,249	3.0
Universities	1,155,180	1,208,504	4.6
Technical schools	97,760	107,878	10.3
Theological seminaries	16,213	18,193	12.2
Other professional schools	83,288	71,078	-14.7
Liberal arts colleges	530,064	553,418	4.4
Teachers colleges	162,199	170,205	4.9
Junior colleges	219,349	208,329	-5.0
Negro institutions*	74,173	70,644	-4.8

* All types of institutions of higher learning.

The enrollment of veterans in institutions of higher learning in the fall of 1948 totaled 1,021,038, a decrease of 101,700, or 9.1 percent, from the total of 1,122,738 for the fall of 1947. Of the 1948 total, 575,930 were enrolled in universities, 58,078 in technical schools, 4,921 in theological seminaries, 41,578 in other professional schools, 207,563 in liberal arts colleges, 56,543 in teachers colleges, 53,899 in junior colleges, and 22,526 in Negro colleges of all types.

The 1948 fall enrollment of first-time students in higher educational institutions decreased to 568,768 from 592,846 in 1947, a decrease of 24,078, or 4.1 percent. Universities had 204,490 first-time students enrolled in 1948, technical schools 23,625, theological seminaries 2,399, other professional schools 15,263, liberal arts colleges 150,333, teachers colleges 50,475, junior colleges 102,961, and Negro institutions of all types 18,952 first-time students enrolled.

There were 1,712,283 men and 695,966 women enrolled in higher educational institutions in the fall of 1948. Of the total enrolled for the first time in any college, 369,924 were men and 198,844 were women. Veterans enrolled in the fall of 1948 included 1,000,942 men and 20,096 women.

In the fall of 1948 there were 1,190,441 students enrolled in publicly controlled institutions of higher learning and 1,217,808 in privately controlled institutions of higher learning.

According to the survey of the U.S. Office of Education, 12 institutions of higher learning had 20,000 or more enrollments each in the fall of 1948.

They were: New York University, University of California, City College of New York, Columbia University, University of Minnesota, University of Illinois, Ohio State University, Northwestern University, University of Indiana, University of Southern California, University of Wisconsin, and University of Michigan.

States of the United States with total enrollments over 100,000 for the fall of 1948 in institutions of higher learning were: New York 308,436, California 190,650, Illinois 152,521, Pennsylvania 148,949, Ohio 140,253, Texas 126,228, and Michigan 101,229.

The statistics reported to this YEAR BOOK by each of the institutions of higher learning for the fall of 1948, or for the latest available period, are recorded in the table entitled *Universities and Colleges in the United States and Canada* on pages 594-624.

UNRRA. While shipments continued during 1948, the United Nations Relief and Rehabilitation Administration (UNRRA) was occupied chiefly in arranging its liquidation. Created on Nov. 9, 1943, to aid the victims of war in liberated areas, and beginning operations immediately on the cessation of hostilities, the Administration devoted approximately \$3,800 million of resources to providing to the governments of liberated countries for the distribution by them to their nationals not only relief supplies in the form of food, clothing, and medicine, but also rehabilitation supplies and services designed to restore transport, light, water, power, and other essential services; and to the repatriation, tracing, and care of persons found in any areas under control of the UN who by reason of war were displaced from their homes. Supplies UNRRA sent to countries lacking adequate foreign exchange were as listed in the accompanying table.

Countries aided	Estimated Value of Program*	Estimated Gross Long Tons
Albania	\$ 26,250,900	130,048
Austria	135,513,200	1,114,461
Byelorussian S.S.R.	60,820,000	141,853
China	517,846,700	2,360,915
Czechoslovakia	261,337,400	1,619,627
Dodecanese Islands	3,900,400	33,122
Ethiopia	884,900	1,551

* Equivalent in U.S. dollars. For conversion rates used see final financial report, (Ninth Financial Report of UNRRA).

More than 7,200,000 persons had been repatriated by 30 June 1947 when the displaced persons operation was turned over to the Preparatory Commission of the International Refugee Organization.

The task of liquidating the numerous UNRRA offices, begun in July, 1947, was completed in 1948 with the closure of the Southwest Pacific Area Office in Sydney at the end of June and the European Regional Office in London at the end of September. On the latter date, an Administrator for Liquidation, Harry E. Howell, Controller since 1946, was appointed at Headquarters in Washington and the Director General, Lowell W. Rooks, left the Administration. Like his predecessors, Herbert H. Lehman, and the late Fiorello H. LaGuardia, and his successor, Harry E. Howell, Rooks was a

citizen of the United States, the largest single contributor of UNRRA's resources under a formula which recommended to non-invaded member nations that they contribute in effect 2 percent of their national income computed for the year ending June 30, 1943.

The governing bodies of the Administration consisted of the Council, composed of representatives of the 48 member nations, which held six sessions, the last in December, 1946; and the Central Committee, composed of representatives of nine member nations (Australia, Brazil, Canada, China, France, U.K., U.S., U.S.S.R. and Yugoslavia) which acted for the Council in making policy decisions during the liquidation period. By the end of 1948, UNRRA had made substantial progress on its main remaining task of obtaining the necessary documentation to support the contributions of supplies and to complete accounts. Moreover, by an agreement of September 27, 1948, with the United Nations, which was approved by the General Assembly on November 18, it arranged for the transfer of its records to the United Nations, the completion of a three-volume history of UNRRA operations, and absorption of all residual functions by March 31, 1949.

Despite postwar dislocations, shortages of goods, strikes, and the fact that much of the contribution was non-convertible or could be utilized only in indigenous surpluses, UNRRA was able to utilize more than 98 percent of its resources and the member nations decided that residual funds of approximately \$45 million should be turned over to successor international agencies, especially the International Children's Emergency Fund, which received upwards of \$30 million in various currencies, chiefly dollars. Other international agencies which shared in residual UNRRA funds include the Food and Agriculture Organization and the World Health Organization, which carry forward activities once performed by UNRRA. The long range rehabilitation projects initiated by UNRRA in China have been continued under the administration of the Board of Trustees for Rehabilitation Affairs of the Republic of China to which \$5 million of UNRRA funds have been transferred. It is expected that the final financial report covering the entire period of the operation together with the report of Council's auditors, Messrs. Deloitte, Plender, Griffiths & Company, will be published in February, 1949.

—THOMAS J. MAYOCK

URUGUAY. A republic of South America. Lowland plains border the southern and eastern coasts, but most of the country is a land of hills and undulating plains. The climate is temperate.

Area and Population. Area, 72,153 square miles. Population, 2,300,000 (1947), of which about 90 percent are of European descent and the rest are mestizos. The largest cities are Montevideo (capital), Paysandú, and Salto.

Education and Religion. The constitution guarantees freedom of worship. Roman Catholicism is the predominant religion. Spanish is the official language. Over 65 percent of the total population is literate. The most recent statistics show 245,129 students enrolled in 1,800 primary schools, and 27,000 students in 90 public secondary schools and 37 private ones. Higher education is provided by the National University.

Production. The country's economy is based on stock-raising and agriculture, with some industries devoted to the processing of meat, wool, hides, and bristles, and manufacturing of consumer goods. The wheat crop in 1947 was of an unusual size,

amounting to 450,000 metric tons. Wool exports in the same year totalled 135,312 bales. Other lines of agricultural production in 1946 were (in tons): corn, 139,882; flaxseed, 83,227; rice, 29,048; and barley, 10,502. Exports of meat and meat products in 1946 were valued at 44,205,000 pesos (controlled selling rate, November, 1948: \$U.S. = 1.899 pesos). Consumer goods include beverages, chemicals, clothing, paper, rubber products, textiles, tobacco, vehicles, and transportation equipment.

Foreign Trade. Exports in 1947 amounted to \$162,500,000 and imports to \$215,300,000. The principal buyers were the U.S., Great Britain, France, Holland, Switzerland, and Brazil, and the chief exporters to Uruguay were the U.S., Brazil, Great Britain, Argentina, and Peru.

Transportation. The railway system has a total of 3,000 kilometers of track, and carries an annual average of 2,500,000 tons of freight and 6 million passengers. Highways and roads have a combined length of 8,514 miles. La Plata River provides good inland transportation as far as the port of Salto. Air service is rendered by two Uruguayan companies as well as important international airlines. Recent statistics place motor vehicle registration at 65,121. There were 125,000 radio sets, and 46,656 telephones. On Mar. 2, 1948, the government purchased the British-owned railroad for £7,150,000.

Finance. The 1946 budget was liquidated with a deficit of 25,221,000 pesos, as expenditure mounted to 208,853,000 pesos and revenue was only 183,632,000. Currency in circulation in September, 1948 was 200,100,000 pesos. Bank deposits were 333,500,000 pesos and gold reserves \$181,000,000. The cost of living in July, 1948, was 177 (1937 = 100).

Government. The constitution of 1934 (amended in 1942) establishes a semi-parliamentary type of government with proportionate representation both in Congress and in the Cabinet. Legislative power is exercised by the General Assembly, composed of two Chambers, one of Representatives and the other of Senators. Executive power is vested in the President, acting with a Council of Ministers. President Luis Batlle Berres took office in August, 1947, replacing President Tomás Berreta, who died in office.

Events, 1948. Small and democratic Uruguay, in contrast with most of her sister republics, had a peaceful year.

Domestic Front. President Batlle Berres' administration had no important political issues to face during the year. The shortage of dollar exchange affected Uruguay, as it did the rest of the continent, and the Bank of the Republic closed its operations on the open market on August 10 but opened again on September 7 with the announcement of a devaluation of the peso, and established the price of the dollar at 2.20 Uruguayan pesos (the previous quotation was 1.90). The measure was aimed at preventing the export of dollars from the country.

In September, Uruguay, the only country in the western hemisphere where all schools, including college and post-graduate work, are free, introduced another innovation in the educational system by organizing two important associations of teachers and professors. These institutions were grouped in the Uruguayan Federation of Teachers, keeping close contact with the government through the National Educational Council. It was agreed that two annual congresses would be held, one in the capital and one in the interior, in order to consider educational problems of all natures and report to the government for action.

International Front. The Uruguayan delegation was active in the meetings of the United Nations, especially in the General Assembly held in Paris in the fall. Uruguay also took an active part in the Ninth Inter-American Congress held at Bogotá in April (see PAN AMERICAN ACTIVITIES), and signed the Charter of the Americas.

One of the characteristics of Uruguayan foreign policy during the year was the firm position taken against the admission of Franco Spain to the United Nations. Delegate Carlos Martini Ríos stated that there have been no changes in Spain that call for a reconsideration of his country's policy toward Franco. The publication of this statement by newspaper *Acción* of Montevideo caused a diplomatic protest by Franco's Chargé d'Affaires Marqués de Orellana, but the attitude of the Uruguayan government remained unchanged.—MIGUEL JORRÍN

U.S. ELECTIONS. On Nov. 2, 1948, Harry S. Truman, Democratic candidate to succeed himself, was elected President of the United States. In the closest contest since the Wilson-Hughes race in 1916, President Truman received 49.58 percent of the popular vote, a plurality of 2,148,125, and 304 electoral votes, to 189 for the Republican standard-bearer, Governor Thomas E. Dewey of New York, and 38 electoral votes for Governor J. Strom Thurmond of South Carolina, candidate of the States' Rights Democrats. Truman's popular vote was 24,045,052; Dewey's 21,896,927; Thurmond's, 1,168,687; Wallace's (Progressive), 1,137,957; Thomas' (Socialist), 95,908; Watson's (Prohibition), 95,075; Teichert's (Socialist Labor), 24,653; Dobbs' (Socialist Workers), 9,005; other, 15,953.

The total vote cast in the presidential race was 48,489,217—less than one percent more than the 48,025,684 cast in the 1944 wartime election. Governor Dewey carried 16 States: Connecticut, Delaware, Indiana, Kansas, Maine, Maryland, Michigan, Nebraska, New Hampshire, New Jersey, New York, North Dakota, Oregon, Pennsylvania, South Dakota, and Vermont. Governor Thurmond carried Alabama, Louisiana, Mississippi, and South Carolina. Truman won the electoral vote of the remaining 28 States.

The Democrats regained control of both houses of Congress, lost to the Republicans in the 1946 election. In the House of Representatives, 263 of the 435 seats went to Democrats, to give the party its largest majority in the lower house since 1938. Of these, 75 were held previously by Republicans and one by the American Labor Party. Republicans won 171 seats and the American Labor Party, one. In the Senate, the Democrats won 9 seats previously held by Republicans and won 15 other contests, while the Republicans retained 9 contested seats. The Democrats now have 54 Senators; the Republicans 42.

State Elections. During 1948, Democrats elected 21 governors to 13 elected by Republicans (including one Democrat elected in Louisiana on April 20th, and one Republican in Maine, elected September 13th). The Republicans also picked up the Wyoming governorship when the incumbent Democratic governor was elected to the Senate and was succeeded by the Republican Secretary of State. As a result of these changes, the previous even division of governorships among Democrats and Republicans was broken. At present there are 29 Democratic governors and 19 Republicans, the largest majority for the Democrats since before the 1940 elections. In 8 States—Connecticut, Delaware, Illinois, Indiana, Massachusetts, Michigan, Montana, and Ohio—the voters replaced Repub-

lican governors with Democrats. Only Utah and Washington bucked the trend and elected Republicans to posts previously held by Democrats. An unusual feature of the 1948 election was the large number of States which elected a governor of one party while casting its electoral vote for the candidate of an opposing party. Democrats elected governors in Connecticut, Delaware, Indiana, and Michigan, but the electoral vote went to Dewey; and they elected a governor in Louisiana, the electoral vote of which went to Thurmond. Republican governors were elected in Iowa, Minnesota, Utah, Washington, and Wisconsin, but the electoral vote went to Truman in these States.

Significant changes occurred in the control of the State legislatures. Prior to the November election, Republicans controlled the lower house in 27 States and the senate in 27 States, while Democrats were in the majority in 19 lower houses and 18 senates—the Washington Senate having an equal number of each party. (The legislatures of Minnesota and Nebraska are non-partisan.) In the 1948 election, Republicans lost control of the lower house to Democrats in Colorado, Illinois, Indiana, Massachusetts, Missouri, Montana, Ohio, Utah, and Washington; and the Wyoming lower house was evenly divided. Democrats now control 28 to 17 for the Republicans, and one tie. Control of the State senates now is evenly divided, each party organizing 22 of them, with 2—Massachusetts and Rhode Island—tied. The Republicans lost senate control in these two States and Connecticut, Idaho, Missouri, and Ohio, while gaining control in Washington, previously tied. As frequently happens when a major shift in voter sentiment is registered, control of the legislatures in a large number of States became divided. In Colorado, Connecticut, Idaho, Illinois, Indiana, Montana, Nevada, and Washington, Republicans control one house and Democrats the other. This divided control is a result of two major factors: (1) variable bases of representation; and (2) staggered terms for the members of one house.

Unusual Aspects. The 1948 election presented several unusual aspects.

First, the Democrats won the presidency, control of Congress, and predominance in more than half of the State governments in spite of public opinion polls which indicated a Republican victory.

Second, Truman's victory was won in spite of—some commentators have said because of—electoral vote losses to the States Rights Democrats in four southern States, and sizeable defections to the Wallace Progressive ticket in a number of northern States, notably New York and California.

Third, the electoral vote pattern, without precedent in American history, revealed unexpected strength for the Democratic ticket, particularly in the agricultural Middle West and Plains States where Dewey lost the votes of Colorado, Iowa, Ohio, Wisconsin, and Wyoming which were his in 1944.

The heavily urbanized and industrialized States of the Northeast, from Maryland to the Canadian border with the exception only of Massachusetts and Rhode Island cast their electoral votes for Dewey. In only one of these—New York—was the Wallace vote apparently decisive in swinging the State to Dewey. Congressional and State candidates on the Democratic ticket were more successful in these States.

The States of Illinois, Indiana, Iowa, Kentucky, Michigan, Minnesota, Missouri, Ohio, West Virginia, and Wisconsin—in the Great Lakes—Ohio River—Upper Mississippi River region—appear to

have given the decisive margin of victory to the Democratic Party. Collectively, these States gave Truman 120 electoral votes to 32 for Dewey; they gave the Democrats 5 of their 9 new Senate seats; they elected 39 of the 75 Democrats who replaced Republicans; and they exactly reversed the number of governors, from 7 Republicans and 3 Democrats to 7 Democrats and 3 Republicans.

—HERBERT L. WILTSEE

U.S. RADIO BROADCASTING. During the year 1948 the numbers of broadcast stations and radio families continued to rise. In the station field, including AM, FM, and TV, authorizations made by the Federal Communications Commission increased to 3,215 from 3,024 for the previous year. Of this number, there was an increase of 165 for AM stations, an increase of 51 for TV, and a decrease of 46 for FM stations.

Of 39,950,000 families in the United States, 37,623,000 were said to be radio families, owning at least one set. More than 10 million automobile radios were in use, as well as about 5 million sets in stores, hotels, offices, and institutions. A total of more than 75 million radio sets was in use, and radio families had increased by 12,500,000 during the previous ten years.

It was a year of growth for broadcasting, especially in television. With a total of 50 television stations actually in operation and over a million television sets produced since the end of the war, great events were brought to the public by television—the World's Series, the political conventions, the football games, the opening night of the Metropolitan Opera, and greatly improved dramatic and variety programs.

Standard radio also continued to grow and improve, its numbers exceeding the total number of newspapers in the United States. A noteworthy event of the year was the adoption at the 26th Annual Convention of the National Association of Broadcasters of the "Standards of Practice" as a guide to good taste in programming, effective July 1, 1948, with due regard to contracts in effect May 19, 1948, but no later than May 19, 1949.

American broadcasters contributed to the national public interest in such programs as the first annual Voice of Democracy contest for the best five-minute broadcast scripts on the subject, *I Speak for Democracy*. High school students from all over the country entered and the four national winners were brought to Washington for a week to receive their awards of college scholarships and for visits with President Truman, the cabinet, and members of Congress.

Radio programming during the year produced continued experiments in documentaries, such as the continuing NBC series, "Living—1948," the ABC "Communism" program, the CBS and ABC venereal disease documentaries, and the MBS civil rights program. On the whole, news and comedy and variety programs continued most popular, with music of all types claiming its usual 40 to 50 percent of all broadcasting time.

Other electronic developments in radio broadcasting demanded attention during the year, such as facsimile broadcasting, ultrafax and transit radio. Facsimile, while as yet available in only a few cities, makes possible having your newspaper produced right in your home or office. An ultrafax, the new RCA development, by a combination of radio, television and highspeed photography, makes possible the transmission of enormous volumes of written or printed material. It has been said that ultrafax can send a million words a minute.

In the case of transit radio, by a contractual relationship between one FM station in a community and the local transportation company, FM receivers, locked to the frequency of the contracting station, are placed in the buses or street cars of the system, and music, news and advertisements are broadcast by the station for the transit riders. Successful operation began in several cities last year and indications are that the service will expand. Extensive surveys, conducted in a number of metropolitan areas, indicate that about 92 percent of the users of transportation systems would like to listen to transit radio while they ride.

There was substantial evidence that all phases of broadcasting, AM, FM, facsimile, and television continued to hold the high regard of the American people. A new edition of the National Opinion Research Center's national survey, conducted by the NORC at the request of NAB, was published by Prentice-Hall at the year's end, under the title *Radio Listening in America*. The survey found 78 percent of the American people were found to be opposed to Federal regulation of radio advertising; 65 percent opposed government control of programming on controversial issues; 59 percent opposed Federal control of accuracy of radio news, and 52 percent were against control of radio station profits. A total of 76 percent said they would prefer radio as it is now, with advertising, to commercial-less radio for which they would pay a \$5 annual license fee.

The entire radio industry's gross billings for sales of time in 1948, according to NAB estimates, increased 6.5 percent from \$374,086,686 in 1947 to \$398,560,000 in 1948. This rise in revenue was

Type of revenue	1947 (FCC figures)	1948 (Estimates)	% Gain
National Networks . . .	\$127,713,942	\$133,461,000	4.5
Regional Networks . . .	7,012,689	7,714,000	10.0
National Spot	91,581,241	100,739,000	10.0
Local Retail	147,778,814	156,646,000	6.0
	\$374,086,686	\$398,560,000	6.5

* Includes "miscellaneous networks and stations."

more than offset by an increase in operating expenses which raised station expenses about 10 percent, from \$121,200,000 in 1947 to \$233,200,000 in 1948. Broken down by types of advertising revenue, the figures were as shown in the accompanying table.

UTAH. A mountain State. Area: 84,990 sq. mi. Population: (July 1, 1948) 655,000, compared with (1940 census) 550,310. Chief city: Salt Lake City (capital), 149,934 inhabitants in 1940. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$54,802,000; total expenditure, \$53,449,000.

Elections. Truman won the 4 electoral votes with a popular majority over Dewey and Wallace about half as large as Roosevelt's 52,000 in 1944. There was no Senate race. Democrats won the 2 House seats for a gain of 1. Incumbent Democratic Governor Herbert B. Maw was defeated for reelection by J. Bracken Lee, Republican. Other state races were won by: Secretary of State—Heber Bennion, Jr.; Attorney General—Clinton D. Vernon; Treasurer—Ferrell H. Adams; Auditor—Reese M. Reese; Superintendent of Public Instruction—E. Allen Bateman.

Officers, 1948. Governor, Herbert B. Maw; Lieut. Governor, None; Secretary of State, Heber Ben-

nion, Jr.; Attorney General, Grover A. Giles; State Treasurer, Reese M. Reese; State Auditor, Ferrell H. Adams.

VATICAN CITY. A sovereign state of 44 hectares (108.7 acres) in northwest Rome created by the Lateran Treaty of Feb. 11, 1929. The population is not given in the 1948 *Annuario Pontificio* but it is close to 1,000 for the state proper, exclusive of the 12 extraterritorial areas in and about Rome. The sovereign is His Holiness, Pope Pius XII (Eugenio Pacelli), born in Rome on Mar. 2, 1876, and elected to the Papacy on Mar. 2, 1939.

The state is regulated by a *Legge fondamentale* of June 7, 1929. Its Governor, Marchese Camillo Serafini, has held office since 1929. He is assisted by a General Counselor and a Technical Consultant. The state has its own flag, import duties, police, coinage (which did not circulate in 1948 due to the disappearance of metallic money in Italy), newspaper, radio station, railway, telegraph, and postal systems.

Vatican City serves as the "territorial basis" for the Holy See in its government of the Catholic Church. This government functions through 11 congregations, 3 tribunals, and 4 offices, which together constitute the Roman Curia. The Secretariat of State, most important of the 4 offices, is normally headed by a Cardinal Secretary. However, the post has been vacant since the death of Cardinal Maglione in 1944. Two substitutes (Msgrs. Tardini and Montini) handled the affairs of the office during 1948. Through this Secretariat, the Holy See maintains diplomatic relations with foreign states.

The President of the United States and 38 governments were represented at the Vatican in 1948. In turn, the Holy See had 37 nunciatures or internunciatures and 21 apostolic delegations (these latter without diplomatic status) in foreign capitals. June, 1948, saw the establishment of diplomatic relations with India.

Events, 1948. Three tendencies have marked Vatican policy during this year: a growing emphasis upon the positive nature of the Christian programme, an intensification of the struggle with Communism, and a deep interest maintained in world problems.

At an audience for the Catholic *Avanguardia* Movement on January 4, Pius XII asserted that it is the duty of every Christian to work towards the establishment of a sound social order and he observed that the place of the Church is with the advance guard where the decisions are made.

Speaking to the College of Cardinals on June 2, His Holiness noted a reawakening of the Christian spirit and urged that it extend to all fields, national and international, which involve moral issues. He appealed to the Catholics of the world not to rest upon good intentions but to work steadfastly at putting them into practice. He warned that where such efforts coincide with those of political groups they must be "parallel, but no more, without identification and without subordination." In the address of June 29 to 60,000 members of ACLI (Christian Association of Italian Laborers), the Pope maintained that the growth of the organization was significant if it meant "that Christ has grown with each of you in the world of labor."

The contest with Communism was highlighted in connection with the Italian elections. On February 22, during an audience with 1,600 transportation workers, Pius XII stressed that irrespective of what a Catholic is told by propagandists, he cannot reconcile materialistic maxims with the

teaching of his Church. Addressing 300,000 Romans in St. Peter's Square on Easter Sunday, the Pope warned that "the hour of the Christian conscience has struck" and urged his hearers to follow that conscience.

The struggle took a bitter turn on April 3 with the publication by the Italian leftist press of "Secret Documents of Vatican Diplomacy" which scored the Church's leaders. In long articles, the Vatican's *Osservatore Romano* assailed the authenticity of the "Documents" until on April 11 one Virgilio Scattolini confessed that he had fabricated the pieces. This sudden collapse of the leftist campaign was not without effect upon the elections of April 18-19 which registered a distinct set-back for the Marxist Popular Front. Some months later the contest flared again when the Communist press interpreted the visit on October 19 of the then United States Secretary of State Marshall to the Pope as an effort to line up Vatican support behind the Marshall Plan.

At the close of the year, the December 27 arrest of Cardinal Mindszenty in Budapest on charges of plotting the overthrow of the Hungarian Communist government and the Vatican's immediate excommunication of all Catholics involved in the seizure pointed toward a violent phase to the struggle in 1949.

The Pontiff continued to interest himself deeply with international affairs. In his March 7 address to the Congress on International Exchange meeting in Rome, Pius XII laid down Christian principles for world trade. On November 11, he assured delegates of the European Union of Federalists of his sympathy with their program but he pointed out the need of first achieving economic peace in Europe before attempting political union. The papal encyclical of October 24 condemned violence as a solution to the Palestinian problem and called for the granting of international status to the holy places of Jerusalem.

In the ecclesiastical sphere, His Holiness proclaimed on June 2 that 1950 would be kept as a Holy Year. His "Motu proprio" of August 15, requiring a Church ceremony for all baptized Catholics entering marriage, introduced one of the few changes in the Church's Code of Canon Law since its adoption in 1918. The death of 5 cardinals brought the membership of the Sacred College to 56 at the close of the year.—HENRY G. J. BECK

VENEZUELA. A republic of South America. The country is divided into four natural regions, the Venezuelan highlands, the Maracaibo lowlands, the Orinoco plains and the Guiana highlands.

Area and Population. Area: 352,143 square miles. Population: 4,398,000 (1947). Census enumeration in Venezuela does not include classification by race, with the exception of the nomadic Indians, composing about 3 percent of the population. Principal cities: Caracas (capital), 269,030 inhabitants (1941); Maracaibo, 112,519; and Valencia, 85,000.

Education and Religion. Freedom of worship is guaranteed by the constitution; Catholicism is predominant and Spanish is the official language. It is estimated that nearly 40 percent of the population is literate. In the school year of 1947-48 there were 5,805 elementary schools with an enrollment of 360,531 pupils; 132 secondary schools of various sorts with an approximate enrollment of 19,000, and 41 special schools with 5,118 students. The three universities in Venezuela had 3,366 students in 1945-46.

Production. Venezuela's economy depends chiefly

on agriculture and petroleum. The production of petroleum in 1947 totaled 62,364,000 metric tons, and accounts for approximately 90 percent by value of total exports. The principal agricultural products include coffee, cacao, sugar, tobacco, cotton, corn, wheat and tropical fruits. Coffee exports in 1947 consisted of 508,200 bags of 60 kilograms each, of which 412,865 were purchased by the United States. Stock raising is another important industry. The diamond output in 1947 amounted to 60,045.34 carats, more than three times that of the previous year. Other minerals produced included coal, gold, silver and platinum. Manufacturing is not highly developed, although consumer goods production has recently increased.

Foreign Trade. Venezuelan imports during 1946 were valued at 98,760,000 bolívares and imports at 1,626,000,000 bolívares. (The controlled value of the bolívar, 1942-1948 was U.S.\$0.2985.) Exports went principally to the United States, Curaçao, Aruba, Brazil, Colombia and Argentina. Venezuela's imports were mainly from the United States, Brazil, Argentina, Mexico and the United Kingdom.

Transportation. The railway system which comprises about 685 miles, carried 1,826,680 passengers and 530,545 tons of freight in 1946. There are 7,955 miles of highways of all kinds. Venezuela is connected by air with other countries by international airlines, and travel within the territory is provided by national companies, the most important of which is the Linea Aeropostal Venezolana.

Finance. The budget for the fiscal year of 1947-48 estimated revenue at \$409,142,260 and expenditure at \$364,217,343. Currency in circulation at the end of October, 1948, totaled 660 million bolívares; bank deposits amounted to 571 million bolívares; gold reserves, including treasury holdings, totaled 305 million bolívares, and the public debt on Jan. 31, 1948, was \$6,933,717. Cost of living in December, 1947, was 185 (1937 = 100).

Government. Under the constitution of 1947, Venezuela is a Federal Union of 20 States, a Federal District, 2 territories, and Federal dependencies. Legislative power is vested in a Congress consisting of a Chamber of Deputies of 160 members, and a Chamber of Senators of 40 members. Executive power is exercised by a president elected for a five-year term. On November 24, an army revolt overthrew President Rómulo Gallegos, and formed a provisional government headed by Lieut. Col. Carlos Delgado Chalbaud.

Events, 1948. Rómulo Gallegos, one of the outstanding authors of the continent and victor in the elections of Dec. 15, 1947, took office on February 15. Special missions from many countries attended the inauguration, and the new government outlined a policy, of which the salient points were political liberty to be preserved, as well as good relations with the Catholic Church; friendliness toward foreign capital; mediation between capital and labor, with protection for both; friendship toward all countries, and elimination of excessive bureaucracy.

The government party, Acción Democrática, was fully behind the President's program. In his first message to Congress, President Gallegos presented in detail the above-mentioned aspects of his program, and then took a trip to the United States, where he was enthusiastically received, and was granted an honorary degree of Doctor of Laws by Columbia University.

Domestic Politics. After the return of President Gallegos to Venezuela, the general opinion was that he would have a peaceful year ahead of him.

In a survey made in April by the *New York Times*, Venezuela, Argentina and Uruguay were the only three South American countries whose governments were considered stable. Communism was not powerful in Venezuela, and the government party expelled Communist members from the Executive Council of the strong oil workers' federation. Opposition to the Gallegos government came from the COPEI party (Concentración de Organizaciones Políticas Electorales Independientes), composed of the wealthy upper classes and backed by the Catholic Church. The army, that had supported the provisional government under Betancourt, was thought to be solidly behind Gallegos.

Army Revolt. On November 24, the government was overthrown by an army revolt, the leaders of which immediately formed a provisional military Junta, headed by Lt. Col. Carlos Delgado Chabaud. The event caused general consternation. President Gallegos was kept under arrest for several days, and then permitted to leave the country for Cuba. On his arrival, he issued a statement accusing the foreign-owned oil companies of backing the plot, as they were dissatisfied with the government's increase in taxes. He also stated that the United States Military Attaché, Colonel Edward R. Adams, was not only cognizant of the movement but actually gave advice to the rebels. He explained that the army's sudden change was caused by his refusal of their request for him to exile ex-President Betancourt.

The new government immediately dissolved the Congress, State Legislatures, and Municipal Councils, whose members had been elected the previous year, and dismissed the Supreme Court as well. The Acción Democrática party was outlawed and numerous members arrested; strict censorship was established, and many newspapers closed. The United States State Department, as well as the oil companies, vehemently denied the Gallegos accusations, and the State Department later condemned the use of force to overthrow the legitimate government. In Mexico, a large number of well-known intellectuals protested against the coup d'état, and that government promptly recalled the Mexican Ambassador from Caracas.

Representatives of Venezuela attended the Ninth Inter-American Conference of American States held at Bogotá in April (see PAN AMERICAN ACTIVITIES).

—MIGUEL JORRÍN

VERMONT. A New England State. Area: 9,564 sq. mi. Population: (July 1, 1948) 374,000, compared with (1940 census) 359,231. Chief cities: Montpelier (capital), 8,006 inhabitants in 1940; Burlington, 27,686. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$21,772,000; total expenditure, \$22,353,000.

Elections. Dewey, as in 1944, won the 3 electoral votes, with 75,926 votes to Truman's 45,557 and Wallace's 1,279. There was no Senate contest. The Republicans retained the 1 House seat. Incumbent Republican Governor Ernest W. Gibson was re-elected. Other State officers elected were: Lieutenant Governor—Harold J. Arthur; Secretary of State—Howard L. Armstrong; Treasurer—Levi Kelley; Auditor—David V. Anderson.

Officers, 1948. Governor, Ernest W. Gibson; Lieut. Governor, Lee E. Emerson; Secretary of State, Rawson C. Myrick; Attorney General, Clifton G. Parker; State Treasurer, Levi R. Kelley; State Auditor, David V. Anderson.

VETERANS ADMINISTRATION. An independent establishment of the United States Government, charged with administering benefits provided by law for a potential one-third of the nation's population—veterans of all wars and their families. VA operates a network of 126 hospitals for the treatment of ill and disabled veterans. In addition, beds in civil, state, and other federal hospitals are being used on a contract or agreement basis.

Veterans of all wars, discharged under conditions other than dishonorable, are entitled to hospital treatment under the following priority system: first, emergency cases; second, those with injuries or diseases incurred in or aggravated by military service, and third, those who state under oath that they are unable to pay hospital charges for treatment for nonservice-connected ailments. Veterans in the third category, if not emergency cases, must wait until beds become available.

On Nov. 1, 1948, a total of 93,541 beds were occupied in VA hospitals. An additional 12,221 beds were used by VA in other-than-VA hospitals for the care of eligible veterans.

VA provides education and training at Government expense to eligible veterans.

Those training under the G.I. Bill may choose their place of study or their job training establishment, if the institution or establishment has been approved by an appropriate State approving agency. They may train for one year plus a period equal to the time served in the armed forces between Sept. 16, 1940, and July 25, 1947. Maximum period of training allowed is 48 months.

Veterans with service-connected disabilities, in training under Public Law 16, receive extensive guidance from VA in selecting their courses and throughout their training. They may remain in training for as long as is necessary to restore their ability to work, up to a maximum of four years. In extraordinary cases, VA may authorize training for more than four years.

Veteran-students and job trainees under the G.I. Bill and Public Law 16 may be eligible to receive subsistence allowances. Monthly maximums for those studying full-time in schools are \$75 without dependents; \$105 with one dependent, and \$120 with more than one dependent. Maximums for job trainees are \$65 a month for those without dependents and \$90 for those with more than one dependent.

Additional allowances may be provided to Public Law 16 trainees, depending on their degree of disability and the number of additional dependents they have.

On Nov. 1, 1948, there were 2,186,092 veterans in schools and job-training establishments under the G.I. Bill. At the same time, 231,854 were in training under Public Law 16.

VA guarantees and insures loans for homes, farms, and businesses, up to a maximum of \$4,000 on real estate and \$2,000 on non-real estate loans. G.I. farm realty loans may be made repayable in up to 40 years; other realty loans, in up to 25 years, and non-realty loans, in up to 10 years.

By Oct. 25, 1948, a total of 1,486,080 G.I. loans of all types, amounting to more than \$8,000 million, had been made by private lenders with VA approval for guaranty or insurance. Ninety percent of the loans—or 1,337,548—were for homes; 48,034 were farm loans, and 100,498 were business loans.

VA administers a readjustment allowance program which provides financial assistance for jobless veterans, those partially employed, and those self-employed netting less than \$100 a month. A

totally unemployed veteran may receive \$20 a week; a partially employed veteran may receive up to \$20 a week less earnings above \$3. A self-employed veteran may receive \$100 a month, minus any net earnings during the month.

During the week ending Nov. 6, 1948, a total of 229,831 veterans claimed readjustment allowances for unemployment. During the week, State unemployment compensation offices paid out \$4,131,779 in VA readjustment allowances.

Claims for self-employment allowances totaled 46,204 during October, 1948. That month, unemployment compensation offices disbursed \$4,471,906 in self-employment claims.

VA conducts one of the largest mutual life insurance systems in the nation. Within the past eight years, the agency wrote nearly 19,600,000 National Service Life Insurance policies having a face value of \$152,500 million. On Oct. 1, 1948, about one-third, or 6,913,600, still were in force. Of these, 5,342,000 were term policies. The remainder had been converted to the half-dozen available permanent forms of insurance: ordinary life, 30-payment life, 20-payment life, 20-year endowment, endowment at age 60 and endowment at age 65.

VA, on Nov. 1, 1948, was paying monthly compensation and pensions to 2,263,296 disabled veterans and to 955,313 dependents of deceased veterans. Payments for disabilities range from \$13.80 to \$360 a month.

On that date, the following cases (living veterans) were on VA's rolls: Civil War, 42; Indian Wars, 674; Spanish American War, 104,660; World War I, 452,815; Regular Establishments, 44,389, and World War II, 1,660,716.

In addition to these functions, VA is charged with administering other benefits to veterans. Among them are a guardianship service; a program to provide homes for paraplegic veterans; conveyances at Government expense to amputees; burial benefits; and a contact service to advise veterans, their dependents, and beneficiaries on their rights and benefits.

Deadlines have been established for most World War II veterans benefits. For most veterans, G.I. Bill training must begin before July 26, 1951, and must end July 25, 1956. Disabled veterans may apply for Public Law 16 training at any time after their discharge, but in time to complete training by July 25, 1956. The deadline for applying for G.I. loans is July 24, 1957. Readjustment allowances may be claimed for any week ending on or before July 24, 1949, or two years after date of discharge, whichever is later, but not later than July 24, 1952.

An exception to these deadlines has been made for persons who enlisted or reenlisted under the Voluntary Recruitment Act. Those persons may count the entire period of their enlistment as war service for purposes of G.I. Bill benefits, regardless of the date the war was declared officially ended.

—CARL R. GRAY, JR.

VETERINARY MEDICINE. Foot-and-Mouth Disease in Mexico. A project of international interest in veterinary medicine, during 1948, was the program administered jointly by Mexican and United States officials to suppress an outbreak of foot-and-mouth disease in central Mexico. This highly infectious plague that attacks cloven-hoofed animals with devastating effects had appeared in the State of Veracruz late in 1946—the first time in many years that it had invaded North America, though it exists in over 50 countries of other continents.

The infection spread to 18 Mexican States during 1947 in spite of the efforts of a well-organized staff of several hundred veterinarians and technical assistants to stamp it out by the slaughter and burial of infected and exposed herds. This method is eminently successful when applied early in an outbreak but good results are less certain if the disease has spread extensively, as was the case in the current instance before vigorous eradication measures could be put into effect.

During 1948 the joint Mexican-United States Commission in charge of operations developed a program embodying large-scale vaccination of healthy animals to confer resistance against the disease. Other elements of the program, carried over from the previous year, were constant inspections, disinfection, and quarantine. In addition the 1948 operations included the slaughter and burial of infected and exposed herds when found near quarantine lines and in other areas being "worked." Lacking vaccine of its own the Commission first contracted for supplies from laboratories in Europe and South America. When it became clear that the quantity from those sources would be insufficient for the program, involving the vaccination of millions of animals, the Commission established its own laboratories in central Mexico.

By October, 1948, the newly built and equipped laboratories attained the remarkable production of a million doses of vaccine monthly, and by the end of the year the output was about 50 percent more. The use of the vaccine as the key to control and eventual eradication of the disease met with better cooperation from the Mexican people than had the previous more drastic program based on large-scale slaughter.

Progress during 1948 included the vaccination of more than 1,500,000 cattle, sheep, goats, and swine and a reduction of the quarantined area by about 40,000 square miles, or more than a tenth of the total. The estimated number of animals still to be vaccinated exceeds 12 million. The officials directly in charge of the campaign against the disease are Oscar Flores, director, representing Mexico, and Harry H. Johnson, co-director, representing the United States. The civilian staff under their supervision numbers over 3,000. It is supplemented by units of the Mexican National Army, which perform protective and quarantine-enforcement duties.

The large-scale laboratory and field operations in Mexico have reduced previous apprehension that the dreaded disease might get out of control there and spread to other countries of North America. Foreign veterinary authorities, seeing in the developments a possible key to their own problems, have shown keen interest especially in the vast vaccination program, and several foreign officials have visited Mexico to obtain first-hand information.

United States Research on Foot-and-Mouth Disease Authorized. Allied to the situation in Mexico but fundamentally concerned with better protection of the United States from foot-and-mouth disease from any source was legislation, passed by the United States Congress in April, 1948, authorizing research on this malady (Public Law 496—80th Congress, Chapter 229, 2d session, S. 2038). United States veterinary officials responsible for suppressing outbreaks that may occur in the United States from time to time have long needed more scientific information than has been available from foreign laboratories.

The United States has never had a foot-and-

mouth disease laboratory of its own, largely because of public sentiment against experimenting with the highly infectious virus. But during 1948 the Bureau of Animal Industry of the United States Department of Agriculture received assurances from several European authorities that modern safeguards were fully adequate to control the infection. This view received support, also, from domestic research workers and representatives of the livestock industry who saw in such a laboratory an aid to United States defenses should an emergency such as germ warfare arise. The same groups held, likewise, that expanding commerce of all kinds with foreign countries, especially by airplane, required new scientific research as a basis for modern quarantine regulations and other improved security measures.

After extensive hearings Congress authorized the establishment of such a laboratory, with specified safeguards. The principal one was that it be on a coastal island separated from the mainland by deep navigable water. The selection of a suitable site and the development of detailed plans were in progress at the end of the year.

Veterinary Education. Increasing demands for well-trained veterinarians for both private and public service have caused veterinary medicine to be one of the least-crowded professions. During 1948, as in other recent years, private practice attracted most veterinarians. Government agencies, particularly the United States Department of Agriculture and the United States Army, have ranked next in importance as employers. For example, the meat inspection service of the United States Department of Agriculture required the services of about 900 veterinarians in 1948. Other noteworthy fields are State and municipal services, teaching, and the commercial preparation of veterinary biological products. Among the newer opportunities of specialized character is veterinary service for fur animals raised in captivity.

During 1948 training for the foregoing lines of work was provided by 10 colleges in the United States and 2 in Canada, accredited by the United States Department of Agriculture. Such accreditation signifies that graduates of those institutions are eligible for appointment for veterinary service in the Department. The accredited colleges of veterinary medicine in the United States and Canada are:

Alabama Polytechnic Institute, College of Veterinary Medicine, Auburn, Ala.
 Colorado State College, Division of Veterinary Medicine, Fort Collins, Colo.
 Iowa State College of Agriculture and Mechanic Arts, Division of Veterinary Medicine, Ames, Iowa.
 Kansas State College, Division of Veterinary Medicine, Manhattan, Kans.
 Michigan State College of Agriculture and Applied Science, Division of Veterinary Medicine, East Lansing, Mich.
 Cornell University, New York State Veterinary College, Ithaca, N.Y.
 Ohio State University, College of Veterinary Medicine, Columbus, Ohio
 University of Pennsylvania, School of Veterinary Medicine, Philadelphia, Pa.
 Agricultural and Mechanical College of Texas, School of Veterinary Medicine, College Station, Tex.
 State College of Agriculture, College of Veterinary Medicine, Pullman, Wash.
 University of Toronto, Ontario Veterinary College, Guelph, Ontario, Canada l'Ecole de Médecine

Vétérinaire, Université de Montréal, Oka, Quebec, Canada.

During 1948 the 10 United States institutions had a total enrollment of approximately 2,350 students and conferred degrees on 141 graduates. Though encouraging veterinary education, the United States Government conducts no schools or courses in veterinary medicine, nor are there any officially accredited night schools or correspondence courses in that subject. During 1948 several new veterinary colleges were being established in other States.

License to Practice. As in previous years, all States and the District of Columbia and the provinces of Canada had laws and regulations governing the practice of veterinary medicine. Licensing tests or examinations are offered periodically to candidates seeking to qualify as practitioners. Registration is generally required, usually with the State board of veterinary examiners at the State capital.

Bovine Tuberculosis Eradication. In the cooperative Federal-State campaign against bovine tuberculosis, conducted systematically since 1917, the average degree of infection in 1948 was found to be 0.19 percent, which is a slight reduction from that reported for the two previous years. At the beginning of the campaign the corresponding figure was about 5 percent for the United States, though in some localities the proportion of tuberculous cattle exceeded 25 percent. Though this campaign has been eminently successful, sporadic outbreaks during 1948 again demonstrated the importance of retesting herds regularly so as to detect and remove promptly any infected animals before they spread the disease.

Progress in Eradicating Brucellosis. The eradication of brucellosis, or Bang's disease, from the cattle of the United States continues to be a major undertaking in veterinary medicine. Federal, State, and private veterinarians, together with county veterinarians in some areas, are participating in various aspects of this campaign.

Owing to extensive interest among cattle owners in the early eradication of the disease from their herds, where it has caused heavy losses, the demand for veterinary service has been unusually heavy, often exceeding the ability of public agencies to meet it. One major factor in the spread of this disease has been the addition, by many farmers, of cows of uncertain origin to clean herds in the effort to increase milk and beef production. The application of blood tests to more than 5 million cattle during the year disclosed approximately 4.3 percent of infection, which is slightly less than that found a few years ago.

The disposal of reacting cattle is covered by detailed regulations and in many States provision has been made for the payment of indemnities for condemned animals. Vaccination, particularly of calves, to increase their resistance to the disease is part of the campaign of control and eradication. During 1948 more than one million calves were vaccinated.

Equine Infectious Anemia Studied. A serious outbreak of infectious anemia among race horses in New England, in 1947, was the object of veterinary study continuing into 1948. It was the first time the disease had occurred among a large number of thoroughbred horses, hundreds of valuable animals at race tracks in Massachusetts, New Hampshire, and Rhode Island being involved. Measures outlined by the United States Bureau of Animal Industry, promptly put in force by State livestock officials, brought the outbreak under control. A thorough investigation indicated that biting

flies had played a part in the early spread of the disease and that further dissemination may have resulted from the use of contaminated hypodermic needles and other instruments that draw blood even in very small amounts.

Rabies Survey. The results of a survey on the extent of rabies in the United States, announced by the United States Department of Agriculture in 1948 though covering the previous year, showed dogs to be the principal animals affected. The data were compiled from information furnished to the Department by livestock sanitary officials or health officers in each State. Of 8,946 cases reported, 6,949 were dogs, 766 cattle, 40 horses, 15 sheep, 20 swine, 393 cats, 9 goats, 26 persons, and 728 animals either unclassified or miscellaneous. The last group included many species of wild animals such as coyotes, foxes, squirrels, and rats. States from which more than 500 cases of rabies were reported were Texas, Tennessee, New York, Louisiana, and Ohio. Those having no reported cases were Connecticut, Delaware, Idaho, Maryland, Massachusetts, Nevada, New Hampshire, North Dakota, Oregon, Rhode Island, South Dakota, Vermont, Washington, and Wyoming.

"X Disease" of Cattle Studied. A baffling cattle malady known thus far mainly as "X disease," although also given other tentative names, became the object of study, during 1948, by Federal and State livestock scientists. By the end of the year it had been reported from 32 States. Early symptoms of the disease include a watery discharge from the eyes and nose. As the malady progresses the appetite fails and there is loss of flesh and condition. The victim becomes depressed and a progressive thickening of the skin occurs. Because of the last symptom some pathologists have called the disease hyperkeratosis. The normal course of the malady is from several weeks to three months. Young stock appear to be more susceptible than adults. Severely affected animals usually die.

A preliminary survey of the disease in five Southeastern States by a group of scientists failed to show its cause. The scientists collected samples of soil, plants, and tissues from affected animals for further study. Until the cause of the strange disease is known, the scientists advise the quarantining, voluntarily, of affected herds as a protection to others on nearby farms.

Decrease in Pullorum Disease. The poultry malady, pullorum disease, which has long caused heavy death losses, especially among young chicks, is being reduced, in the United States, by the testing of breeding stock and the elimination of infected birds. Of 30 million chickens tested in 1948, approximately 1.9 percent reacted, indicating infection, as compared with 3.3 percent of a smaller number tested 12 years ago when the systematic suppression of the disease began. The tests are made as a part of the National Poultry Improvement Plan conducted jointly by Federal and State officials in cooperation with the poultry industry.

Of great value in this work is a simple, rapid, accurate diagnostic test developed in 1931 by the United States Department of Agriculture scientists. Although the disease is especially fatal to young chicks, it causes further losses through reduced hatchability of eggs, curtailed egg production, and deaths of hens from generalized infection. Since the main reservoir of the disease is the farm flocks that supply commercial hatcheries with eggs, Federal and State sponsors of the national plan have provided official recognition for progressive steps in eradicating the infection from individual flocks.

International Veterinary Congress Award. The International Veterinary Congress Award for 1948 was presented to Col. A. E. Cameron, Ottawa, Canada, for "long and distinguished service to veterinary medicine and to mankind and for his zeal to improve the profession." Col. Cameron was formerly Veterinary Director General of Canada. Presentation was made by Dr. W. A. Hagan, President of the American Veterinary Medical Association at its annual convention, held in San Francisco.

New Veterinary Books and Pamphlets. Much new literature on veterinary subjects appeared during 1948 both as individual documents and as articles in professional and livestock journals. The published material included: *Proceedings*, 51st Annual Meeting of United States Livestock Sanitary Association, (Waverly Press, Inc.); *Manual of Veterinary Bacteriology*, by R. A. Kelsner and H. W. Schoening, (Williams & Wilkins); *Diseases of Poultry*, edited by H. E. Biester and L. H. Schwarte, 2d edition (Iowa State College Press); *Report of Chief of the Bureau of Animal Industry*, fiscal year 1948, by B. T. Simms (U.S. Government Printing Office); *Career Opportunities for Graduate Veterinarians in the Bureau of Animal Industry*, Miscellaneous Publications No. 671 (U.S. Government Printing Office). —DALLAS S. BURCH

VIKING FUND, INC., The. This non-profit organization was created and endowed in 1941 by Axel Leonard Wenner-Gren for the promotion and support of scientific, charitable, and educational enterprises. Its main sphere of interest is the encouragement and support of research in anthropology and closely related sciences, and the meeting of educational and institutional needs for the propagation of these sciences. During the year ended Jan. 31, 1948, a total of 107 grants were awarded, including twelve Pre-Doctoral and Post-Doctoral Viking Fund Fellowships in Anthropology. The projects aided by grants are described in the Annual Reports of the Viking Fund, and are listed in the Cumulative Record of Grants printed therein.

During the year ended Jan. 31, 1949, a total of 106 new grants were awarded, including 24 Pre-Doctoral and Post-Doctoral Viking Fund Fellowships in Anthropology.

Publications: *Viking Fund Publications in Anthropology*, nos. 1-10; *Yearbook of Physical Anthropology*, 1945, 1946; and others resulting from projects supported in whole or in part by the Viking Fund (listed in Cumulative Record of Publications in Annual Reports). Prizes and awards: the Viking Fund Annual Awards in Anthropology, consisting of a medal and a cash award. Medalists for 1946 and 1947 were, respectively: Dr. A. L. Kroeber and Dr. Robert Harry Lowie for the American Anthropological Association; Dr. Franz Weidenreich and Dr. Earnest A. Hooton for the American Association of Physical Anthropologists; and Dr. A. V. Kidder and Dr. John Otis Brew for the Society for American Archaeology. President, Richard C. Hunt; Director of Research, Dr. Paul Fejos. Headquarters: 14 East 71 St., New York 21, N.Y.

VIRGINIA. A south Atlantic State. Area: 39,899 sq. mi. Population: (July 1, 1948) 3,029,000, compared with (1940 census) 2,677,773. Chief city: Richmond (capital), 193,042 inhabitants in 1940. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947,

total revenue amounted to \$152,482,000; total expenditure, \$156,704,000.

Legislation. The General Assembly met January 14 and adjourned March 30, having passed a record-breaking \$511 million biennial budget, 40 percent of which is derived from business operations and involves no tax money. Increased tax rates were placed on corporate and individual income, merchants, public service corporations, beer, and recording of deeds. Appropriations for education, public health, welfare, and care of mental defectives were increased.

A thorough reorganization of the executive branch was approved, reducing independent departments and agencies from 72 to 30. Improved and more economical administration is expected to result.

Other important enactments include \$2.5 million direct aid to localities for hospital and health center construction; increased unemployment compensation payments and greater coverage of workmen's compensation; stronger child labor laws; broader regulation of insurance; approval of the eight-State Ohio River pollution control compact; an airport channeling law; and submission to popular vote in November, 1949, of a constitutional amendment to repeal the poll tax.

Elections. Truman won the 11 electoral votes, also taken by Roosevelt in 1944, with a plurality over Dewey, Thurmond, and Wallace. Incumbent Democratic Senator A. Willis Robertson was reelected. Democrats retained the 9 House seats. There were no Statewide contests for State office.

Officers, 1948. Governor, William M. Tuck; Lieut. Governor, L. Preston Collins; Secretary of the Commonwealth, Mrs. Thelma Y. Gordon; Attorney General, Harvey B. Apperson; State Treasurer, Jesse W. Dillon; Auditor of Public Accounts, J. Gordon Bennett; Comptroller, Henry G. Gilmer.

VIRGIN ISLANDS, U.S. An insular possession of the United States, situated about 70 miles east of San Juan, Puerto Rico. This possession, acquired in 1917 for \$25 million through a treaty with Denmark, forms part of the chain of the Lesser Antilles which extends from Puerto Rico to the coast of South America. Of the 50 islands in the group only the three largest are inhabited—St. Thomas, St. John, and St. Croix.

Area and Population. Total area: 132 square miles. Population: 24,889. Individual islands (1940): St. Thomas, 28 square miles, 11,265 inhabitants; St. John, 20 square miles, 722 inhabitants; St. Croix, 84 square miles, 12,902 inhabitants. Of the whole population, 69 percent in 1940 were Negroes, 22 percent of mixed race, 9 percent whites. Vital statistics (1947): birth rate, 37.0; death rate, 16.3, per 1,000. Capital: Charlotte Amalie (on the island of St. Thomas), population 9,801 in 1940. The estimated population of the Virgin Islands at the end of 1947 as the result of a local survey was 30,000.

Education. For over a century education has been compulsory. At the present time all children between 5½ and 15 years of age are required to go to school. Free education is provided by the local government in the elementary grades through high school. In the fiscal year ended June, 1948, there were 27 schools for all grades with a total enrollment of 4,260 pupils. Most of the people speak English.

Defenses. The islands are the most eastern outpost of the United States and are so situated as to furnish protection both to United States' holdings in the Caribbean Sea and the Panama Canal.

The fine harbor of Charlotte Amalie provides shelter for as many as 23 warships at one time. Defenses constructed in this region during the past few years have been primarily to bulwark the great naval, military, and air bases in Puerto Rico.

They include a permanent United States Marine Corps air base near Lindbergh Bay on St. Thomas, a large submarine base at Charlotte Amalie Harbor, and a United States Army air base on St. Croix near Frederiksted. In December, 1947, the United States Navy removed its personnel and ceased operations of the Submarine Base and the Marine Corps Air Facilities at Bourne Field in St. Thomas. At the same time the United States Army ceased operations of the airport at Benedict Field, St. Croix. In April, 1948, the San Jose Project, a permanent installation of the United States Army Chemical Service, was transferred to St. Thomas from Panama and took over the former Naval Submarine Base.

Production and Trade. St. Thomas has largely depended upon commerce, trade and shipping for income. St. Croix has depended chiefly upon agriculture for its revenues. During the fiscal year ended June, 1948, St. Croix produced 4,350 tons of sugar, 1,400 tons more than the previous year. A total of 224,236.86 proof gallons of alcoholic beverages were exported from the Virgin Islands.

Public Finance. The revenue of the Municipality of St. Thomas and St. John amounted to \$817,581, almost the same as for the preceding year. Budget expenditures totaled \$965,733. Income tax collections were \$417,698, as compared with \$511,870 in the preceding year. The revenue of the Municipality of St. Croix was \$269,474, as compared with \$273,027 in the past year. Budgeted expenditure was \$456,893. Congress appropriated \$140,000 toward the expenses of local government in the Municipality of St. Croix. Income tax collections there amounted to \$103,070 as against \$86,232 in the previous year.

Government. During the first 14 years of United States control the Virgin Islands had a naval government. In 1931 jurisdiction was transferred from the Navy Department to the Department of the Interior and a civil governor was appointed by the President. Congress passed an Organic Act for the islands in 1936 which effected little change in the structure of the government although it did allow for a greater measure of political freedom. The autonomy of the two municipalities was retained and both have Municipal Councils, which when called in joint session, constitute the Legislative Assembly. The Governor is appointed by the President and holds office at his pleasure.

Governor in 1948 William Henry Hastie (inaugurated May 17, 1946). Other government officials are: Morris F. de Castro, Government Secretary; Louis Shulterbrandt, Commissioner of Finance; Francisco Corneiro, U.S. Attorney; and Herman E. Moore, District Judge of the District Court of the Virgin Islands.

Events, 1948. The outstanding event of 1948 was the commemoration of the one hundredth anniversary of the abolition of slavery in the Virgin Islands. At the official opening held in Charlotte Amalie on July 3, Governor Hastie read greetings from the President of the United States and from the King of Denmark. With the Governor, the Danish Ambassador to the United States, Mr. Henrik de Kauffman, was one of the principal speakers. President Harry S. Truman visited the Virgin Islands in February, and unveiled a plaque commemorating the Emancipation Centennial at Charlotte Amalie.

The Legislative Assembly provided for a Referendum on questions of basic importance in any revisions of the present Organic Act. Voters were given the opportunity to express their views on the popular election of the Governor, unification of the quasi-independent political districts of St. Croix and St. Thomas and St. John, and the election of a Resident Commissioner to the United States Congress.

—WILLIAM H. HASTIE

VITAL STATISTICS. In 1948, the number of births in the United States declined somewhat from the record high point recorded the previous year, according to provisional data of the National Office of Vital Statistics, in the Public Health Service of the Federal Security Agency. The crude birth rate was the second highest recorded in almost 30 years. The crude death rate estimated for 1948 was at

TABLE 1—NUMBER OF BIRTHS, DEATHS, MARRIAGES, AND DIVORCES: UNITED STATES, 1933-1948

(Births and deaths exclusive of stillbirths; divorces include reported annulments)

Year	Births	Deaths ^a	Marriages	Divorces ^b
1948 ^b	3,540,000	1,454,000

1933.....	2,081,232	1,342,106	1,098,000 ^b	165,000

^a Data for 1940-48 exclude deaths among armed forces overseas. ^b Estimated. ^c Provisional.

the record low first set in 1946. The number of divorces in 1947 and the number of marriages in 1947 and 1948 declined from the all-time high in 1946, but remained well above prewar levels.

Nativity Statistics. Provisional data for 1948 indicate that the second largest number of births in the history of the country occurred during the year. It is estimated that about 3,540,000 live births were registered in 1948, a decline of about 160,000

Note: Birth and divorce rates for 1940-46 based on population including armed forces overseas; after 1946, based on population excluding armed forces overseas. Death and marriage rates based on population excluding armed forces overseas, 1940-48.

^a Data for 1940-48 exclude deaths among armed forces overseas. ^b Estimated. ^c Provisional.

from the 3,699,940 registered in the preceding year. The 1948 estimated birth rate of 24.2 per 1,000 population (excluding the armed forces over-

seas) was 6 percent lower than the 1947 rate (25.8) and is the second highest recorded in almost 30 years. The estimated birth rate for the first six months of 1948 was about 10 percent below that estimated for the first half of 1947. In the second half of 1948, however, the monthly rate rose to the 1947 level.

As may be seen from Table 2, the trend since 1933, when the birth rate reached its lowest point in this country, is characterized by an irregular rise in the rate from 16.6 in 1933 to 17.9 in 1940, a more rapid rise to 20.9 in 1942, and a further rise in 1943 when the wartime peak rate of 21.5 was set. The decline in the rates during the next two years to 19.6 in 1945 erased about half of the rise which occurred during the period 1941-43 and may be attributed in large part to the assignment of millions of men in the armed forces to overseas posts. The demobilization late in 1945 and in 1946, the high marriage rate during this period, and the high level of economic activity account for the upsurge in the birth rate which occurred in the second half of 1946 and the record high rate in 1947. Favorable economic conditions undoubtedly were a factor in the continuation of a high rate in 1948.

Person in Attendance at Birth. The period 1935-46 was marked by a rise in the proportion of births attended by physicians, a sharp increase in the proportion of births in hospitals, and a decline in the proportion of births attended by midwives. The increased use of hospitals and physicians at birth has been a contributing factor in the decline in the infant mortality rate.

In 1946, 94.6 percent of all live births were attended by physicians, an increase of about 8 percent over the proportion (87.5) in 1935. A much larger change occurred in the use of hospitals. Between 1935 and 1946, the proportion of births attended by physicians in hospitals more than doubled, increasing from 36.9 percent in 1935 to 82.4 percent in 1946. The proportion of births attended by physicians outside hospitals decreased from 50.6 percent in 1935 to 12.2 percent in 1946. Midwives attended 5.1 percent of all births in 1946, a reduction of more than one-half from the 1935 proportion (10.7 percent).

In both white and nonwhite groups there has been a continued upward trend in the proportion of births occurring in hospitals. Over the 12-year period, the proportion of such births in each of these groups has approximately doubled. Nevertheless, in 1946 the proportion of births of white infants in hospitals (87.1 percent) was almost twice the proportion (45.2 percent) for nonwhite infants. This disparity is reduced to some extent if births attended by physicians outside hospitals are included. In 1946, 98.4 percent of all white births as compared with 65.2 percent of nonwhite births were attended by physicians in or out of hospitals. Midwives attended more than a third (33.8 percent) of the nonwhite births in 1946 but were of negligible importance (less than 2 percent) in white births.

Mortality Statistics. During the 3-year period, 1946-48, the crude death rate for the United States was at the lowest level ever recorded. The rate reached the record low of 10.0 per 1,000 population in 1946, then rose slightly to 10.1 in 1947. The rate for 1948 was estimated to be 10.0 on the basis of provisional figures for the first 10 months of the year.

The number of deaths and the crude death rate for the United States for 1933 to 1948 are shown in Tables 1 and 2 (figures for 1940-48 exclude armed forces overseas). In general, the rate rose

from 1933 to 1936, decreased in 1937 and 1938, and remained relatively level until 1946, when a further decrease occurred. In such comparison, however, account must be taken of changes in the composition of the population during these years, notably the gradual aging of the population, and, for the war years, the changes caused by the withdrawal from the population of physically fit men in the younger age groups for duty overseas with the armed forces. If allowance were made for the changes which occurred in the age composition of

States represented a decrease of 8.9 percent from the comparable figure of 1,526,783 issued in January–September, 1947. (See Table 4.) In major cities (cities of 100,000 or more population, or their counties), a total of 572,386 licenses issued during the first 11 months of 1948 was a decline of 8.7 percent from the comparable 1947 figure.

The crude marriage rate of 16.4 per 1,000 estimated population in 1946 was the highest ever recorded in the United States. The provisional 1947 rate of 13.9 represented a decline of 15 per-

^a Excludes deaths among armed forces overseas. ^b Based on population excluding armed forces overseas.

the national population, it would be seen that mortality decreased from 1936 to 1947, with the exception of a rise in 1943.

Table 3 presents the number of deaths and the crude death rates for the ten leading causes of death in 1947 and the rates for the ten leading causes in 1900. (The data for 1900 are for 10 States and the District of Columbia.) The major mortality trends for the country may be seen here, namely: the decline in importance of the infectious diseases and the increased importance of the chronic diseases of old age.

At the turn of the century, pneumonia and influenza (combined) was the leading cause of death, with a death rate of 202.2 per 100,000 population. In 1947, this cause was in sixth place, with a rate of 43.1. Equally dramatic declines are seen for tuberculosis (from 194.4 to 33.5), diarrhea, enteritis, and ulceration of the intestines (from 142.7 to 5.6) and diphtheria (from 40.3 to 0.6). Tuberculosis dropped from second to seventh place as a cause of death, while diarrhea, etc., and diphtheria did not rank among the ten leading causes in 1947. These four causes accounted for 33.7 percent of the total deaths in 1900 as compared with only 8.2 percent in 1947.

During this period, the degenerative diseases of old age have come to the forefront. To these causes—diseases of the heart, cancer and other malignant tumors, intracranial lesions of vascular origin, nephritis, and diabetes mellitus—the overwhelming proportion of deaths are now attributed. In 1900, 23.7 percent of all deaths were attributed to this group of causes. By 1947, the corresponding proportion had risen to 62.2 percent. Important among the factors responsible for this marked increase are: the decline in mortality from infectious disease; the gradual aging of the national population; and improved methods for the diagnosis of chronic conditions.

Marriage Statistics. Although final figures on marriages in the United States are not yet available for 1948, provisional statistics on marriage licenses issued, which tend to approximate the number of marriages occurring, indicate that 1948 continued the decline from the all-time high in 1946.

During the first 9 months of 1948, a total of 1,390,240 marriage licenses issued in the United

cent from the record 1946 rate, but was still second highest on record.

The population base used in arriving at marriage rates for the years 1940–47 comprises the total population present in the United States as of the

^a Provisional.

midyear, estimated by the Bureau of the Census, and excludes armed forces stationed overseas. Overseas personnel have been excluded primarily because no figures are available on foreign marriages contracted by members of the armed forces.

During the 15-year period, 1933–47, marriages increased successively each year except in 1938, 1943–44, and 1947. (See Table 1.) A provisional total of 1,992,354 marriages in the United States in 1947 was 81 percent higher than the total of 1,098,000 registered in 1933. The peak of the rises came in 1946, for which an increase of 678,000 marriages over the 1945 total was larger than the increase of the 1945 total over the 1933 total.

Divorce Statistics. Divorces in 1947 dropped proportionately more sharply than marriages; the crude divorce rate of 3.3 per 1,000 estimated population in 1947 represented a decrease of 23 percent from the record high rate (4.3 per 1,000 population) of 1946. No divorce data for 1948 are available as yet.

For the years 1940–46, the population base used in computing divorce rates represents the total population of the United States as of midyear, estimated by the Bureau of the Census, including armed forces overseas. It was assumed that di-

— Data not available. ^a Excludes armed forces overseas. ^b Includes reported annulments. ^c Estimated. ^d Marriage licenses issued.

vorces involving military personnel on overseas duty were for the most part granted in this country. The population base for divorce rates after 1946 excludes armed forces overseas.

A record total of 610,000 divorces was granted in the United States during 1946, while the 1947 provisional estimate was 471,000. In the period, 1933-47, divorces rose sharply, except in 1938 when a decline of 2 percent from the 1937 total occurred, and in 1947 when the decline from 1946 was 23 percent. (See Table 1.) Between 1933 and 1943, the number of divorces doubled, rising from 165,000 in 1933 to 359,000 in 1943 and from 1.3 divorces per 1,000 population in 1933 to 2.6 per 1,000 in 1943. The years 1945 and 1946 showed

a marked upward acceleration, followed by the 1947 decline.

HALBERT L. DUNNE

VOCATIONAL REHABILITATION, Office of. A unit of the Federal Security Agency which serves as the United States Government's agent in the State-Federal partnership for vocational rehabilitation of disabled civilians. The Office of Vocational Rehabilitation is responsible for certifying Federal grant-in-aid funds for the use of the States and Territories, establishing standards in the various areas of service, and furnishing technical and professional assistance to the State general rehabilitation agencies and those separate agencies serving the blind—87 in all. Vocational rehabilitation is

designed to restore, preserve or develop physically and mentally handicapped men and women of working age, including the blind, to the fullest possible physical, mental, social, vocational and economic usefulness.

Under the State-Federal partnership, services are provided for disabled civilians, and for veterans with non-service-connected disabilities, who are of working age, whose disabilities constitute substantial job handicaps, and who have reasonably good chances of becoming employable or more suitably employed through rehabilitation. The services include: (1) thorough medical examinations for all individuals to determine extent of disability, to discover hidden disabilities, to determine work capacity and to determine eligibility; (2) medical, surgical, and psychiatric treatment and hospital care to reduce or remove disability; (3) artificial appliances such as limbs, hearing aids, braces, and the like, to improve work ability; (4) individual counsel and guidance to help the disabled to select and attain the correct job goal; (5) training for the right job in schools, colleges, universities, on-the-job, in-the-plant, by tutor, or otherwise, to enable the individual to do the right job well; (6) maintenance and transportation during physical restoration and/or training, if necessary; (7) customary occupational tools, equipment and licenses to give the rehabilitated person a fair start; (8) placement on the right job; (9) post-placement follow-up to make sure the workers and the jobs match each other and that employers and workers are mutually satisfied. Services (1), (4), (5), (8), and (9) are provided without charge to all individuals, regardless of financial situation; public funds are used to provide the others to the extent that the individuals are unable to do so from their own resources.

During the last five years—from July, 1943, through June, 1948—219,039 disabled men and women have been rehabilitated by the State-Federal program to qualify for, to take, and to perform useful work, compared to a total for the past 23 years of 210,125 under limited legislative authority. On an average yearly basis, program gains during the last five years represent an increase in successful rehabilitations of almost 400 percent over the figure for the previous 23 years.

In the same five-year period, rehabilitation resulted in an estimated increase of more than \$900 million in earned income for this group. These rehabilitated people paid an estimated \$75 million into the Federal treasury in Federal income taxes alone.

To meet the annual toll of disabilities, from 200,000 to 250,000 rehabilitations a year would be required.

During the 1948 fiscal year, the most successful in the State-Federal program's 28-year existence, the State agencies served an all-time high number of disabled civilians, and also greatly enhanced the volume, quality, and diversity of the component services in the vocational rehabilitation program. By the end of the fiscal year 1948, the State agencies' caseload totaled 347,753 disabled persons. Of this number 53,131 were prepared for and placed in gainful employment, and their rehabilitation was declared completed; 9,229 received services and were working gainfully, but were receiving some degree of post-placement follow-up; and 7,396 were ready for employment. Approximately 118,000 disabled persons were undergoing the process of rehabilitation at the close of the 1948 fiscal year.

For the fiscal year 1948, the annual rate of earn-

ings for the rehabilitated group upon application for services—approximately \$17 million—rose to \$86 million during the first year after rehabilitation, an increase of approximately 400 percent. The post-rehabilitation earnings do not include those of some 6,000 rehabilitants who were engaged in farming or family work and whose earnings were not reported.

Twelve thousand of the successful rehabilitants during 1948 were employed at the time they applied for services but required rehabilitation for one of the following reasons arising from their disabilities: They were in danger of losing their jobs, were in jobs that were hazardous to them or their fellow workers, were working only part-time, or were in otherwise unsuitable employment.

—MICHAEL J. SHORTLEY

WAGE AND HOUR AND PUBLIC CONTRACTS DIVISIONS. These Divisions of the U.S. Department of Labor administer the Fair Labor Standards Act of 1938 and the Walsh-Healey Public Contracts Act.

The Fair Labor Standards Act, which is popularly known as the Wage and Hour Law, applies to employees engaged in interstate commerce or in the production of goods for interstate commerce, including occupations necessary to such production. All such employees, unless specifically exempted, must be paid not less than 40 cents an hour and not less than time and one-half their regular rate of pay for all hours worked in excess of 40 in a single workweek. Minimum wage rates up to 40 cents an hour have been established by wage orders issued on the basis of the recommendations of industry committees, for all industries in Puerto Rico, and for substantially all industries in the Virgin Islands under a section of the Act which permits rates lower than those established in the United States to apply in the Islands. The Act also prohibits the shipment in interstate commerce of any goods produced in establishments in or about which oppressive child labor is employed within 30 days prior to shipment. As of July 1948, the Act covered approximately 22,600,000 workers in the continental United States.

The Public Contracts Act, which applies to contracts made by the Government, or any agency thereof, for the manufacturing or furnishing of materials, supplies, articles, or equipment in any amount exceeding \$10,000, provides for the payment of prevailing minimum wage rates as determined by the Secretary of Labor, and overtime pay at not less than time and one-half the basic rate for all hours worked over 8 in a day or 40 in a week, whichever method of computation will yield the employee the greater compensation.

This Act also sets restrictions on child labor and prohibits convict labor, employment of home workers, and provides for standards of safety and health. In the fiscal year 1948, the Administrator also initiated a postwar resumption of the minimum-wage determination program under the Walsh-Healey Public Contracts Act. As a result of this program, a new determination for the Suit and Coat Branch of the Uniform and Clothing Industry became effective during the fiscal year and a public hearing was held on the amendment of the determination for the Cap and Cloth Hat Branch of the Men's Hat and Cap Industry.

The Portal-to-Portal Act relieves an employer from punishment or liability under the Fair Labor Standards Act and the Public Contracts Act for failure to pay minimum wages or overtime compensation for activities performed before May 14, 1947, unless the activities were compensable

by contract or custom or practice, and permits the compromise of remaining claims which accrued before that date. For the period on and after May 14, 1947, this Act sets a two-year statute of limitations for employee claims and relieves an employer from punishment or liability for his failure to pay minimum wages or overtime compensation for preliminary and postliminary activities, unless compensable under contract, custom, or practice. Under certain conditions, the Act allows employers "good faith" defenses against liability or punishment for non-compliance with the Acts.

During the fiscal year which ended June 30, 1948, 30,053 inspections were completed under both Acts and 29,024 establishments were found subject to their minimum wage or overtime provisions. Of the establishments inspected, 15,320 or 51 percent were in violation of the minimum wage or overtime provisions of the Acts. However, these figures should not be interpreted as representative of the extent of violations among all covered establishments since establishments are selected for inspection on the basis of complaints and other information indicating that violations probably exist.

Inspections during fiscal year 1948 disclosed a total of \$10,757,900 in back wages owed to approximately 184,400 employees in 15,320 establishments. Employers voluntarily agreed or were ordered by the courts to make restitution of \$4,256,800 to some 102,800 underpaid employees.

Since many establishments are covered under both Acts, it is impossible to give separate figures for restitution, which in many cases would be due under either Act. Of the 30,053 inspections completed during the year, 1,559 were made under the Public Contracts Act, all but 26 of which were concurrent with Wage-Hour inspection. Thirty-eight percent of the Public Contracts inspections disclosed violations of the minimum wage, overtime or child-labor provisions.

Under the Fair Labor Standards Act, oppressive child labor means in general the employment of minors under the age of 16 in any occupation, or the employment of minors under the age of 18 in any occupation found and declared hazardous by the Secretary of Labor. The Secretary of Labor is empowered, however, to provide by regulation or order for the employment of minors between 14 and 16 years in non-manufacturing and non-mining occupations, under conditions not interfering with their schooling, health or well-being. The child-labor provisions of the Public Contracts Act provide that no boy under 16 or girl under 18 shall be employed on Government contracts in excess of \$10,000.

Violations of the child-labor provisions of either or both Acts were found in approximately 5 percent of the total number of establishments inspected during the fiscal year. Of these, 1,384 violated the Fair Labor Standards Act by employing minors in oppressive child labor. As a result of employing 1,134 minors in violation of the Public Contracts Act, 99 firms were assessed liquidated damages amounting to \$162,000.

The Divisions are also charged with the inspection of safety and health conditions in those plants holding public contracts.

Proceedings for injunctions against future violations of the wage and hour and child-labor provisions of the Fair Labor Standards Act were instituted in 273 cases, while the criminal penalties which the statute provides for cases of wilful violation were invoked in 113 cases.

During the last fiscal year, a special industry committee for Puerto Rico recommended minimum

wage rates for 14 industries and the Administrator subsequently held public hearings on these recommendations to determine whether they were the highest rates (up to 40 cents an hour) which would neither result in substantial curtailment of employment nor give any industry in Puerto Rico a competitive advantage over any industry in the remainder of the United States. By the close of the fiscal year, the Administrator had put wage orders for five industries into effect, disapproved recommendations for two industries, announced his final adoption of orders for two industries to become effective after the close of the fiscal year, and proposed his adoption of orders for the remaining five industries.

The Fair Labor Standards Act provides that the Administrator shall submit annually to the Congress recommendations for further legislation in connection with matters covered by the Act as he may find advisable.

Accordingly, and on the basis of the Divisions' enforcement experience during the ten years the Act has been in existence, the Administrator recommends: (1) raising the minimum wage immediately and that provision be made for industry committee action to increase this minimum in those industries where it is economically feasible; (2) definition of the regular rate of pay; (3) prohibition of employment of child labor in commerce and direct prohibition of employment of child labor in the production of goods for commerce; (4) revision of the requirements for employment on an annual basis so as to make such employment agreements more flexible; (5) clarification of the exemption for retail or service establishments.

In addition, the Administrator favors simplifying the present complex system of exemptions which apply to the agricultural handling and processing industries by replacing them with a uniform overtime exemption for seasonal operations on an industry basis. It is also proposed that employees in the fish processing and handling industries, now exempt from both the minimum wage and overtime provisions, be accorded minimum wage protection; and that they be included in the overtime exemption as proposed for agricultural processing industries. The Administrator also recommends extending the minimum wage provisions to employees in transportation, and providing overtime benefits for non-operating employees in transportation.

WAKE ISLAND. A coral atoll in the mid-Pacific (19° 15' N. and 166° 35' E.), 2,004 miles west of Hawaii and 1,334 miles northeast of Port Apra, Guam. It comprises a group of three islands (Wake, Peale, and Wilkes) which enclose a shallow lagoon. Total land area: 4 square miles. By Executive Order dated Dec. 29, 1934, Wake Island was placed under the control and jurisdiction of the U.S. Navy Department. During 1935 Pan American Airways established a base on Wake, as a step in its trans-pacific air route.

WAR ASSETS ADMINISTRATION. The government's war surplus disposal agency geared its activities to virtual liquidation by the end of 1948. The Supplemental Independent Offices Appropriation Act of 1949 (approved June 30, 1948) provides for abolishment of War Assets Administration by Feb. 28, 1949. It terminated declarations of surplus property by owning agencies as of June 30, 1948, and terminated priorities and preferences in the disposal of personal property as of Aug. 1, 1948. The Administration set as its goal complete dis-

posals of consumer and producer goods, aircraft and electronics by the end of the year and the greatest reduction possible in real property and aircraft components by the end of February, 1949. Great progress was made in the reconciliation of records and accounts and reduction of operating expenses so that the government will receive the greatest net return from surplus property disposal and so that the remaining disposal functions may be transferred in an orderly manner to successor agencies.

As inventories dwindled, residuals became more difficult to sell. The ratio between operating expenses and returns from sales suffered accordingly. Freezes and restrictions placed on various disposals, because of national defense considerations and needs, slowed activities. On the other hand, elimination of priorities and preferences, firming of inventories, and the use of improved sales methods tended to speed accomplishment of the Administration's goals.

WAR CRIMES TRIALS. During 1948, trials for gross violations of the laws of war, for Crimes against Humanity and (against a few leading personalities) for Crimes against Peace, were continued by many countries. In Germany, except for the U.S. Occupation Zone, the German courts were authorized to try Germans under the Allied Control Council Law concerning war criminals. In Belgium, the commutation of the death sentences of two quisling Gestapo traitors caused the downfall of the Government. Britain prepared the trials of Generals von Brauchitsch, Rundstedt, and Mannstein for mass atrocities, maltreatment of prisoners of war, etc. (Brauchitsch died before the indictment was served.) A short summary of the most important of the 1948 trials in which the United States was involved, follows.

The Tokyo Judgment. In November, the Judgment was rendered in the historical trial against 28 Japanese political and military leaders, which had started before the 11-nation* "International Military Tribunal for the Far East" on May 3, 1946. The Court was established, and the Charter under which it operated, issued by General MacArthur as Supreme Commander for the Allied Powers. It was the longest continuous trial ever—because of the number and complexity of the issues (covering events between Jan. 1, 1928, and Sept. 2, 1945, and an area extending from New Zealand to Berlin and from Manchuria to Washington, D.C.), the latitude given to the defense, the volume of evidence (transcript of the proceedings covers 48,412 pages), the language and translation problems, and the considerable time (6 months) needed to prepare the judgment.

In short, the defendants were charged with responsibility for Japan's aggressive wars against countries that opposed her drive to dominate East Asia and the Pacific and Indian oceans and their adjoining countries and neighboring islands; with a conspiracy to have Japan wage aggressive war against China and eight other countries, including the United States; and with a conspiracy with Germany and Italy to have the three Axis countries mutually assist each other in aggressive war (Crimes against Peace); and with wholesale murder and atrocities against prisoners of war and enemy civilians, with murder at Pearl Harbor and other places, and other violations of the law of war (War Crimes).

The Judgment (1,211 pages) carefully describes

why it found most of these charges to be established by the evidence (which evidence consisted mainly of contemporaneous Japanese documents). Of the 25 defendants found guilty (3 died during the trial, including Matsuoka), the 2 Prime Ministers (Hideki Tojo and Koki Hirota), and 5 others (Kenji Dohihara, Seichiro Itagaki, Heitaro Kimura, Jwane Matsui, Akira Muto) were sentenced to death by hanging, 16 to life imprisonment, one to 20, and one to 7 years.

Tojo was found to "bear major responsibility for Japan's criminal attacks on her neighbors" (p. 1,207); being "associated with the conspirators as a principal in almost all of their activities" to conquer the vast areas from the East Indies to Australia and New Zealand. The Tribunal rejected Tojo's and the others' elaborate argument that all of Japan's acts constituted legitimate self-defense.

The main significance of the Tokyo judgment consists in the fact that it is the second international Court (the Nürnberg International Tribunal was the first) to uphold the principle that aggressive war is an international crime for which those guilty are punishable, and secondly to lay down findings as to what actions and what state of mind are required to constitute Crimes against Peace. (The Indian judge dissented, arguing that "Aggression" is not clear enough a concept, and that it was not declared to be a crime at the time the acts were committed. The majority decision, just as the Nürnberg decision, declared that it was.)

Some defendants appealed to the U.S. Supreme Court. Reversing its previous stand in war crimes cases, the Supreme Court decided, 5 to 4 (with Justice Jackson casting the decisive vote), to hear argument. After doing so, it decided to have no jurisdiction. Thereupon, on orders of General MacArthur the death sentences were carried out.

American Trials in Nürnberg. The series of 12 great trials before U.S. Military Tribunals which started late in 1946 (following the trial of the International Military Tribunal against Hermann Goering et al.) almost came to a conclusion by the end of 1948.†

Military Cases. The "Hostage" Case. Thus called because it dealt largely with the German policy of shooting, for one German killed, up to 100 enemy civilians ("hostages"). The 12 defendants (2 Field Marshals and 10 Generals) were charged with the murder of hundreds of thousands of civilians in Greece, Yugoslavia, and Albania as "hostages," "bandits," "partisans," "communists," and the like, for having carried out wholesale devastation in these countries and in Norway, and for other War Crimes and Crimes against Humanity (torture, systematic terrorization, imprisonment in concentration camps, deportation to forced labor, etc.). Defendant Gen. Franz Boehme committed suicide; the proceedings against Field Marshal von Weichs were suspended due to physical unfitness. Two, including Field Marshal Wilhelm List, were sentenced to life imprisonment, two defendants who were chiefs of staff were acquitted, and the others received prison terms between 7 and 20 years.

† About the organization of these Trials, and the five cases decided in 1947, see previous YEAR BOOK. Each Tribunal was composed of 3 judges; plus, in some cases, one alternate judge. In all, there were 32 judges; 13 were former members of their State supreme courts. All were civilian American jurists. The prosecution, headed by Brig. Gen. Telford Taylor, consisted of 131 attorneys—almost all U.S. civilians employed by the U.S. Dept. of the Army; the rest were Allied personnel. The 185 defendants in the 12 cases were represented by 373 defense counsel and assistant defense counsel. Except for some American lawyers, they were German citizens.

* One judge each from Canada, China, France, Great Britain, India, Netherlands, New Zealand, Philippines, U.S., U.S.S.R., with the Australian, Sir William Webb, presiding.

The Judgment considerably narrowed the content of the Prosecution concerning the criminality of the shooting of hostages and partisans. But it declared:

"That the acts charged as crimes in the indictment occurred is amply established by the evidence. In fact it is evident that they constituted only a portion of the large number of such acts which took place as a part of a general plan for subduing the countries of Yugoslavia and Greece. The guilt of the German occupation forces is not only proven beyond a reasonable doubt but it casts a pall of shame upon a once highly respected nation and its people." (p. 39)

The High Command Case. Fourteen other military leaders of the Third Reich—including three field marshals (Wilhelm von Leeb, Hugo Sperrle, Georg von Kuechler) and some other field commanders in World War II; Admiral Otto Schniewind; Gen. Walter Warlimont, top man, after Keitel and Jodl, in Hitler's Armed Forces Operation Staff which issued the basic orders for Germany's conduct of the war; General Hermann Reinecke of the OKW (Supreme Command of the Armed Forces), who was responsible for the regulations concerning the treatment of prisoners of war—were descendants. They were charged with having issued, or ordered to be executed, criminal Orders resulting in the death of masses of prisoners of war and of civilians of occupied territories, as well as torture, deportation, enslavement, and other mistreatment; plunder, wanton devastation, and destruction; and other War Crimes and Crimes against Humanity.

The Judgment particularly emphasizes the criminality of 3 general German orders which had disastrous effects: the "Commando Order" (ordering the killing of Allied "Commandos" after capture); the "Commissar Order" (which ordered for "ideological reasons" the "extermination" of all Russian Commissars and of "the Communist intelligentsia"—the German Commanders being asked to "make—the sacrifice of overcoming their personal scruples"); and the so-called "Barbarossa Jurisdiction Order," issued six weeks before the German attack on the Soviet Union, authorizing every German officer in the area "Barbarossa" (i.e. Russia) to order the summary execution without trial, of "Franc tireurs" and, beyond that, promising immunity to German soldiers for crimes against the inhabitants unless military discipline or security were endangered.

The Judgment declares to "have a strong suspicion from the record of this case that anti-partisan warfare was used by the German Reich as a pretext for the extermination of many thousands of innocent persons" (p. 95); and that

"the evidence in this case shows that hundreds of thousands of Russian prisoners of war died from hunger, cold, lack of medical care, and ill-treatment that were not a result of conditions" beyond the control of defendants.

The Tribunal further found intimate connection of the German Armed Forces and some defendants, with the heinous extermination activities of the special SS Einsatzgruppen (see below).

These defendants also were charged with Crimes against Peace," namely with having actively participated in the planning, preparation, and waging of Hitler's aggressive wars and invasions. After studying a mass of contemporaneous German documents and hearing many witnesses, the defendants, and detailed arguments, the Tribunal acquitted under this count. It found that these defendants were not on "the policy level." It ruled

that the knowledge that a war which is being prepared or waged is criminal,

"is not sufficient to make participation even by high-ranking military officers in the war criminal. It requires in addition that the possessor of such knowledge, after he acquires it shall be in a position to shape or influence the policy that brings about its initiation or its continuance after initiation."

Since this was the only trial (except the Goering and Tokyo Trial) in which military men were charged with "Crimes against Peace" and the decision on whether and when high military leaders become punishable for preparing or waging aggressive war was one of the basic results of Nürnberg, a few more quotations may be given:

"It is not a person's rank or status but his power to shape or influence the policy of the State, which is the relevant issue for determining his criminality under the charge of Crimes against Peace.

"... The misdeed of the policy makers is all the greater in as much as they use the great mass of the soldiers and officers to carry out an international crime; however, the individual soldier or officer below the policy level is but the policy maker's instrument, finding himself, as he does, under the rigid discipline which is necessary for and peculiar to military organization.

"We do not hesitate to state that it would have been eminently desirable had the Commanders of the German Armed Forces refused to implement the policy of the Third Reich by means of aggressive war. . . . This would have been the honorable and righteous thing to do. . . . Had they done so they would have served their fatherland and humanity, also. But, however much their failure is morally reprimandable, we are of the opinion and hold that International Common Law, at the time they so acted, had not developed to the point of making the participation of military officers below the policy making or policy influencing level into a criminal offense in and of itself."

Industrial Cases. The Krupp Case; the I. G. Farben Case. In these cases some of Germany's industrialists, namely 12 and 23 leaders, respectively, of the firm of Krupp, and of the huge chemical combine I. G. Farben-Industrie were charged with "Crimes against Peace," namely with knowing participation in the planning, preparation, and waging of Hitler's aggressive wars and invasions. Again on the basis of a mass of contemporaneous documents, testimonies, and affidavits, the Prosecution endeavored to show: that the defendants' started clandestinely to rearm, immediately after the First World War, for aggressive purposes; that they later on enormously increased their production in the two vital fields of guns and other war equipment made of steel (Krupp) and of synthetic rubber, synthetic gasoline, nitrogen, and other chemical material in which I. G. Farben had a virtual monopoly, to enable Hitler to start the war; that the defendants actively helped Hitler to come to power and to stay in power; that their knowledge of the aggressive designs was proved by their intimate and continuous collaboration with the highest Nazi authorities; and that during the war, by their use of slave labor, by spoliation in occupied countries, and by preparing to dominate industries outside Germany after the hoped-for victory, they participated in the criminal "waging" of Hitler's war.

However, both judgments acquitted under these counts. The Krupp judgment indicated, in essence, that it might have decided differently with respect

to old Gustav Krupp (too sick to stand trial), who "stood at the apex of the huge Krupp combine until 1943."

With respect to Alfred Krupp, and the other defendants, however, the Tribunal found that Krupp's rearmament production in violation of the Peace Trials was established, but that their knowledge and intent that this was done for aggressive war and not, as the defense argued, for defensive war and for creating a strong bargaining position for Germany, had not been shown *prima facie* by the Prosecution. In a concurring opinion, Judge Wilkins, stated that with respect to some defendants the evidence was so strong that under a less conservative interpretation, the conspiracy to prepare aggressive war, as charged, might have been established; but since Crime against Peace is the "gravest accusation that can be raised against any individual," the Tribunal wished to adopt a conservative interpretation in this "comparatively new field of international law."

The majority decision in the I. G. Farben case declared that the I. G. Farben leaders were merely acting as private business men, who were duped by Hitler just as so many others inside and outside Germany, and that to find them guilty of Crimes against Peace might open the door to mass punishment. For, where should be the limit? Judge Herbert, in a separate opinion in this case, agreed with the finding of not guilty on the count, but sharply disagreed with the "moral exculpation."

On the other counts, particularly systematic spoliation and plunder of industrial and other property of great value in various countries overrun by Germany, and employment under most inhumane conditions of great numbers of deportees from those territories, and of concentration camp inmates, Krupp and Farben defendants were found guilty to varying degrees.

In the Farben case, the gravest aspect of the Slave Labor count was, as the Judgment found, that Farben in 1941-42 erected a large buna factory in Auschwitz (Poland) with labor partly furnished from the notorious Auschwitz concentration camp. "Many of those who became too ill or weak to work were transferred by the SS to Birkenau (the extermination section of Auschwitz) and exterminated in the gas chambers." After Farben set up a separate labor camp, "those who became unable to work or who were not amenable to discipline were sent back to the Auschwitz concentration camp, or, as was more often the case, to Birkenau for extermination in the gas chambers." (p. 148)

The most important feature of the Krupp judgment was that Alfred Krupp was sentenced not only to 12 years imprisonment but to confiscation of the entire Krupp plants and property (which he had owned since 1943; they were unofficially valued at some \$500 million). Presiding Judge Anderson dissented with respect to this latter penalty.

The Rusha Case. In this case, 14 high officials of Nazi organizations which were under the supervision of Himmler (the "Reich Commissar for Strengthening of Germanism," the "Main Race and Settlement Office" of the SS ["Rusha"]; the "Repatriation Office for Ethnic Germans;" and the "Well of Life 'Lebensborn' Society") were tried for a combination of War Crimes and Crimes against Humanity which has become known under the name of "genocide"—the crime of destroying or weakening entire racial or ethnic groups. In the words of the Judgment:

"The Germanization program envisioned certain drastic and oppressive measures, among them:

"Deportation of Poles and Jews; the separation of family groups, and the kidnapping of children for the purpose of training them in Nazi ideology; confiscation of all property of Poles and Jews for resettlement purposes; the destruction of the economic and cultural life of the Polish population; and the hampering of the reproduction of the Polish population. This policy was put into practice in all of the countries, twelve in number, as they were ruthlessly overrun by Hitler's armed forces." (p. 5292)

E.g., a Himmler directive ordered for the non-Germans in the East the following schooling:

"Simple arithmetic up to 500 at the most; writing of one's name; the doctrine that it is divine law to obey the Germans and to be honest, industrious and good. I don't think that reading should be required."

More schooling would only be given in Germany if a child was found by the SS to be racially perfect, and he had to remain permanently in Germany.

"The parents of such children . . . will then probably produce no more children so that the danger of this subhuman people of the East . . . will disappear." (p. 5293)

The judgment continues: . . . "as the ferocity of war quickened, more drastic decrees and barbaric policies were adopted. For instance, . . . the question of dealing with the so-called "racially inferior" population was solved not so much by deportation as by adoption of extermination measures, thus bringing about a speedier elimination of undesirable foreign elements by death." (p. 5294)

The Einsatzgruppen (Special SS Units) Case. Some of the most shocking aspects of the Nazi extermination program were dealt with in the case against 24 leaders of special SS units called Einsatzgruppen. Organized before the German attack on Russia, their special task was systematically to exterminate Jews, Communists, gypsies, "a-socials," and other "undesirables"—men, women, and children. On the basis of the contemporaneous top-secret reports of these units which were regularly sent to Berlin, the Tribunal, after 4½ months of trial, reaffirmed the finding of the International Military Tribunal that "the Einsatzgruppen and other units of the Security Police killed two million defenseless human beings," and it found that of these, the units under the command of the defendants caused the death of a cumulative number of 1 million deaths, over a huge area extending from the Baltic to the Crimea and the Caucasus. These units were also used to search the prisoner of war camps, and to execute Russian Government and party officials, "leading personalities of the economy," "intellectuals" and "all Jews" whom they found among the prisoners of war.

The Judgment makes some gory quotations from the Reports of the units, about the methods of execution—how victims had to dig their own graves, or kneel in ditches, how they had to give up and sort their shoes, clothing, and underclothing before being executed, etc., and states that "the imagination staggers in the contemplation of a human degradation beyond the power of language adequately to portray it." (p. 6649)

(As said before—see *High Command Case*—these extermination units worked in areas which were under the jurisdiction of German Army Commanders, and the latter's collaboration or connivance played a big role in the High Command Case.)

The main defense arguments were: that the defendants had to do the work despite misgivings,

because it was ordered; that these measures were necessary because the victims were actual or potential enemies of Germany who either had committed or would commit crimes. The judgment most strongly refused these arguments and the argument of the legality of "ideological killings," and then convicted 14 of the 24 defendants to death.

The Administration of Concentration Camps Case (Pohl Case). Some of the ugliest features of the Nazi regime also were revealed in the trial of 18 officials of the central SS agency (SS General Oswald Pohl was its chief) which was in charge of administering and supervising all German concentration and extermination camps. The task included the allotment of food, clothing, etc., and even of the facilities for the gassing; the disposal of the belongings of the victims, including their gold teeth; the hiring out of camp inmates to industry; and the running of the considerable industrial enterprises of the SS in which the labor was furnished by concentration camp prisoners. The evidence (contemporaneous documents and reports by surviving inmates) told a story of starvation, torture, murder, "medical experiments," and other mass atrocities.

The main defense arguments were, again, "superior orders" by Himmler and Hitler; and non-involvement because the acts were committed outside the jurisdiction of the defendants. There were 3 death sentences, 3 acquittals, 3 sentences to life imprisonment, and 9 lesser prison terms.

The balance sheet of the American Trials in Nürnberg as of the end of 1948, was: 11 of the 12 cases (involving 164 of 185 defendants) were completed; 33 defendants were acquitted, 4 were released from trial because of sickness, 4 committed suicide, 24 were sentenced to death by hanging, 20 to life imprisonment, 69 to other prison terms, and 10 were released because their terms were considered as served.—JOHN H. E. FRIED

WASHINGTON. A Pacific State. Area: 69,127 sq. mi. Population: (July 1, 1948) 2,487,000, compared with (1940 census) 1,736,191. Chief cities: Olympia (capital), 13,254 inhabitants in 1940; Seattle, 368,302. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended March 31, 1947, total revenue amounted to \$239,218,000; total expenditure, \$257,701,000.

Elections. Truman won the 8 electoral votes with a majority over Dewey, Wallace, and other candidates. His plurality over Dewey was about two-thirds of Roosevelt's 125,000 in 1944. There was no Senate race. Democrats won 2 of the 6 House seats for a gain of 1. Incumbent Democratic Governor Mon C. Wallgren was defeated for reelection by former Governor Arthur B. Langlie, Republican. Democrats won other State contests: Lieutenant Governor—Victor A. Meyers; Secretary of State—Earl Coe; Attorney General—Smith Troy; Treasurer—Tom Martin; Auditor—Cliff Yelle. Mrs. Pearl A. Wanamaker was reelected Superintendent of Public Instruction. The voters approved a \$100 million veterans' bonus bond issue; increased legislative pay; home rule powers to localities; a city-county consolidation measure; and sale of liquor by the drink.

Officers, 1948. Governor, Mon C. Wallgren; Lieut. Governor, Victor A. Meyers; Secretary of State, Earl S. Coe; Attorney General, Smith Troy; State Treasurer, Russell H. Fluent; State Auditor, Cliff Yelle.

WATER SUPPLY AND PURIFICATION. New light has been thrown upon the important process of sterilization of water with chlorine by studies conducted at Harvard University. The vital role of undissociated hypochlorous acid, HOCl, in the process has been demonstrated and the effect of acidity, pH, upon the effectiveness of the killing-power of chlorine has been explained. The success and extended use and general approval of free residual or break point chlorination for the treatment of water both to kill pathogenic organisms and to reduce and avoid bad tastes and odors continue to be reported. Devices for automatic continuous recording of chlorine residuals, both total and break point, have come on the market this year. Warning lights and bells that give immediate notice of either under- or over-dosage make possible great uniformity of residuals and resulting success and economy of the process. The use of chlorine dioxide not only to sterilize drinking water but also to oxidize taste- and odor-producing compounds, especially of chlorophenol tastes, from industrial wastes, continues to meet with success at several places.

Improvements in the art of water treatment are anticipated by a prominent researcher in the application of the electron microscope to the study of pathogenic organisms. This may prove of value in determining the role of water, if any, in the dissemination of the virus of infantile paralysis. Seven cities are known to be participating in a study of the effect of adding sodium fluoride to water normally deficient in fluorides to combat tooth decay. (The cost would be about 10¢ per capita.)

Suspicion has been directed against excessive nitrates in drinking water as a possible cause of cyanosis in infants.

The management of many water supplies has been concerned with the increase of rates to meet the rising costs, many of which have been allowed by Public Service Commissions.

The increase in the use of water for air-conditioning has continued. The general assembly of Indiana passed an act requiring anyone who removes 200 gallons per minute or more from a well for air-conditioning to return it to the ground through a re-charge well and in a safe condition.

New developments in electric operation of pumps have made possible the automatic pressure-flow control system of water pumping which promises better efficiency, fewer disruptions of operation, reduction in size and cost of elevated tanks and other improvements and economies. These methods have been successfully used in Richmond, Va. An interesting new process has been reported in successful use for lining water mains in place with electrically deposited bitumen. Sections of pipe from 300 to 1,000 ft. in length are valved off, cleaned mechanically, and lined with electrically deposited bitumen.

The cathodic protection of the various metallic structures of a water distribution and water treatment plant has this year received the recognition of the American Water Works Association through the publication of a committee report, and successful operation of these devices has been reported—both of the type which employs rectified current from an electric power line through anodes hanging within the structure as in an elevated tank to protect its interior surface and also the type which employs a metal like magnesium, high in the electromotive series, to act as an exterior anode to protect the exterior of a structure, such as a pipe in the ground. The successful use of magnesium in this way has been reported as a protective de-

vice for the entire municipal piping system (water and gas) of Lake Jackson, Texas, a village of 800 homes.

Among the new water supply projects mentioned in the news of 1948 is a \$9 million new well field and water treatment plant planned for Miami, Florida. Additions to the water treatment facilities of Tampa, Florida, now being completed embrace large upward flow sedimentation units. An industrial supply to cost \$2 million will increase the water supply of Birmingham, Alabama, by 50 million gallons per day. Savannah, Georgia, has completed a new \$4,800,000 water supply project with a filtration plant of 40 million gallons per day capacity. In Jacksonville, Florida, the voters have approved expenditures of \$5 million for extensions and rehabilitations of the municipal water system.

Anderson, Indiana, has embarked upon a program of installing four Ranney well collectors in the river bottom. Approximately 15 million gallons per day are available in the aquifer. The city will make no capital investment but agrees to buy 6,500,000 gallons per day to operate the system and to pay the company according to an agreed-upon schedule. The cost of the system is estimated to be slightly under \$500,000. Two-story sedimentation tanks have been designed for the new 25 million gallons per day water treatment plant of Long Beach, Cal. The water treatment plant at Dallas, Texas, will improve operating conditions and increase capacity from 72 to 100 million gallons per day. A bond sale of \$3,340,000 has been approved, and the money is to be used largely for improvements in the water works system.

At Worcester, Mass., a \$3 million loan has been approved for water works improvement, to include a 1,000-million-gallon reservoir. A new 150 million gallon per day intake line 18,500 ft. long made of 10 ft. diameter, 24 ft. long sections of precast reinforced concrete pipe has been started at Cleveland, Ohio. It will lead to the proposed Nottingham Water Filtration plant of equal capacity. A total of \$35 million will be provided during the next 10 years for expenditure on Detroit's water supply, and rates will be increased to provide this sum. The largest item in proposed improvements is a new pumping station which together with a four-mile tunnel will cost \$23,500,000. Initial operating experiences with Chicago's new 320 million gallon per day filtration plant serving one and one-half million people and 112 square miles, which is 53 percent of the city's area, have been reported. Partial operation of the plant has occasioned operating difficulties for a number of reasons. This new plant has many unique features. To conserve horizontal space, many parts of the plant were made two-story. The filters are designed to operate at almost double the average rate for short periods of time.

Progress is being made on the new Delaware water supply for New York City to be completed in 1954 but it appears that the city will barely catch up with its water needs. The present safe yield is 1,045 million gallons per day, less than the actual use in 1947 which was 1,185 million gallons per day. In 1954, the Delaware supply will bring in an additional 540 million gallons per day but at that time, at the present rate of increase in demand, the requirements will be for 1,556 million gallons per day. It is planned to place the ground water supplies in reserve at that time and the safe yield of the remaining supplies will be then only 1,400 million gallons per day or less than the estimated requirements. It appears, then, that the city should again look for more water.

Los Angeles plans to construct additional reservoirs and conduits to add a mean annual supply of 258 million gallons of water per day of Colorado River water to bring the total water supply of the city up to the requirements of 3,500,000 people expected in 1980 (twice the present population). The three main systems from Owens, Colorado, and Los Angeles Rivers will be so interconnected that either of its two aqueducts could be out of use for three months without curtailing service. The wells in the San Fernando Valley would be pumped to furnish the additional water needed during this period.

Los Angeles is not the only city of the West receiving water from Reclamation Bureau Projects. It has been reported that (in July, 1947) 37 municipalities were so supplied. In the Missouri River Basin Project, 19 municipalities were thus to be supplied. The larger cities of the far western states resort to long-distance transportation of water from 30 to 240 miles.

The value of water works construction in 1948, according to the *Engineering News Record*, was \$297 million, an increase in dollar value of 50 percent over that of 1947. This may be compared with the total dollar value of construction in 1948 of \$1,740 million, which represents an increase of 21 percent over that of 1947; but because of the decreased value of the dollar it is said to represent an increase in actual volume of construction of only 11 percent.

—W. E. HOWLAND

WATERWAYS, Inland. Cargoes carried on inland waterways showed a marked increase in 1948. In the United States they have reached all-time levels. The Mississippi River system was estimated to have carried 148 million of the 500 million tons carried on United States shallow draft waters, and a further 15–20 percent increase is expected in 1949.

In England and Continental Europe the primary reason for increased volume is the shortage of freight cars and motor transport. In the United States it was caused by the 40 percent increase in freight rates since the war, improved towboats and handling equipment in use, and clearing the rivers of ice.

About thirty large new Diesel towboats were put in service in 1948 and more were being built. Today large river trains carry as many as 20 barges with a tonnage equal to five or six freight trains. An integrated tow, the *Harry Truman*, was completed in June. This is a series of eleven integrated barges built to lock together, reducing water resistance. The complete 1,200-ft. unit is longer than the *Queen Mary* and cuts the time from New Orleans to St. Louis by nearly a week.

The Corps of Engineers recommended a new \$100 million Illinois-Mississippi canal from Bureau, Ill., to Hampton, Ill., a distance of 64 miles, since the present canal is inadequate for modern barges and towboats. Another recommendation was for a \$65 million tidewater ship canal across the Mississippi delta, seven miles long, 500 feet wide, and 36 feet deep, which would save considerable mileage to the Gulf of Mexico.

A proposal was made to connect the New York Barge Canal with the Ohio system at Pittsburgh using the Alleghany and Genesee Rivers. An alternate route would connect Lake Erie at Ashtabula, Ohio, with the Ohio via Beaver River, northwest of Pittsburgh.

The St. Lawrence Waterway was still a live issue. [President Truman urged its construction in his 1949 State of the Union Message and \$20 million

for preliminary work was provided in the 1949-50 budget.] Proposals for converting the Panama Canal into a sea-level route were aired during the year, as were proposals for an additional canal through Colombia.

Most canal operating machinery in Western Germany was undamaged during the war and now practically all of the 2,800 miles of canals and waterways are open for at least one-way traffic. Lack of shipping keeps totals below prewar levels.

In England, canal receipts as of Oct. 1, 1948, were up 11.4 percent over 1947. Most British canals are narrow and in poor repair, which limits the size of carriers to 7 by 70 ft. Because of their condition, motorized equipment, even of very low power, is damaging to the banks.

In Spain the proposed mile-long Duestra ship canal would allow 10,000-ton ships to reach the center of Bilbao. Here nearly a mile and a half of 200-ft. quays equipped with an extensive rail system would serve shipping.

In Poland the Oder River was being deepened, wrecks removed, and completion of the Danube-Oder canal will provide navigation for all countries concerned. Stettin will be the terminal and is being equipped as Poland's first bulk cargo port.

—J. W. HAZEN

WEATHER BUREAU, U.S. Weather Service. A major problem facing the U.S. Weather Bureau in 1948 was to meet increased demands by industry, commerce, agriculture and the general public for weather service. This problem was attacked by placing special emphasis on mass distribution of weather information through local commercial publication and broadcasting channels and by adding about 50 communities without local weather offices to the list of those served through telephoned or telegraphed bulletins from existing Weather Bureau stations.

The establishment of new airports, the expansion of air commerce, particularly among non-scheduled operators, and the increase in private flying placed heavier demands on the Weather Bureau for aviation weather services. The increased observational requirements were met as fully as practicable through a system of "cooperative airway stations" at approximately 150 airports where local airport or airline personnel provided official weather observations in cooperation with the Weather Bureau. Service to pilots of privately owned aircraft was improved by the broadcast of local flying weather reports by radio stations in some localities.

A new weather forecasting center was established at Seattle to encompass the States of Idaho, Oregon and Washington, all formerly in the San Francisco district. Subdivision into smaller districts enabled the forecast centers to provide better weather service by giving more attention to local weather variations. Specialized weather services were also improved. New mobile weather units were assigned to fire-weather warning centers in Oregon and Washington, bringing the total of these to seven units which enable the forecaster to move his office to the scene of the fire where his weather services become a component part of the fire suppression organization. Horticultural service formerly operating in Florida, California, Oregon and Washington only, was extended to Wisconsin to give frost warnings to cranberry growers and other farming interests.

The meteorological observation network of the Western Hemisphere was strengthened by the establishment of additional Arctic weather stations at Prince Patrick and Isachsen Land. This program

was carried out by the Weather Bureau, operating jointly with Canada and using air transportation of the U.S. Air Force in winter and vessels of the U.S. Navy during the summer.

The increased demand for daily weather service was paralleled by similar demands for climatological information. These extensive demands led the Weather Bureau to expand its program for treatment of weather data by machine methods. Punch card machine units began taking over from the State Climatological Section Centers the tabulation and preparation for publication of the daily records from the basic network of 6,000 cooperative climatological stations. The changeover from manual to mechanical procedures, which should be completed in about a year, will result in increased accuracy and accessibility of original climatological records and also a more adequate climatological service.

Research. One of the major research undertakings of 1948 was the Cloud Physics Project, popularly called the "Artificial Precipitation Project." Because of strong public interest and the potentially great economic value of producing rainfall artificially, the Weather Bureau with the cooperation of the U.S. Air Force, National Advisory Committee for Aeronautics, and the U.S. Navy, carried out near Wilmington, Ohio, scientifically controlled experiments using all available measuring facilities including radar and instrumented aircraft. Experiments on winter-type stratus clouds (Weather Bureau Research Paper No. 30) and on summer-type cumuliiform clouds (Weather Bureau Research Paper No. 31) showed that artificial modification of clouds by use of dry ice as a "seeding agent" is of doubtful economic importance for production of rain and they gave no indication that seeding initiates self-propagating storms. Dissipation of cumulus clouds rather than new development was generally the result of treatment.

Observational phases of the Thunderstorm Research Project, under joint sponsorship of the U.S. Air Force, U.S. Navy, National Advisory Committee for Aeronautics, and the U.S. Weather Bureau, were completed in 1947 after accumulation of an excellent series of data from the vicinity of Orlando, Fla., in 1946, and Wilmington, Ohio, in 1947. Analysis of the observations, which is being carried on through contract with the University of Chicago, is expected to be completed in 1949. A program started by the Weather Bureau in 1946 to observe by radar the location and movement of significant precipitation areas was continued in 1948 with the installation of experimental radar storm detection units at several midwestern locations where they could serve for locating destructive thunderstorms and tornadoes that frequent those areas.

In the field of forecasting research, several methods for forecasting specific weather elements at particular places were developed through application of statistical techniques. These objective methods represent new tools which supplement but do not replace other forecasting procedures. In addition to seeking to improve methods for forecasting a few hours to a week in advance, the Weather Bureau reported experimentation with methods for predicting weather a month in advance.

—F. W. REICHELDERFER

WESTERN PACIFIC ISLANDS, British. The British island groups (Gilbert and Ellice Islands, British Solomon Islands, Tonga, New Hebrides, and Pitcairn Island), under the administration of the British High Commissioner for the Western Pacific.

WESTERN SAHARA. Spanish colonial possessions on the Atlantic coast of Africa, consisting of the Territory of Ifni (area, 741 square miles; population, 35,000 in 1944) and Spanish Sahara (area, 105,409 square miles; population, 37,000 in 1944) which includes the two zones of Rio de Oro and Sekia el Hamra. Chief towns are Villa Cisneros and Smara in Spanish Sahara and Sidi Ifni in the Territory of Ifni. Under the jurisdiction of the high commissioner of Morocco, the colony has a politico-military local government in Cabo Juby.

WEST VIRGINIA. A south Atlantic State. Area: 24,282 sq. mi. Population: (July 1, 1948) 1,915,000, compared with (1940 census) 1,901,974. Chief cities: Charleston (capital), 67,914 inhabitants in 1940; Huntington, 78,836. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$110,859,000; total expenditure, \$101,791,000.

Elections. Truman won the 8 electoral votes by a majority over Dewey and Wallace half again as large as Roosevelt's 70,000 in 1944. Incumbent Republican Senator Chapman Revercomb was defeated for reelection by Matthew M. Neely. Democrats captured all 6 House seats for a gain of 4. Democrats swept all Statewide contests for State office, including: Governor—Okey L. Patterson; Secretary of State—D. Pitt O'Brien; Attorney General—Ira J. Partlow; Auditor—Edgar B. Sims; Treasurer—Richard E. Talbott; Commissioner of Agriculture—J. B. McLaughlin.

Officers, 1948. Governor, Clarence W. Meadows; Lieut. Governor, None; Secretary of State, William S. O'Brien; Attorney General, Ira J. Partlow; State Treasurer, Richard E. Talbott; State Auditor, Edgar B. Sims.

WHEAT. The 1948 wheat crop of the United States, as reported by the U.S. Department of Agriculture in December, 1948, amounted to 1,288,406,000 bushels, compared with the 1947 crop of 1,367,180,000 bu. and the 10-year average (1937-46) of 942,623,000 bu.

Yields of the chief producing States of the United States in 1948 were (in bushels): Kansas 231,368,000, North Dakota 136,580,000, Oklahoma 98,962,000, Montana 90,547,000, Nebraska 82,988,000, Washington 79,268,000, Ohio 57,648,000, Texas 56,290,000, Colorado 53,525,000, South Dakota 50,391,000, Illinois 40,065,000, Missouri 39,270,000, Michigan 36,270,000, Idaho 34,583,000, Oregon 27,818,000, Minnesota 18,509,000, Pennsylvania 18,354,000, New York 12,452,000, California 11,988,000.

World Wheat. The world output of wheat in 1948 was estimated by the U.S. Department of Agriculture on Nov. 29, 1948, to total 6,285 million bu., as compared with a world output of 5,815 million bu. in 1947.

WHITE HOUSE OFFICE, The. A division of the Executive Office of the President, which serves the President in the performance of detailed activities incident to his office. The officials include three Secretaries: Matthew J. Connelly, Charles G. Ross, William D. Hassett. Assistant to the President: John R. Steelman. Special Counsel: Clark M. Clifford. Administrative Assistants: David K. Niles, Charles S. Murphy, Donald S. Dawson. Administrative Assistant in the President's Office: Rose A. Conway. Social Secretary: Reathel M. Odum. Executive Clerk: William J. Hopkins.

WINDWARD ISLANDS. A group of four British colonies consisting of the islands of Grenada (133 square miles), St. Vincent (150 square miles), St. Lucia (233 square miles), and Dominica (304 square miles). Total area, 820 square miles. Population, about 285,000. Capital, St. George's (on Grenada), 5,755 inhabitants. More than 75 percent of the people are Negroes, 2 percent Europeans, and the remainder mulatto. Agriculture is the chief occupation of the inhabitants. Arrowroot, nutmeg, cocoa, sugar, cotton, copra, citrus fruits, rum, spices, and vegetables are the main products. Foreign trade (1946): imports, £2,126,298; exports £1,363,925. Finance (1946): revenue, £1,550,355; expenditure, £1,392,217.

Government. Each island colony retains its own institutions of government. Under the administration of one governor, the colonies have no common legislature, law, revenue, or tariffs, but do unite for certain other common purposes. Governor and Commander in Chief, Sir Arthur F. Grimble.

WISCONSIN. An east north central State. Area: 56,066 sq. mi. Population: (July 1, 1948) 3,309,000, compared with (1940 census) 3,137,587. Chief cities: Madison (capital), 67,447 inhabitants in 1940; Milwaukee, 587,472. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended June 30, 1947, total revenue amounted to \$197,918,000; total expenditure, \$179,946,000.

Elections. Truman won the 12 electoral votes, Dewey's in 1944 by a 24,000 majority, with 647,310 votes to Dewey's 590,959 and Wallace's 25,282. There was no Senate contest. Democrats broke the Republican monopoly on House seats by winning 2 of the 10. Incumbent Republican Governor Oscar A. Rennebohm was reelected. Other State officers elected included: Lieutenant Governor—George M. Smith; Secretary of State—Fred R. Zimmerman; Attorney General—Thomas E. Fairchild; Treasurer—Warren R. Smith.

Officers, 1948. Governor, Oscar A. Rennebohm; Lieut. Governor (Vacancy); Secretary of State, Fred R. Zimmerman; Attorney General, John E. Martin; State Treasurer (Vacancy); State Auditor, J. Jay Keliher.

WOMEN'S BUREAU. This bureau in the United States Department of Labor is the Federal agency established by Congress in 1920 to promote the welfare of wage-earning women, improve their working conditions, increase their efficiency, and advance their opportunities for profitable employment. In the first year in which the Bureau functioned, only 8½ million women had gainful employment outside the home. By late 1948, approximately 17,272,000 were employed and another 530,000 available for employment. Taken together, the women with jobs and those seeking them accounted for about 32 percent of the country's total woman population 14 years of age and over, and 29 percent of all persons in the labor market.

During 1948, the Women's Bureau conducted research on employment opportunities for women, their working conditions in important woman-employing industries, their earnings in specific occupations, and on other subjects directly related to women's participation in the economic life of the United States. Continuing the long time program of cooperation with State labor departments, women's organizations, trade unions, and others, it also compiled data and gave technical assistance on legislation and administration dealing with minimum

wage, equal pay, hours of work, and laws affecting the civil and political status of women.

Another method by which the Bureau helped to promote the economic welfare of women was the convening in February, 1948, of a major conference on "The American Woman, Her Changing Role—Worker, Homemaker, and Citizen." This 3-day session, which was opened with an address by the President of the United States, 1) Reviewed the basic social and economic factors underlying women's increased employment; 2) Evaluated the progress made by women since the "Declaration of Sentiments" was drawn up at the first Woman's Rights Convention in Seneca Falls, N.Y., in 1848; and 3) Afforded an opportunity for a thorough exchange of opinion on the issues women face in their capacities as workers, homemakers, and citizens.

Other significant activities of 1948 included technical and consultative services to the United Nations and the International Labor Organization. The Bureau's Director served as an adviser to the United States delegation at the 7th session of the United Nations Economic and Social Council in Geneva, and throughout the year as a representative on the Human Rights and the Status of Women subcommittee of the Interdepartmental Committee on International Social Policy.

Services to the International Labor Organization included attendance of two senior staff members at the 31st International Labor Conference in San Francisco and preparation of technical documents on a number of subjects, among which were night work, maternity leave, re-employment rights of women, equal pay for women, welfare facilities for women in textile mills, and vocational training for women production workers.

As in the past, the Bureau also carried on a program of Inter-American cooperation and developed training courses for visiting women labor officials from the other Americas. Recipients of grants awarded by the United States Government, these women studied methods of promoting the welfare of employed women through legislation, improved working conditions, and wider employment opportunities.

Studies Published in 1948. Among research studies published in 1948 was *The Outlook for Women in Science*. Composed of 8 separate bulletins, this series discusses women's contributions to, and expected employment in, 13 major fields of science and in 5 occupations directly related to science.

A second major study published during 1948 was the project, *Women's Occupations Through Seven Decades*. An occupational history of women in the United States, this 260-page report discusses the leading occupations of women, as reported in decennial censuses, from 1870 to 1940 and furnishes other information considered vital to a realistic appraisal of the current and anticipated employment of women.

One of the new projects of 1948 was the *Handbook of Facts on Women Workers*. This handbook includes current facts on women's employment, their wages or salaries, economic responsibilities, standards for employment, civil and political status, and other subjects relating to and of concern to women workers.

Studies in Progress in 1948. Projects on which preliminary work was completed in 1948 included studies on night work in the hotel and restaurant industries, women in Federal service, and the employment outlook for women in the social services.

Legislation. Minimum-Wage. Bureau service rendered to State administrators of minimum-wage

legislation included assistance, on request, in the preparation of basic factual data for presentation to wage boards; consultation on specific points of wage board procedure and other administrative problems; and the preparation of such technical material as digests of laws and compilations of wage orders. Minimum-wage activity was particularly heavy in 1948 because of the programs carried on in many States for the revision of existing wage orders and the growing recognition in others of the need for such action.

Equal Pay. Technical assistance was given to State officials, women's organizations, trade unions, and others interested in passing or amending State equal-pay legislation and in the passage of Federal legislation on equal pay. By the end of 1948, 9 States had equal-pay laws and a proposal for a Federal law was pending in the U.S. Congress.

Hours of Work. As in past years, State administrators were furnished technical data in support of improved hours-of-work legislation. Employers and individuals, upon request, also were given considerable information on the laws of the 43 jurisdictions which limit daily or weekly hours of work of women employees in one or more specific occupations.

Civil and Political Status. Progress in this field during 1948 included revision of the major study, *The Legal Status of Women in the United States*. This project, in addition to a summary report for the United States as a whole, includes separate reports on women's status in each of the 48 States, the District of Columbia, Alaska, Puerto Rico, Hawaii, the Canal Zone, and Virgin Islands. Work also was continued on a detailed United Nations Questionnaire dealing with public law and its relation to women of the United States. Also prepared were statements for the United States Congress on the need for broadening laws governing the service of women on Federal juries and on the discriminations against women in existing immigration laws.

Special Services and Publications. The publication, *Facts on Women Workers*, was issued monthly, and throughout the year a number of interpretative articles, news releases, radio scripts, and leaflets were prepared on such subjects as women's participation in the labor market, their wage-earning responsibilities in relation to family, their hours of work and wages, their protection under minimum-wage laws and other labor legislation, and their status under the civil and political laws of the 48 States, the District of Columbia, and the three territories.

—FRIEDA S. MILLER

WOOL. The 1948 world wool production was indicated at 3,730 million lb., according to reports received by the Office of Agricultural Relations, U.S. Department of Agriculture (*Foreign Agriculture Circular*, Nov. 29, 1948). In 1947 the world wool output was estimated at 3,710 million lb.

The 1948 wool yields of the chief producing countries (in millions of lb.) were: Australia, 1,040, Argentina 430, New Zealand 345.4, United States 289.3, U.S.S.R. 285, Union of South Africa 212 (includes Union Protectorates and South-West Africa), Uruguay 149.9, Spain 88, China 75, Great Britain 70, Turkey 64.1, India 53, Brazil 50, Chile 46.3, Iran 30, France 29.3, Bulgaria 28.6, Italy 28, French Morocco 28, Pakistan 25, Iraq 24.2, Peru 20.7, Algeria 18.3, Portugal 18, Greece 17, Afghanistan 15.

WORLD HEALTH ORGANIZATION (WHO). Combining the functions of former organizations in the field

of international health cooperation, WHO represents the first truly world-wide body of this kind in history. It is based on the concept that health, whether for whole nations or for the individuals comprising them, is no longer possible in the shrunken world of today without teamwork between governments and peoples on a scale far greater than ever before, and that defensive measures against diseases cannot be looked upon as adequate protection for the health of the peoples of the world.

Origins. The WHO Constitution, drafted in the spring of 1946 at Paris, was approved by the International Health Conference convened by the UN Economic and Social Council in New York, June 19–July 22, 1946. In order to carry on certain urgent functions which previously had been the responsibility of agencies such as the League of Nations Health Organization and UNRRA's Health Division, a WHO Interim Commission was established at the conclusion of the 1946 New York Health Conference.

The Interim Commission, which consisted of representatives from eighteen states, under the Chairmanship of Dr. Andrija Stampar of Yugoslavia, achieved its most dramatic success in 1947 in helping the Government of Egypt to bring a large-scale cholera epidemic to a complete standstill within six weeks. Much other less sensational, but no less important, work was done during the life of this preparatory body through the establishment of expert committees in a number of fields to advise the organization on technical questions and through the continuation of a field services program taken over from UNRRA in fourteen countries of Europe, Africa and Asia.

In the arrangements made at the International Health Conference it had been specified that the WHO Constitution would come into effect when 26 members of the United Nations ratified their signatures. This number was exceeded on Apr. 7, 1948. As a result it was possible to convene the first World Health Assembly.

This Assembly met in Geneva from June 24 to July 24, 1948, and among other things fixed the date of Sept. 1, 1948, for the permanent World Health Organization to come into existence officially as a specialized agency of the United Nations.

Purpose and Scope. The objective of WHO, as stated in its Constitution, is "the attainment by all peoples of the highest possible level of health," the word "health" being defined as "a state of complete physical, social and mental well-being and not merely the absence of disease or infirmity." Its functions may be summarized as follows: (1) to coordinate international health work, including that of inter-governmental and governmental agencies and of private groups; (2) to propose and administer international conventions on health matters, and to work for epidemic control; (3) to provide technical services, including the reporting of epidemics and vital statistics, the unification of medical terminology, the establishment of standards for biological and pharmaceutical products, etc.; (4) to assist governments in strengthening their health services and to give health assistance to special groups (e.g. the peoples of trust territories); (5) to foster mental health activities; in cooperation with other agencies, to promote nutrition, maternal and child health, environmental hygiene, etc.; and to promote improvement in standards of health teaching and the development of informed public opinion; (6) to conduct research in the field of health.

Members. Membership in WHO is open to all states. There were 56 members as of Dec. 31, 1948, including both members and non-members of the United Nations. The eighteen states selected by the first World Health Assembly in July, 1948, to designate persons to serve on the WHO Executive Board are the following: Australia, Brazil, Byelorussian S.S.R., Ceylon, China, Egypt, France, India, Iran, Mexico, Netherlands, Norway, Poland, Union of South Africa, United Kingdom, U.S.S.R., United States, Yugoslavia.

Officers and Headquarters. At its first session, held immediately following the first World Health Assembly, the WHO Executive Board elected Sir Aly Tewfik Shousha, Pasha (Egypt), as its Chairman. Dr. Brock Chisholm (Canada) had been appointed first Director-General of WHO by the Health Assembly. Headquarters of the Organization is in the Palais des Nations, Geneva, Switzerland. The Organization also maintains a liaison office in the Empire State Building, New York.

Regional Arrangements. Regional Offices exist or will be established in six major geographical areas of the world (Eastern Mediterranean, Western Pacific, South East Asia, Africa, Europe, and the Americas). The Regional Office for South East Asia, established at the end of 1948, is the first such body. The Regional Office for the Eastern Mediterranean is to be established at a meeting in Cairo on Feb. 7, 1949. The Pan American Sanitary Organization is in process of becoming the WHO regional body for the Western Hemisphere. Other such offices are being created as soon as the majority of countries in the areas concerned agree to participate. A (temporary) Special Office for Europe, particularly concerned with health rehabilitation in the war-devastated regions, was also established on Jan. 1, 1949.

Events of 1948. The year's principal development was the creation of the permanent organization itself on foundations laid by the Interim Commission during the preceding two years. This landmark in international cooperative effort for improving the world's health standards resulted directly from the first World Health Assembly.

Delegates and observers from nearly seventy nations participated in this gathering. The chief task facing them was to decide what WHO could and should do in view of the limited resources that would be available for the first year of operations (\$5 million). Basing their decisions for the most part on recommendations made by the Interim Commission, the delegates assigned top priority to work in the fields of malaria, tuberculosis, venereal diseases, maternal and child health, nutrition, and environmental hygiene. They also decided on a long-range program in public health administration, on special studies in parasitic and virus diseases, and on a campaign for the promotion of mental health.

In addition to these activities, many of which had been begun during the life of the Interim Commission, it was agreed that WHO would continue such work as biological standardization, the unification of pharmacopoeias, the revision of international quarantine regulations, and the collection and dissemination of epidemiological information to help control the international spread of communicable disease.

Most of these various undertakings were under way as the year 1948 came to a close. Two sessions of the WHO Executive Board were held (July and October) to give effect to decisions and policies of the Health Assembly, while a whole series of meetings of expert committees took place between

September and December to deal with specific technical aspects of the work being carried out or planned for the near future.

Details on program and personnel for the South East Asia Regional Office of WHO were decided at another major international gathering which took place in New Delhi at the beginning of October, attended by representatives of the countries in that area and by members of the Secretariat. Moreover, representatives of seventeen countries in all parts of Europe met in Geneva at a two-day conference in November to outline their needs for assistance from WHO in rehabilitating national health services. This conference was held in connection with the establishment of the Special Office for Europe, mentioned above.

WHO's six top priority campaigns, in particular, are planned and coordinated at the headquarters level with the advice of international committees of specialists in each of the fields concerned. The programs are carried out primarily by advisory and demonstration teams sent into the field to assist national health authorities. These activities, representing a part of WHO's so-called "field operations," are supplemented by a Fellowship Program for the international exchange of medical and public health personnel and by a Medical Supply Service to provide teaching material and to give advice on the procurement of drugs, biologicals, equipment, etc.

As the work of the organization developed during the first months of its existence as a permanent agency it became clear that future budgets of WHO would need to be substantially larger than the first one if even a minimum of work represented by requests of governments for demonstration teams and other assistance were to be carried out effectively. By the end of 1948 such requests already amounted to more than twice as much as WHO could fulfill. Accordingly, plans were being made to present more nearly adequate budget proposals to the second World Health Assembly, which was scheduled to meet during the latter part of June and the first part of July, 1949, in Rome.

—G. BROCK CHISHOLM

WORLD PEACE FOUNDATION, The. An organization, founded by Edwin Ginn, devoted to the presentation of the facts of international relations in clear and undistorted form. This function is performed through the publication of an annual series of *Documents on American Foreign Relations* and through two quarterly periodicals, *International Organization* and *Documents of International Organization: A Selected Bibliography*. In addition the Foundation publishes occasional studies on international relations, which have been extensively used by teachers, specialists, and government officials; maintains a documents library, and carries on a modest program of community education in the New England area through a number of voluntary organizations. President of Board of Trustees, Harvey H. Bundy; Director, Raymond Dennett. Offices: 40 Mt. Vernon St., Boston 8, Mass.

WRESTLING. A strong band of matmen from the U.S. Navy captured team honors in the national A.A.U. championships, winning two individual titles on the way. Individual winners were Ensign Malcolm MacDonald, U.S. Navy, 114.5-lb. class; Lieut. Robert Kitt, U.S. Navy, 125.5; Leo Thomsen, Cornell College of Iowa, 136.5; Newt Copple, University of Nebraska, 147.5; Leland Merrill, New York A.C., 160.5; Dale Thomas, Marion, Iowa, 174; Henry Wittenberg, New York Police Department,

191; Ray Gunkel, Purdue University, heavyweight. Wittenberg later won the light-heavyweight class as the Olympic Games in London.

Oklahoma A. and M. took the National Collegiate A.A. team title. Individual champions follow: Arnold Plaza, Purdue, 114.5; George Lewis, Waynesburg, 125.5; Bill Dickenson, Michigan State, 136.5; Bill Koll, Iowa State Teachers, 147.5; Jack St. Clair, Oklahoma A. and M., 160.5; Glen Brand, Iowa State, 174; Vern Gagne, Minnesota, 191; Richard Hutton, Oklahoma A. and M., heavyweight. Brand added to his laurels by annexing the Olympic crown in middleweight free-style wrestling. See OLYMPIC GAMES.

—THOMAS V. HANEY

WYOMING. A mountain State. Area: 97,914 sq. mi. Population: (July 1, 1948) 275,000, compared with (1940 census) 250,742. Chief city: Cheyenne (capital), 22,474 inhabitants in 1940. See AGRICULTURE, EDUCATION, MINERALS AND METALS, SCHOOLS, UNIVERSITIES AND COLLEGES, VITAL STATISTICS.

Finance. For the fiscal year ended Sept. 30, 1946, total revenue amounted to \$20,017,000; total expenditure, \$16,491,000.

Elections. Truman won the 3 electoral votes, Dewey's in 1944, by a plurality over Dewey, Wallace, and others. Governor Lester C. Hunt, Democrat, defeated incumbent Republican Senator Edward V. Robertson, running for reelection. Republicans retained the sole House seat. There was no contest for State office. Dr. A. G. Crane, Secretary of State, succeeded to the Governorship.

Officers, 1948. Governor, Lester C. Hunt; Lieut. Governor, None; Secretary of State, A. G. Crane; Attorney General, Norman B. Gray; State Auditor, Everett T. Copenhaver; State Treasurer, C. J. Rogers; Superintendent of Public Instruction, Edna B. Stolt.

YACHTING. A tremendous growth in the world's navy of pleasure-seekers and keen competition marked last season. White sails dotted inland waterways as well as the rougher waves of the seas in a year of colorful international contests, and the sparkling performances written into 1948's log by United States skippers featured the heavy calendar.

In the five Olympic classes, American sailors gained two firsts and a second (see OLYMPIC GAMES). Lockwood Pirie of Chicago annexed the world Star Class championship off Lisbon, Portugal, with his racer *Twin Star* after having nailed victories to the mast in the midwinter and Bacardi Cup series off Havana. Henry C. Taylor's black yawl *Baruna*, a consistent scorer all year, finished first in the Newport-to-Bermuda ocean race for the third time and led all opposition on corrected time to become the first yacht in history to take the major prize twice in this classic.

Garner H. Tullis's 77-foot ketch *Windjammer II*, out of New Orleans, won the fifteenth St. Petersburg-to-Havana thrash and Larry Barr of San Diego, Calif., sailed his *Mickey* home to triumph in the inaugural Newport Harbor-to-Ensenada event, that Pacific Coast test drawing a mighty fleet of 104 starters. The Cuban cutter *Ciclon* took the Miami-to-Nassau fixture.

Henry S. Morgan's sloop *Djinn* was among the year's leading winners, annexing one of yachting's most coveted prizes, the cup put in competition by the late King George V of England, then adding the famous Astor Cup. Among the highlights of international competition were the Scandinavian

Gold Cup and Seawanhaka Cup regattas for Six-meters, both sailed on Oyster Bay, L.I., under the auspices of the Seawanhaka Corinthian Y.C. Norway and Sweden both made bids for the Gold Cup, but it was successfully defended by George Nichols' *Goose*, sailed by Briggs Cunningham. Sven Salen's challenger *Maybe VI* from Stockholm invaded in an attempt to capture the Seawanhaka Cup, but lost to the American craft, *Llanoria*, sailed by Herman F. Whiton, which previously had scored in the Olympics. The blue-hulled *Llanoria* proved one of the leading victors of the year.

Other features were the Long Island Sound's sweep of its team series with the International One-Design Class skippers of the Royal Bermuda Y.C. and Bermuda's victory over the Luders Sixteen team from the Indian Harbor Y.C. The Chicago Y.C. swept its series of Luders Sixteen races for the Ocean-Great Lakes challenge trophy.

Club and interclub regattas and overnight races drew record fleets, with Larchmont's Race Week again holding the spotlight. Although sailing gained in many parts of the world and the United States in particular, Long Island Sound remained the greatest center for the sport. One of yachting's outstanding feminine skippers, Aileen Shields, led her crew from the Larchmont Y.C. to both the Long Island Sound and the national women's championships. The Vineyard Haven Y.C. crew, with Norman D. Cassel at the tiller, captured national junior laurels. The Atlantic Coast Star Class title was taken by *Shillalah*, owned by E. W. Etchells, veteran sportsman who again ranked with yachting's top winners. —THOMAS V. HANEY

YEMEN. An absolute monarchy (Arab) in the southwest corner of the Arabian peninsula. A population of about 3,500,000 with their capital at San'a live in an area of some 75,000 square miles much of which is well-watered. Agriculture is extensive, with such crops as barley, wheat, millet, and coffee, the country's leading export.

Government. A 1936 Treaty of Friendship signed by Great Britain and the Kingdom of Yemen recognized the latter's complete independence. Constituted as a theocratic state Yemen was ruled by the elderly Imam Yahya, leader of an old branch of the Moslem Shia sect. The country's fanatical sectarianism resulted in its virtual inaccessibility to Europeans and its almost complete isolation from world affairs, modified by recent adherence to the Arab League and the United Nations. Education is of the most primitive.

Events, 1948. In February Imam Yahya was murdered and San'a held for three weeks by the army of the insurgent al-Sayyid Abdullah ibn Ahmad al-Wazir, leader of a group dissatisfied with the prolonged ultra-conservative rule of Yahya. He was supported by the Imam's sixth son, Sayf al-Haqq Ibrahim, who had previously retired to neighboring Aden as leader of the dissident "Free Yemeni" party. The forces of Sayf al-Islam Ahmad, the Imam's eldest son, powerful but unpopular, succeeded in entering San'a. He had been designated by his father as next in line. On March 21 the Arab League, after investigating the situation, recognized him as ruler of the Yemen, and shortly thereafter Pakistan, India, and Great Britain also recognized him. —DOROTHEA SEELYE FRANCK

YUGOSLAVIA. A Balkan republic. Area: 96,134 square miles. Population (Jan. 1, 1941 est.): 15,920,000. Chief cities (1931 census): Belgrade (capital) 266,849, Zagreb 185,581, Subotica 100,-

058, Ljubljana 79,056, Sarajevo 78,173, Skopje 64,737, Novi Sad 63,985.

Education and Religion. The new law provides for free and compulsory education of 7 years in elementary state schools. Enrollment (1946-47): 15,165 elementary schools, 669,578 pupils; 894 secondary schools, 308,772 pupils; 51 teacher training institutions, 15,493 pupils; 67 art and music schools, 13,044 pupils; 49 faculties of the higher institutions of learning, 46,423 students; also (1945-46) over 1,698 elementary classes for minorities (Albanian, Magyar, Slovak, Czech, Italian, Rumanian), and 127 secondary schools with 22,583 pupils for minorities. Under Tito, new universities opened at Skopje (Macedonia) and Sarajevo, and new faculties added to the universities at Belgrade, Zagreb, and Ljubljana. Over half of the population cannot read or write.

The religion of the Serbs (roughly the regions of Serbia, Montenegro, and large parts of Bosnia and Herzegovina) is Eastern Orthodox, while that of the Croats and Slovenes is Roman Catholic; Moslem communities are scattered in Bosnia, along the Albanian border, and in Macedonia. (The 1931 census showed 48.7 percent of Serb Orthodox, 37.4 percent Roman Catholics, and 11.2 percent Moslems.)

Production. The country is predominantly agricultural; forestry, cattle raising, and mining. Coal, copper, marl, bauxite, iron, lead and chrome, are especially important. Manufacturing industries are chiefly lumbering, textile weaving, milling, tanning and the production of leather goods, chemical products, brewing, and sugar refining. Between 1946-1948, under the 5-Year plan, 200 new factories had been erected. But on November 26, Tito admitted that he was obliged to "reorganize and regroup" the 5-Year plan to industrialize the country and to eliminate all secondary projects due to the economic offensive against him by the Cominform states. All local projects were to be sacrificed for the benefit of the main target which was to industrialize the country.

Foreign Trade. Main imports: cotton (raw), cotton yarns, and textiles; iron and manufactures thereof; wool, wool yarns, and cloths; machinery; vehicles; electrical apparatus; coal; crude and lubricating oils; silk, silk yarns, and manufactures thereof; synthetic organic dyes. Exports: timber, copper and various ores, livestock, wheat, meat, hemp, fresh fruit, eggs, lard, dried prunes, hops, corn, tobacco. But the prewar trades' trends changed by the "Iron Curtain" situation.

Finance. Unit is the dinar; one dinar equals 26.5 milligrams of gold. The 1947 revenue totalled 97,631 million dinars, and expenditure 85,976 million dinars. The estimated 1948 budget of 124,841.3 million dinars, allowed for an expenditure of 54.3 percent above the 1947 revenue. The army estimates, which in 1947 amounted to 13,550 million dinars, were raised to 15,500 million dinars in 1948.

Transportation. In 1939 there were 6,655 miles of railways and 20,906 miles of highways. On Oct. 26, 1948, Belgrade's radio announced that in the postwar period over 1,041 km. of railway lines had been constructed and 4,350 km. repaired. Lack of transport constituted the main bottleneck in the development of Yugoslavia's economy; roadbeds are poor and rolling stock is worse. All railroad facilities are heavily overtaxed by the movement of equipment, supplies, materials, and manpower required by the 5-Year plan. The Danube is the most important artery of the total length of 26,687 miles of waterways.

Government. The Constitution of Sept. 3, 1931, was replaced by that of Nov. 29, 1945, proclaiming the Republic. On Jan. 31, 1946, the Constitution of the Federal People's Republic of Yugoslavia proclaimed a federal state, with supreme power vested in a central government. Yugoslavia has 6 republics (Slovenia, Croatia, Serbia, Bosnia-Herzegovina, Montenegro, and Macedonia); each of these areas has its own government. In addition there is an autonomous province (Vojvodina) and an autonomous region (Kosovo-Metohiya).

On Dec. 11, 1948, the Yugoslav Presidium created two new Ministries (the Ministry of Science and Culture and the Ministry of Railways) in the federal government. All legislative and administrative authority rests in the National Assembly, elected every 4 years and consisting of 2 branches (the Federal House of Representatives and the House of Nationalities).

Events, 1948. As during the last several years, Marshal Tito continued to capture the headlines of world news. Tito's defection from the Cominform and subsequent differences with his neighboring pro-Soviet satellites were reflected in the domestic situation. On November 26, Tito announced that the unfriendliness of the Cominform states had caused him to modify his Five-Year plan for the industrialization of Yugoslavia. Despite internal economic difficulties and open political hostilities from the East, Tito's government enjoyed more stability and had less to fear for its continuity than did most of the governments in Europe. Tito headed a strongly disciplined party, a strong army, and strong security forces; he commanded a country that was well disciplined and loyal to him, and he was in possession of political alternatives that gave him any needed freedom of movement.

Purges. Nearly two months before the Cominform quarrel came to a head in the anti-Tito resolution of June 27, Tito had taken measures to decapitate the pro-Soviet opposition at home; he had removed from office Andrija Hebrang, one-time planning board head, and Sreten Zujović, who had been Finance Minister; the elimination of these elements neutralized any attempt that might have been made to organize opposition leaders inside the Yugoslav Communist Party. At the same time, Ožna, the Yugoslav security police, put a close watch on Soviet officials. At its Fifth Congress in July, Tito succeeded in reorganizing the Yugoslav Communist Party and expanded its Central Committee and Politburo to include key men of tried and trusted loyalty.

The reorganization was followed by a purge within party ranks. Nevertheless, Tito had to admit that the economic boycott by the Kremlin's satellites hurt him; he was short of oil and other basic commodities as a consequence of his political difficulties with the U.S.S.R. (Since Tito launched his Five-Year plan, 1947-1951, at an estimated cost of over 278 million dinars, it became apparent that the plan depended on Yugoslavia's foreign trade which, after 1945, was predominantly in U.S.S.R. hands.)

Break with Stalin. The breach between Tito and Stalin had been developing some 6 months largely without the knowledge of the West. Tito had to slow down his pro-Communist domestic policy since the Five-Year plan was not doing well—the peasants were not producing enough food. Tito's protests to Stalin that the U.S.S.R. had not delivered the goods and machinery needed for Yugoslavia's Plan brought no results. Tito thereupon discussed with the American Ambassador, Cavenish Cannon, the possibility of unfreezing 50 mil-

lion of Yugoslavia's gold. The Cominform quarrel came to a head in the anti-Tito resolution of June 28 (following the first "brotherly critique" of March 20 from the Central Committee of the All-Union Communist Party in Moscow, and then of almost identical letters stressing the orthodox Communist line, sent to Tito by the Hungarian Communists and all other Cominform parties).

In April, Tito sent a firm letter to Moscow denying all charges and stating that his policies were best adopted to the present condition of Yugoslavia and that they were not inconsistent with the doctrine of Marx and Lenin. (Immediately thereafter Tito ordered the nationalization of small industry and retail trade. A new grain tax was imposed on independent peasants to force marginal farmers to enter cooperatives—the Yugoslav substitute for the collective farm.)

The mid-June issue of the Cominform bulletin attacked Tito directly. Then a personal message was sent to the Marshal from Stalin, warning him of his deviation from orthodox principles of land nationalization. Tito refused to send delegates to the Bucharest meeting of the Cominform (where the headquarters had been transferred from Belgrade) and the Cominform adopted a resolution confirming Moscow's accusations. In turn, Tito challenged the right of the Cominform to issue directives to him.

Foreign Relations. Tito's stand helped to improve his relations with the West. He received 17 Italian warships. On July 19 the United States unfroze Yugoslavia's gold (Yugoslavia agreed to pay the United States \$17 million in settlement of American claims for the nationalization of American property in Yugoslavia, compensation for 2 American transport planes shot down in August, 1946, and settlement of lend-lease and pre-UNRRA accounts). Although Prague-Belgrade relations also cooled off due to the Cominform troubles, a trade agreement was signed on May 24 (to run up to Dec. 31, 1948). The Czechoslovak-Yugoslav talks for a trade pact, held at Belgrade in December, for the purpose of renewing an annual trade treaty, collapsed.

After July 1, Tito sent several notes to Albania protesting against "provocative acts," and on July 3, Albania broke off economic relations with Yugoslavia. Tito had several arguments with Hungary. In the case of Bulgaria, the old problem of Macedonia reappeared, Yugoslavia accusing Sofia of "aggressive nationalism." That Tito's regime did not defect fully from Moscow's camp was evident at the international conferences where Tito's spokesmen reaffirmed in the strongest language that the country was an ally of the U.S.S.R. Frequent Yugoslav-Greek border clashes occurred; in fact, a United Nations' Assembly resolution stated that the "continued aid given by Albania, Bulgaria, and Yugoslavia to the Greek guerrillas endangered peace in the Balkans." See UNITED NATIONS.

The Danube Conference (q.v.), held in Belgrade, July 20-August 18, adopted a new Danube Convention legalizing "the Danube for the Danubians" under Soviet leadership.

On December 23, three agreements, believed designed to help Yugoslavia insure against an economic boycott by the satellite states, were signed with Great Britain. They covered compensation for nationalized and expropriated British property in Yugoslavia, a short-term trade pact, and a money and property agreement. Yugoslavia was to export timber, wood products, and some foodstuffs; Great Britain was to send textiles, raw materials, crude oil, chemicals, and machinery to Yugoslavia. These

commodities are important to Yugoslavia's Five-Year plan of industrialization and will also aid the nation in its economic defense against boycotting actions by the Soviet bloc.—JOSEPH S. ROUCEK

YUKON. A territory in northwestern Canada extending over an area of 207,076 square miles; including 1,730 square miles of fresh water. Population (1941 census): 4,914; (1948 est.) 8,000. Chief towns: Dawson (capital) 1,043 inhabitants in 1941, Whitehorse 754.

Production. Mining is the chief industry, the output for 1946 being valued at \$1,693,904 of which gold (45,286 fine oz.) accounted for \$1,664,260 and silver (31,230 fine oz.) for \$26,124. Final figures on 1947 mineral production show a total value of \$2,095,508, of which gold (47,641 fine oz.) amounted to \$1,667,435 and silver (372,051 fine oz.) to \$267,877. Fur pelts taken in the season 1946–47 numbered 58,777 valued at \$373,176. White spruce has commercial importance; other forest trees are pine, balsam, poplar, cottonwood, and birch.

The amount of fish landed was 265 cwt., valued at \$5,014. The Alaska Highway (British Columbia to Alaska) passes through the southern part of the territory. There are 58 miles of railway, and several landing fields for aircraft. The Yukon River (1,437 miles long) is an important means of communication from the coast to the interior. Finance (1946–47): revenue \$1,270,594; expenditure \$1,158,628.

Government. The Yukon is governed by a controller and a territorial council of three elected members. A member elected to the House of Commons represents the territory in the Federal Parliament at Ottawa. Commissioner: J. E. Gibben, K.C. See CANADA.

ZANZIBAR. A British protectorate consisting of the islands of Zanzibar (640 sq. mi.) and Pemba (380 sq. mi.), off the East coast of Africa. Total area, 1,020 square miles. Population (1945 estimate), 250,000, of which Zanzibar has 150,000, Pemba, 100,000. Capital, Zanzibar (45,276), one of the finest ports in Africa.

Production and Trade. Cloves, the most important industry of the islands, occupies about 48,000 acres and furnishes about 82 percent of the world supply. A total of 310,258 cwt., valued at £1,159,322 was exported in 1946. Production of clove oil in the same year amounted to 410,677 lb., valued at £83,784. The coconut industry ranks next in importance, there being about 57,000 acres under cultivation. Export of domestic copra in 1946 amounted to 8,035 long tons, valued at £204,110. Rice and tropical fruits are also grown. The exports for 1946 totaled £2,163,886, imports, £1,977,996. Chief imports are textiles, tobacco, petroleum, foodstuffs, and cattle.

Government. The estimated 1947 revenue was £824,793; expenditure, £956,753. The protectorate is administered by a British Resident who presides over the Legislative Council, established in 1926. The Sultan, Seyyid Sir Khalifa bin Harub, who succeeded to the sultanate in 1911, presides over the Executive Council and retains considerable authority. British resident, Sir Vincent G. Glenday (appointed Mar. 3, 1946).

ZINC. Domestic consumption of zinc established a peacetime record in 1948, 806,000 net tons of slab zinc (1947: 780,675 tons), despite important increases in price during the year that brought Prime Western grade, East St. Louis, to 17.50 cents per

lb. from 10.50 cents at the beginning of the year. Demand for galvanizing was heaviest, taking 45 percent of the total; die castings took 29 percent; brass products took 13 percent, but this industry also consumed heavy tonnages of scrap.

Domestic mine production dropped to approximately 618,000 net tons in 1948 due to strikes in several production areas (1947: 637,608 tons). There was an important decline in the production of the Tri-State District (Kansas, Missouri and Oklahoma) due to a two-month strike. Production of the western States increased some, but this was offset in part by lower production in States east of the Mississippi.

Imports of slab zinc increased about 30 percent over 1947, and came principally from Canada. Imports for the first eleven months of 1948 totaled 84,519 tons (year 1947: 72,312 tons). Imports of zinc ore declined about 10 percent from 1947, 242,371 tons (zinc content) in the first eleven months of 1948 (year 1947: 297,959 tons). Mexico was the principal source of the ore imports, shipping about 50 percent of total receipts by the United States, but this tonnage was well below 1947 shipments. Canada was second with about 20 percent of the total. Receipts from Peru, less than 10 percent, were only half as large as in 1947.

Consumers were hard pressed to obtain enough zinc to keep their plants in operation throughout the last half of the year. At year end, the shortage of zinc was generally conceded to be more acute than that of any other nonferrous metal. In the first three quarters it had been possible for consumers to supplement purchases from producers with shipments from a small stock held by the Office of Metals Reserve. But with the transfer of this metal to the strategic stockpile, this was no longer possible. The United States government was reported to be carrying a stockpile of about 250,000 tons of slab zinc and about 175,000 tons of zinc in concentrates. The present Munitions Board procurement program calls for shipments of about 5,000 tons a month until the middle of 1949.

World smelter production of slab zinc was approximately 1.6 million net tons, excluding the U.S.S.R. and Japan (1947: 1,545,532 tons). The United States was the leading producer with about 845,000 tons (1947: 861,245 tons). Canada was second, 185,000 tons; Belgium, 166,000 tons; Poland, 96,000 tons; Australia, 92,000 tons; Great Britain, 81,000 tons; France, 62,000 tons; Mexico, 56,000 tons; Rhodesia, 25,000 tons. There were gains in the smelter production of all countries except the United States. —JOHN ANTHONY

ZOOLOGY. The thirteenth International Congress of Zoology, the first to be held since before the war, met in Paris in July, 1948, with good representation of zoologists from most parts of the world. Papers covering many fields of zoology were presented and published in summary form. Symposia were held on animal pigments, sex determination and evolutionary mechanisms. The committee on zoological nomenclature adopted a number of proposals designed to make scientific names more stable. Official lists of generic and specific names are to be proposed and once adopted will not be subject to change. Hemming (*Nature*, 162:708) summarized the work of this committee.

A list of the phyla, classes and orders of the animal kingdom was prepared by a committee for the American Association for the Advancement of Science (Duke Univ. Press). Unfortunately it contains several errors.

Ecology; Evolution. In 1883 all life on the island

of Krakatau in the East Indies was destroyed by a tremendous volcanic explosion. After a few years animals and plants began to reestablish themselves and now hundreds of kinds are present. This transformation has been studied over the years by a number of Dutch scientists with important results for evolution, dispersal and ecology. The original data and conclusions are summarized in a large volume by Dammerman (*Trans. Netherlands Royal Acad.*).

A volume by Hatt and collaborators on the life of islands in Lake Michigan (Cranbrook Inst. Science, *Bull.* 27) reveals that the same evolutionary and dispersal factors responsible for the peculiar fauna of older and more isolated oceanic islands are at work. Change in habit in response to the narrower insular environment, the first step in evolutionary modification, is often noticeable as in the voles (*Microtus*), confined to meadows on the mainland but swarming through the forest on the islands, or the peepers (*Hyla crucifer*) which lay their eggs in the shallow water of the lake edge on the islands where ponds of the type frequented by this frog on the mainland are lacking.

Formosov presented an important study of the ecological importance of snow in the lives of birds and mammals (Moscow, Russian with French summary). The important and puzzling cyclic fluctuations in the populations of northern animals were extensively analyzed by Siivonen (Helsinki, *Papers on Game-research*, 1).

Genetics. Volume 2 of *Advances in Genetics* (Academic Press) contains, among others, important papers by Heston on the genetics of cancer, by Mayr on the genetical nature of species, by Catchside on the genetic effects of radiation, and by Dahlberg on human genetics. The last named author also published a book, *Mathematical Methods for Population Genetics* (Interscience Press). An important review volume *Animal Genetics and Medicine* by Gruneberg appeared (Paul B. Hoeber, Inc., 1947). A new British journal *Heredity* contains a bibliography of German publications on genetics during the war and a criticism of the often mentioned "Sewall Wright effect" in genetics by Fisher and Ford, among other contributions.

Anatomy; Embryology; Physiology. Several important studies of the vertebrate brain were published. Edinger's pioneering work on the evolution of the brain in the horse (as revealed by fossil brain-casts) shows that the primitive Eocene horses had brains that were almost at the reptilian level (Geological Soc. Amer.). A monograph on the brain of the tiger salamander (*Ambystoma*) by Herrick (Chicago Univ. Press) contains "the distilled wisdom of one of the keenest minds ever to study the organization of the nervous system as an approach to the problems of behavior."

O. Larsell published an important study of the cerebellum in birds (*Jour. Comp. Neurology*), while in Denmark volume 4 of Krabbe's treatises on the morphogenesis of the mammalian brain was brought out. A copiously illustrated text of comparative anatomy, very up to date in its treatment of evolution and allied subjects, was written in Switzerland by Portmann (Benno Schwabe, Basel).

The New York Academy of Sciences published a significant study of mechanisms of embryonic development, the results of a symposium. Guyenot and others cooperated in a major contribution to knowledge of innervation and regeneration in the forelimb of the salamander (*Rev. Suisse Zool.*, 55).

G. H. Parker summarized his lifelong interest in color transformations in an excellent treatise

Animal Colour Changes (Cambridge Press). Another monograph combining anatomy and physiology is *The Avian Egg* by Romanoff and Romanoff (John Wiley).

H. M. Evans and colleagues wrote a series of papers on pituitary-induced gigantism in rats and its corollaries (*Growth*, 12). Riddle's extensive studies of endocrines and constitution in pigeons and doves (Carnegie Inst. Washington) contain a wealth of valuable experimental data bearing on genetics, physiology and anatomy. Another volume by Riddle and his associates relates to the metabolism of carbohydrates and fats in the pigeon (Carnegie Inst. Washington, 1947). It will be a valuable reference on the basic physiology of the bird. A comprehensive text, *General Endocrinology*, by Turner was brought out (G. B. Saunders).

A bibliography of about 4,000 entries on animal venoms by Harmon and Pollard (Univ. Florida Press) will be of as much interest to zoologists as to physicians.

Animal behavior. In *Hormones and Behavior*, a review volume by Beach, we have the "first complete survey ever made of present knowledge regarding the influence of hormones on animal and human behavior." The school of animal behavior founded in Austria by Lorenz, particularly his concept of "releasers," was expounded with numerous striking illustrations by his follower Tinbergen (*Wilson Bull.*, 60).

Von Frisch's remarkable studies of the dances of the honeybee, brought out obscurely in Austria during the war, were translated and published in English (*Jour. Animal Behavior*, 1947). He found that a bee which has discovered a source of honey can reveal its distance and direction to other bees by means of these "dances." A summary of present understanding of the concept "instinct" by Thorpe will be of value (*Bull. Animal Behavior*, 7). Breder (*Bull. Amer. Mus. Nat. Hist.*, 92) has described the behavior and adaptations of certain tide pool fishes of the Bahamas.

Bird Display and Behavior by Armstrong provides an inclusive, if somewhat uncritical, summary of this field, with an extensive bibliography (London: Lindsay, Drummond).

The perplexing question as to how birds find their way home when removed to a distance, and how they find their goal when migrating, received extended, if somewhat inconclusive, discussion. Yeagley (*Jour. Applied Physics*, 18) suggested that birds detect latitude by sensitivity to the inclination of magnetic lines of force, and longitude by detecting the Coriolis force due to the rotation of the earth. Yeagley's work has been much criticized both from a theoretical and experimental point of view. It seems virtually certain that the forces he would invoke are too slight and too much cloaked by other forces to be of service to birds. This is best brought out in a symposium held in England (*Nature*, June 26, 1948).

Meanwhile Griffin and Hock (*Science*, 107) released gannets (*Morus bassanus*), a coastal bird, inland at a distance from their nests and followed them in an airplane. They seemed to seek home solely by circuitous wandering until the coast, with which they were familiar, was reached. The homing feats of certain other species of birds, however, make it unlikely that all homing in strange territory has its basis in trial and error.

Invertebrates. The first volume of the *Annual Review of Microbiology* (Stanford Univ., 1947; C. E. Clifton, editor) summarizes recent studies of protozoa. A fully annotated bibliography on oysters by Baughman appeared (Texas A. and M. Col-

lege). Extensive studies of the Coelenterata of Belgium by Leloup and of the freshwater and terrestrial molluscs of Belgium by Adam were issued by the Royal Natural History Museum of Belgium. Oughton completed a study of the zoogeography of the land snails of Ontario (Univ. Toronto Press).

Kaston's large and well illustrated work *Spiders of Connecticut* (State of Conn.) will be of value far beyond the confines of this State. Bryant wrote on the spiders of Hispaniola (*Bull. Mus. Comp. Zool.*, 100), while Snodgrass completed a valuable anatomical study of the feeding organs of arachnids.

The Songs of Insects by G. W. Pierce (Harvard Univ. Press) is by an author who is primarily a physicist. The result is a model investigation of this fascinating subject. Of papers on a particular group of insects, Uvarov's reviews of the literature on the economically important Acrididae (locusts) may be mentioned (*Trans. Royal Ent. Soc. London*, 99; and *British Mus. Publ.*).

DeLong monographed the Cicadellidae (leafhoppers), another group of agricultural pests (*Bull. Illinois Nat. Hist. Sur.*, 24), while Braun wrote extensively on the Microlepidoptera (*Memoir Amer. Entom. Soc.*). The aquatic beetles of the family Corixidae were treated at length by Hungerford and Sailer (Univ. Kansas Press). Vaurie reviewed the North American members of another family of beetles, the Languriidae (*Bull. Amer. Mus. Nat. Hist.*, 92).

Of more biological interest is Nielsen's study of the development and biology of the caddis flies (Hydroptilidae) (*Danish Royal Soc. Biol.*, 5). The anopheline mosquitoes of South Africa were the subject of a book by De Meillon (S. African Inst. Med. Res., 1947). Of medical importance as vectors of malaria, these mosquitoes also present many problems to the student of speciation.

Zimmerman's *Insects of Hawaii*, of which five of ten proposed volumes appeared, is the most important regional work of the year in entomology. The first volume is devoted to a description and analysis of the evolutionary peculiarities of the Hawaiian fauna, of which the insects provide many examples. The Institute of National Parks in Belgium published more in the series of technical monographs on the natural history of Albert Park, Belgian Congo, the latest dealing with various families of insects.

Cold blooded vertebrates. A notable review of the distribution of cold blooded vertebrates by Darlington (*Quart. Rev. Biol.*, 23) makes tropical Asia an important evolutionary center for this group. Berg's important classification of fishes, hitherto available only in Russian, was published in English (J. W. Edwards, Ann Arbor). Schultz' *The Ways of Fishes* (Van Nostrand), though popular in approach, contains much information and a classification. A completely revised edition of Hubbs' and Lagler's valuable *Fishes of the Great Lakes Region* was issued (Cranbrook Inst. Science, 1947). Miller continued his studies of the distribution and evolution of fishes in the isolated springs of the Great Basin desert and Death Valley (*Univ. Michigan Publ. Zoology*).

The first general review of the biology of the amphibians in many years was written by Angel (Payot, Paris, 1947). Pickwell's *Amphibians and Reptiles of the Pacific States* (Stanford Univ. Press) is a popular but well illustrated and informative volume. Continuing their work on the Mexican fauna, Smith and Taylor published a check-list and key to the amphibia of Mexico.

The reptiles and amphibians of New Guinea

were the subject of an extensive paper by Loveridge (*Bull. Mus. Comp. Zool.*, 101). De Witte and Laurent published complete taxonomic revisions of some of the Colubrine snakes of Africa (Royal Belgian Mus. Nat. Hist., 1947).

Birds. Older beliefs that birds hibernate are considered myths, yet Jaeger has now shown that the poor-will (*Phalaenoptilus*), a species of nightjar, may spend days or weeks of inclement weather during the winter in a hibernation-like, comatose condition (*Condor*, 50). Cott (*Proc. Zool. Soc. London*, 116) found that the flesh of brightly colored or conspicuous birds is less palatable to flesh eaters, including man, than is that of dull-colored birds. The bright colors of the former group, therefore, are believed to have the function of warning potential enemies.

Volume 6 of Peter's *Check-list of Birds of the World*, treating the woodpeckers and allied families, appeared (Harvard Univ. Press). Another valuable reference work, *Catalogue of Birds of the Americas*, neared completion with the publication of a volume by Hellmayr and Conover on the waterbirds (Chicago Natural Hist. Mus.). Bent's great series on the life histories of North American birds reached 16 volumes with the appearance of one covering the wrens and related groups (U.S. Nat. Mus., *Bull.* 195).

Among works pertaining to more limited areas may be mentioned Bailey's excellently illustrated *Birds of Arctic Alaska* (Colorado Mus. Nat. Hist.). Bond's volume on the birds of the West Indies deals with a remarkable insular fauna, notable for the high percentage of species that have become extinct (Macmillan, 1947). Van Bemmels' list of birds of the Molucca Islands (*Treubia*, 19) complements recent lists of birds of most of the adjacent island groups. A monographic study, *The Ruffed Grouse*, by Bump and collaborators is one of the most exhaustive studies ever made of a game bird (N.Y. Conservation Comm.).

O.L. Austin, Jr., in charge of conservation for the military government in Japan, published a carefully annotated list of Japanese publications on birds and mammals during the war (U.S. Fish and Wildlife Serv., *Tech. Leaflet* 305). Among the important works by Japanese scientists, many of them published in English, may be mentioned Kuroda's bibliography of the duck tribe, Yamashina's studies of the chromosomes of birds and hybrid sterility, and a study of the physiology of molt in the canary by Kiyochi and Hideshi. Austin himself contributed a valuable volume on the birds of Korea (*Bull. Mus. Comp. Zool.*, 101).

Mammals. Among regional works Rand's account of the mammals of Alberta, Canada (Canad. Nat. Mus.), Dalquest's *Mammals of Washington* (Univ. Kansas Publ.), and Handley and Patton's report on the mammals of Virginia (Va. Comm. Game, 1947) deal with portions of North America. The unique mammalian fauna of Australia was reviewed in an informative, semi-popular volume, *Furred Animals of Australia* (Scribners, 1947).

The earliest fossil mammals of South America, of interest because of their peculiar evolutionary history during the long geological isolation of that continent, were the subject of the first of a projected series of volumes by Simpson (*Bull. Amer. Mus. Nat. Hist.*). The same journal published further results of Tate's studies of the anatomy and taxonomy of the marsupials, and a revision of the fossil bison of Alaska by Skinner and Kaisen.

The American pronghorn antelope, of interest as a game species and as the only surviving member of its family, is the subject of a book by Einarsen

(Wildlife Management Inst.). The whales and dolphins of the west coast of the United States are discussed in an excellently illustrated article by Scheffer and Slipp (*Amer. Midland Naturalist*, 39). Other important studies of marine mammals are listed by Austin in the bibliography of Japanese publications mentioned above, along with other works of interest on the mammals of eastern Asia.

Anthropology. A memorial volume presented to the veteran South African anthropologist, Robert Broom, contains several articles by recognized authorities on *Australopithecus* and the other "ape-men" known from African fossil material (Royal Soc. South Africa). Later in the year Dr. Broom,

in cooperation with scientists from the United States, discovered a new fossil man in Africa of much larger size than any hitherto known from that continent. It may be related to the giant fossil pre-human types known from Java and southern China.

Another African discovery, this by a British expedition, was of a skull of the Miocene ape, *Proconsul*, previously known from fragments only. It lacked the pronounced ridges above the eyes characteristic of living anthropoid apes, such as the gorilla, and thus may have been an evolutionary point of departure for some of the earlier pre-human types in which such ridges tend also to be inconspicuous.

—DEAN AMADON

G L O S S A R Y

GLOSSARY

OF IMPORTANT NEW WORDS AND WORDS IN THE NEWS

Compiled by HAROLD WARD

- ac-globulin.** A protein discovered in 1944 by a Norwegian physician and now known to be associated with four other factors in the blood-clotting process, serving especially to accelerate the production of prothrombin.
- Acro-theater.** An art form which combines dramatic performances with acrobatics and strenuous physical display. Established in Chicago in 1947 by Erwin F. Beyer, Gymnastic Coach of the University of Chicago.
- airdrop.** To drop supplies by parachute from an airplane; by extension, the delivering of supplies in this manner and the supplies themselves.
- airfreighter.** An airplane designed to carry heavy freight.
- airlift.** The operation of transporting foodstuffs and other consumer goods into Berlin by airplane; organized under American initiative during the land transport blockade imposed by the U.S.S.R. in 1948.
- artillery.** Air artillery; especially with reference to the long-range guided missiles which it is believed will replace bombers and heavy guns in future wars.
- Americanocracy.** Economic and political domination of a country by the United States. Term attributed to Niklas Zachariades, Secretary of the Greek Communist Party, in an attack upon American intervention in Greece.
- aminopterin.** A synthetic drug under investigation in the treatment of acute leukemia in children. Chemical name, 4-aminopteroyl-glutamic acid.
- Anacom.** An electrically operated analytic computing machine designed to solve complex mathematical problems pertaining to electrical circuits, hydraulics, thermodynamics, and various types of machinery.
- anhydrovitamin A.** A substance obtained by treating vitamin A with an acid to remove its water content; it has an action similar to but very much weaker than that of vitamin A but its function is not yet clearly understood.
- Antrycide.** Trade mark of a synthetic crystalline compound developed by British scientists in the search for a drug effective against trypanosomiasis in cattle, especially in tropical Africa. It is derived from a group of organic compounds chemically designated as the 4-amino-6-(2'-amino-6'-methylpyrimidyl-4'-amino) quinaldine-1:1'-dimetho salts, all of which were found to have trypanocidal properties against laboratory infections.
- APF.** Animal protein factor. See VITAMIN B-12.
- aquametry.** Quantitative chemical analysis applied to reactions involving water.
- atomic clock.** A high-precision instrument for the measurement of time by a constant frequency derived from a microwave absorption line in the spectrum of ammonia gas or other suitable vibrator. Developed in the U.S. Bureau of Standards and believed to have a potential accuracy of one part in as high as 10 billion.
- aureomycin.** An antibiotic extracted from a mold fungus (*Streptomyces aureofaciens*), differing from penicillin and streptomycin in having a specific effect on viruses; so called from its golden color. Isolated by Dr. B. M. Duggar and associates.
- autotronic.** Describing a system for the automatic, electronically controlled operation of banks of elevators in office buildings; designed especially to relieve traffic congestion during rush periods in accordance with signals which actuate properly adjusted electronic devices.
- avogram.** That quantity of matter which is equal to one gram divided by Avogadro's number; a term proposed by a group of American chemistry teachers.
- bacillomycin.** An antibiotic isolated from a soil micro-organism (*Bacillus subtilis*), found to be effective against certain fungi, especially that causing athlete's foot.
- balladromic.** Traversing a direct course; heading to hit the target; said of guided missiles.
- bepo.** A British experimental pile, slightly larger than the gleep and also located at Harwell; used in research on atomic energy. Its power rating is about 6,000 kilowatts.
- bibliophenom.** A person with a phenomenal knowledge of books, authors, publishers, editions, and related topics; used humorously by Bennett Cerf in description of a New York dealer in rare books.
- biobibliography.** A combination of biographic and bibliographic information; a commemorative or memorial bibliography.
- bisociation.** A state of conflict between two contrasting or hostile systems of thought occupying the mind simultaneously or in rapid alternation. Term used by Arthur Koestler in his book *Insight and Outlook*.
- boval.** A natural clearing in a forest due chiefly to erosion of the soil overlying a ferruginous crust; hence, **bovalization**, the process of forming such an area, to the detriment of soil fertility.
- brachydromic.** Heading short; taking a deflected or slanting path toward the target; said of guided missiles.
- cardiolipin.** A phosphorus-containing substance extracted from beef heart and of value in checking blood tests for syphilis in persons who have had malaria or have been vaccinated against certain diseases: isolated by Dr. Mary C. Pangborn of New York.
- cartophily.** The collecting and appreciation of the pictorial cards formerly enclosed in packages of cigarettes; hence, **cartophilist**, one who collects these cards.
- cenogonal.** Having one or more angles in common; applied especially to different crystals some of whose angles have identical values. Term proposed by A. F. Rogers of Stanford University.
- cepharanthine.** A drug related to quinine; developed by Japanese chemists and under investigation as of possible value in the treatment of tuberculosis.
- channel wing.** A type of airplane wing which resembles a half-section of a cylinder, curving downward and having an engine at the center of the arc connected with a propeller. It is claimed that such wings permit easy take-off and landing.
- chemastery.** A pedagogical aid in the teaching of chemistry, based on the use of playing cards picturing various chemical symbols, formulas, valences, etc. Designed by H. M. Demuth.

- chemonomics.** A proposed term for chemical economics, especially with reference to chemical market research; coined by C. D. Ulmer of the Koppers Co.
- chemosurgery.** A medical technique which utilizes chemistry, surgery, and microscopic analysis; applied especially in the removal of skin cancers.
- cinematome.** An apparatus for the examination of very thin sections of rock samples extracted from oil-bearing formations; it consists of a specially designed microtome which feeds the rock slices to a motion-picture camera, the developed film then being carefully studied for peculiarities of rock structure.
- clathrate.** Any of a class of quinol compounds whose quinol molecules are so interlocked through hydrogen bonds as to form infinite three-dimensional complexes of trigonal symmetry. Term proposed by the English chemist Powell in allusion to the enclosed or protected nature of the giant molecules of the compound.
- clinodromic.** Traversing a path held at a constant angle with respect to a moving target; said of guided missiles.
- clinoscopic.** Viewing aslant; specifically, sighting to keep a guided missile in line with a shifting target.
- cocoon.** The special weatherproof covering in which valuable military or other equipment may be tightly sealed during transport or when not in use. It is usually in the form of cellophane sheets or a liquid resin which may be sprayed onto the surface, where it dries instantly, forming a tough film.
- condylometer.** A dental instrument which indicates the exact bite of a patient by facilitating observation of the condyle bones of the jaw.
- cosmotron.** An immensely powerful atom-smashing machine under construction at the Brookhaven National Laboratory of the Atomic Energy Commission. It is designed to bombard the nuclei of atoms with particles having energies comparable to those of cosmic rays, or from 2.5 to 3 billion electron volts.
- criminalistics.** That branch of criminology which deals especially with the scientific methods of crime detection.
- cybernetics.** A new science which, in the words of its originator, Norbert Wiener, an American mathematician, studies "the common elements in the functioning of automatic machines and of the human nervous system" in order "to develop a theory which will cover the entire field of control and communication in machines and in human organisms." The term is from a Greek word meaning steersman.
- Darvisul.** See PHENOSULFAZOLE.
- de-cocoon.** To remove the cocoon (special weatherproof covering) from military or other equipment, prior to installation and use.
- deltiology.** The collecting of postcards as a hobby.
- dihydroergocornine.** A drug considered promising in the treatment—not cure—of high blood pressure; it is derived from ergot and acts by a blockage of sympathetic nerve impulses.
- discophile.** A collector and connoisseur of phonograph recordings.
- disinflation.** A general reversal in the trend of industrial production, commodity markets, and prices after a prolonged boom period: term coined by Geoffrey Crowther, an English economist.
- dithiobiuret.** A growth-promoting chemical developed by a research group at the University of California; it has been shown to prolong the life of grape-vine cuttings when applied in proper concentration.
- Dixiecrat.** A member of the Democratic Party in the United States who rejected the plank of civil rights of the party platform and its candidate for the presidency; especially one from the southern States: word coined during the 1948 presidential campaign. See STATES' RIGHTS PARTY.
- Dramamine.** Trade name of a synthetic drug found beneficial in the treatment and prevention of seasickness. Discovered by medical research workers at Johns Hopkins University. Chemical name, betadimethylaminoethyl benzohydril ether 8-chlorotheophyllinate.
- dropsonde.** A radiosonde which, instead of being sent up into the atmosphere by balloon, is dropped by parachute from an airplane flying above difficult terrain not suitable for ground stations, as in deserts and arctic regions.
- duo-stroller.** A baby carriage built to accommodate two children.
- echridine.** An organic compound derived from pyridine, which has been found effective against fungi causing athlete's foot and ringworm and in the prevention of certain fungus diseases of plants.
- Econometer.** An apparatus for exhibiting the correlations between selected groups of economic data. The factors chosen are represented on opposite sides of a large disk on which value-relationships are shown by an indicator which controls the rise and fall of colored liquids in a series of flasks.
- Econorama.** An array of machines designed to illustrate various aspects of economic theory by the use of such graphic devices as dials, pointers, colored liquids, models, graduated scales, and the like. Similar in purpose to, but more elaborate than, the Econometer, it was invented and built by an American industrialist, J. D. Mooney.
- electrokymograph.** An instrument for recording and measuring the action of the heart by means of X-rays which project the heart-shadow upon a fluorescent screen used in conjunction with a photoelectric cell.
- electromyograph.** An instrument resembling the electrocardiograph, but adapted for recording electric waves set up in muscles, converting them into both sound and visual records.
- Electronic Flight Simulator.** An exact, full-scale replica of the cockpit of an airplane designed for the ground training of flight crews under all flying conditions.
- electronography.** A method of printing without direct contact between paper and inked surface by means of an applied electric charge which ionizes the ink particles, causing them to migrate from the type or printing plate to the oppositely-charged printing surface. Invented by W. C. Huebner. Also called *electromigratetics*.
- electrophrenic.** Describing a method of artificial respiration which depends upon the electrical stimulation of one or both of the phrenic nerves.
- estron.** A generic term proposed by the Tennessee Eastman Corporation to distinguish all types of cellulose acetate fibers, yarns, and filaments from the rayon types, which use regenerated cellulose.
- ethnolinguistics.** The study of linguistics in relation to other elements of human culture; language treated as an integral part of sociobiology.
- evapotranspiration.** The physiographic processes of evaporation and transpiration, treated as a functional unit in the study of climate.

Fair Deal. President Truman's name for the program and policies of the government under his administration, as given in his State of the Union message before Congress, Jan. 5, 1949.

feedlift. The emergency feeding of stranded livestock by supplies of hay and other fodder dropped from airplanes to range areas isolated by storms, blizzards, and extreme cold. This "Operation Hayride" was performed by U.S. Air Force planes to save starving cattle trapped on Western and Rocky Mountain ranges during the exceptionally bitter winter of 1949.

Fiber A. See ORLON.

flaperon. One of the winglike surfaces which provide for the automatic control of speed, lift, and altitude in a rocket or guided missile: a device combining the functions of a flap and aileron in an airplane.

Fotoseetter. Trade name of a printing machine by means of which the copy is first photographed and then transferred directly to the printing surface from the film.

gleep. The British graphite low-energy experimental pile, installed at Harwell for atomic energy investigations and the production of radioisotopes. It operates at a rate of about 100 kilowatts.

goitrogenesis. The act or process of producing goiter; whence **goitrogen**, any substance capable of initiating or promoting such a growth.

guppy. A high-powered, diesel-engined submarine equipped with an extensible air-intake tube (the schnorkel) to permit long periods of undersea operations at great depths. Developed in the U.S. on the basis of captured German designs. Name from the initials of Greater Underwater Propulsive Power + Y.

hankie-hatter. The British equivalent of bobbysoxer, so called because she wears a kerchief in place of a hat.

helicodromic. Having a flight path curving like a corkscrew or bent screw spiral; applied to guided missiles.

heliport. An airport for helicopters, especially one located in small and congested urban areas not accessible to regular airplanes.

herringbone. A peculiar up-and-down distortion of a television image, due to interference from wave frequencies set up by diathermy machines. Sometimes called *Parker method* from its resemblance to the old-fashioned method of penmanship.

historiate. To provide (a map, chart, or the like) with interesting historical details, often in the form of pictures in color.

holidate. A holiday date; a sharing of all or part of one's vacation time with another person.

Hydrafrac. Trade name of a method for loosening underground rock formations by means of jellied gasoline pumped down an oil well, thus permitting the imprisoned oil to flow to the surface along with the recovered gasoline.

hydrofoil. A winglike structure placed under a speed-boat to lessen drag by raising the hull completely out of the water.

hydrolube. A non-flammable, non-corrosive, anti-freeze liquid for use in the hydraulic system of airplanes; developed by the U.S. Naval Research Laboratory.

hydronamic. Contraction of hydrodynamic, especially as applied to the study of airplane design and performance.

hydronitrogen. Any of a class of chemical compounds containing hydrogen and nitrogen, as ammonia, hydrazine, etc.

hypersonic. Pertaining to or characterized by very high supersonic velocities, especially those with a Mach number of 5 or greater.

INBA. A plant-growth regulator which has been made radioactive to permit an exact tracing of its course through the plant.

isosyst. The state or condition of constant composition throughout a given experiment; applied especially in studies of chemical phase equilibria. Term suggested by V. C. Williams, an American chemist, on the analogy of *isobar*, *isotherm*, etc.

isotone. The stable nucleus of an atom or any of its isotopes; term suggested by Maria G. Mayer, American nuclear physicist.

kappa. A substance of undetermined composition present in the cytoplasm of certain stocks of the unicellular organism *Paramecium* and essential to the production of paramecin. Although located outside the chromosomes it is believed to exert a powerful, and under certain conditions a permanent, effect upon the genes and hence upon the processes of inheritance. Discovered by T. M. Sonneborn and associates.

K-band. A band of microwave frequencies below 3 centimeters in wavelength; used in radar.

Keedoozle. Trade name of a type of grocery store which dispenses canned or packaged goods on the principle of the Automat or juke box, the customer recording selections on a special tape-device whose various punchings are then made to actuate corresponding chutes. Devised by Clarence Saunders.

khellin. A substance extracted from the fruit of a Middle East plant (*Amni visnaga*) and shown to have a strong vasoconstrictor effect on the blood vessels of the heart.

kynurenin. An organic compound formed by the break-down of the amino acid tryptophane; it is believed to participate in the formation of nicotinic acid.

litterbug. A person who is careless in disposing of garbage, waste, and litter; one who violates or ignores street-cleaning regulations.

lorate. To disseminate or spread about, as news, gossip, information, etc. Also, **lorating**. Possibly from *loran*, the navigation system developed during World War II.

LP record. A long-playing phonograph record, constructed with grooves so close together that one face of a 12-inch disk will carry a 22½-minute recording. Developed by Peter Goldmark of the Columbia Co.

Lysenkoism. The body of doctrine regarding the nature and processes of inheritance associated with the Soviet agronomist Trofim D. Lysenko. It challenges the formal genetics of Weismann, Mendel, and Morgan, claiming that the genes may be permanently modified by somatic conditions, especially in regard to nutrition, and that individually acquired characters may, under suitable conditions, be inherited.

marbleomania. An over-emphasis upon ornate and intimidating marble effects in public buildings, especially art museums, theaters, etc.

Methadon. Trade name for a powerful narcotic used as a substitute for morphine in the relief of extreme pain; developed in Germany and under investigation in the U.S.

methoxychlor. A powerful insecticide, related to but less toxic than DDT; tests have shown it to be effective against lice, flies, the Mexican bean

- beetle, and certain other pests. The chemical name is *p*-methoxyphenyl trichloroethane.
- Metopon.** Trade name for a morphine derivative which has been found effective in relieving the intense pain of those in the last stages of cancer.
- microcard.** A standard 3 × 5-inch library card on which are pasted microfilm reproductions of books, pamphlets, documents, etc.; designed to be read by a special device called the Scrutinizer.
- microgroove.** An LP disk; so called from the exceptional fineness of the grooves cut into its surface.
- micronutrient.** A substance, especially certain metals, whose presence in minute quantities is essential to the health of man and animals.
- migratetics.** See ELECTRONOGRAPHY.
- motorboating.** The tendency of an audio system to emit a succession of pulsating sounds resembling that of a motorboat; it is associated with feedback of certain audio frequencies.
- myanesin.** A chemical derived from glycerin and thought to be of value in the treatment of various neuro-muscular disorders.
- neo-materialism.** A philosophic system formulated by S. W. Tromp, a Dutch geologist: it seeks to integrate the various fields of scientific knowledge so as to provide a materialist base for the reevaluation of all moral and religious concepts.
- nitrogation.** A method of fertilizing the soil by direct application of liquid anhydrous ammonia to the irrigation water; used on farms in the U.S.
- nitrojection.** The direct application to the soil of anhydrous ammonia gas as a means of improving its fertility; the method was first commercially used in the U.S. in 1943, subsequent to the nitrogation process.
- omnirange.** A type of very-high-frequency radio beams emitted in all directions simultaneously. Developed in the U.S. as an aid to air navigation, permitting aircraft pilots to find their course and position anywhere within the network of about 400 omnirange stations.
- operational research.** Described by P. M. S. Blackett, a leading British scientist, as "the technique of the scientific analysis of war"; by extension, any application of scientific method and technical resources to peacetime operations, especially with reference to planned development.
- Operation Hayride.** See FEEDLIFT.
- Orlon.** Trade name of a synthetic fiber made from acrylonitrile, an ingredient of Buna N synthetic rubber. Preliminary tests show it to possess great strength, toughness, and durability, especially as a fabric for curtains, drapes, seat coverings and the like. Formerly referred to as Fiber A.
- ostreodynamometer.** An instrument capable of detecting the movements of an oyster within its shell and without disturbing its normal activities. Developed to study the effects of water pollution on oysters.
- overtake.** In printing, proofread galleys: term used by Winston Churchill (1948). Compare earlier figurative use of the verb (1330), indicating completion of a task beset with difficulty or hindered by other intervening business.
- oversigned.** The person whose name appears at the beginning of an article, document, report, etc.; analogous to *undersigned*.
- palynology.** The scientific study of pollen and other spores, their dispersal and applications; pollen analysis: term proposed in 1944 by British researchers.
- paramecin.** A powerful nucleoprotein which occurs within the bodies of certain paramecia, where its production is controlled by the cytoplasmic factor kappa. It is transmitted by inheritance within certain strains of the organism and is generally lethal to other strains lacking in kappa. Discovered and isolated by T. M. Sonneborn and associates in research on genetics in *Paramecium*.
- parathion.** A synthetic insecticide developed in Germany; it is effective against mites and toxic for many other insects attacking fruits and vegetables. It is also highly toxic for warm-blooded animals and may be distinguished by its garlic-like odor.
- Parker method.** See HERRINGBONE.
- permenorm.** A nickel-iron alloy that has the property of becoming highly magnetized when placed in an electric field, thereby improving the performance of vacuum tubes, amplifiers, and rectifiers. Developed in Germany.
- petrochemistry.** The chemistry of petroleum and its derivatives, especially the natural and synthetic hydrocarbons.
- phellumenist.** One who collects matchbox labels; also, **phellumenism**, the collecting of such objects. British coinage.
- phenosulfazole.** A modified sulfa drug reputed to have value in the treatment of poliomyelitis. Also called *Darvisul*.
- Phenurone.** Trade name of a derivative of phenobarbital reported to be of therapeutic value in the treatment of epilepsy.
- photocomposition.** The composing of printed matter by photographic means rather than directly from movable type; a method coming into use through such machines as the Fotosetter and Phototext-type.
- photodiagram.** A diagrammatic view, as of a factory, community, etc., superimposed upon an actual photograph of the area.
- photo-skinned.** Describing a terrain relief model over whose surface corresponding aerial photographs have been pasted in exact alignment.
- plasmagene.** A factor present in the cytoplasm of a cell which is believed to play a significant, and sometimes decisive, role in the mechanism of heredity; an extra-nuclear replica of the gene, subject to the influences of the cellular environment.
- plastics.** Plastics, resins, and other synthetic products, considered as forming a single branch of chemical science, technology, and engineering. Term coined by British chemists.
- plastisol.** A suspension of finely divided resin particles in a plasticizer: useful in the application of plastic coatings to various surfaces.
- Polacolor.** Trade name of a three-color motion-picture process by means of which the separate color images are imposed on a single layer of standard black-and-white film.
- pollster.** One who takes public opinion polls; derisively, one who makes overconfident or inaccurate predictions based on the data of such polls, as happened in the U.S. Presidential election of 1948.
- polo-crosse.** A combination of polo, lacrosse, and netball, played by mounted teams of six on a side, the polo sticks having a net on the end instead of a mallet. Introduced in Australia.
- polymixin.** An antibiotic discovered in a soil bacillus by American scientists; it is believed to be more effective than streptomycin in the treatment of certain diseases, especially undulant fever, tularemia, and a type of meningitis caused by Friedlander's bacillus.

- precoat.** To apply (to metals) a thin surface-layer by hot-dip or electroplating methods in order to improve quality, wear, or performance of metal parts. Also **precoating**.
- Progressive Party.** A new political party calling for a program of "peace, freedom, and abundance" established in Philadelphia, July 23, 1948. It nominated Henry A. Wallace for President of the U.S. and Glen H. Taylor for Vice President.
- psychoquack.** One who practices psychiatry without adequate training or license; a quack psychiatrist.
- quantum liquid.** Helium in the superfluid condition; so called because it confirms the prediction of quantum theory that even at the temperature of absolute zero there is motion among the molecules.
- radiocardiography.** A method for studying the blood flow through the heart by recording the passage of injected radioisotopes with the aid of a specially constructed Geiger-Muller counter connected with a pen which traces the **radiocardiogram** on graph paper.
- raster.** The pattern of variably luminescent lines traced on a radar, television, or other viewing screen by the movement of the cathode-ray beam across the photosensitive surface of the transmitting unit.
- resinography.** The study of the structure of synthetic resins; especially, the microscopic examination of the etched or polished surfaces in order to identify the various pigments, fillers, or other substances entering into their composition. Hence, **resinographer**, a specialist in this technique.
- resistentialism.** A humorous British parody on existentialism, attributed by its author, P. F. Jennings, to a mythical Pierre-Marie Ventre. "Pre-atomic philosophies were concerned with what men thought about things. Resistentialism is the philosophy of what Things think about us."
- roentgen equivalent physical (r.e.p.).** Radiation of an intensity such that it may be absorbed at the rate of 83 ergs per gram of tissue. Also called **roentgen equivalent man (r.e.m.)**.
- rotachute.** A parachute for use with rockets or in high-altitude airplanes. It is in the form of a long, dartlike tube equipped at the tip with a propeller whose horizontal blades, by their swift rotation during descent, break the fall of delicate instruments, supplies, or other loads attached to it.
- Rouxcolor.** Trade name of a 4-color motion-picture process in which the separate images are superimposed on one standard frame, both camera and projector lenses using filters to achieve the final color image. Developed by A. and L. Roux, French opticians.
- rutherford (rd).** Proposed name for a unit of radioactive disintegration smaller than the curie and independent of any natural constants: defined as that quantity of a radioisotope which disintegrates at the rate of a million disintegrations per second. Term suggested by E. U. Condon and L. F. Curtiss, American physicists.
- sabosterite.** A hygroscopic, dielectric, anti-acid mineral discovered in southern Italy.
- Salamander.** An unmanned, remote-controlled amphibious craft developed by the U.S. Navy toward the end of World War II for use against enemy mines and for the demolition of beach defenses prior to attack by landing forces. Also called **X-craft**.
- scopodromic.** Traversing a course in the line of sight; homing; applied to guided missiles.
- sengierite.** A radioactive mineral discovered in the Congo and shown to contain copper, uranium, and vanadium in hydrous form. Named after Edgar Sengier, Belgian mining executive.
- serotonin.** A crystalline protein isolated from beef serum and believed to be associated with vasoconstrictor activity in blood vessels.
- Shellie.** Trade name for a collapsible, disposable nursing bottle for babies.
- simulcast.** To broadcast by radio and television simultaneously.
- SKF 538-a.** A synthetic pain-killing drug having many times the potency of cocaine; under investigation as a local anesthetic. Chemical name, 1-(B-dimethylaminoethoxy)-4-butyl-isoquinoline.
- slope-line.** A system of lights so arranged on an airfield as to form a pair of sharply defined converging lines between which an aircraft pilot may guide his plane to a safe landing.
- sociobiology.** The study of human sociological phenomena from the viewpoint and in terms of the biological and physical sciences; biophysics as applied to sociology. Term proposed by C. F. Hockett of Cornell University.
- spasmolytic.** Having the power to relax spasms; anti-spasmodic; said especially of various drugs, **spasmolytes**, capable of relaxing spasms in certain smooth muscles.
- Spirodome.** Trade name for an experimental apparatus combining the functions of a respirator and oxygen tent, designed to give the exact amount of oxygen at the correct pressure needed for normal breathing.
- sprig.** The branched small sparks appearing in the stream of sparks emitted in grinding iron or other metal.
- spurchase.** A purchase made on the spur of the moment; something bought on impulse. Term coined by marketing specialists of the Du Pont Co.
- STAMNI.** An instrument for the accurate measurement of airplane speeds by the use of high frequency sound waves; adapted also for the determination of the Mach number. Name a contraction of "sonic true airspeed and Mach number indicator," developed at the Cornell Aeronautical Laboratory.
- States' Rights Party.** A political party founded during May, 1948, in Jackson, Miss., by southern Democrats who opposed the civil rights program of the regular Democratic Party. At its Birmingham, Ala., convention, July 17, it chose Governor James Strom Thurmond of S.C. as its 1948 Presidential candidate.
- submariner.** A qualified and fully trained member of a submarine crew.
- sulfamethazine.** A sulfa drug believed to be effective in controlling certain animal diseases, as mastitis in cows and shipping-fever in horses.
- sulfaquinolaxalin.** A sulfa drug which has been successfully used in the control of the destructive poultry disease, coccidiosis; developed by chemists at the Rhode Island State College.
- superfluid.** A peculiar state of matter, noted only in helium when cooled to within a degree of absolute zero. Among its properties are an exceptional heat conductivity, the ability to permeate very dense substances, and to flow upwards against gravity. Called also *quantum liquid*.
- Swartkrans man.** A race of giant ape-men whose former existence is inferred from the anatomical characteristics of a single huge fossil jawbone

and teeth discovered by Dr. Robert Broom in the Swartkrans cave in Africa.

TAPline. The Trans Arabian Pipe Line.

tele-juke. A juke box equipped for television.

tele-transcription. A method for the transcribing of television programs on films for subsequent presentation; also, the film itself.

thesauric. Encyclopedic; having or containing large stores of miscellaneous information, most of it useless; used in a description of the radio comedian Robert Q. Lewis.

thiazolyl. A synthetic drug of the sulfa type now under investigation as of possible therapeutic value in the treatment of polio.

throughput. The quantity of raw materials which may be processed for intended final use in a given time, as in a chemical plant for the conversion of paraffins to fatty acids.

thujaplicin. A crystalline substance isolated by Swedish chemists from an oily extract of the heartwood of the western white cedar (*Thuja plicata*); it may prove to have useful antibiotic properties.

tomodromic. Having a flight path which cuts athwart a moving target; heading to cut or intersect; applied to guided missiles.

topectomy. A brain operation in which certain affected areas are removed with little or no damage to the patient's normal personality.

transistor. A very small, compact, and highly efficient device for the instantaneous control and amplification of an electron current without using a vacuum and at low power consumption. The current from a fine tungsten wire strikes a crystal of germanium which transmits it, greatly amplified, to another tungsten wire connected with the receiving apparatus. The device, developed by scientists of the Bell Laboratories, may replace the vacuum tube in many electronic applications.

tricothecin. An antibiotic extracted from a fungus (*Tricothecium roseum*) and shown to be effective in arresting the spread of certain other fungi by impairing their reproductive powers. Discovered by chemists of the Imperial Chemical Industries (England).

trifocal. Having three foci; said especially of a lens one segment of which corrects for near vision, another for far vision, and the third being adapted for intermediate vision.

Trimeton. Trade name of the organic compound propenpyridamine, reported to have been effective in the treatment of various types of allergy.

trudgery. Hard, tiresome, and monotonous labor involving incessant trudging from one place to another.

Tuf-lite. Trade name of a hard, durable plastic formed from butadiene-styrene resins; suitable for use in bowling balls, shockproof helmets, etc.

Turbo-Wasp. A jet propulsion engine designed in England and improved in the U.S. It operates with a single-stage, double-entry centrifugal compressor, nine combustion chambers, and an axial flow gas turbine, delivering the equivalent of 9,000 horsepower.

Twilight War. Winston Churchill's name for the "phony war" period of World War II, which ended when he became Prime Minister; used in his book, *The Gathering Storm*.

twofer. A free coupon which entitles the holder to two theater tickets for the price of one if presented at the box office of the designated show or other attraction.

Uniforce. The combined military forces of the proposed Western Union defense pact between Britain, France, and the Benelux countries, with headquarters at Fontainebleau. The principal sections are the Uni-air, Uni-terre, and Uni-mer, for the air, land, and sea forces respectively.

update. To bring up to date; to revise, with corrections, additions, etc., as a textbook, manual, handbook, etc.

Vari-Typer. Trade name of a compact, keyboard-operated, electrically actuated composing machine for the rapid preparation of copy and stencils for all types of reproduction. It has the general appearance of a typewriter, but is equipped with various styles and sizes of types and is self-justifying.

vetmobile. A vehicle designed and custom-built for disabled veterans; it is equipped with special devices, gadgets, and accessories according to the needs of the user and was first conceived by E. T. Adkins, formerly of the U.S. Naval Reserve.

vitamin B-12. A red crystalline substance isolated from liver and also from a mold of the streptomycin group. It has been shown to be highly effective in the treatment of pernicious anemia and is possibly identical with the animal protein factor (APF) essential for the growth of chicks, pigs, and other animals. Its isolation was accomplished independently by British and American chemists.

vitamin U. A vitamin present in many raw foods and vegetables and possibly responsible for the prevention of stomach ulcers; under investigation by Dr. Garnett Cheney of Stanford University.

X-craft. See SALAMANDER.

xerography. Dry printing; a photoreproduction method invented by C. F. Carlson. The photoconductive surface of an electrically charged plate, after exposure to the copy, retains only a positive charge in the areas covered by the copy. Negatively charged powder, sprayed upon the plate, adheres to these areas, from which it is transferred to the positively charged printing surface, being permanently fused thereto by a few seconds of heating.

xeroprinting. A simplified variation of xerography which uses a suitably prepared plate on a rotating cylinder in conjunction with a charging device and various mechanisms for the development, transfer, and fixing of the images.

ylem. The primordial flux of highly compressed neutron gas from which all matter has been supposed to develop through expansion and the building of atoms by neutron capture. Term introduced by R. A. Alpher, American physicist.

yoke. To lock an arm around a person's throat preparatory to robbing him; a variant of the underworld term, *to mug*.

Zarem camera. A high-speed camera whose shutter, constructed on the principle of a Kerr cell, can operate at the rate of 10 million exposures per second or give a single exposure in 100-millionth of a second. Designed by A. M. Zarem.

Zoe. The French atomic energy pile, designed, built, and successfully operated under the direction of Fréderick Joliot-Curie. It uses uranium oxide as the activating material, heavy water as the moderator, and develops no external heat energy requiring elaborate cooling arrangements. The energy generated does not exceed five kilowatts. Name from initials of the words *zéro énergie, oxyde d'uranium, eau lourde* (heavy water).

INDEX
